With regard to YouTube, a significant difference in the perception of the analyzed variables was observed in all cases between men and women. In the case of the information search motive, the values of $\bar{x} = 4.05$ ($\tilde{x} = 4.00$) for men and $\bar{x} = 3.59$ ($\tilde{x} = 4.00$) for women were observed for the YT_info_1 variable, while for the YT_info_2 variable $\bar{x} = 3.98$ ($\tilde{x} = 4.00$) for men and $\bar{x} = 3.49$ ($\tilde{x} = 4.00$) for women, while YT_info_3 acquired the values $\bar{x} = 4.13$, ($\tilde{x} = 4.00$) for men and $\bar{x} = 3.53$ for women ($\tilde{x} = 4.00$). All observed differences were in favor of a higher rate of agreement among men in the case of the YouTube social network. None of the differences were statistically insignificant.

4. Discussion

Despite the initial assumption, which finds support in the demographic composition of Facebook users (Statista, 2021a), where male users comprise a noticeable 56% majority, our analysis did not reveal significant gender-based differences in attitudes toward the areas of interest on the Facebook platform. This observation aligns with findings from Semeraro Dowling's study (2019), which also reported that Facebook exhibited the lowest average engagement levels among the set of social networks under investigation. This result is further substantiated by Statista's 2021b data, indicating that the primary motivation for using Facebook is to maintain connections with family and friends. In contrast, the pursuit of following and engaging with brands accounted for only a third of users' motivations for utilizing the platform. Nonetheless, this should not discourage brands from investing their resources, be it capital, human resources, finances, or time, in this network. Facebook still retains its position as the largest social network globally and maintains a high level of interaction with paid posts (Oberlo, 2020), thereby offering substantial marketing potential. Additionally, it's crucial to consider the content nature on this social network, as user content creation activities often begin on other platforms, with users subsequently sharing their content on Facebook. This scenario could be perceived as a concealed form of content creation. Nevertheless, the choice to invest in Facebook should always be evaluated within the context of the

brand's strategy and target audience. If the target audience is predominantly female, it may be appropriate to consider this platform or integrate content marketing efforts with other social networks.

On the social network Instagram, the scenario regarding gender differences stands in stark contrast to that observed on Facebook. Gender disparities were evident in all three cases, with women expressing much higher agreement with the statements under investigation. This outcome finds further support in the demographic makeup of Instagram users, where women constitute the majority at 57% (Statista, 2021c). Karatsoli and Nathanail (2020) highlighted that visually dominant content, such as photos and images (which are the core of Instagram), tends to resonate more with women than men. Even when it comes to the motives behind brand-related activities, women tend to evaluate them more positively. Success on Instagram is closely linked to the aesthetics and visual appeal of the content shared, making it a magnet for female users (Brahmadas, 2019). Another parallel can be drawn from the fact that women exhibit greater daily activity on social networks compared to men, and Instagram, in particular, embodies this temporal element through its chronological content display. The relatively less favorable assessment among men might be linked to their higher usage of desktop devices and laptops to access these platforms in contrast to women (Lounge, 2015). However, Instagram's graphic interface is primarily optimized for mobile devices, offering a less compelling user experience on other devices.

Gender disparities were also evident on the YouTube social network. In this case, we observed significant differences across all three variables under investigation, consistently with a more favorable evaluation among men. A parallel to this outcome can be found in a study conducted by Landrum in 2021, which identified a lower interest among women in this platform due to status-related reasons, which are better fulfilled by the female audience on Instagram. Moreover, in contrast to the discussion about the suboptimal user experience on desktop computers and laptops (Lounge, 2015), YouTube is a platform that performs exceptionally well on these devices, making it a crucial aspect given the nature of the content published on the platform. Furthermore, a study by Wegener et al. (2020), which explored the content creators on this platform, reported a significant prevalence of 73% male creators.

Conclusion

Digital marketing is a broad term that encompasses all marketing efforts that use electronic devices or the Internet. This type of marketing can include various channels such as search engines, email, mobile apps and other digital platforms. On the other hand, social network marketing is a specific sub-category of digital marketing, focused on creating and maintaining relationships with the target group through social media such as Facebook, Instagram, Tik Tok and the like. Both areas are closely connected. Social media marketing is one of the channels that digital marketing uses to achieve various goals, such as increasing brand awareness, customer engagement or conversions. Social media often serves as a platform for other forms of digital marketing, including content marketing and paid online advertising. This makes social media marketing an integral part of a comprehensive digital marketing strategy. Digital marketing is essential for businesses to survive and thrive in the modern marketplace. Digital marketing is often characterized by its ability to reach a global audience, provide measurable results, and adapt to evolving consumer behaviors and technological changes. We found out, while Facebook did not exhibit noteworthy gender-based disparities in information search motive, the scenario on Instagram and Youtube was distinctly different. these findings can be instrumental in formulating more effective, targeted, and resource-efficient marketing strategies for businesses operating in the ecosystems of Facebook, Instagram, and YouTube. By understanding the nuanced behavior of different genders across these platforms, businesses can better allocate their resources and refine their approaches to customer engagement.

Exploring the Impact of Gender on E-commerce Growth in Central European Countries

Mária Oleárová^{1,*}, and Radovan Bačík¹

¹ University of Presov, Department of Marketing and International Trade,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The constant development of technology and the impact of digitalization has caused the e-commerce market to be on a constant rise. Consumers perceive many advantages to sell and buy products via the internet, however, the culture and consumer behaviour of different countries may also result in different developments in this sector. Monitoring the state of e-commerce can streamline management decision-making processes internationally.

Purpose of the article: The main goal of the presented paper is to map the development of electronic commerce in the countries of Central Europe. Using Eurostat's publicly accessible data, our objective is to examine the disparities between men and women in two aspects of e-commerce: (1) online shopping and (2) selling products or services over the Internet. The objective is also to contrast the state of e-commerce in these countries with the EU average.

Methods: Data for this study was sourced from Eurostat, the Statistical Office of the European Communities, and the European Institute for Gender Equality. Our research covers the timeframe from 2018 to 2022, targeting Slovakia, the Czech Republic, Hungary, Poland, Austria, and Slovenia.

Findings & Value added: Our findings highlight a progressive upswing in the Central European e-commerce market, with men holding a marginal edge over women in terms of participation. Moreover, the prevalence of online sellers differs significantly among these Central European countries, with men prevailing in this aspect as well. Understanding the state of e-commerce in international markets is especially important for those business entities that plan to expand abroad.

Keywords: e-commerce, online shopping, online sales, gender differences, Europe

JEL classification: M2, M21

1. Introduction

In the view of Khan (2016), e-commerce refers to the exchange of goods or services using the Internet. This contemporary phenomenon has brought about significant shifts in our daily lives, introducing highly effective concepts and processes. Consequently, it has become a top priority for many individuals and has provided entrepreneurs with opportunities to solidify their market position for their products and services (Taher, 2021). With the proliferation of internet stores and the trend of online shopping, it has become a favored and widely embraced activity for a substantial portion of the population. There exists a plethora of thoughts and conspiracies surrounding the potential demise of traditional brick-and-mortar establishments, foretelling their overshadowing of numerous established global brand e-commerce retailers. Undeniably, the momentum behind e-commerce stems from its popularity among the majority of the population, who increasingly embrace the convenience and benefits of this type of shopping facilitated by the Internet.

Unlike most studies that focus solely on investigating online purchasing behavior, our research also gives considerable attention to the dimension of selling products through digital platforms. It recognizes that e-commerce encompasses more than just shopping activities. Additionally, our study endeavors to identify gender-based differences in both buying and selling behaviors of products and services. By analyzing the prevalence of buyers and sellers in Central European countries, we aim to shed light on the e-commerce landscape in these nations and how they compare to the pan-European average. The article is

* Corresponding author: maria.olearova@unipo.sk

structured systematically. It commences by laying out the theoretical underpinnings of the topic being explored, and subsequently, the analytical methodology is clarified. Thereafter, the results of the analysis will be presented and thoughtfully interpreted. In the closing segment, the findings are discussed in-depth, and potential areas for future research are outlined. The paper's primary objective is to serve as a supportive reference for future research in the international context, and at the same time, it aims to reveal the varied buying and selling tendencies among people residing in different countries.

2. Theoretical background

E-commerce functions as a virtual system where sellers conduct transactions involving products or services in exchange for money, facilitating communication and interaction with buyers through Internet platforms (Fu et al., 2020). An essential aspect of e-commerce is online shopping, enabling individuals to acquire goods or services through electronic stores accessible via websites or applications (Rao et al., 2021). Additionally, users have the convenience of shopping online using different devices like desktop computers, tablets, and mobile phones (Hamli & Sobaih, 2023). The e-commerce transaction commences when sellers advertise their products on a website, leading customers to engage in product evaluation, price comparison, and delivery option assessment before making a purchase and proceeding with payment (Ribadu & Rahman, 2019). Moreover, researchers emphasize the advantages of e-commerce for small and medium-sized businesses (Kartiwi et al., 2018).

The growth of e-commerce has been significantly fueled by remarkable technological and economic advancements (Nanda et al., 2021). Noteworthy is the fact that the per capita e-commerce market in Slovakia outperforms that of Hungary, Slovenia, or Croatia (Benčík, 2022). The e-commerce industry in Slovakia shows remarkable annual expansion, with online purchases reaching a substantial volume of 1.810 billion euros in 2022 (Borko, 2023). Concurrently, this growth has escalated competition, leading to the establishment of over 1,000 new online sales points in Slovakia annually, all continuously raising their standards of quality and professionalism. Determining the exact count of online sales points on the Slovak Internet is challenging as researchers' estimates vary slightly, and the calculation methodology is generally non-transparent. Presently, e-shops are estimated to range from 12,000 to 18,000 in number (Benčík, 2022). Interestingly, after three years of growth, Slovak e-commerce experienced a decline of 13% in 2022. Nonetheless, the future progress of e-commerce is anticipated to be contingent on the overall development of the economy and the unemployment rate, considering that e-commerce has become an integral component of the entire retail sector (Heureka, 2023).

However, recent studies have revealed exponential growth in e-commerce (Mofokeng, 2021) with Tarhini et al. (2018) noting that online shopping has been gaining momentum due to the time and effort-saving benefits it offers. Undoubtedly, online shopping provides customers with a wide array of products and services, enabling them to compare offerings from various intermediaries and select the most suitable option (Sivanesan, 2017). Nevertheless, this is not the sole reason why customers choose to shop online. Following pandemics and periods of uncertainty, consumers have undergone a transformation in their cognitive consumer behavior – they now turn to online shopping not only for the sake of convenience but also for security (Eger et al., 2021). According to other researchers, online shoppers seek enjoyment, recreation, and exciting deals. They are attracted to online channels for their access to modern products, trendy styles, and a wide range of offerings (Alavi et al., 2016). Additionally, online shoppers engage in price comparison among various online retailers, ultimately selecting the most competitive and acceptable price (Pandey et al., 2019).

Scientific literature indicates that consumer decisions to purchase specific products or services are rooted in their behavior (Wai et al., 2019), which requires an adjustment of business strategies (Rajnoha et al., 2019). Consumer behavior entails the examination of psychological, behavioral, and emotional processes that influence individuals' choices regarding what, how much, and how frequently they consume products and services (Mothersbaugh et al., 2020). It also encompasses individuals' personal thoughts and feelings during the purchase process (Famileki et al., 2015). Gaining an understanding of customer behavior, both before and after purchase, enriches knowledge in diverse scientific fields, including economics and psychology. Additionally, it significantly aids businesses in identifying new business opportunities (Qazzafi, 2019) and enables the prediction of future e-commerce trend (Gudigantala et al., 2016).

E-commerce's significance in today's business landscape is increasing, indicating the growing necessity of formulating effective e-commerce strategies (Yanes-Estévez et al., 2018). In the domain of strategic management for e-commerce, a key aspect involves identifying the determinants influencing its overall processes (Svatosova, 2020). Huseynov & Yildirim (2016) have underscored that comprehending

the motives driving consumers to shop online plays a pivotal role in successfully establishing and executing an Internet marketing strategy. Economic uncertainty prompts changes in buyers' behavior (Hamli & Sobaih, 2023), leading several researchers to emphasize the importance of identifying factors contributing to the adoption of e-commerce, particularly online shopping, as a substitute for conventional brick-and-mortar stores (Alflayyeh et al., 2020).

The question has been extensively addressed by several authors. According to a study conducted by Jadhav & Khanna (2016), the key factors influencing online shopping include availability, low prices, promotions, product comparisons, customer service, user-friendliness, time efficiency, and a variety of choices. Nachar (2019) discovered that customers embrace online shopping when the technology is easy to use and efficient. Various studies have explored consumer-related factors like hedonic value (Chang et al., 2016), shopping experience (Lim, 2015), and trust (Agag & El-Masry, 2016). In addition, other authors have delved into technical aspects such as website quality (Al-Debei et al., 2015), security and privacy (Hsu & Hsu, 2014), and the perceived usefulness of online shopping (Kim, 2017). Bruschi et al. (2019) emphasize the significance of online retailers fostering positive customer relationships by providing a gratifying shopping experience based on these values, which serves as the foundation for long-term success in online retailing.

3. Methods

The primary objective of this study is to examine the progression of e-commerce in Central European countries. Specifically, we aim to explore the disparities in online shopping and selling of products/services concerning gender characteristics among Europeans. In this context, we have formulated two research questions:

1. How has online shopping changed in Central European countries in the period under review in terms of differences between men and women?
2. How has the sale of products and services via the Internet changed in the countries of Central Europe in the monitored period in terms of differences between men and women?

Data for this study was sourced from Eurostat, the Statistical Office of the European Communities, and the European Institute for Gender Equality. The research process involved two indicators: (1) Digital single market - focusing on e-commerce promotion for individuals, and (2) Individuals using the Internet for selling goods or services. The study concentrated on six Central European countries, as defined by the European E-commerce Report (2022), which are Slovakia, Czech Republic, Hungary, Poland, Austria, and Slovenia. However, Switzerland, although geographically located in Central Europe, was excluded due to incomplete data. The objective of the research is to illustrate the e-commerce development between 2018 and 2022. The analysis covered the general population, specifically individuals aged 16 to 74, who had made at least one online purchase within 12 months or were involved in selling products and services through the Internet. The data is presented as percentages of individuals. The descriptive statistics method was used for the analysis, specifically we focused on the EU average.

4. Results

In this section of the paper, we will assess the acquired data. Initially, we will analyze the evolution of online shopping during the observed period, highlighting the disparities between men and women's shopping behaviors. Additionally, we will provide an overview of this entire topic in the context of Central European countries.

The data presented in Figure 1 highlights a consistent upward trend in the percentage of online shoppers, irrespective of gender, over the years. However, when comparing the differences between men and women in the monitored countries, the variations are relatively minor, with men showing a slightly stronger inclination for online shopping throughout the entire observed period. The same trend can be observed in the European average. In 2018, approximately 58.5% of European women shopped online, while the figure for men was approximately 60.5%. By 2019, both percentages experienced an increase of around 4%. Interestingly, in 2020, during the Covid-19 pandemic, which restricted physical shopping, the overall average of individuals in the EU shopping online rose by less than 2%. The subsequent years, 2021 and 2022, also saw moderate increases of approximately 2% and no significant change, respectively. Notably, the most significant surge occurred in 2019. Taking into account the entire monitored period, the data indicates a 9.2% increase in the percentage of female shoppers in the EU, while the increase for men reached 7.9%.

The data from Figure 1 indicates that in 2018, certain countries, namely Slovenia (50.7%), Poland (47.8%), and Hungary (41.2%), showed notably lower percentages of women engaging in online shopping compared to the European average (58.5%). However, Austria emerged as the leading country in Central Europe with the highest proportion of women shopping online (60.3%). Concerning men, the situation showed slight distinctions. In all surveyed countries, the percentage of men shopping online fell below the European average (60.5%), except for Austria, where 3.8% more men engaged in online shopping than the average. Notably, in 2018, men dominated online shopping in all surveyed countries, except for the Czech Republic, where more women (58.6%) shopped online compared to men (57.4%). The year 2019 marked the most substantial year-on-year increase within the monitored period (2018-2022). Despite this growth, the online shopping trends remained relatively consistent with the previous year. Interestingly, during this time, the Czech Republic recorded the highest percentage of women engaged in online shopping (64%), surpassing the EU average. On the other hand, among the Central European countries, Austria registered the highest proportion of men shopping via the Internet (65.4%). Conversely, Hungary had the lowest number of online shoppers in 2019, with women constituting 49.2% and men comprising 50.6% of the total. Poland was the second Central European country with the lowest share of men and women engaged in online shopping (women - 53.6%, men - 54.0%).

Figure 1. Share of online shoppers by gender across Central European countries
 Source: own processing according to Eurostat

Despite our previous observation of the highest year-on-year increase in the EU average occurring in 2019, individual Central European countries experienced this surge in 2020. Consequently, the state of online shoppers underwent significant changes during this year, especially among countries with lower shares in the past. Hungary, for instance, witnessed an exponential 10.8% increase in the proportion of women engaged in online shopping, while the share of men rose by 9.7%. Similarly, both women and men in Poland experienced a 7.3% increase, and in Slovenia, there was a 7.6% rise for both genders. In 2021, the impact of the pandemic and associated restrictions on physical stores was apparent, leading to a remarkable increase in online shopping. Slovenia, previously below the Central European average, saw a substantial surge, with online shoppers reaching 71.2% for women and 71.6% for men, significantly surpassing the European average (women - 66.5%, men - 67.7%). Additionally, it is intriguing to observe that while the percentage of buyers (both men and women) saw a rise in all monitored countries, Austria, which had been leading in this domain, experienced a decline of 3.1% for women and 0.4% for men. On the contrary, Slovakia emerged as the new leader in this area in 2021, with an impressive 76.2% of male shoppers, significantly surpassing the European average. As for women, their share closely resembles that of online buyers in the Czech Republic (75.3%).

The year 2022 marked the post-pandemic era, which saw a rapid transition to digital shopping, and this trend is expected to continue, leading to an expansion in the share of online shoppers. Based on Eurostat data, the development of online shoppers in Central European countries reflects a positive

trajectory, although the growth in the share of female shoppers has decelerated compared to the pandemic period. Surprisingly, Slovenia experienced an unfavorable trend, witnessing an 8.6% decrease in the share of women and an even more substantial 11.1% decrease in men shopping via the Internet. Austria's development has stagnated, with rates of 65.7% for women and 68.9% for men, placing it around the European average (slightly below for women). In contrast, Hungary significantly outperforms the average, boasting rates of 70.3% for women and 70.5% for men. The Czech Republic and Slovakia emerge as the leaders in this aspect, with the share of Czech men (77.1%) nearly matching the share of women (77.0%), while Slovakia maintains a higher presence of men (78.0%) in online shopping compared to women (76.7%). However, both countries notably exceed the European average (women – 67.7%, men – 68.4%).

In order to gain a comprehensive understanding of the e-commerce landscape, this paper delved into the differences between men and women engaged in selling products via the Internet, focusing on Central European countries. As depicted in Figure 2, the scenario for selling products differs from that of buying. However, one common aspect is the prevalence of men in this domain. Notably, the differences between men and women in selling are more pronounced than those observed in online shopping throughout the monitored period. Nevertheless, this trend does not hold true for the European average. In 2018, 17.9% of women and 20.8% of men engaged in selling products online. By 2022, the proportion of women remained steady compared to 2018, with a 1% decrease observed in 2021. On the other hand, men experienced a slight increase in 2019, reaching 21.6%, but saw decreases in 2020 and 2021. In 2022, the share of men selling via the Internet rose to 19.2%, which, in comparison to 2018, still represents a decrease of 1.6%.

Figure 2. The share of online sellers in terms of gender across the countries of Central Europe
Source: own processing according to Eurostat

To some extent, it is apparent that in 2018, the proportion of women selling products online in all monitored countries was notably lower than the EU average. The lowest level was observed in Hungary (8.9%), which was almost 4% lower than Poland, where the share stood at 13.2%. In Slovenia, the proportion reached 13.4%, in Austria 13.4%, and in the Czech Republic 14.6%. However, Slovakia emerged as a leader in this domain, significantly surpassing the European average, with a share of women selling products online at the level of 21.9%. Surprisingly, in Slovenia, men surpassed women in the proportion of sellers, reaching up to 22.1%, which is higher than the European average. Slovakia (25.6%) was the country with the highest proportion of male sellers. In all other countries, the share of male sellers remained below the European average. In the Czech Republic, the share of male sellers was also lower (13.4%) than that of female sellers (14.6%). The year 2019 brought an interesting trend, as several countries experienced a decrease in the proportion of both male and female sellers using the Internet to sell products. In the Czech Republic, there was a 2.3% decrease, while Austria saw a 3.3% decline, Poland experienced a 0.3% decrease, Slovenia had a 0.6% decrease, and there were 1.7% fewer women selling products via the Internet. Notably, Hungary was the only country with a year-on-year increase, with a 2.1% increase.

According to Figure 2, 2020 was a pivotal year, particularly for Hungary, as both men and women significantly increased their participation in selling products online. For women, there was an impressive 15.2% surge, and for men, a notable increase of 14.4%. This upswing in Hungary surpassed the EU average, making it the clear leader among Central European countries. Interestingly, despite pandemic-related measures that led to the closure of physical stores, all other countries, except Slovakia, remained below the average. It appears that while people were compelled to buy products online due to the circumstances, the fear of uncertainty led to a decline in the number of people selling products online. It is also possible that the unfavorable situation led to the closure of many smaller businesses that operated both online and offline, contributing to the decline. In the Czech Republic, we observe another year-on-year decrease of 11.0% for women and 10.6% for men. On a positive note, Austria experienced an increase of 12.7% for women and 17.3% for men compared to the previous year. However, despite the improvement, it still falls short of the EU average. Poland recorded a slight year-on-year decrease of 1.6% for women and 1.5% for men. In Slovenia, the proportion of female sellers increased by 3.5%, but the share of male sellers declined by 3.7%.

The year 2021 showcased varying trends in selling products via the Internet between men and women in Central European countries, and the pandemic had a significant role to play. In the Czech Republic, the share of men (10.6%) slightly outpaced that of women (10.2%). Notably, while the share of men and women engaging in online shopping remained consistently high among Central European countries and exceeded the European average, the country fell below average in terms of selling products throughout the entire monitoring period. Hungary experienced an overall decrease, but the share still remained considerably above the European average. Conversely, Austria witnessed a substantial increase in both women and men selling products online in 2021. The proportion of women sellers rose by 11% to reach 23.7%, significantly surpassing the average. For men, there was a remarkable year-on-year increase of 14.5%, leading to a share of 31.8%, also exceeding the EU average. In Poland, there was a decline of 0.5% to 2.1% in both cases. Slovenia displayed a significant difference between men (21.8%) and women (13.4%). While the share of women experienced a year-on-year decrease of 2.4%, the share of men increased by 1.9%. In 2022, Slovakia witnessed a substantial decrease in the number of individuals selling via the Internet. For women (16.9%), the share even fell below the average. For men, there was a year-on-year decrease of 7.5%. Conversely, the Czech Republic observed an increase of 5% for women and 4.4% for men. However, this share still remains below the European average. Hungary's interesting aspect is its contrast between buying products online, where it falls below the Central European countries, and selling products, with both women (27.1%) and men (30.3%) maintaining a leading position well above the average, even in 2022.

5. Discussion

This paper offers a comprehensive overview of the e-commerce market's progression in Central European countries, emphasizing gender distinctions. Our study meticulously investigated two crucial factors: the digital purchase and sale of goods and services. Our findings consistently indicate a progressive rise in product acquisitions in all the observed countries and among both genders (Jedrzejczak-Gas et al., 2019). Generally, men tend to dominate online shopping activities in the monitored nations, except for the Czech Republic, where women exhibit a slight lead. Furthermore, our analysis highlights the notable shopping tendencies of Czech women and Slovak men.

We also take note of the notable surge in the share of online shoppers in Hungary, likely attributable to the pandemic, reaching the EU average level (Ebrahimi et al., 2021). Regarding the online sale of products, the percentages of female and male sellers exhibit substantial variations annually across all countries. Nevertheless, it is evident that men significantly dominate in this aspect. A compelling discovery is that despite Hungary's share of male and female shoppers being below average, the country emerges as the leading nation in selling products. Conversely, Czech women and men exhibit prominence in shopping, but their selling activities fall considerably below the European average.

Conclusion

In conclusion, it is evident that the e-commerce market in Central European countries is experiencing a continuous growth trend. The pandemic has likely influenced changes in shopping preferences in certain nations, while in others, the closure of physical stores had minimal impact on consumers' shift to the online realm. With technology consistently evolving and offering numerous advantages to both buyers and

sellers in the e-commerce landscape, it is reasonable to expect that online purchasing and selling will not remain an exclusive business channel but rather become the dominant one.

This study focused on examining the proportion of individual online buyers and sellers using data from the Eurostat database. However, a limitation of the study is the only two indicators from which we drew information, as well as the sample to which the data refer. Our future research endeavors aim to shed light on the preferred product assortments and shopping behavior of Europeans concerning expenditure and frequency of online purchases. The article serves as an overview of the e-commerce market in Central European countries, providing valuable insights for traders considering international expansion. Moreover, the study can be a foundational resource for future research inquiries.

Abstract

Research background: In the dynamic and diverse business world, brands play a vital role in establishing an identity and connecting with consumers. Even though global brands may dominate the global market, regional brands have their distinctive image and significance. A regional brand is a business or product primarily serving a local or regional customer base and operating in a specific geographic area.

Purpose of the article: The study's objective is to investigate the communication effect of regional brands of products established in Slovakia. Moreover, it identifies factors influencing respondents when purchasing regional brands. It reveals how many respondents know and purchase the brands - Nitrava, Ponitrie, Piešťansko, Záhorie, Kopanice and Malodunajsko-Galanstko. Finally, the study focuses on whether the respondents are satisfied with the brands.

Methods: The research is based on primary data. In total, 211 responses were collected. By applying the Z-test, the study verifies whether the respondents know the given regional brands. Using Friedman's test, groups of determinants affecting the purchases of regional products were identified.

Findings & Value added: Based on the results, 64% of respondents know the concept of regional brands. When exploring associations, it was found that women and respondents aged 25-34 have the most significant knowledge about regional brands. The main determinants affecting the purchasing decisions are primarily previous experience, the traditional method of production and the support of local producers. Fairs, exhibitions, and direct purchases were marked as important places where most respondents buy regional products. Results show that the most known brand of regional products towards respondents are regional products of Ponitrie (68%), Nitrava (64%) and Piešťansko (57%). According to the results, respondents claim they learned about regional products from the Internet and directly from the local producer.

Keywords: consumers, regional brand, regional products, Slovakia

JEL classification: M30, Q13

1. Introduction

Nowadays, cities and regions face intense competition to attract people and businesses due to globalisation, internationalisation, and statehood scaling (Ikuta et al., 2007). Many small local producers left the market as a result of globalisation and the gradual liberalisation of the market because they were insufficiently competitive. Different nations recognise territory branding as a crucial tactical tool of regional politics. (Zenker & Jacobsen, 2015). Moreover, regional branding has emerged as one of the critical ideas for fostering regional competition (Ikuta et al., 2007) and gaining a sizable market share. Therefore, regional branding creates an opportunity for small local producers as customer interest in rediscovering their identity, those of the local cultures, and traditional values (Pícha et al., 2017).

* Corresponding author: janka.beresecka@gmail.com

According to Cayla & Eckhardt (2008), a regional brand is only used in the place of origin and ensures particular characteristics. Regional labelling of local products is a unified graphic designation of quality products and services produced or provided in a defined region and meeting predetermined criteria. They highlight the natural and cultural heritage, local people, gastronomy, traditional specialities, and accommodation services and events typical of the region (Jaďud'ova et al., 2023). All of these regionally specific elements distinguish regional products and provide them with features that are challenging to replicate (Garcia-Galan et al., 2010). Chinnakonda & Telford (2007) claim that regional products can be examined as local products on a bigger scale. According to Van Ittersum et al. (2007), a regional product is one whose quality and origin are connected to a particular region. The fact that the product is marketed with the name of its origin place is a crucial characteristic. Local product labelling programmes are intended to ensure, typically by certification, a direct connection between a particular product and a specific area, enabling the producer to use a label signifying this connection (Kařkova & Chromy, 2014). In order to create positive associations, provide value, and set the location apart from others, place branding entails creating brands for specific geographic locations, such as cities, regions, or communities (Eshuis & Klijn, 2012). As Zhou et al. (2023) reported, regional brands have regional characteristics and brand effects based on regional resource advantages, which provide regional meaning and value to the products. Moreover, according to Jarossova & řupolova (2015), creating a regional brand also contributes to developing rural tourism in the region. Regional brands are not applied only to tangible products, but recently, the trend of regional brands has received yet another impetus to expand with the addition of tourism, accommodation, and adventure travel. Customers who buy such products are guaranteed quality, origin, originality, and other advantages (Stoklasa & Starzyczna, 2016).

řtensova (2013) states that regional products have the potential to become distinguishable. Each region has its unique character. It is given by the natural and cultural wealth, history and centuries-old traditions of the local inhabitants, which are often unique and typical of the region. Creating a regional brand is connected with benefits. Place branding is also thought to improve a location's reputation and image both inside and outside of it (Ashworth & Kavaratzis, 2010). Additionally, it aids in the growth of society and the economy. Thanks to the products that have received the regional label and their promotion, the region's traditions, crafts, and historical and cultural values are preserved. It also supports the development of agriculture in the region and, thus, its overall economy. Creating a regional brand also contributes to developing rural tourism in the region (Jarossova & řupolova, 2015). According to Stoklasa & Starzyczna (2016), regional brands help local businesses (small farmers, artisans, and micro businesses) by promoting them, diversifying the nation's economy, and reviving regional economies. It strengthens regional links and sparks various business, government, nonprofit, and environmental protection sector collaborations in the area, which benefits the local community. Regarding the environment, regional brands encourage local production and consumption and increase the prospect of sustainable tourism. Through regional branding, cities, counties, nations, and regions can gain a persistent competitive edge. If tourists and locals perceive a place's brand positively, the region may have a competitive edge. The use of sign systems to convey its history and personality is referred to as its brand identity. A strong regional brand identity is a potent tool to outperform rivals and increase its visibility (Song & Jeon, 2017).

The paper examines the communication effect of regional brands of products established in Slovakia. This article aims to fill the research gap by finding out: what the consumer regional brand awareness is, what are the main determinants of purchasing decisions, which regional brands are the most known and how the customers are satisfied with them. The research sample consists of a selection of 6 product brands in Slovakia. The topic of the paper is important and relevant. In 2020, we faced a Covid-19 pandemic. Stoklasa & Matuřinska (2022) state that regional brands were denied their traditional availability and communication channels due to lockdowns. According to Vignali et al. (2008), the interest in buying and consuming local products and supporting domestic tourism will likely continue to grow. Traditional and regional products can contribute to an agritourism product's distinct regional identity and originality. Therefore, stimulating the region's territorial potential, including touristic attractiveness, gastronomy and regional products, can positively impact regional development. Thus, regional products promote tourism in rural areas (Barska & Wojciechowska, 2018). Moreover, This paper is structured into four parts. The study provides insight into regional brands and the advantages of regional branding. The following section deals with the hypothesis and research

framework. The following part is focused on the results and discussion. Finally, the last part of the study is the conclusion.

2. Methods

The study's primary objective is to examine the communication effect of regional brands of products established in western Slovakia - Nitrava, Ponitrie, Kopanice, Záhorie, Piešťansko and Malodunajsko-Galantsko. The research is based on primary data obtained from an online questionnaire survey via Google Forms. The survey was conducted from April to June 2023. The questionnaire survey included 38 questions divided into 11 sections. The first section contains a selective question about regional brand knowledge. The second section was composed of questions about the barriers and benefits of regional brands, followed by questions about the promotion of regional brands. The following section includes questions related to purchasing habits towards regional brand products. Since the paper is focused on 6 types of regional brands, one section in the questionnaire survey is dedicated to each brand. Finally, the socio-demographic questions were inducted in the last section. In total, 330 responses were collected, but after applying selective criteria (respondents must be familiar with the concept of regional brands, and purchaser of regional brands, residence in Slovakia), the final research sample included 211 responses.

The socio-demographic profile of the respondents is displayed in Table 1. Based on the results, it is evident that women were predominant. Men represent 37% of the research sample. More than 72% of respondents were employed and living the rural area (58%). Most respondents had a university degree (55%) and were 25 – 34 years (26%).

Table 1. Socio-demographic profile of respondents

Variable	Category	Frequency	Frequency in %
Gender	Female	133	63.03%
	Male	78	36.97%
Age	18 – 24	18	8.53%
	25 – 34	55	26.07%
	35 – 44	46	21.80%
	45 - 54	35	16.58%
	54 – 64	36	17.06%
	More than 65	21	9.95%
	Economic activity	Student	23
Employed		151	71.56%

Pensioner		21	9.95%
Place of residence	Urban	89	42.18%
	Rural	122	57.82%
	Primary	0	0%
Education	Secondary	95	45.02%
	University degree	116	54.98%

Source: authors (2023)

The study is concentrated on 6 regional brands operating in western Slovakia – Nitrava, Ponitrie, Piešťansko, Kopanice, Záhorie and Malodunajsko-Galantsko (Figure 1). The uniform appearance of the logo of the type symbolising the sign typical of the region is displayed on each regional label's website. The following criteria have also been accepted for product certification: regional distinctiveness, local raw resources from the region, tradition and manpower, and environmental protection (Jad'ud'ová et al., 2018).

Figure 1. Examined regional brands

Source: Regionálny produkt Nitrava (2023)

As mentioned before, the study focuses on measuring the communication effectiveness of regional brands: Nitrava, Ponitrie, Piešťansko, Záhorie, Kopanice and Malodunajsko-Galanstko. According to Matisková (2012), the communication effect follows the induced change in brand awareness, attitudes towards the brand, and brand image. The methods of determining the effectiveness of marketing communication include:

- Recognition test - based on finding correct or incorrect identifications. The customer is shown various materials and must identify which they have seen, read or heard about.
- Memorisation test - customers reconstruct what they saw, heard or read.
- Feedback measurement - the degree of awareness of the product is determined in % - how many % of respondents tried the product, how many tried it and were satisfied.

Respondents were asked to answer questions regarding regional brands, if they know them, purchased them and their overall satisfaction with the brand or product. Therefore, we propose two hypotheses:

H₁: We assume that more than 30% of respondents know the Nitrava, Ponitrie, Piešťansko, Kopanice, Záhorie and Malodunajsko-Galantsko regional brands.

H₂: There is a difference between respondents' age and the regional brands' general awareness.

Furthermore, investigating factors affecting purchasing decisions is a fundamental aspect of marketing and business strategy. It allows businesses to align their products and marketing efforts with consumer needs, ultimately leading to success in the marketplace. By tailoring their messaging, advertising, and promotional efforts to resonate with consumers' motivations and values, producers can increase the effectiveness of their marketing campaigns. Therefore, in this study, we focus on identifying factors affecting purchasing decisions, and the hypothesis is as follows:

H₃: There are statistically significant differences in evaluating the importance of factors that affect consumers when purchasing regional products.

3. Results

At the beginning of the questionnaire survey, respondents were asked to answer a selective question if they knew the concept of regional brands. Based on the data, 64% of respondents are familiar with the regional labels. On the other hand, 36% of respondents do not know the regional brand labelling. For them, this was followed by the end of the questionnaire and the filling in of socio-demographic questions. The relationship between categorical variables was examined by applying the Chi-Square Independence. According to Table 1, it could be concluded that there exists a difference between respondents' age and the regional brands' general awareness. As the computed p-value is lower than the significance level $\alpha=0,05$, one should reject the null hypothesis H_0 and accept the alternative hypothesis H_2 . The general awareness of the regional brand is different in individual age categories. Respondents aged 25 – 34 and 35 – 44 have the highest knowledge about regional brands. However, respondents between 18 – 24 most likely do not know the regional brand concept. According to gender, we found that awareness of regional brands is higher for women than men.

Table 2. The results of tested hypotheses

Characteristics	Chi-Square (Observed value)	Chi-Square (Critical value)	df	p-value	Result
Age	29.528	11.070	5	<0.0001	H ₂ accept
Gender	26.404	3.841	2	<0.0001	H ₂ accept

Source: authors (2023)

The next question was focused on the main barriers and benefits of regional branding. Respondents could choose several options. The majority of respondents (78%) consider the support of local producers as the main benefit of regional branding. Moreover, 73% of participants declared that regional brands help the development of regions. Maintaining values and traditions in the region was evaluated as the primary advantage by 66% of individuals. Assurance for the consumer that the product marked with the regional brand meets specific quality criteria that are regularly checked was the benefit marked by 64% of respondents. Creating a common functioning network of producers and service providers as a benefit was evaluated by 19% of respondents. On the other hand, when discovering the main barriers of regional brands, it could be concluded that higher prices compared to conventional food prices were evaluated as the main barrier by 91% of respondents. Concerning the promotion of regional brands, more than 83% of participants think that regional brands are not promoted enough. Finally, 70% of participants claimed that the main barrier to regional brands was low awareness.

When discovering the sources from which participants know about the regional brand concept, it is evident that more than 35% of respondents stated they knew about the regional brands from the Internet. Moreover, 27% of participants learned about the logo of regional brands directly from the producer. Based on the data, 22% of individuals declared they knew about regional labels from fairs and exhibitions and 9% of respondents from family and acquaintances. Leaflets as a source of knowledge were claimed by 4% of respondents, and tourist information centres by 3% of respondents.

With respect to purchasing behaviour, the study concentrates on finding the main factors which affect buying decisions. In the questionnaire survey, respondents were asked to evaluate different determinants using a 5-point Likert scale ranging from 1 to 5, where 1 represented the least important factor, and 5 represented the most critical factor. The third hypothesis H₃ assumed statistically significant differences in evaluation among selected determinants while purchasing. Using Friedman's test (Table 3) and Nemenyi's method, we discovered three groups of factors according to importance. The findings show statistically significant differences between selected determinants (p-value = <0.001).

Table 3. The results of Friedman's test

Sample	Frequency
Q (Observed value)	602.991
Q (Critical value)	15.507
DF	8
p-value (one-tailed)	<0.0001
alpha	0.05

Source: authors (2023)

The significant differences in groups are also explained by Nemenyi's method (Table 4). Previous experience, the traditional production method and product quality are the three most significant factors represented by Group C. The least significant characteristics, on the other hand, are found in group A and are related to ecological origin, supporting sustainability and supporting tourism in the area. When comparing groups C and A, we discovered that there are substantial variations based on the overall evaluation of the data. Respondents make different decisions when purchasing regional products. The most important factor influencing the purchase of regional products is previous experience. The ecological origin is the least significant factor influencing the purchase of regional products.

Table 4. Results of Nemenyi's method: Differences among examined factors while purchasing

Sample	Frequency	Sum of ranks	Means of ranks	Groups		
Ecological origin	211	600.500	2.846	A		
The purchase supports the sustainability and development of the region	211	634.500	3.007	A		
Support of tourism in the area	211	715.000	3.389	A		
Originality of the product	211	1168.000	5.536		B	
Composition	211	1175.500	5.571		B	
Support of local producers	211	1206.500	5.718		B	
Product quality	211	1271.500	6.026		B	C
The traditional method of production	211	1292.000	6.123			C
Previous experience	211	1431.500	6.784			C

Source: authors (2023)

Furthermore, the next question was focused on where respondents buy regional products. Respondents had the option of choosing several options. According to the results, 76% of respondents declared purchasing directly from the producers. The majority of respondents (87%) buy regional products at fairs and exhibitions. Purchases of regional products directly at the e-shop were stated by 36% of individuals. 47% of respondents buy regional products in specialised stores, and only 9% directly in restaurants and cafes.

The last part of the questionnaire survey dealt with examining individual regional brands. Each section contained 5 questions regarding whether they know the given brand, whether they buy it, what associations they associate with the given brand, what products they buy and how satisfied they are with the products and the brand. Our findings in Figure 2 show that the most-known regional brand is Ponitrie – 68% of respondents. Furthermore, 64% of participants stated that they know the regional brand of Nitrava. The regional brand Piešťansko was known by 57% of respondents and Záhorie by 36%. The lowest level of knowledge was demonstrated for the brands Kopanice (27%) and Malodunajsko-Galantsko (24%). The first hypothesis focuses on the awareness of individual regional brands. We assume that more than 30% of respondents know the regional brands of Ponitrie, Nitrava, Piešťansko, Kopanice, Záhorie and Malodunajsko-Galantsko (Table 5).

Figure 2. Regional brand knowledge in %
Source: authors (2023)

Table 5 shows the summary of results for tested hypothesis H_1 . Based on the results, it is evident that in the case of Ponitrie, Nitrava, Piešťansko and Záhorie, the value of the Z test is higher than the critical value (1.6449). Therefore, we reject the null hypothesis of knowledge about regional brands. More than 30% of respondents are aware of the regional brands of Ponitrie, Nitrava, Piešťansko and Záhorie. In the case of Kopanice and Malodunajsko-Galantsko, less than 30% of respondents know the brands.

Table 5. Results of Nemenyi's method: Differences among examined factors while purchasing

	Ponitrie	Nitrava	Piešťansko	Kopanice	Záhorie	Malodunajsko-Galanstko
n	211	211	211	211	211	211
x	143	135	120	57	76	51
p	0.6777	0.6398	0.5687	0.2701	0.3602	0.24171
p ₀ (expected share)	0.30	0.30	0.30	0.30	0.30	0.30
Z (Test statistic of one sample proportion test)	11.9731	10.7713	8.5179	-0.9464	1.9079	-1.8478
Critical value	1.6449	1.6449	1.6449	1.6449	1.6449	1.6449
Result	H ₁ accepted	H ₁ accepted	H ₁ accepted	H ₁ rejected	H ₁ accepted	H ₁ rejected

Source: authors (2023)

The next question was focused on the purchases of regional products. Regarding the regional brand Ponitrie, 57% of individuals stated that they purchase products. More than 40% of respondents purchase products from the regional brand of Nitrava and 20% from Záhorie. Only 10% of individuals claimed that they purchase products from Piešťansko. On the contrary, only 2% of the respondents said they buy products from Malodunajsko-Galantsko and only 6% from Kopanice. When investigating which product categories the respondents buy the most, we found that the majority of respondents mostly purchase agricultural and food products – honey, bee products, wine, jams and fruits and vegetables. Moreover, handicraft products were evaluated as the second most purchased, followed by accommodation and catering facilities.

Finally, the last questions of the section examined satisfaction with the brands' purchases. We used a 5-point Likert scale to determine if the respondents were satisfied with the brand. 1 represented "not satisfied at all", and 5 represented "very satisfied with the brand." According to the results, the most satisfied respondents were with the Ponitrie, Piešťansko and Nitrava brands.

Table 6. Satisfaction with the brand

Brand	Mean
Ponitrie	4.075
Nitrava	3.8046
Piešťansko	3.9048
Kopanice	3.6667
Záhorie	3.6905
Malodunajsko-Galantsko	3.4000

Source: authors (2023)

4. Discussion

Our results conclude that women and respondents between the ages of 25 – 34 and 35 – 44 had the highest knowledge about the regional label concept. Similar results were obtained in the study by Jad'ud'ová et al. (2018). The results revealed that women had a higher level of knowledge about regional brands. Moreover, the study discovered that the knowledge of regional labelling is present in the case of younger respondents aged 18 - 25. On the other hand, respondents of age 62 and more did not know what the regional brand stands for. Regarding education, respondents with university degrees and with urban residence have higher knowledge about regional brands. Margarisová et al. (2018) identified that the general awareness of regional brands was influenced by respondents' age, education and place of living correlated.

As the primary sources from where respondents encountered regional brands were the Internet, directly from producers and from fairs and exhibitions. Our results also revealed that respondents tend to purchase regional products directly. Respondents in the study of Margarisová et al. (2018) encountered

regional brands directly on the package. More than 36% of participants saw the regional brand label on the promotional materials, and 29% of respondents saw the brand on the producer's website. Furthermore, our results are in line with Henschion & McIntyre (2000), who emphasises the importance of direct sales, especially for regional products. Furthermore, research by Jačud'ová et al. (2023) revealed that respondents living in urban areas (22%) tend to buy regional products at social events and in stores (11%). Contrary, 15% of individuals living in rural areas stated purchases from public events and 9% purchased regional products directly from the producer. According to research done in Hungary by Kiss et al. (2020), supermarkets, discount stores and conventional marketplaces were the most popular places to purchase regional products. On the other hand, online shopping, fairs and festivals, and purchasing at the producers' place or home delivery by producers were evaluated as the least important sales channel.

The results show that the majority of the respondents believed that regional labelling help with supporting regional producers. Furthermore, the development of regions and maintaining traditions were also evaluated as the benefits of regional branding. According to Butoracová Šindlerová & Hoghová (2020), it is evident from the study that the main benefits of regional brands are publicity and raising awareness of the region, promotion of regional development and promotion of local traditions, customs, and culture. It is essential to underline that they are practical tools for boosting local and regional economies, particularly in less developed regions where regional product branding is being applied.

Our study aimed to determine the communication effect of selected regional brands. Applying the Z-test, we confirmed the hypothesis that more than 30% know the brands Nitrava, Ponitrie, Piešťansko and Záhorie. This hypothesis was not confirmed in the case of the Malodunajsko-Galanstko and Kopanice regional brands. Moreover, questions in the survey were also focused on the feedback measurement with the regional brands. According to the results, customers of the Nitrava, Piešťansko and Ponitrie brands were the most satisfied. The study provides valuable information for regions and regional producers. Increasing sales and competitiveness for regional producers requires a comprehensive approach. Regional products represent product quality, uniqueness, and differentiation in the market. We suggest leveraging social media platforms and digital marketing to promote products, engage with customers, and build a loyal following. Furthermore, we believe that influencer partnerships extend the reach of customers. Partnering with local retailers, grocery stores, and restaurants can also help to expand the distribution network. Moreover, attendance at trade shows, fairs, and food festivals to showcase products can connect producers with potential customers and distributors. By understanding consumer behaviour, regional producers can identify gaps in the market and unmet customer needs. Moreover, understanding consumer behaviour allows regional producers to design effective marketing strategies. Producers can craft compelling advertising messages by knowing what influences consumer decisions, and choosing appropriate marketing channels. Satisfied customers are more likely to remain loyal to a brand. By investigating purchasing behaviour, businesses can enhance customer satisfaction, increasing customer retention rates and customer loyalty.

Conclusion

Regional brands refer to products or services specifically associated with a particular geographic area or region. These brands often connect strongly to the local culture, traditions, and preferences of those in that region. Unlike global or national brands, regional brands tend to have a more localised market presence, focusing their efforts on serving and appealing to the unique tastes and needs of the regional population. They often leverage their regional identity to create a sense of authenticity, trust, and loyalty among consumers. Regional brands play a crucial role in promoting local economies and preserving the distinctiveness of various regions, making them an integral part of the diverse consumer landscape.

Our study investigated the communication effect of selected regional brands. Out of 330 respondents, 64% know the concept of regional brands. The findings lead us to the conclusion that female respondents and respondents between the ages of 25 and 34 and 35 and 44 had the most significant knowledge of the regional label concept. The most frequent sources from which respondents learned about regional brands were the Internet, directly from the producer, and from fairs and exhibitions. Applying the Z-test, we confirmed the hypothesis that more than 30% know the brands Nitrava, Ponitrie, Piešťansko and Záhorie. This hypothesis was not confirmed in the case of the Malodunajsko-Galanstko and Kopanice regional brands. Moreover, we found that the most critical determinants influencing the purchases of regional brands were the previous experience and traditional method of production. The study provides valuable information for regions and regional producers. By knowing what influences consumer behaviour, regional producers can adapt marketing tools and increase their sales and competitiveness.

Finally, two limitations are available which provide directions for further future research. First, this study examined only regional brands operating in western Slovakia, suggesting that further research should be focused on all regional brands operating in Slovakia. Second, the study's limitation is the small sample size, only 211 respondents. A representative sample of respondents is needed to generalize the recommendations.

Capturing Attention: Investigating the Impact of AI-Generated and Photographer-Captured Product Photos through Neuromarketing

Alena Kusá¹, and Patrícia Beličková^{1,*}

¹ University of Ss. Cyril and Methodius, Department of Marketing Communication, Faculty of Massmedia Communication, Námestie J. Herdu 2, Trnava, 917 01, Slovakia

Abstract

Research background: With the advancements in artificial intelligence (AI) technology, AI-generated product photos have emerged as a viable alternative to images captured by real photographers. These AI algorithms are capable of creating visually appealing and realistic representations of food and other products. However, the impact of AI-generated product photos on consumer perception and engagement remains relatively unexplored.

Purpose of the article: The purpose of this article is to examine the differences between AI-generated product photos of food and photos taken by real photographers using neuromarketing techniques, specifically eye tracking and facial recognition. By employing these techniques, we aim to gain insights into the visual attention patterns, emotional responses, and preference for AI-generated versus real photographer's images.

Methods: In this study, a sample of participants was exposed to AI-generated product photos and real photographer's images of food. Eye tracking technology was used to measure participants' visual attention patterns, capturing which elements of the photos attracted their gaze and for how long. Self-report measures were used to collect data on participants' preference.

Findings & Value added: The findings of this study provide valuable insights into the differences between AI-generated product photos and photos from real photographers. Participants reported higher purchase intent and perceived brand quality when exposed to real photographer's images. The value added by this research lies in its contribution to understanding the impact of AI-generated product photos on consumer perception and engagement. The findings can inform marketers about the strengths and limitations of using AI-generated visuals in their marketing strategies.

Keywords: artificial intelligence, AI-generated product photos, eye-tracking, marketing, neuromarketing

JEL classification: M31, M37

1. Introduction

Advertising constitutes an essential aspect of contemporary society's daily existence. Nonetheless, the advertising sector frequently overlooks the reality that individuals might interpret advertisements in varying ways, consequently influencing their actions. Eye movements, durations of fixation, points where gazes rest, and regions of focus within visual images serve as reliable indicators of customer behavior (Liaudanskaite et al., 2019).

The impact of customer satisfaction on purchase intention is highly significant (Dash et al., 2021). That's why brands should care about how their marketing communications impact their customers. Is it attractive and interesting to them? Does it offer them clear enough information? Does it leave them with an emotion? Will they remember the ad? The visual part of the marketing communication is equally important. However, with the advent of artificial intelligence, some brands have started to use simpler and faster ways to create advertising.

Consumer behavior has significantly changed due to technological innovation and ubiquitous adoption of hand-held devices, directly contributing to how we interact and use social commerce to make decisions and shop online (Dwivedi et al., 2021).

* Corresponding author: belickova2@ucm.sk

An increasing amount of research on Intelligent Systems/Artificial Intelligence (AI) in marketing has shown that AI is capable of mimicking humans and performing activities in an 'intelligent' manner (Vlačić et al., 2021). That's why we were also interested in whether consumers are able to recognize AI-generated images and whether there is a preference for real, creative photos taken by a photographer.

The rapid advancement of artificial intelligence (AI) offers exciting opportunities for marketing practice, as for example: understanding consumer sentiments, analyzing customer satisfaction, improving market performance, using AI for brand management, measuring and enhancing customer loyalty and trust, and using AI to improve customer relationships (Mustak, et al., 2021). AI has emerged as a transformative force in marketing advertising. Its application goes beyond automation, deeply influencing how firms approach customer engagement and business growth. Organizations adopting AI-driven marketing strategies tend to experience improved performance. This technology enables personalized interactions, refined targeting, and data-driven decision-making, contributing to enhanced outcomes (Wu & Monfort, 2023).

In the marketing, personalization signifies the art of crafting content and products that resonate with individual customer preferences. By tailoring experiences to align with these preferences, personalized marketing can alleviate customer fatigue, streamline decision-making, and reduce cognitive load. Artificial intelligence is nowadays very helpful for companies to implement personalised marketing more efficiently (Chandra et al., 2022).

Artificial intelligence can also help in the field of neuromarketing. On the one hand, it can make it easier for researchers to investigate the emotions consumers experience when viewing a piece of marketing content. There are a number of tools that can capture and then analyse a consumer's emotions when viewing a piece of content via a webcam or smartphone camera. The data is stored and then made available in visual form to the marketer, who can use it to make marketing communications more effective (Filipovic et al., 2019).

Nonetheless, artificial intelligence has found a significant role in content generation within the marketing domain. The growing availability of AI-driven tools empowers marketers to streamline content creation, encompassing both written and visual components. For numerous marketers, artificial intelligence translates into heightened efficiency when addressing specific tasks. However, it also presents potential challenges, potentially leading to the redundancy or underutilization of certain marketing roles. In this article, we undertook a study to determine how AI-generated content affects people. We decided to test visual content, specifically product photos of food and beverages.

The application and sometimes overapplication of neuroscience and psychological research methods have emerged as a prominent topic in consumer research, especially within the context of food product analysis. The realms of neurology and psychology hold the potential to greatly benefit consumer researchers, sensory analysts, and those in the food industry by shedding light on consumers' unconscious motivations and responses. Furthermore, these fields offer insights into product claims and sensory experiences (Niedziela & Ambroze, 2021).

Cutting-edge artificial intelligence technologies and purpose-built software designed for digital communication enable us to juxtapose and correlate bodily responses to external stimuli with the intricacies of neural network processes. With the digitization of marketing communication activities, numerous responsibilities traditionally undertaken by marketing experts are progressively being absorbed by neural network technology-driven software. The refined and efficient promotion of target products is inherently tied to the digitization of communications, coupled with the incorporation of psychophysiological techniques within the realm of neuromarketing (Cheredniakova et al., 2021).

While AI technology has advanced to produce visually compelling product images, the repercussions of using such AI-generated visuals on consumer perception and engagement are yet to be fully comprehended. By employing neuromarketing techniques encompassing eye tracking and facial recognition, this research aims to bridge this knowledge void. The study's methodology involving AI-generated product photos and real photographer's images of food, coupled with the application of eye tracking, promises to offer illuminating insights into visual attention patterns, emotional responses, and preference dynamics. Through these revelations, the study not only contributes to a more profound understanding of the role of AI-generated visuals but also equips marketers with valuable insights to make informed decisions in crafting impactful marketing strategies.

2. Methods

A total of 21 respondents (14 females and 7 males, mean age = 22,8) were recruited from the general population in Trnava, Slovakia during February 2023 to participate in this study.

This research recorded participants' unconscious perceptions through selected consumer neuroscience research techniques. This method of obtaining information about perceptions of marketing communications is based on retrieving and recording implicit responses. Secondly, expressing such information to individuals is difficult, as they are often unaware of these aspects of perception themselves. Much of the information that our brains receive and react to remains only in our subconscious minds. Thus, neuromarketing research techniques bring to light hidden information that individuals are not consciously or unconsciously aware of, do not want to know, or cannot accurately access. The more precise information presented by consumer neuroscience can make management decisions more accurate and objective.

Eye path analysis plays a pivotal role in the realm of eye-tracking research. It encompasses the interpretation of dynamic eye-tracking data recorded within dynamic environments. This paper aims to elucidate the principles underpinning gaze path analysis and its subsequent metrics, including heat maps, Area of Interest (AOI) analysis, fixations, viewpoints, and looking time.

Visual path analysis:

By analyzing the visual pathway, we were able to create heat maps that graphically highlighted the locations on the visuals that were most frequently visited by the participants' eyes. The heat maps complement the results in a way that they point to the specific locations that received the most attention from the research participants. The analysis of the gaze paths helped us to identify more precisely which parts of the photographs, or the photographs as such, were noticed by the participants at first glance, in what order particular elements caught their attention, or, for example, which photographs they repeatedly returned to in order to view them in more detail.

Heat Maps:

Heat maps serve as visualizations that portray the overarching distribution of gaze points. Presented as color-gradient overlays on stimuli, these maps utilize red, yellow, and green hues to signify the density of gaze points directed at different image regions. By swiftly illustrating the focus disparity across elements, temperature maps facilitate the identification of visually salient aspects. Comparisons of heat maps between respondents and participant groups provide insights into how diverse populations perceive stimuli.

We performed an inferential analysis to compare the mean values of different levels of control variables (gaze fixation durations, number of gaze returns). A general linear analysis of variance model was used to capture differences between levels of the relevant variables for each variant.

3. Results

For the scope of this study, we opted for 4 distinct categories of product photos. The initial set showcased coffee, the second illustrated vegetable salad, the third centered on soup, and the concluding series presented images of ice cream. Within each category, a pair of photos originated from a professional product photographer, and another pair emerged from artificial intelligence algorithms. In the case of the AI-generated photos, we intentionally selected those featuring specific imperfections, such as mismatched product shadows, inaccurately rendered utensils like forks, or anomalies with coffee beans or bread. Our curiosity extended to whether these discrepancies would be discerned by research participants, thereby enabling them to unmistakably distinguish AI-generated photos from authentic product images.

The series of individual photographs were presented to participants within a video format, with each series of four photographs allocated an equal observation time of 13 seconds. Utilizing an eye-tracking camera, we monitored the photographs that captured their interest. Analysis of the resulting heatmaps (refer to Figure 1, Figure 2, Figure 3, and Figure 4) distinctly indicates a greater focus on photographs captured by the professional photographer.

Figure 1. Heat map: AI images - bottom row. Real product photos - top row
Source: iMotions, own processing (2023)

Figure 2. Heat map: AI images - top left and bottom right. Real product photos - top right and bottom left
Source: iMotions, own processing (2023)

Figure 3. Heat map: AI images - top and bottom right. Real product photos - top and bottom left.
Source: iMotions, own processing (2023)

Figure 4. Heat map: AI images - top right and bottom left. Real product photos - top left and bottom right
Source: iMotions, own processing (2023)

The research participants were intentionally kept unaware that the series included images produced through artificial intelligence. This information was also deliberately omitted from the subsequent questionnaire that respondents were asked to complete. In essence, our objective was to ascertain whether, notwithstanding certain technical limitations, participants could discern such AI-generated photographs and evaluate their appeal.

We inquired of participants which photograph from each category they would consider using in an advertising campaign. Across all categories, photographs taken by professional photographers overwhelmingly dominated their choices. Infrequently, participants opted for images generated by artificial intelligence. These AI-generated images were subsequently rated in the questionnaire as lacking creativity, appearing unnatural, suffering from an excessive number of distracting elements, displaying poor composition, execution, contrast, and underexposure.

Numerous individual results exist, yet no pertinent overarching conclusions can be drawn from them. This is because, stemming from a sole stimulus, these findings might be speculative or linked solely to the particular type of food/drink portrayed in the product photograph. Consequently, our primary focus shifted towards the shared measurable attributes of the individual stimuli, leading us to discover that:

Based on the testing results, it becomes evident that the comparative analysis provides noteworthy insights. Notably, the examination reveals a distinct trend: real photographs outshine their AI-generated counterparts in terms of creativity and attractiveness. Participants consistently allocated more time to gaze at real photographer's images, suggesting a higher level of engagement and interest. Strikingly, participants appeared oblivious to any discrepancies or errors in the AI-generated pictures. This observation implies that, despite their appeal, AI-generated visuals may require further refinement to seamlessly replicate the nuanced creative and captivating elements inherent to real photographs. The juxtaposition of these findings underlines the compelling influence of human photography's artistry and its ability to capture and retain viewer attention. Of course, it is important to take into account that AI-assisted image generation programs are constantly improving. It can only be a matter of time before they also have a creative aspect that is natural to consumers and captures their attention enough to encourage them to buy a product or service.

4. Discussion

The findings of this study shed light on several intriguing aspects regarding the perception and preferences of research participants when presented with photographs taken by human photographers compared to those generated by artificial intelligence. Our exploration aimed to uncover whether participants could discern technical imperfections within AI-generated images and how these imperfections influenced their preferences and evaluations.

An essential element of this study was the deliberate omission of information about the presence of AI-generated images within the series presented to participants. This choice aimed to simulate real-world scenarios where viewers may not be aware of the origins of visual content. Remarkably, despite this lack of information, participants exhibited a discernible preference for photographs captured by human

photographers. This implies that certain qualitative nuances within the AI-generated images might have triggered a subconscious bias against them.

The identified technical flaws within AI-generated images proved significant in shaping participants' perceptions and preferences. Images featuring errors such as mismatched product shadows, inaccuracies in utensil representation, and anomalies in product elements were found to be consistently associated with diminished appeal. The participants' characterization of these images as lacking creativity, appearing unnatural, and compromised by multiple distracting elements underscores the critical role that technical accuracy plays in the visual content's aesthetic appeal. The dominance of images captured by human photographers in participants' choices for potential advertising campaigns is an intriguing outcome. This result highlights the enduring value that human-created visuals possess in conveying a sense of authenticity, emotional connection, and artistic prowess that AI-generated content currently struggles to replicate. The participants' preference for professionally captured photographs emphasizes the continued importance of human intuition and creative judgment in crafting compelling visual narratives.

However, we are cautious with this statement, as we know how much the capabilities of software using artificial intelligence to create images that can be used for marketing communication purposes are advancing. It is the increasing availability of such software that offers marketers an easier way to create advertising messages. It is also a less costly route. At the same time, there is no need to involve a photographer, retoucher and other members of a collaborative team in the creation process. Artificial intelligence also just presents vast possibilities in the creation of product photography as well. It's only a matter of time before marketers have tools easily available to them using artificial intelligence that also deliver more visually appealing product photos that may no longer be judged by recipients as unattractive or compositionally distracting. However, it should still be noted that artificial intelligence only draws on the combination of data available to it. The question is therefore whether the role of the creative human photographer, who can translate his or her idea into a product photograph, bring an interesting visual representation of the product in question and thus appeal to the consumer and increase the preference for the product brand, will ever disappear.

Conclusion

In conclusion, this study has illuminated the intricate interplay between technical precision, human perception, and aesthetic appeal in the realm of visual content. The findings emphasize the enduring role of human creativity and intuition in crafting visually resonant content, even in the face of advancing artificial intelligence capabilities. As technology continues to evolve, understanding the delicate balance between technical accuracy and artistic perception will remain a vital consideration for marketers, designers, and content creators seeking to engage and captivate audiences through visual media.

While this study has provided valuable insights, several avenues for future research have emerged. Exploring whether the observed preferences for human-generated content extend to other contexts or visual mediums could offer a more comprehensive understanding of the dynamics at play. Additionally, investigating how advancements in AI-generated imagery, particularly in addressing technical shortcomings, might impact participant perceptions is an area ripe for exploration. For marketers and designers, this underscores the importance of understanding and harnessing the emotive and intuitive aspects of human-created visuals, which hold a unique power to resonate with audiences.

Acknowledgements

This contribution is a partial result of the project Vega no.1/0606/21 Change in preferences in buying behaviour of consumers in the context of the dynamics of marketing communication tools development.

Exploring Information Sources in Consumer Purchase Decision-Making: An Empirical Analysis in the Slovak Market

Lucia Vilčeková^{1,*}, Katarína Gubíniová¹, and Peter Štarchoň¹

¹ Comenius University Bratislava, Department of Marketing, Faculty of Management, Odbojarov 10, 820 05 Bratislava, Slovakia

Abstract

Research background: Understanding consumer behavior and the sources of information individuals utilize before making purchase decisions is crucial for businesses to develop effective marketing strategies.

Purpose of the article: This article is dedicated to a comprehensive exploration of the diverse sources of information that Slovak consumers rely upon when making purchase decisions. By shedding light on this aspect, businesses can refine their marketing tactics for better alignment with consumer preferences.

Methods: To achieve a robust understanding of this phenomenon, the research draws upon a representative sample of 1000 participants. Data collection was carried out through a well-structured survey, ensuring a reliable and comprehensive dataset.

Findings & Value added: The findings reveal that personal recommendations and online reviews were the most influential sources, highlighting the significance of social connections and collective opinions. Additionally, company websites and social media platforms emerged as important digital sources. The study also identified the influence of demographics, with younger participants and those with higher educational levels exhibiting distinct information-seeking behaviors. Based on these findings, practical recommendations for businesses in the Slovak market include harnessing the power of personal recommendations, optimizing their digital presence, and tailoring marketing strategies to demographic preferences. By understanding and leveraging these insights, businesses can effectively engage with Slovak consumers, build trust, and enhance their competitiveness in the marketplace. In conclusion, this study's contribution lies in its illumination of the intricate web of information sources that influence Slovak consumers' purchase decisions. By capitalizing on these insights, businesses can bolster their engagement with consumers, cultivate trust, and fortify their competitive stance in the dynamic marketplace.

Keywords: Slovak consumer, consumer behavior, sources of information

JEL classification: M30, M31

1. Introduction

Consumer behavior plays a crucial role in understanding purchase decision-making, as individuals engage in a complex process of information search, evaluation, and choice. The study of consumer behavior provides valuable insights into the factors that influence consumers' purchase decisions and helps businesses tailor their marketing strategies accordingly. In the context of the Slovak market, understanding consumer behavior becomes even more significant due to its unique characteristics and dynamics.

Several theoretical frameworks have been developed to explain consumer behavior. The Theory of Planned Behavior posits that individuals' intentions to engage in a particular behavior are influenced by their attitudes, subjective norms, and perceived behavioral control. (Ajzen, 1991)

The Information Processing Model suggests that consumers go through a cognitive process purchasing. These theories, among others, provide a foundation for understanding the complex nature of consumer decision-making. (Blackwell et al., 2006)

Existing literature on consumer behavior has extensively explored the various sources of information that consumers rely on before making purchase decisions. Scholars have investigated the impact of

* Corresponding author: lucia.vilcekova@fm.uniba.sk

traditional sources such as personal recommendations (Cheung et al., 2008), print media (Moriarty et al., 2011), and television advertisements (Fam and Waller, 2006). Moreover, the advent of digital technology has introduced new information sources such as online reviews (Kanwal et al., 2022), social media (Muntinga et al., 2011), and company websites (Dwivedi et al., 2019).

Ajzen (1991) proposes that individuals' intentions to engage in a specific behavior, such as making a purchase, are shaped by their attitudes, subjective norms, and perceived behavioral control. Attitudes reflect consumers' evaluations of the product or service, subjective norms involve social influences and norms, while perceived behavioral control represents consumers' perceptions of their ability to perform the behavior. (Miklosik, A., Jantova, M., & Starchon, P. 2022)

The Information Processing Model provides a comprehensive framework for understanding the cognitive process consumers go through when making purchase decisions. (Blackwell et al., 2006) This model consists of five stages: problem recognition, information search, evaluation of alternatives, purchase decision, and post-purchase evaluation. These stages highlight the importance of information sources in shaping consumer decision-making.

Information sources play a vital role in shaping consumer purchase decisions. As defined by Engel et al. (1995), information sources refer to "any stimuli that an individual uses to understand and respond to a marketing message". (p. 242) Consumers rely on different types of information sources, including personal, interpersonal, and impersonal sources, to gather information about products or services. (Goldsmith et al., 2000; Katz & Lazarsfeld, 1955)

Personal information sources consist of the consumer's own experience and knowledge. Past experiences with a product or brand significantly influence consumer decision-making. (Bettman, 1979) Furthermore, personal opinions and beliefs play a critical role in evaluating and selecting products. (Goldsmith et al., 2000)

Interpersonal information sources involve interactions with family, friends, and acquaintances. Word-of-mouth (WOM) communication is a widely recognized interpersonal information source. (Brown & Reingen, 1987) WOM communication is highly influential due to its perceived credibility and trustworthiness. (Hennig-Thurau et al., 2004) Social media platforms have further amplified the impact of interpersonal information sources by facilitating online conversations and recommendations. (Chu & Kim, 2011)

Impersonal information sources encompass a range of external stimuli, such as advertising, product reviews, and expert opinions. Advertising, as a mass communication tool, plays a significant role in influencing consumer purchase decisions. (Aaker & Bagozzi, 1981) Product reviews and ratings have gained importance in the digital era, as consumers actively seek online reviews to inform their decisions. (Cheung & Thadani, 2012)

Various factors influence consumers' selection of information sources. The perceived credibility, expertise, and relevance of the source significantly impacts its influence on consumer decision-making (Goldsmith et al., 2000). Individual characteristics, such as the consumer's level of involvement, knowledge, and socio-demographic factors, also affect the choice of information sources. (Engel et al., 1995)

A number of studies have investigated the role of information sources in consumer purchase decision-making. (Ganobčik, J. et al 2022) These studies have found that the importance of different information sources can vary depending on the product or service being considered, the consumer's level of involvement in the purchase decision, and the consumer's personal characteristics.

For example, a study by Yoo et al. (2015) found that online consumer reviews were an important source of information for consumers making travel purchase decisions. However, a study by Broilo et al. (2016) found that word-of-mouth was a more important source of information for consumers making car purchase decisions.

The level of consumer involvement in the purchase decision can also affect the importance of different information sources. A study by Ward and Lee (2000) found that consumers who were highly involved in the purchase decision were more likely to use a variety of information sources, including advertising, consumer reports, and word-of-mouth.

Finally, the consumer's personal characteristics can also affect the importance of different information sources. A study by Du and Xie (2021) found that consumers who were more price-sensitive were more likely to use online price comparison tools when making purchase decisions.

Social media platforms have become influential channels for information exchange and product recommendations, as consumers seek peer opinions and engage in conversations related to products and

services. (Štefko et al., 2023) Company websites also serve as important sources of information, allowing consumers to access product details, specifications, and customer reviews. (Dwivedi et al., 2019)

However, while much research has been conducted in global contexts, there is a dearth of studies specifically focused on the Slovak market. Therefore, this paper aims to fill this research gap by exploring the information sources that Slovak consumers utilize before making purchase decisions. By focusing on the Slovak market, this study takes into account the unique cultural, social, and economic factors that may influence consumer behavior in this context. Understanding the information sources preferred by Slovak consumers can provide valuable insights for businesses operating in the market, enabling them to effectively target their marketing efforts.

2. Methods

While previous studies have investigated information sources in consumer decision-making, there is a notable research gap specific to the Slovak market. The cultural, social, and economic factors that characterize the Slovak market may influence consumer behavior and their preferred sources of information. Therefore, there is a need for empirical research that focuses specifically on the Slovak market to provide insights into the information sources utilized by Slovak consumers and their implications for businesses operating in this context.

The objectives of this empirical analysis are to (1) identify the specific information sources that Slovak consumers rely on, (2) examine the factors influencing their choice of information sources, and (3) explore the implications for businesses operating in the Slovak market.

To achieve the objectives of this study, an empirical research approach was adopted. This approach allowed for the collection of primary data directly from Slovak consumers, providing valuable insights into their information-seeking behaviors and preferences.

A purposive sampling technique was utilized to select a representative sample of Slovak consumers. The sample consisted of individuals aged 18+ years residing in various regions of Slovakia. Efforts were made to include participants from diverse demographic backgrounds to ensure a comprehensive understanding of information sources across different segments of the population. A total of 1000 participants were recruited for the study.

Primary data were collected through a structured survey. The survey instrument was designed to capture information regarding participants' demographic characteristics, purchase decision-making processes, and the sources of information they relied on before making a purchase.

The survey included a combination of closed-ended questions, such as Likert scale items and multiple-choice questions. The questionnaire was pilot-tested with a small group of respondents to ensure clarity and validity of the questions before the main data collection phase. The survey was conducted as a part of VEGA Project 1/0737/20 on Consumer behavior and Consumer Literacy in 2022.

Ethical guidelines were followed throughout the research process. Participants were provided with informed consent forms that outlined the purpose of the study, their rights as participants, and the confidentiality and anonymity of their responses. Participation was voluntary, and participants had the option to withdraw from the study at any time without penalty.

Descriptive statistical analysis was conducted to summarize the demographic characteristics of the participants. To analyze the information sources utilized by Slovak consumers, frequency analysis was performed to identify the most commonly used sources. Cross-tabulations and chi-square tests were employed to examine the relationship between demographic variables and the choice of information sources. The significance level for statistical tests was set at $\alpha = 0.05$. The research question was whether there is a difference between individual age groups of consumers in which information sources they use before they make a purchase decision. This led to the following hypotheses:

H0: there is no statistically significant difference between age groups and information sources

H1: there is statistically significant difference between age groups and information sources

The null hypothesis assumes the independence of the two investigated variables, the alternative, on the other hand, assumes the variables are dependent. We verified all hypotheses at the level of significance $\alpha = 0.05$. In order to use the chi-square test of independence, two conditions must be met:

1. The individual observations in the contingency table are unenviable,
2. At least 80% of the cells of the contingency table must have an expected frequencies higher than 5.

The first condition is automatically fulfilled by the fact that each respondent could choose only one answer to each question and at the same time the questions were mandatory. The second condition was also fulfilled due to the size of the sample and the distribution of the response

3. Results

This chapter presents the findings derived from the analysis of the data collected on the information sources utilized by Slovak consumers in their purchase decision-making process. The section begins with an overview of the demographic characteristics of the participants and proceeds to explore the various sources of information that participants relied on.

The sample consisted of 1000 Slovak consumers of all age groups. The participants were diverse in terms of age, gender, educational background, and geographical location within Slovakia. Figure 1 provides an overview of the demographic characteristics of the participants.

Figure 1. Demographic Characteristics of Participants
Source: own processing (2023)

The total number of respondents in the table is 1000, with each age group represented by a different number of respondents and a corresponding percentage in the total sample. The age group of 18 to 29 years represents 18% of the total sample and includes 180 respondents. The age group of 30 to 39 years accounts for 20% of the total sample and includes 199 respondents. The age group of 40 to 49 years represents 19% of the total sample and includes 192 respondents. The age group of 50 to 59 years constitutes 16% of the total sample and includes 158 respondents. The largest age group is 60 and above, which comprises 27% of the total sample and includes 271 respondents.

Participants were asked to indicate the sources of information they utilized before making a purchase decision. Figure 2 illustrates the frequency distribution of the information sources reported by the participants.

Figure 2. Frequency Distribution of Information Sources
Source: own processing (2023)

73.60% of respondents stated that they search for product information online. 65.90% of respondents stated that online product reviews are important to them. 55.80% of respondents consider recommendations from friends and family as an influential factor. 50.50% of respondents reported noticing advertisements on television. 42.40% of respondents mentioned noticing advertisements online. 40.60% of respondents noticed advertisements in print media. 35.30% of respondents noticed

advertisements on the radio. 27.10% of respondents reported following influencers on social media platforms. Participants emphasized the significance of personal recommendations due to the trust they placed in the opinions of people they knew. Online reviews were valued for their transparency and the ability to access a wide range of perspectives. Company websites were seen as reliable sources of detailed product information. Social media platforms were appreciated for their convenience and the ability to interact with brands and seek opinions from peers.

To examine the relationship between demographic variables and the choice of information sources, cross-tabulations and chi-square tests were conducted. The chi-square tests were performed with a significance level of $p < .05$.

The results indicate that age had a significant association with the choice of information sources, $\chi^2(2) p = .027$. Younger participants (18-29 years) were more likely to rely on social media platforms compared to older participants. The chi square tests also showed that personal recommendations are the most influential source for older generation $\chi^2(2) p = .038$. Online reviews were also highly utilized in younger age groups in comparison to the older generations $\chi^2(2) p = .013$.

4. Discussion

The findings indicate that Slovak consumers rely on a mix of traditional and digital information sources in their purchase decision-making process. Personal recommendations and online reviews play a crucial role in shaping their perceptions and choices. The influence of digital platforms, such as social media and company websites, is also notable. The findings align with previous research conducted in other contexts but provide specific insights into the preferences and behaviors of Slovak consumers.

The results further reveal the growing influence of digital platforms in the Slovak market. Company websites and social media platforms were valued by consumers for their convenience, accessibility, and ability to interact with brands and peers. These findings highlight the need for businesses to have a strong online presence and to actively engage with consumers through these digital channels.

The relationship between demographics and information sources suggests that age plays a role in shaping consumer preferences. Younger participants exhibited a stronger reliance on social media platforms, reflecting their digital-native tendencies.

Based on the research findings, several implications can be drawn for businesses operating in the Slovak market:

- **Harness the power of personal recommendations:** Businesses should focus on fostering positive word-of-mouth through providing excellent products, services, and customer experiences. Encouraging satisfied customers to share their positive experiences with others can greatly influence potential customers' purchase decisions.
- **Emphasize online reputation management:** Online reviews hold significant influence over consumer decisions. Businesses should actively manage and respond to online reviews to maintain a positive brand image. Encouraging satisfied customers to leave reviews and addressing negative feedback promptly can enhance trust and credibility.
- **Optimize digital presence:** A well-designed and user-friendly company website is essential for providing detailed product information and facilitating consumer decision-making. Social media platforms should be leveraged to engage with consumers, build relationships, and provide valuable content that aligns with their interests and needs.
- **Consider demographic preferences:** Understanding the information-seeking behaviors of different demographic segments is crucial. Tailor marketing strategies to target specific age groups and educational backgrounds. For younger consumers, invest in social media marketing and influencer collaborations. For educated consumers, emphasize the availability of in-depth product information and expert reviews on company websites.

Conclusion

This study explored the information sources utilized by Slovak consumers in their purchase decision-making process. The findings highlight the importance of personal recommendations, online reviews, company websites, and social media platforms as influential sources of information. Businesses operating in the Slovak market can benefit from understanding these preferences and adapt their marketing strategies accordingly.

It is important to note that consumer behavior is a dynamic field, and preferences may evolve over time. Therefore, businesses should continuously monitor consumer trends and adapt their strategies to align with changing consumer behaviors and preferences.

By leveraging the insights gained from this study, businesses in the Slovak market can effectively engage with consumers, build trust, and enhance their competitiveness in the marketplace.

This study provides valuable insights into the information sources utilized by Slovak consumers. However, further research is needed to delve deeper into specific product categories or industries within the Slovak market. Additionally, exploring the influence of cultural and social factors on consumer behavior would provide a more comprehensive understanding of purchase decision-making processes in Slovakia.

Further investigation into the impact of emerging technologies, such as artificial intelligence and virtual reality, on consumer information-seeking behaviors would also be worthwhile. These technologies have the potential to reshape the landscape of consumer decision-making and warrant exploration in future research studies.

In conclusion, understanding the information sources utilized by consumers in the Slovak market can enable businesses to develop effective marketing strategies that resonate with their target audience. By adapting to changing consumer behaviors and preferences, businesses can build stronger connections, increase customer satisfaction, and ultimately drive business growth.

It is important to acknowledge the limitations of this study. The findings are based on self-reported data and may be subject to response biases. The sample primarily consists of internet users, which may not fully represent the entire population of Slovak consumers. Generalizability to the broader population should be interpreted with caution.

Abstract

Research background: Apart from traditional decision-making factors such as brand or quality, consumers have certain purchasing preferences regarding the origin of products. Previous research produced conflicting results in terms of preferences of Slovak consumers for domestic products.

Purpose of the article: The aim of the research presented in the paper was to provide insights into the attitudes of Slovak consumers towards purchasing domestic products and examine how demographic attributes affect these attitudes.

Methods: To investigate described conflict, we conducted quantitative research in the form of a survey on a representative sample of 1,000 Slovak consumers over 18. Our research also aimed to identify whether the attitudes of Slovak consumers towards purchasing domestic products changes according to their demographics. We were interested in determining whether consumers' opinions statistically significantly differ based on their gender, age, and education.

Findings & Value added: The data shows that 75% of Slovak consumers prefer domestic products and 63% of consumers are even willing to pay more for them. The support for Slovak products is stronger by consumers with higher education. We also investigated the reasons for this preference and found that 89% of Slovak consumers believe that they support the local economy by purchasing Slovak products. The results prove that environmental friendliness is also a significant factor contributing to the Slovak consumers' preference for purchasing domestic products.

Keywords: consumer attitudes, country of origin, local brands, Slovak consumers

JEL classification: M31

1. Introduction

Consumer demands for products are constantly increasing. Apart from traditional decision-making factors such as brand or quality, consumers are now also looking at the origin of products. The importance of country of origin has been studied intensely, revealing what factors are essential to consumers when assessing the origin of products. A previous study, based on about 2500 country pairs, indicated that consumer evaluations in a country (the 'rating country') of products made in another country (the 'rated' country) are directly related to the GDP of the rated country and inversely related to the GDP of the rating country (Bhat, 2019). Consumers perceive certain countries of origin as attractive, neutral or unattractive (Pileliene & Sontaite-Petkeviciene, 2014). For example, in developing countries such as Ghana, domestic products are not perceived favourably, and consumers prefer products from developed countries (Opoku & Akorli, 2009).

This research on supporting Slovak produce is significant, especially to the Slovakian government, as they encourage the purchasing of quality Slovak products through e.g. the National Program for the Support of Domestic Agricultural Products and Groceries (Dudekova, 2015). Furthermore, the information published by researchers and research agencies is contradictory. Some state that the volume of products made in Slovakia is increasing (Podnikam, 2015), while others claim that factors such as the price of the product, are more important in purchasing decisions than whether it has been locally produced (GFK, 2016). The preferences also shift over time, and therefore it is of utmost importance to

* Corresponding author: peter.starchon@fm.uniba.sk

get up-to-date data showing the preferences of Slovak consumers regarding the purchasing of domestic or foreign products.

The main goal of the research presented in this paper is therefore to determine the attitudes of Slovak consumers towards purchasing domestic products. Based on a research model consisting of seven key components, we identify their relationship to domestic products and determine whether such products are important to Slovak consumers. Also, the research evaluates whether consumers are willing to pay extra for this type of product and whether they perceive the supply of such products as sufficient. The role of demographic attributes in consumer attitudes of Slovak consumers towards purchasing domestic products is also determined and discussed.

2. Literature Review

2.1 Consumer preferences for domestic products

Previous studies revealed that in certain countries, consumers prefer domestically manufactured goods (Knight, 1999; Kalicharan, 2014) and are often willing to pay a higher price for them (Knight, 1999). The willingness to buy domestic products is moderated by the level of consumer ethnocentrism (Wu et al., 2010; Yen, 2018). Researchers have analysed the psychological processes involved and found that ethnocentric consumers experience a greater degree of activation in brain regions linked to self-reference and reward when considering purchasing domestic products (Casado-Aranda et al., 2020), and that domestic goods convey neural rewarding sensations (Luis-Alberto, Angelika & Juan, 2021).

It has been proven that consumers regard products produced in developed countries to be of higher quality than locally produced products (Kalicharan, 2014). Quality is also perceived to be lower when a brand from a developed country is manufactured in a developing country (Wu et al., 2012). However, research has also shown that the result of continuing globalisation is that country of origin would have a lower effect on consumers' perception of product quality than other quality attributes (Kalicharan, 2014). Also, brand origin is more related to quality perceptions and influences purchase intention more prominently than where the product is made (Wu et al., 2012).

2.2 Consumer preferences for local food

As the distances between the places of production and consumption have increased, consumers also consider the place of origin of the products they purchase (Feldmann & Hamm, 2015). When referring to local food in various studies, country of origin (Wageli & Hamm, 2012), region (Wawrzyniak et al., 2005) or distance (Adams & Adams, 2011) are commonly used as factors influencing purchasing decisions. Consumers prefer local food that has travelled shorter distances (Holloway et al., 2007). Many consumers do not only purchase domestically produced groceries, but they also tend to prefer local food that has been produced within a particular region. Other factors contributing to the preference for local produce include its perceived safety (Nganje, Hughner & Lee, 2011), environmental friendliness of the production process and transportation (Brown, Dury & Holdsworth, 2009), as well as the willingness to support the local economy and community (Dunne et al., 2011).

It has also been confirmed that consumers are willing to pay more for such local produce (Feldmann & Hamm, 2015). In terms of the influence of socio-demographic factors on the preference to buy local food, it was found that their explanatory power is relatively weak (Tregear & Ness, 2005; Cranfield, Henson & Blandon, 2012).

2.3 Slovak consumers and their attitudes towards domestic products

In Slovakia, consumers buy more domestic products than before (Podnikam, 2015). The positive relationship between consumer ethnocentrism and the preference for domestic products was also confirmed in Slovakia (Cvirik, 2021). However, it has also been determined that the level of consumer ethnocentrism is quite low in Slovakia, and Slovak consumers do not perceive foreign products as 'enemies' (Cvirik, 2018). On the other hand, another study revealed that product price is far more critical for Slovak consumers than the fact that the product has been made in Slovakia (GFK, 2016). This is in line with the research performed in the neighbouring Czech Republic, which has revealed that consumers are not really willing to pay more for domestic brands (Weberova & Ližbetinová, 2016). The results were similar to a previous research study published in Slovakia (Smolkova, 2013).

Some issues were detected in the area of product recognition. Although consumers in Slovakia prefer domestic products, it is sometimes difficult for them to identify products that were made in Slovakia (Vilcekova, 2014a). Demographics also affects consumer preferences. For example, young people in Slovakia pay attention to brand origin, because they prefer foreign brands (Vilcekova & Sabo, 2013). Consumer preferences tend to change over time depending on factors such as the current economic situation (Vilcekova, 2014b). Based on the previous research, we identified the research gap, namely whether Slovak consumers from different demographics pay attention to the origin of the products they purchase and what is their attitude towards purchasing products that were made in Slovakia.

3. Methods

To meet the goal of the research, quantitative research in the form of a survey was carried out among a group of Slovak consumers.

3.1 Participants

Respondents in the survey were selected to meet a representative sample for gender, age, education, size of residence, and region. The research involved 1,000 Slovak consumers over 18. A more detailed description of the sample based on socio-demographic factors can be found in Appendix A.

3.2 The survey

The survey was performed between 02 and 07 December 2020. The answers were collected online using a standardised questionnaire containing 30 statements concerning consumer attitudes to the attitudes of consumers to the purchase of domestic and organic products, their attitudes to advertising, and whether they perceive themselves as being informed consumers. In this article, we focus on 7 questions related to the attitudes of Slovak consumers to the analysed topic, which is a partial output of the entire research project.

For each statement, respondents were asked to express a degree of agreement or disagreement on a 5-point Likert scale, which is typically used to measure respondents' level of agreement with various statements (Emerson, 2017). Respondents chose from one of five possible answers: 1) I definitely agree; 2) I somewhat agree; 3) I somewhat disagree; 4) I strongly disagree; v) I do not know.

The questionnaire also included classification questions characterising the respondents based on socio-demographic characteristics. All questions in the questionnaire were mandatory, with respondents being able to choose only one of these options.

3.3 Hypotheses

Based on the literature review and the previous research about Brand and the Slovak customer (2013), we established the following seven hypotheses:

- H1: Slovak consumers are paying attention to the origin of products as purchasing Slovak products is important to them.
- H2: Thanks to paying attention to the country of origin, Slovak consumers have noticed that Slovak products are more expensive.
- H3: When buying domestic products is important for Slovak consumers, they are willing to pay more for such products.
- H4: Even though products produced in Slovakia are more expensive, Slovak consumers are willing to pay the price.
- H5: Environmental friendliness is a significant factor contributing to the importance of purchasing Slovak products
- H6: Supporting local businesses is a significant factor contributing to the importance of purchasing Slovak products
- H7: Slovak consumers who notice the country of origin of purchased products think that the offer of Slovak products is sufficient.

There are seven main components of the research model. They are listed in Table 1.

Table 1. Components of the research model

Recognition	I notice the country of origin of the products I buy.
Importance	Buying Slovak products is important to me.
Priciness	Slovak products are more expensive.
Willingness	I am willing to pay more for Slovak products.
Environmental friendliness	The purchase of Slovak products has a smaller impact on the environment.
Supporting local economy	By purchasing Slovak products, I support our economy.
Sufficient offer	The offer of Slovak products is sufficient for me.

Source: own processing

The research model is visualised in Figure 1.

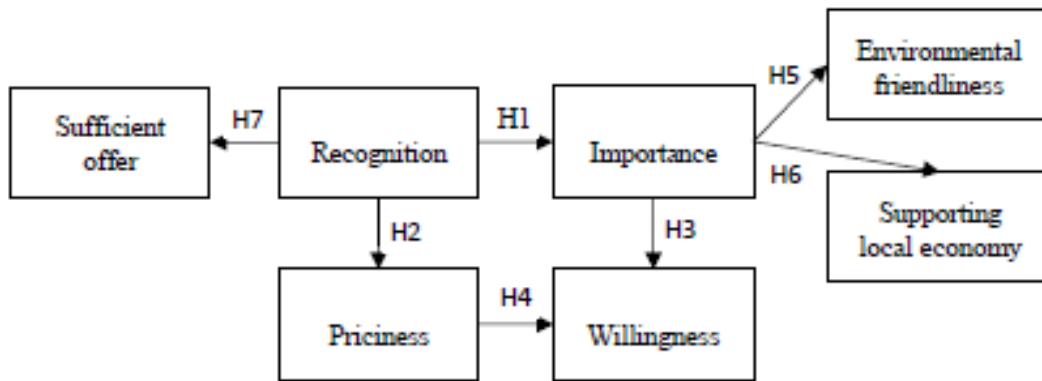

Figure 1. Research model

Source: own processing

Our research also aimed to identify whether the attitudes of Slovak consumers towards purchasing domestic products changes according to their demographics. We were interested in determining whether consumers' opinions statistically significantly differ based on their gender, age, and education. Null and alternative hypotheses were defined:

H0: There is no statistically significant relationship between demographic indicators and the opinions of Slovak consumers regarding the purchase of domestic products.

H1: There is a statistically significant relationship between demographic indicators and the opinions of Slovak consumers regarding the purchase of domestic products.

3.4 Data analysis

The results were evaluated using descriptive statistics, specifically frequency tables and Pearson's chi-square test of independence to verify the hypotheses. The null hypothesis assumes the independence of two random variables. The alternative hypothesis states the opposite and assumes a dependence of two random variables. The null hypothesis H0 is rejected if the p-value is less than or equal to the significance level α . The p-value indicates the probability that we obtain a value of test statistics that is greater than or equal to the value actually obtained, provided that the null hypothesis holds (Yarandi, 1996).

We verified all hypotheses at the significance level $\alpha = 0.05$. To use the Chi-square test of independence, two conditions must be met: 1) The individual observations summarised in the PivotTable are independent, so each element of the sample is included in only one cell of the PivotTable; 2) At least 80% of the PivotTable cells have an expected frequency greater than 5 (Kent State University, 2020). Both assumptions were met when testing all hypotheses. The first condition is automatically satisfied by the fact that each respondent could choose only one answer to each question, and at the same time, the questions were mandatory. The second assumption was verified by testing the hypotheses in SPSS at the end of each Chi-square table listed for each hypothesis.

4. Results

The research focused on the attitudes of Slovak consumers towards purchasing domestic products. The research results describe the relationship between respondents' attitudes to domestic products and selected demographic factors and describe the relationships in the research model.

4.1 Attitudes of Slovak consumers towards purchasing domestic products

The attitude of Slovak consumers towards purchasing domestic products can generally be considered positive. 75% of respondents consider the purchase of domestic products to be important (answers “strongly agree” and “somewhat agree”) and 74% of respondents expressed the opinion that they also pay attention to the country of origin of the purchased products. Almost 25% of respondents consider the offer of Slovak products insufficient. Although 74% of respondents state that they consider Slovak products more expensive, 63% are willing to pay more for domestic products. When asked whether Slovaks think they support the Slovak economy by buying domestic products, we recorded the highest number of positive answers. 89% of respondents agreed with the statement. On the contrary, we recorded the least positive answers in the statement whether the purchase of Slovak products has a lower impact on the environment, less than 60%. An interesting finding in this question is that as many as 16% of respondents do not have an opinion about the impact of buying domestic products on the Slovak economy. Figure 2 presents an overview of the answers.

Figure 2. Attitudes of Slovak consumers to domestic products

Source: own processing

We used Pearson's Chi-square test of independence to evaluate the hypotheses in the research model. Hypotheses with p-value below 0.05 were accepted at a significance level of $\alpha=5\%$. Table 2 shows that for all seven hypotheses, the p-value was lower than 0.001.

Table 2. Evaluation of hypotheses

Hypothesis	p-value	Supported
H1: Slovak consumers are paying attention to the origin of products as purchasing Slovak products is important to them.	<0.001	Yes
H2: Thanks to paying attention to the country of origin, Slovak consumers have noticed that Slovak products are more expensive.	<0.001	Yes
H3: When buying domestic products is important for Slovak consumers, they are willing to pay more for such products.	<0.001	Yes
H4: Even though products produced in Slovakia are more expensive, Slovak consumers are willing to pay the price.	<0.001	Yes
H5: Environmental friendliness is a significant factor contributing to the importance of purchasing Slovak products	<0.001	Yes
H6: Supporting local businesses is a significant factor contributing to the importance of purchasing Slovak products	<0.001	Yes
H7: Slovak consumers who notice the country of origin of purchased products think that the offer of Slovak products is sufficient.	<0.001	Yes

Source: own processing

The updated research model with the p values is shown in Figure 3.

Figure 3. Research model after validation hypotheses

Source: own processing

Regarding the relationship between the recognition Slovak products and importance, it was found that the p-value is less than 0.001; therefore, H1 is accepted: Slovak consumers are paying attention to the origin of products as purchasing Slovak products is important to them. The findings of this study showed that the relationship between the recognition and priciness is significant ($p < 0.001$), therefore, H2 is also accepted. Consumers who pay attention to the country of origin of products also noticed that Slovak products are more expensive. Testing of the third hypothesis (H3) with a $p < 0.001$ confirmed a statistically significant relationship between the importance of purchasing domestic products and the willingness to pay the higher price. Also, in H4, based on the p-value, the relationship between priciness and willingness proved to be significant. This means that despite the higher price, consumers are still willing to pay more for domestic products. Confirmation of hypotheses H6 and H7 showed that the perception of environmental friendliness and the support of local businesses has a significant impact on how Slovak consumers perceive the importance of purchasing Slovak products. The relationship between recognition and sufficient offer with a $p\text{-value} < 0.001$ is also significant, which resulted into accepting H7.

4.2 The influence of demographic parameters on the attitudes of Slovak consumers towards purchasing domestic products

In the next part, we looked at the impact of socio-demographic parameters on the attitudes of Slovak consumers towards purchasing of domestic products. We specifically examined whether age, gender, and education have a statistically significant effect on respondents' responses. Table 3 shows the p-values that resulted from Pearson's Chi-square test for the seven statements.

Table 3. Testing the statements against socio-demographic parameters

Statement	Gender	Age	Education
I am willing to pay more for Slovak products.	0.268	0.106	0.029
Buying Slovak products is important to me.	0.073	0.001	0.045
I notice the country of origin of the products I buy.	0.129	0.001	0.001
By purchasing Slovak products. I support our economy.	0.041	0.095	0.001
The purchase of Slovak products has a smaller impact on the environment.	0.015	0.417	0.019
Slovak products are more expensive.	0.922	0.584	0.059
The offer of Slovak products is sufficient for me.	0.579	0.025	0.004

* p values below 0.05 are highlighted

Source: own processing

Based on the results obtained we reject H_0 and therefore consider the dependence between the responses of respondents who expressed the degree of agreement or disagreement with the product and the demographic factor as statistically significant at the level of significance $\alpha = 5\%$.

The most differentiated answers were identified in the responses of respondents with different education. While respondents with a university degree are more willing to pay extra for Slovak products (72% of the answers indicated 'I definitely agree' and 'I somewhat agree'), respondents with primary (37%) or apprenticeship education (35%) tend to reject the statement. We can see a difference between university-educated respondents and respondents with primary education also in the question of whether the purchase of domestic products is important for them. 61% of respondents with primary education find the purchase of Slovak products important, while it is more than 20 percent more for university-educated respondents. There was an even bigger difference when respondents were asked whether they notice the country of origin of the products they buy. As many as 83% of university-educated respondents notice the country of origin, compared to 75% of high-school graduates and only 55% of those with primary education.

More than three quarters of respondents in each education group agree with the statement that the purchase of domestic products supports the Slovak economy, while this impact is most recognised by university-educated respondents (94%). The fact that 48% of respondents with primary education believe the purchase of Slovak products has a smaller impact on the economy, a large percentage (38%) do not agree with the statement at all. A quarter of respondents with secondary education disagree with the given statement, while for university-educated respondents this number is slightly more than 20%. When we asked the respondents whether the offer of Slovak products was sufficient for them, we recorded the most positive answers among respondents with secondary education (65%) of respondents. The offer seems the least sufficient to respondents with the university education. The summary of findings regarding the attitudes of consumers towards purchasing Slovak products according to their education can be found the Appendix B.

The answers of respondents from different age groups differed significantly in the statement whether respondents pay attention to the country of origin of the products they purchase. While the oldest age category clearly pays the most attention to the country of origin of the products. i.e. respondents aged 60 and over (86% of answers include 'I definitely agree' and 'I somewhat agree'), in the youngest age group only 64% of respondents from 18-29 age pay attention to the country of origin. Similarly, when deciding whether the purchase of domestic products is important for respondents, the older age groups agreed the most - 82% of respondents in the age group of 50 to 59 years and in the oldest age group of respondents over 60 years of age. Even though youngest respondents represent a group for which the purchase of domestic products is least important (only 62%), they are the most critical age category for the supply of domestic products on the market. 42% of respondents in the 18-29 age category consider it insufficient. On the contrary, the offer of Slovak products is sufficient for more than 70% of respondents in the productive age of 30-39 years. Details of the attitudes that significantly differ based on the age of consumers are presented in Appendix C.

The opinions of men and women statistically significantly differed only in relation to whether the purchase of Slovak products has a smaller impact on the environment and whether they support the Slovak economy by purchasing domestic products. In both statements, women expressed a greater degree of

agreement than men. As many as 9 out of 10 women surveyed agreed with the statement that the purchase of Slovak products supports the domestic economy (answers 'I definitely agree' and 'I somewhat agree'). Only 55% of men think that buying domestic products has a lower impact on the environment, while it is 7 percentage points more for women. Details of the attitudes that significantly differ based on the gender of consumers are presented in Appendix D.

5. Discussion

Slovak consumers are paying attention to the origin of products as purchasing Slovak products is important to them. This is in line with the previous research studies e.g. (Cvirik, 2018, 2021). However, contrary to the findings of Vilcekova & Sabo (2013), younger consumers do not notice the country of origin of products more than older consumers. In fact, our research revealed that the older consumers aged 60 year and more pay attention to the product origin the most (86% answered definitely or somewhat agree).

Our results are consistent with the study of Kalicharan (2014) who found out that consumers from developed countries prefer domestic products. This is also the case of Slovakia which is a developed country with high Human Development Index. Analysis of research data also showed that Slovak consumers perceive Slovak brands to be more expensive, but they are willing to pay higher price for them. This has been determined in countries outside Slovakia earlier, e.g. (Knight, 1999), however, in Slovakia it represents a shift from the past where consumers were less willing to pay more for domestic brands (Smolkova, 2013; Weberova & Ližbetinová, 2016). Before, price was far more important to Slovak consumers than the fact that the product was made in Slovakia (GFK, 2016).

In regard to the reasons why consumers prefer Slovak products, environmental friendliness is a significant factor contributing to the importance of purchasing Slovak products, in line with Brown, Dury and Holdsworth (2009). Also, Slovak consumers believe that by purchasing Slovak products they support local economy. This has been identified as a factor contributing to the preference of local produce by Dunne et al. (2011). Slovak consumers also believe that the offer of Slovak products is sufficient.

This study contributes to theory by providing evidence of current attitudes of consumers to locally produced brands and manufactured products in Slovakia. It builds on previous research and either confirms previous findings or reveals changes in preferences and importance of local products to consumers (e.g. the willingness to pay). Thanks to the representativeness of the research with a large research sample used, results reflect the preferences of the Slovak population and differences between age groups, various levels of education, and gender could be analysed.

Conclusion

The results are practically usable by both Slovak and foreign companies and enhance their knowledge of how Slovak consumers deal with product origin and thus can help improve business retailing strategies. Retail, wholesale and distribution companies can use the fact that country of origin is really important to consumers to include more Slovak products in their portfolio. This is further accentuated by the fact that consumers are willing to pay more for such products. Thus, even higher price does not necessarily mean that they will not sell equally or better than similar products manufactured overseas. Manufacturers should also look for more options to make their products environmentally friendly. This starts with the ingredients, continues with the production process, and finished with packaging and distribution. The results of the research presented in this paper are also valuable to government bodies, which are dealing with the support of locally manufactured products through various business support initiatives and communication campaigns.

The use of a unique methodology developed for the purpose of this study also represents its limitation as the results cannot be directly compared with previous research studies.

We see opportunities for further research in applying the same methodology for data collection and analysis in a different country, e.g. the Czech Republic, which has always been the closest market in terms of consumer behaviour. Some of the older studies have provided comparisons between the Czech and Slovak markets and, therefore, it represents an opportunity to use our research model to gain up to date insights on the situation in the Czech Republic or another country within the region.

Media Behaviour of Generation Z: The Way to Optimise Communication Strategies on Social Networks

Ludmila Čábyová^{1,*}

¹University of St. Cyril and Methodius in Trnava, Faculty of Mass Media Communication,
Námestie J. Herdu 2, 917 01 Trnava, Slovakia

Abstract

Research background: Generation Z is the first generation to have been exposed to digital technologies since birth. This has fundamentally influenced their lifestyles, abilities and skills, but also the way they search for information or consume specific media.

Purpose of the article: the aim of the paper is to find out what is the media behaviour of the generation and to identify the basic stereotypes of its media behaviour.

Methods: In our paper, we analyzed data from two surveys that allowed us to gain a deeper understanding of Generation Z's media behavior when developing a communication strategy. The first research was qualitative, in which we used the media diary method. Our research consisted of asking Generation Z respondents, specifically those aged between 19 and 23, to create essays on the topic 'My Day with the Media'. The second research was quantitative on a sample of 182 respondents, in which we focused on young people's social activity on various social media sites.

Findings & Value added: Together, these two research approaches have provided a comprehensive view of Generation Z's media behaviour that allows us to better understand how this generation interacts with the media and social networks in their everyday lives, thus providing valuable insights for developing a communication strategy to reach this generation.

Keywords: generation Z, social media, digital technology, mobile phone, communication strategy

JEL classification: M03

1. Introduction

The rise of digital technologies has led to the emergence of a generation that has specific skills and abilities to work with modern digital technologies. They are referred to as 'digital natives'. The term was first used by Mark Prensky in 2001 (Prensky, 2001) in his work "Digital Natives, Digital Immigrants". The author categorizes a group of young people who are proficient with computer work with ease, understanding digital media, video games and various software programs because they were born in the era of information technology. In current discussions, this demographic is often referred to with terms such as "Generation Z" or "Net Generation".

It is the first generation for whom technology has been available since childhood (Seemiller, 2016). Technological advances in multimedia, including tablets, smartphones (which integrate a mobile phone, media player, camera, and internet into one device), social media, and other platforms, have made access easier. (Prensky, 2010). Social media platforms have drastically changed the way people socialize, share information, present themselves, perceive others, and work (Gil-Or, 2015) Generation Z is constantly online and connected to social media. These are their main source of information and have a great influence on their decision making. (Djafarova and Bowes, 2021). At the same time Generation Z is preferring to enjoy more choice, variation and autonomy in selecting content types and channels of communication. They claim to choose Spotify over radio, Netflix over TV because it gives the user an illusion of more control. This motivation, however, plays out in mostly entertainment content used and foregrounds the individual, not the society as collective (Čábyová et. al, 2023)

Globally, the highest percentage of Gen Z mobile internet users who visit social apps is on YouTube - 84%. This is followed by TikTok at 61%, Snapchat at 58% and Instagram at 56%. Other platforms still see

* Corresponding author: ludmila.cabyova@unipo.sk

a significant share of this age group, with Facebook and Twitter reaching one in three mobile internet users, Pinterest and Reddit reaching one in four, and LinkedIn and Twitch reaching one in ten. Even earlier studies from 2017 claim that Generation Z spends on average more than 10 hours a day online (ParashYadav, Jay, 2017) Most of the time spent online is on mobile phones, which are the most used device for members of Generation Z ahead of others such as laptops, gaming consoles or TVs (Edison research, 2022). Media use starts as soon as they open their eyes after a night out, with 44% saying they check their phones as soon as they wake up (Comscore, 2023). The Go4insight agency (2022) presents the results of the Slovak Generation Z. 81% of young people under 26 connect to social networks several times a day, 9% once a day, 8% several times a week, 2% once a week.

2. Methodology

For the purposes of this paper, we analyzed data from two different studies. The first one was a qualitative research, which we carried out using the method called media diary. The second was quantitative research, which we conducted through written inquiries of respondents.

Qualitative research

Respondents belonging to Generation Z were asked to write essays on the topic "My day with the media". According to Hyers, media diaries provide a subjective contextual understanding of users' habits, behaviours, experiences and engagement with digital media in order to understand social and personal changes in young people's lives. (Hyers, 2018) MaxQDA software was used to process the research results. This is a specialist qualitative data analysis software that is used to process and analyse text, audio, image and video data. The software has many features and tools that enable researchers and analysts to work effectively with qualitative data. Using it, the responses of the respondents were coded and then evaluated. This was an extensive research on Generation Z's media behavior, for the purpose of this study we worked with essay sections that addressed the topic of how Generation Z uses media in their daily lives. 113 respondents between the ages of 19-23 participated in the research.

Quantitative research

The results of the quantitative research were complementary to the results of the qualitative research, which focused on exploring young people's social activity on different social networks. The aim of this quantitative research was to gather data on the extent and specific forms of young people's activity on these platforms.

Due to the comprehensiveness of the social activity information, several areas were included. The first was the identification of the preferred social networks of the young respondents, whereby we sought to uncover which platforms they engaged on most frequently and were therefore considered to be the most active.

Another area was the analysis of the specific ways in which their activity manifested itself on social networks. These ways included creating their own posts, commenting on other users' content, regularly sharing stories, creating blogs and vlogs, or just expressing their opinions through emoticons and reactions to content. This analysis aimed to more accurately capture the variety of interactions and expressions that young people engage in on social media. The quantitative research also included an analysis of the frequency and intensity of these activities in order to better understand how young people use social networks in their daily lives. The results of this quantitative research provided us with a numerical and statistical view of young people's social activity on these platforms, allowing us to better understand and contextualise the findings from the qualitative research.

For the purpose of research evaluation, the following research questions were formulated:

Q1: How does Generation Z use digital media in their daily lives?

Q2: What are the main behavioural patterns, habits and interests of Generation Z in relation to digital media?

Q3: What specific forms of activity do young people carry out on social networks?

3. Results and discussion

Qualitative research shows that young Generation Z participants are in contact with the media almost all day. Unsurprisingly, they are online almost all day and the main device through which they consume media is their mobile phone. This fact was confirmed by all respondents. With a mobile phone they

connect to friends, follow current events, music, podcasts, and entertaining videos. *"I spend most of my time on my phone during the day."* (EN, 74)

The majority of respondents immediately focus on their mobile phone when they wake up in the morning (82.93%). Only a very small proportion of respondents make a conscious effort to avoid using their mobile phone immediately after waking up (8%). The most common reason is that they prefer to sleep longer. During the day, they follow messages from friends and keep up with world news. Their mobile phone accompanies them on the way to school, where they listen to music or podcasts. During breaks at school, they watch funny videos and soc. networks. After school, they go back to their mobile phones to watch more content, especially on YouTube or Tik-Tok. Evenings are spent watching movies on streaming platforms like Netflix. *"As soon as I open my eyes in the morning, I reach down to the carpet, still half asleep, where I pick up my mobile phone."* (F105) *"Instagram accompanies me through my daily routine of waking up. It is a kind of alarm clock for me in the media world. After viewing almost the entire message board and stories from friends on Instagram, I switch to the Whatsapp and Messenger platform where I reply to messages from friends."* (F, Sk, 99) *"Every morning when I get up the first thing I do is open my mobile phone and check Instagram and Messenger, I reply to messages from friends on these social media platforms. Then I check what's new on Instagram and Facebook."* (F, SK91)

Other social networks they like to use to communicate with their friends and family are WhatsApp and Messenger. They also follow social media, with Instagram being their most popular platform. As many as 88.62% of the respondents ranked Instagram as the network they use the most. Some of them even claim that they have a Facebook account just because of Messenger, so that they can communicate with older generations (parents and other family). Interestingly, as many as 4.88% of the respondents said that they actively refuse to use Facebook. *"My most used and followed social networks are mainly Messenger and Instagram, so I check those first. During the day, apart from Messenger, I also use Whatsapp to communicate with loved ones."* (SK81) Music listening apps, especially Spotify, are very popular for students.

They listen to music throughout the day, especially when travelling and at leisure. *"It's a long journey to school and I like to cut it short by listening to the streaming service Spotify."* (SK105)

As for watching media together with the rest of the family, a large proportion of this time is spent with their parents or friends (43.09%). The preferred forms are television and the streaming platform Netflix. However, more than half of the students (56.91%) did not comment on this activity.

"Sometimes we'll find a night where we all get together in the living room and we'll put Netflix on the TV, find a movie we all agree on and watch it." (SK1) *I watch media with my family minimally. Usually when we do watch something together it's TV.* (SK84) *When I had more time before the exam period, I used to watch movies or series from Netflix or TV stations' programs with my parents in the evening.* (SK106). In the early evening at dinner, my mother and I traditionally turned on the television, specifically the TV station Joj, because at 6:00 p.m. we watched the daily show No Napkins together. It was a relaxing time for us. (SK6)

Television and radio are often used as a medium of communication. Television is watched while doing household chores, cooking, but also while eating. The radio is turned on while travelling in the car, some while playing sports or studying. *In our household, probably all media are on right from the morning. While there is music in our children's room, the TV in the living room is on Telerano* (SK). In the background, we have music playing that my brother picks out. He uses the YouTube platform for this. (SK15)

Interestingly, more than half of Generation Z respondents refuse to watch television (51.22%), due to excessive advertisements and lack of attractive content. They also reject printed newspapers and magazines (40.65%), as they can quickly find the information they need online. Radio is listened to by only a minority of respondents, while those who use it prefer stations such as Radio Express, Fun radio and Radio Europa 2." The medium that I do not use at all is printed newspapers and magazines. I have never bought them, I have never read them and I don't plan to. All the information that I find in these newspapers is also available on the Internet, on various news portals. You have to pay for newspapers, you have to spend a lot of paper to produce them, and I get to read the same things online and I don't have to spend the money to use them - as long as they're free. (Sk25)

Compared to their parents, they also follow traditional media, but social media is also popular. *As for my family members, my sister uses the same media as me (i.e. social media in particular) and generally follows the media and gets her information from the same or similar media as me. However, my parents, in contrast to me, often watch television as they have access to it. Likewise, they are also active on social*

media, which is sometimes a detriment as they cannot distinguish misinformation from all content well enough. (EN122) My family and I occasionally watch, a couple of times a month, a film in the evening at the weekend, which I choose myself as I know everyone's tastes and can find a match. (SK89)

If I'm with my family on the weekend or in my free time we either watch TV together or listen to the radio. (SK24) Television newspapers are still his primary source of information, it's "old school" after all and teaching him to watch something more modern is not that easy. (SK112)

The results of the quantitative research also confirm that Generation Z is very active on social media, with up to 95% of respondents confirming that they add their own content to social media in the form of their own posts, photos, videos, blogs, comments, etc. (Figure 1). Their active participation in social networking sites is a clear reflection of their involvement in the online community and their ability to express themselves through the digital medium. This generation has become not only consumers of content, but also creators of content, contributing to the constant flow of information and interactions on social media.

Figure 1. Activity on social network
Source: own processing (2023)

In Figure 2, we see the distribution of Generation Z activity among the different social networks. From the data shown, it is clear that the social network Instagram dominates, with 96.7% of respondents being active on it. Instagram is followed by Facebook with 49.5%, Snapchat with 41.2%, TikTok with 38.5% and Pinterest with 33% of users. These numbers show that Instagram is incomparably more popular than other social networks for Generation Z. However, it is interesting to note that the results for this generation differ significantly from the global survey, which is dominated by YouTube, which is identified as the most popular social network (84%), followed by TikTok (61%), Snapchat (58%) and Instagram (56%) (see Comscore, 2023). These distinct preferences of Generation Z suggest that this generation has its own unique preferences when it comes to social networking, and that these preferences can be influenced by a variety of factors, including age, interests, and cultural context.

Figure 2. Networks where you are active
Source: own processing (2023)

Table 3 gives us a glimpse of respondents' preferences regarding social media activity. For this question, respondents were only allowed to indicate one social network, which allowed us to get clear and unambiguous data on which platform was most important to them. We cannot overlook the result, which shows us that Instagram is the social network on which 83.5% of them are most active. This finding gives us a deeper insight into the social behaviour of Generation Z and their preferences, as Instagram becomes a key platform for content sharing and communication among its members. It is clear that Instagram plays a significant role in the digital lives of this generation and remains the main means for them to express and interact online.

Figure 3. Networks where you are the most active
Source: own processing (2023)

Figure 4. Activity on social network
Source: own processing (2023)

Individual social networks provide a multitude of activities through which Generation Z can interact with their surroundings. Respondents make the most use of posting photos and pictures (91.8%), followed by videos (55.5%) reacting through (54.9%) and sharing content (45.10%). Surprisingly, only 14.3% engage in discussions in comments. The answer may lie in the fact that Generation Z may prefer faster, visual and audiovisual forms of expression (e.g., images, videos, emoticons) to writing long comments. Many people, including members of Generation Z, may be afraid of exposing themselves to negative reactions in comments, so they prefer not to communicate or limit themselves to passive interactions.

In the case of dissatisfaction with the product, this situation is even more visible. Only 17% of respondents actively initiate communication on social networks in case of dissatisfaction with a product. Each Gen Z has their own personal style and preferences when it comes to problem solving. Some may

prefer face-to-face contact, phone contact or email communication over publicly expressing themselves on social media. Answers to their inactivity can also be found in the results of qualitative research. Almost all respondents use the time spent on social networks mainly for rest, relaxation, distraction or to get up-to-date information.

Figure 5. Communication in case of dissatisfaction

Conclusion

The results of this research point to a significant shift in the way young people from Generation Z interact with the media in today's digital age. They are almost constantly online and their main device for consuming media is their mobile phone, which was confirmed by all respondents. Mobile phones are used to connect to friends, follow current events, listen to music, podcasts and entertainment videos. The majority of respondents focus on their mobile phone immediately upon waking up, with only a small proportion making a conscious attempt to avoid it immediately upon waking up. This is often due to a desire to stay in bed longer. During the day, they follow news from friends and world events. Their mobile phone accompanies them on the way to school, where they listen to music or podcasts. During breaks at school, they watch entertaining videos and social media. After school, they go back to their mobile phone again to watch more content, especially on platforms like YouTube or TikTok. Evenings are spent watching movies on streaming platforms like Netflix. Instagram and Messenger are other social networks that young people like to use to communicate with friends and family, with Instagram being their favourite platform. Interestingly, some of them have a Facebook account only because of Messenger so that they can communicate with older generations, especially parents and other family members. When it comes to media consumption, music plays a significant role, Spotify is a very popular app among young students. They listen to music throughout the day, especially when travelling and in their free time. Television and the streaming platform Netflix are the preferred forms of watching media together with the family.

In a study conducted by Kalogeropoulos (2019), he stated that members of this generation are very dependent on their electronic devices. In our research, we can confirm his findings that they use electronic devices almost constantly, for communication, for entertainment and relaxation, for playing games, for socializing and for getting news.

More than half of Generation Z respondents refuse to watch TV and print media, often because of excessive advertising and unappealing content. Only a minority of respondents listen to the radio, with those who do using it preferring stations such as Radio Express, Fun radio and Radio Europa 2. This shift in young people's media consumption shows that we are moving from traditional media to digital formats where young people have more control over content and its timing. It also shows that mobile phones have become indispensable tools for communication, information and entertainment. (Dolot, 2018) Young people tend to seek out content that matches their interests and have moved from passive consumption to active interaction with media. This change has significant implications for media and advertising, which must adapt to new ways of media consumption and communication with this generation.

Generation Z is highly active on social media, with up to 95% of them actively contributing content to these platforms. This confirms their ability to express themselves and actively participate in the online community. The clear favourite among social networks for this generation is Instagram, where up to 96.7% of respondents actively participate. This fact underlines the importance of Instagram in the digital life of Generation Z.

Generation Z's preferences differ from global trends. Unlike the global survey, which is dominated by YouTube, Instagram is the number one social network for Generation Z in Slovakia. This difference highlights the unique preferences of this generation, which can be influenced by a variety of factors.

Generation Z is mainly interested in sharing photos and images, followed by videos, reactions and sharing content. This clearly shows their interest in visual and audiovisual forms of expression. These activities show that the visual aspect of social media content is important to them.

If they are dissatisfied with the product, only a very small proportion of them actively start communicating on social media. This low activity may be due to fears of negative reactions or personal preferences in solving problems.

Overall, these results point to the strong presence of Generation Z on social media, but also to their unique behaviors and preferences in the online environment. This generation has become active content creators and has a significant impact on the digital world.

Generation Z, which has grown up in the digital age, displays its own distinctive behavioural patterns, habits and interests in relation to digital media. These patterns distinguish this generation from its predecessors and are important for a better understanding of how young people integrate media into their daily lives.

Generation Z is virtually always connected to the internet via their smartphones and other digital devices. Regularly checking social networks, emails and other online applications is part of their daily lives. They consume a lot of content on social media, where they follow content from influencers, YouTubers and other content creators, with video content being particularly attractive to them.

But Generation Z are not just passive consumers of media. Many of them are actively contributing content on social media, sharing their own videos, photos, posts and opinions. In this way, they build their personal brands and interact with their peers.

With the fast flow of information on the internet, they tend to flip between content quickly because they have a short attention span. This means that content creators are forced to engage them right from the start of their videos or articles.

Generation Z is very visual and photos, images and videos have a significant place in their communication and self-expression. Apps like Instagram and Snapchat that focus on visual content are popular for them.

In addition to consuming entertaining content, they are also interested in current events and social issues. They express their opinions on these topics online and participate in discussions.

Generation Z youth prefer to watch TV and movies on streaming services like Netflix, Hulu and YouTube instead of traditional broadcast TV.

These patterns of behaviour, habits and interests of Generation Z are influencing the way they communicate, consume information and build their online identity. They are important for marketers, companies and researchers trying to communicate effectively with this young generation in the digital environment.

Abstract

Research background: The covid-19 pandemic has changed the consumers' shopping behavior forever because of lockdown. These restrictions affected brick-and-mortar stores the most, which had to close their business overnight. The only stores in Slovakia that could actively operate during the lockdown were groceries. Despite of this, their position in e-commerce sales was strengthened. This study is dedicated to the revealing of the drivers of groceries online shopping and relationships between them.

Purpose of the article: The aim of the paper is to assess the relationships and effects of the individual drivers of online food consumer shopping behavior on the consumers' intention to the groceries online shopping.

Methods: The methods of correlation analysis (Spearman ρ) were applied in order to define the relationships and effects of the drivers on the consumers' intention to the groceries online shopping. The sample consisted of the 635 online shopping consumers and the research was conducted in Slovak republic reflecting the conditions of the local e-commerce market.

Findings & Value added: The study represents a pilot study in the field of the groceries online shopping in the Slovak republic. The contribution of the pilot study lies on the identification of the drivers influences the consumers' intention to the groceries online shopping. The most significant drivers affecting the intention of groceries shopping online were online advertising, e-commerce and digital trust factors and sellers involvement in CSR activities.

Keywords: online shopping behavior, e-commerce, groceries, CSR

JEL classification: H8, M0, M14

1. Introduction

The food sector is a relevant context in many countries because of its impact in terms of company revenues and employment (Giacosa et al. 2017). Food consumption and shopping behaviour shifted massively because of Covid-19. It caused the increment mainly of the online orders because of Covid-19 restrictions. With more people ordering their groceries online, retailers found themselves challenged to fulfil orders. Online grocery shopping is the purchase of food or personal use items via a food retail company's internet-based portal or application, with delivery to the consumer's home or designated delivery area or preparation for in-store pickup (Thomas-Francois and Somogyi 2021; Pavlou, Georgiou 2021). Even though the threat of the covid-19 pandemic is on the wane, online food shopping by consumers is still growing in 2023, which can be caused by several factors. According to the mentioned knowledges in this field of problematic, our research question was formulated: Which factors drives the consumers to shop the groceries online in the area of Slovak republic?

* Corresponding author: veronika.skerhakova@unipo.sk

2. Literature review

Singh and Soderlund (2019) conducted the research on the factors affecting the groceries online shopping, where in the conceptual framework the five factors were predicted in order to affect the online grocery shopping experience: 1. Customer service; 2. Website experience; 3. Product Experience; 4. Delivery Experience; 5. Brand experience. The satisfaction within these areas leads to repurchase intention and Word-of-mouth recommendation to the customers' relatives. According to their results the customer satisfaction and customer service are key drivers of the online customers experience. The research in the field of this problematic was conducted also in 2020 in China by Zheng et al. In their research they focused on the investigation of consumers' online grocery shopping preferences and behavior and identified several factors in which online food markets work differently from offline markets: 1. the product's origin was an important factor for the customers which are more likely to shop online; 2. the price advantage in shopping fresh food comparison to physical shops; 3. the importance of freshness and quality of the delivered food; 4. E-vendors characteristics (ratings, reviews, sales volume, history etc.) which are not available for physical stores (Zheng et al. 2020). Vasudevan et al. (2022) examined the relationships between three factors (convenience, service quality and social factors) and online grocery shopping behavior where convenience and service quality showed as the most influential.

The COVID-19 pandemic caused that the customers have become more oriented to sustainability, buying local products and embracing digital commerce and this has made the need for more environmentally sustainable offers even more evident (Sorrentino et al. 2022). Calza et al. (2023) conducted research on the potential of the fusion of corporate environmental sustainability and customer experience management. They offered the first attempt to combine these two approaches to deliver an integrated model helping managers and companies to reshape their corporate decisions. Their integrated model represents the first step to incorporate both the environmental challenges and the customer experience in decision-making. O'Neill et al. (2023) in their study focused on the profile of the sustainable food consumer. Based on their results we can conclude that sustainability-related food behaviours referred to: 1. quality attributes (e.g., purchasing local food); 2. food responsibility (e.g., using a shopping list); 3. dietary choices (e.g., adopting vegetarianism); 4. food organisation and management within the home (e.g., avoiding food waste).

The frequency of online food shopping is dependent on various factors. COVID-19 restrictions caused exponential increase in the field of using online and mobile devices in order to online shopping (Purohit et al. 2022). The attitude, subjective norms, perceived behavioural control and trust are according to Wen et al. (2022) the driving factors which positively predicted consumers' intentions to continue shopping food online. On the other side there are opposing factors like: high perceived threat (linked to Digital trust), low product involvement, low perceived benefits of online food shopping and low frequency of online food orders causing the less likeliness of consumers to order food online (Mehroli et al. 2021). Online customers' intention to buy groceries online are strongly affected by perceived risk. Hong et al. (2021) in their study revealed that perceived trust, ease of use usefulness, price-saving benefit aspect, time-saving benefit aspect are the most important predictors which affected online food delivery usage intention of customers. The findings of their study also highlighted that during the COVID-19 pandemic, generations Y and Z were more willing to use online food delivery compared to older generations. In contrary, the study of Horváth et al. (2021) on the Generation Y consumers in Slovakia proved, that 62.50 % of them never shopped food or groceries online. Only 8 % of respondents declared they do online shopping of groceries frequently.

The pandemic also accelerated new services, but mainly increased people's need to buy more and more goods and immediately. Such routing is referred to as so-called quick commerce, in short q-commerce, or immediate delivery. During COVID-19 pandemic consumers did not have the opportunity to make their usual purchases in brick-and-mortar stores and a large part of purchases moved to the online space, but only 14.12 % of Slovak consumers have started regularly using food delivery (Veselovská and Bartková 2022). According to experts, this is the future of shopping. Online supermarkets, which focus primarily on fast delivery, following the model of gastronomic establishments, are developing most actively in this area. Quick commerce responds to current changes in customer behavior. In the last few years, people have learned to value their time more and do not want to spend it in stores on long purchases. They start shopping on a smaller or medium scale and the quick availability of goods that they consume immediately is important to them. Q-commerce goes against them in this direction (Fingl, 2022). According to Bakoš (2022), the biggest representatives of q-commerce in Slovakia are Wolt market, Food

Panda and Lunys. Another important player on the market was the company Bolt with its Market, but in September 2022 it stopped operating this service and announced that it would continue only with the delivery of food. Bolt Market is the online marketplace accessed through the application, from which the user could order by clicking on the icon of the desired product, while the estimated delivery time of the order was also shown in the application.

The failure of Bolt is offset by the success of Wolt Market, which seems to have been better adopted by consumers and used more often. Since the beginning of the operation, sales have doubled in the Slovak Wolt Market. Since the first purchases, the average price of the shopping basket has increased to 20-30 eur. For customers of this platform, the most important factors when shopping online are convenience, time saving, or a clearer and simpler choice when purchasing. According to Wolt, the reason for the rising sales is a more rational expansion, as well as the fact that quick commerce is still establishing itself in Slovakia. This represents advantages in the form of further growth potential, but at the same time it requires informing and educating customers and breaking down prejudices and myths that prevail about purchasing behavior. According to this company, food delivery is mainly used by younger generations between 15 and 34 years old, while customers between 15 and 34 years old emphasize financial benefits, consumers of the older generation over 55 years especially valued convenience and comfort. Also Foodpanda offers the purchase of FCMG. As part of its services, it offers customers the delivery of food from restaurants, but also the increasingly popular delivery of various goods, namely from its own panda markets, as well as from the network of partner establishments Tesco Express, Žabka, and Hiva (Bakoš 2022; Ecommercebridge 2022).

3. Methodology

The aim of the paper is identify the individual drivers of online groceries consumer shopping behavior and assess the relationships between them. The data were collected within Slovak republic by online self-administered questionnaire in April 2022. The 635 respondents participated in this research. All variables were measured on a 5-point Likert scale. The variables suitable for this research were derived from the literature review of the previous research dedicated to this problematic (Sundararajan 2019; Pham et al. 2019; Ali Taha et al. 2019; Pencarelli et al. 2018) and divided into 8 latent variables-drivers, in order to examine the relationships between them. Descriptive analysis was used in order to analytical data processing, which was carried out based on statistical characteristics such as Mean, Median, Standard Deviation, Minimum and Maximum. A non-parametric correlation analysis (Spearman ρ) was applied in order to describe the relationships between factors of online food consumer shopping behavior. The data were processed by programming language R (version 4.1.0.).

4. Results

The following part was focused on the presentation of the results, and it was divided into two chronologically connected sections. The first section was devoted to the conceptualization of the model of consumers online groceries shopping behavior, its reliability, validity and description of the model in holistic way. The second part was devoted to the relationships between the selected factors.

Figure 1. Factor loadings
Source: own elaboration (2023)

Figure 1 presents the basic value of the validity of the model and thus a sufficient level of loadings factors. It is important to emphasize that all variables acquired the value of loadings factors higher than 0.7, which is important for the further construction of the model.

Table 1. Model characteristics

Variable	Mode	MVs	Cr. alpha	DG.rho	eig.1st	eig.2nd
ESS	Reflective	7	0.887	0.912	4.177	0.864
RES	Reflective	3	0.694	0.831	1.863	0.617
ADV	Reflective	6	0.842	0.884	3.356	0.870
ATD	Reflective	5	0.835	0.883	3.016	0.730
ECT	Reflective	4	0.836	0.892	2.704	0.654
SUS	Reflective	3	0.848	0.908	2.301	0.438
FOS	Reflective	3	0.781	0.874	2.097	0.624
EXP	Reflective	2	0.612	0.837	1.441	0.559

Source: own elaboration (2023)

The results of the model's reliability are presented in Table 1. All latent variables fulfill the character of reflective mode, where the MVs column presents the number of manifest variables creating each individual factor (latent variables). As it is showed, the model consisted of eight reflective variables namely: 1. E-shop services (ESS); 2. Reputation (RES); 3. Advertising (ADV); 4. Attitude (ATT); 5. E-commerce and Digital trust (ECT); 6. Sustainability (SUS); 7. Frequency of online shopping (FOS); 8. Expenditures (EXP). The reflective variables were constructed from 33 manifest variables obtained by self-administered questionnaire. Cronbach's α as well as Dillon-Goldstein ρ showed acceptable reliability results in all cases. The only small deviation was detected within the EXP factor, where the outputs was at the limit of acceptability, which could be explained by the low number of manifest variables shaping this factor. The first and second eigenvalues have acquired acceptable values in all cases, where no output is lower than 1 in the first eigenvalue, and in the second one, on the contrary, all outputs are below the limit of 1. Based on the given information, the model can be considered as sufficient and suitable for further processing.

Table 2. Descriptive analysis of all variables

Var	Manifest Variables					Latent Variable (mean)

Source: own elaboration (2023)

Based on a sufficient degree of reliability, average factors were created for the purpose of factor approximation analysis through descriptive help with the help of arithmetic mean. Selected characteristics of the descriptive analysis are presented in Table 2. As it is showed from these results the most important factors for consumers were E-shop services (ESS); Advertising (ADV) and Attitudes of consumers (ATT). The E-commerce and Digital trust factor (ECT) or Sustainable (SUS) approach of merchant weren't as important for them while shopping the groceries online.

Table 3. Correlation matrix – Spearman's ρ

ρ	ESS	RES	ADV	ATD	ECT	SUS	FOS	EXP
ESS	1	0.771	0.753	0.48	0.387	0.72	0.319	0.137
RES	<0.001	1	0.686	0.402	0.364	0.641	0.293	0.138
ADV	<0.001	<0.001	1	0.482	0.406	0.675	0.306	0.131

Source: own elaboration (2023)

Table 3 presents the output of the correlation analysis, above the diagonal line are showed the tightness measures and below the diagonal line the significance measures presented by p value. None of the p values acquired a value higher than 0.05, so we can conduct that all the considered and tested relationships between factors are statistically significant. From the point of view of the closeness of the relationships, it is possible to observe them from low to strong ones and in all cases, with positive coefficients. In general, the highest rate of coefficients was recorded in relation to the ESS factor. This factor presented a strong relationship with the RES, ADV and SUS factors. Interestingly, the relationship with the EXP factor can only be perceived in the low to medium range.

Conclusion

After the analysis of our results, it can be concluded that eight factors showed as significant in driving the consumers to shop the groceries online in the area of Slovak republic. The aim of the paper was to assess the relationships between the individual drivers of online groceries consumer shopping behavior

where it can be stated that the strongest relationship was observed between E-shop services and Reputation of an e-shop; between E-shop services and Advertising of an e-shop; and between E-shop services and Sustainable approach of an e-shop. These results showed that for online grocery consumer it is still the most important the E-shop services. The confirmation of these relationships would deserve deeper understanding through further testing.

As every research, also this has its limitations like the size of research sample or geographically limited area of research. The future research orientation in the field of this problematic could be enlarged by examining how individual factors affects frequency of online grocery shopping or the spent number of expenditures on the online grocery shopping.

Will Volunteering Drive Social Entrepreneurship in Ukraine?

Nina Chala^{1,*}, Kateryna Pichyk¹, and Olga Voropai¹

¹ National University “Kyiv-Mohyla Academy”, Department of Marketing and Business Management, Voloska 8/5, 04070 Kyiv, Ukraine

Abstract

Research background: UN Volunteers identify the financial value of volunteer work to reach \$287.6 million in 2022. Ukrainian statistical data from the Labour Force Survey reveals that approximately 7.1% of the population aged 15 and over, equivalent to 2,260,800 individuals, were identified as volunteers in January-June 2021. Nonetheless, the literature lacks grounded research on volunteer and social entrepreneurship ecosystems and their cooperation.

Purpose of the article: This article explores volunteering as a prerequisite to social entrepreneurship in Ukraine. Namely, the research describes volunteering as part of a larger ecosystem that supports social innovation and entrepreneurship development.

Methods: We analyse a selection of articles to identify the structure and interaction between the Volunteering Ecosystem (VE) elements and the input it can provide for the Social Entrepreneurship Ecosystem (SEE). We use desk research to map the VE and secondary data analysis to identify the portrait and the dynamics of volunteering in Ukraine.

Findings & Value added: During the war, there are two main directions of volunteering in Ukraine: (1) rear support directly related to combat operations, and (2) organisations that resemble social entrepreneurship, operating with the support of international organisations and state cooperation. The article defines the ways in which the volunteering ecosystem can contribute to social entrepreneurship development: skills formation, networking, and collaboration, identifying social needs, testing ideas and models, inspiration, and motivation. The paper also offers recommendations to stimulate social entrepreneurship through volunteering.

Keywords: volunteering, social entrepreneurship, volunteering ecosystem

JEL classification: D64, O35, D71

1. Introduction

When a crisis occurs, governance or local authority do not always have time to respond. Also, there are a lot of tasks to solve with limited resources, so there are gaps where volunteers are very important. Volunteers play a crucial role in filling gaps and meeting needs that may not be adequately addressed by formal institutions or systems.

Volunteering refers to the act of offering one's time, skills, or resources for a cause, organisation, or community without expecting financial compensation. It is a selfless and altruistic activity undertaken to make a positive impact, address social issues, or contribute to the welfare of others and the overall betterment of society. They contribute their time, expertise, and enthusiasm to various causes, often bringing about positive change and making a difference in the lives of individuals or communities they serve. It offers a pathway for individuals to translate their passion for social change into entrepreneurial action, ultimately driving innovation and sustainable solutions to address pressing social and environmental issues.

Since 2011, volunteer activity in Ukraine has been defined at the legislative level (the law “On Volunteering”, 2011) as a voluntary, socially oriented, non-profit activity carried out by volunteers through the provision of volunteer assistance. At the same time, after the Russian full-scale aggression, the volunteer activity in Ukraine had acquired immense proportions. Regions in which active hostilities are not taking place work tirelessly, aiding in various directions: support for displaced persons; support of

* Corresponding author: n.chala@ukma.edu.ua

hospitals; support of the Ukraine Armed Forces and the National Guard; protection of animals; support for people who need help due to various circumstances (loss of job, for example); psychological support; legal support; cultural and social development.

Directing efforts to create benefits for society is related to the idea of social entrepreneurship, which is looking for innovative solutions to environmental, social, or cultural problems. Therefore, we plan to investigate what exactly can transform the volunteer movement into social entrepreneurship. Volunteering can catalyse social entrepreneurship by fostering inspiration, understanding, networks, skills, and practical experience.

Social entrepreneurship has gained significant attention as a tool to address social issues and foster economic development. On the other hand, volunteering involves individuals dedicating their time and skills to serve their communities without financial compensation. By examining existing literature on the subject, this review seeks to shed light on whether volunteering can drive social entrepreneurship in Ukraine. The transformation of volunteering into social entrepreneurship is a catalyst for sustainable post-war recovery for Ukraine. It can also serve as an example of such a transformation for other regions with ongoing armed conflicts.

1.1 Volunteering as a social phenomenon

Scientific interest in volunteering gradually grew. If in 1995, the Scopus database had only one scientific article, then in 2010, there were 43 such articles, and in 2021 there are already 152 scientific publications. Scientists have a more considerable interest in social entrepreneurship than volunteering. A keyword search in the Scopus database shows 106 articles in 2010 and 685 scientific papers in 2021. However, the relationship between volunteering and social entrepreneurship is not well understood. For example, the Scopus database search for “volunteering” and “social entrepreneurship” found limited publications from 2013 to 2022.

Scientists have been interested in the motives and motivations of volunteer activity for a long time, so many scientific works are devoted to this topic. Scientists believe that individual characteristics are decisive for volunteers. (Howarth, 1976). Later, scientists proposed an integrated approach to understanding volunteering: social theories that stress the importance of context, roles, and integration; individual characteristic theories that emphasise values, traits, and motivations; and resource theories that focus on skills and free time. (Einolf & Chambre, 2011). Researchers (Dury et al., 2015) were interested in individual characteristics that motivate people to volunteer. A two-year study (Hovard & Burnds, 2015) of volunteering in Kenya, Mozambique, Nepal, and the Philippines showed the importance of volunteering for achieving the Sustainable Development Goals (SDGs), as well as a call for a better understanding of indigenous informal volunteering and how ‘outsider’ volunteers can support it.

Volunteers are those who, during a short reference period (four weeks or one calendar month), perform any unpaid, non-compulsory activity to produce goods or provide services for others. Therefore, community engagement and social impact is critical for volunteer.

“Any activity” means work performed for at least one hour.

The term “unpaid” refers to the absence of remuneration in cash or in-kind for work done or hours worked. Volunteer workers may receive some small form of support or stipend in cash when below one-third of local market wages (e.g., for out-of-pocket expenses or to cover living expenses incurred for the activity) or in kind (e.g., meals, transportation, symbolic gifts).

“Non-compulsory” is interpreted as work carried out without civil, legal, or administrative requirements, different from the fulfilment of communal, cultural, or religious social responsibilities.

The production “for others” refers to work performed:

- Through or for organisations comprising market and non-market units (i.e., organisation-based volunteering), including through or for self-help, mutual aid, or community-based groups of which the volunteer is a member.
- For households other than the household of the volunteer worker or of related family members.
- Excluded from volunteer work:
- Community service and work by prisoners ordered by a court or similar authority, compulsory military, or alternative civilian service.
- Work for the benefit of others during working time.

In October 2013, the 19th International Conference of Labour Statisticians identified volunteering as one of the primary forms of work. It recommended that countries regularly measure the phenomenon to assess its contribution to household well-being and development of countries.

These are referred to as equal to own-use production work, employment work and volunteer work. It is also acknowledged that other forms of work exist, such as unpaid compulsory work for others, but the proposals in the draft resolution deal only with the three forms of work identified here.

No priority is assigned between the three forms of work. Rather, they are introduced to enable the production of separate sets of statistics on each, providing measurement flexibility to meet different policy needs better. Underlying this feature of the proposals is the recognition that persons may engage in various forms of work during a given reference period. Persons may hold one or several income-generating jobs and may also engage in the own-use production of goods and/or work as volunteers for an organisation or the community. At the same time, they may provide services for their own use by the household. The benefit of this is that the labour input into each form of work is measured exhaustively within the specified period. It is also possible to examine how persons allocate their time to different productive activities and how participation in one form of work may impact participation in others (see Fig. 1).

Figure 1. Participation in different forms of work

1.2 Volunteering ecosystem

There is no standard term to refer to the participants of the volunteering process in the literature and the expert community. Most papers and industry reports use the term “sector” to name the organisations dealing with voluntary work and having a social impact as their primary purpose. Other stakeholders are not considered in this case, and cross-collaboration opportunities are often overlooked.

In Europe, the term “voluntary infrastructure” includes supporting tools and organisations in sector analysis. The Centre for European Volunteering (Rusteki, Bal, & Czerwińska, 2012) uses the term “volunteering infrastructure” to refer to the system for supporting volunteering and its development, but its elements slightly differ across countries. In the UK, this infrastructure was defined for the Volunteering strategy, developed in 2004 and included “the physical facilities, structures, systems, relationships, people, knowledge and skills that exist to support and develop, coordinate, represent and promote frontline organisations thus enabling them to deliver their missions more effectively.” (Penberthy & Forster, 2004)

Polish experts, in turn, include volunteering organisations of all types into the infrastructure definition (Rusteki, Bal & Czerwińska, 2012): organisations active specifically in the field of volunteering, organisations involving volunteers but having other aims, public administration at all levels, business supporting volunteering, media specialised in civil society/volunteering issues, academic institutions active in the field of volunteering and social research, governmental agencies. In addition, Political, Legal, Educational and Economic framework; Research and analysis; Supporting tools & matching systems are also considered to constitute the voluntary infrastructure of the country.

Australian National Strategy for Volunteering (Volunteering Australia, 2023) defines the volunteering ecosystem as “a network of people, organisations, institutions, and agencies all working for the collective viability and recognition of volunteering”. Its elements include Volunteers, Volunteer Involving Organisations, Volunteering Support Services, national and local administration bodies, national and local volunteering associations, industry associations, Community Organisations/Groups, Philanthropy, Business community and Research community, supporting volunteering or having an interest in volunteering, Enabling Organisations.

1.3 Volunteering as a driver for social entrepreneurship

Social entrepreneurs are individuals who harness the principles of business and innovation to address pressing social issues. Their ventures aim to create sustainable solutions that benefit society as a whole.

Social entrepreneurship applies the principles and guidance start-up founders and entrepreneurs use to a business that directly generates social change or impacts a social cause. A social entrepreneur is primarily motivated by a desire to alleviate systemic social or cultural problems. Social entrepreneurship is well-researched and systematised. There is a fundamental bibliographic analysis of social entrepreneurship research (Trabskaia et al., 2023). The authors of this analysis said that social enterprises are embedded in their social and cultural communities, orientated to create both social and economic value. Social enterprises are built on an understanding of a community’s needs. Research on social entrepreneurship from an ecosystem perspective has increased in the past 13 years (Thomas, 2023).

Researchers from New Zealand and the UK (de Bruin et al., 2022) proposed the conceptual framework advances understanding of social entrepreneurship ecosystem by demonstrating the intrinsic inter reliability of social entrepreneurship ecosystem dimensions, envisaging the ecosystem itself as a complex context linking communities of interdependent actors engaged in both dyadic interactions and collective processes of social value creation (Fig. 2).

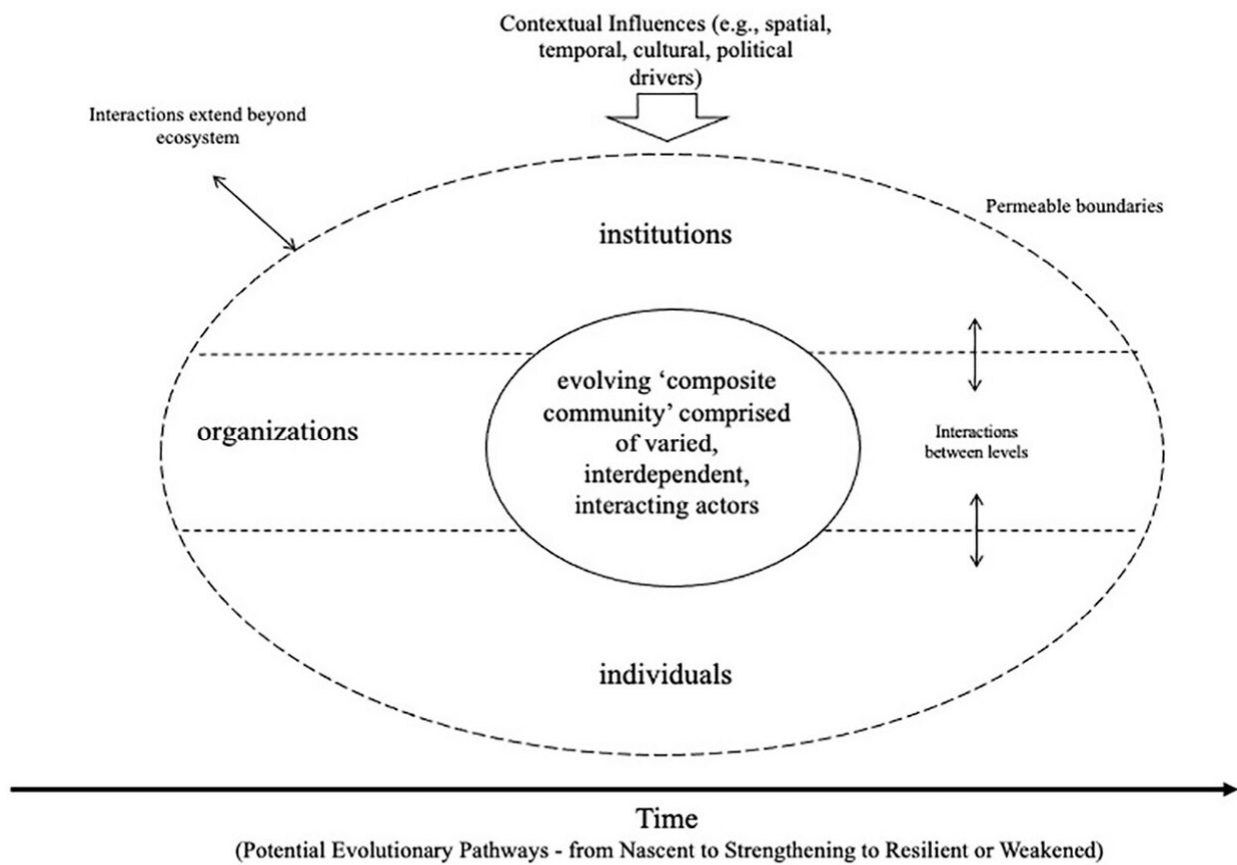

Figure 2. Social entrepreneurial ecosystem framework
Source: Bruin et al. (2023)

It is interesting to study the experience of university volunteer programs in Argentina (Raimondo et al., 2017), which encourage entrepreneurship culture by developing innovative socio-environmental projects that promote a joint effort between the different administrations of the state, the universities, and regional social organisations. The program includes a training phase for the university volunteers, an action plan addressed to the social agents and an evaluation of the results.

The choice experiment survey in Chicago, Illinois and Portland, Oregon (Ando et al., 2020) shows that people are willing to spend free of their own time (volunteering) to solve critical social problems, including environmental issues and water purification, which is shown in the study. Researchers believe that local authorities can effectively use volunteering during decentralisation. At the same time, they recommend further research to elicit a true marginal monetary value of time independent of any utility or disutility of volunteer activity.

Social entrepreneurs often operate within tight budgets and limited resources. Engaging with social entrepreneurs provides a unique learning opportunity for volunteers. These individuals possess a deep understanding of social issues and a relentless drive to address them. Volunteers gain valuable insights into the challenges faced by marginalised communities and the strategies employed to effect change by spending time with them. They witness first-hand the innovation, resourcefulness, and determination required to create sustainable solutions.

So, we can see that the motivation and activity of volunteers are similar to social entrepreneurs, but they differ in the way and methods of its implementation. (1) The activity of volunteers and social entrepreneurs is aimed at solving social problems. (2) Work in conditions of limited resources. Volunteers offer their time, skills, and resources without seeking financial gain. Social entrepreneurship combines business principles with a social mission. Social entrepreneurs are driven by a desire to address social and environmental problems through innovative solutions. They create sustainable ventures that aim to bring about systemic change while generating revenue to support their mission. (3) Institutional organisation of work. Volunteering typically involves working within an established organisation or program. Volunteers often join existing initiatives and assist with specific tasks or projects. Social entrepreneurs create their ventures or organisations. They take the initiative to identify a social problem, develop an innovative solution, and build a business model around it. (4) Financial sustainability. Volunteering is typically a non-monetary contribution. Volunteers offer their time, skills, and resources without expecting financial compensation. Their involvement is based on altruism and the desire to give back. In contrast, social entrepreneurship involves creating financially sustainable models. Social entrepreneurs develop revenue-generating strategies that support their social mission. They often use business principles to generate income through products, services, or partnerships. This financial sustainability allows social entrepreneurs to sustain and expand their impact over time. Therefore, we believe that transforming volunteers into social entrepreneurs is a driving force for solving social problems and should be stimulated.

2. Methods

This study explores volunteering as a prerequisite to social entrepreneurship in Ukraine. The research's exploratory nature and the subject's relative novelty define the case study as the most appropriate research method. The primary objective of our study was to analyse the structure and dynamics of the VE in Ukraine and determine the extent to which it can contribute to the development of the SEE. Ukraine was chosen as a case country intentionally for several reasons. Firstly, the current situation in Ukraine has boosted volunteering to a nationwide phenomenon. Secondly, due to the war and the deteriorating economic conditions, social issues will become a real challenge for policymakers and society. Thirdly, the accumulated volunteering experience and the thrive for quick solutions can make Ukraine a perfect market for testing social innovations. The volunteering phenomenon under study is complex in nature and involves multiple actors in a relatively complicated social context. Therefore, in-depth data from multiple sources is needed to draw relevant conclusions (Caridà et al., 2022). The literature analysis served as a foundational step in understanding the conceptual framework and key components of the VE. We analysed sector reports and research publications on volunteering published between 1995 and 2023.

We employed a desk research methodology to gain a comprehensive understanding of the VE within the context of Ukraine. This involved collecting and analysing existing reports, surveys, and data sources related to volunteering in Ukraine. We collected secondary data from 2019-2022 using Ukrainian State Statistics, UN Volunteers reports, online publications, and reports of voluntary organisations in Ukraine. Through this process, we aimed to map out the landscape of volunteering activities in the country, discern the prevailing trends and patterns, and identify any challenges or opportunities that exist within the VE.

By examining secondary data sources, such as national surveys and organisational reports, we were able to develop a detailed portrait of volunteering dynamics in Ukraine. By integrating desk research, literature analysis, and secondary data analysis, our study aimed to provide a comprehensive description of the VE in Ukraine and its potential contributions to the SEE. We described the elements of the VE based on the VE structure suggested by the National Strategy for Volunteering 2023-2033 (Volunteering Australia, 2023).

We paid specific attention to the ways in which the insights generated from this research endeavour can inform policymakers, social entrepreneurs, and volunteer organisations in developing strategies to

foster collaboration, leverage the strengths of the VE, and maximise the positive social impact achieved through the synergistic relationship between volunteering and social entrepreneurship..

3. Results

3.1 The elements of the volunteering ecosystem in Ukraine

Volunteers and Volunteer-Involving Organisations: The total number of volunteers in Ukraine account for almost 2,7mln people, volunteering both individually and through organisations. This number has increased gradually since 2021 (see Fig. 3). The register (National social service office of Ukraine) of the Ukrainian Ministry of Social Policy as of July 12th, 2023, contains 1505 entries of the organisations involving voluntary workers or doing voluntary work themselves.

Figure 3. Number of volunteers in Ukraine, thousands of people

Source: The State Statistics Service of Ukraine (2021)

Governments. The law “On Volunteering” (2011) and the Resolution of the Cabinet of Ministers of Ukraine on “Some issues of the National Social Service of Ukraine” (2020) define the legal framework for volunteering in Ukraine and the National Social Service of the Ministry of Social Policy in Ukraine as the body, responsible for volunteering-related policies within the Ukrainian Government. Voluntary organisations and individual volunteers in Ukraine are also actively supported by the representatives of local authorities and the ministries - the Ministry of Defence, and the Ministry of Social Policy. According to most of the civil society and voluntary experts in Ukraine, the issue which needs to be resolved is that volunteering is not well distinguished from charity.

National and local volunteering associations. Volunteers and their interests are advocated for and protected by four volunteering associations: e.g., NGO “Association of People’s Volunteers of Ukraine”, Ukrainian Voluntary Service, NGO “FOR the Association of Veterans, War Disabled and ATO Volunteers”, NGO “International Volunteer Association”, and NGO “Association of Volunteers of Ukraine”.

National Associations. The list of national associations involved in volunteering in Ukraine contains 44 international, national, and local level associations, mainly representing communities. There are only a few industry associations on the list, e.g., NG “Ukrainian Association of Artificial Intelligence” (“UASHI”) and NGO “Ukrainian Association of Certified Accountants and Auditors”.

Community Organisations/Groups. Civil society organisations and volunteers are increasingly uniting to tackle complex challenges that small, fragmented organisations alone cannot handle. In the Ukrainian civil society landscape, we witness the emergence of digital platforms, hubs, and other institutional mechanisms that provide support to volunteers. One prominent example is UAREforms, a platform that brings together active citizens, public organisations, businesses, and other stakeholders to discuss the implementation of necessary reforms in Ukraine.

Philanthropy. Ukrainian volunteers have three main sources to finance their operations. Most of the funding is collected from individual donors through crowdfunding platforms and social media. In addition, they raise business donations and grant funding from international organisations. Despite this diversification and the fact that Ukrainian volunteers got extensive access to funding during the war, the lack of financial resources is mentioned by experts as the most important problem volunteers face due to the unfavourable economic situation and the military risks Ukraine continues to experience.

Business community. The Ukrainian business community is helping volunteers in managing processes related to military volunteering (evacuation, logistics etc.), creating digital platforms for volunteer networking, providing catering services for those in need and volunteering to organise food delivery etc.

Research community. As volunteering in Ukraine is a relatively new and rapidly developing phenomenon, it becomes pertinent to explore the motivations behind volunteering and assess the sustainability of this trend. We can recall such research papers from the KSE Foundation, Ilko Kucheriv Foundation “Democratic Initiatives” (2016), GfK Ukraine, National Institute for Strategic Studies (Potapenko & Dvignun, 2022). Notably, the National Institute of Strategic Studies of Ukraine identifies it as a new social movement that took clear shape after 2014. Ukraine’s mass social volunteer movement operates as a network comprising sympathisers rather than formal members. It relies on diverse funding sources, creating a mosaic of financial support. Despite certain shortcomings, this movement reflects genuine democratic processes, aiming to ensure stability at the rear to achieve success on the frontlines.

Additionally, some volunteer organisations are evolving to take on social entrepreneurship functions. These organisations primarily rely on funds from international organisations, joint participation budgets, and membership fees to sustain their operations. This blending of volunteerism and entrepreneurship highlights the dynamic nature of the civil society landscape in Ukraine.

Enabling Organisations. Monobank made fundraising for volunteers easier through their “Banka” tool.

Currently, key elements such as community organisations and enabling organisations are undergoing significant development, leading to the maturation of the volunteer ecosystem in Ukraine. The presence of war has acted as a catalyst, accelerating this process. We can confidently assert that the volunteer ecosystem in Ukraine has evolved and expanded, with various actors coming together to address pressing challenges.

The results of the survey (Povrar et al., 2023) indicate the existence of a request to strengthen the volunteer ecosystem for more effective work of volunteers, in particular noting the need for (1) increased transparency and ease of cooperation with state and local authorities; (2) creation of educational programs of civil society and volunteer management; (3) consultations on tax legislation.

The awareness of Ukrainian volunteers with international volunteering practices is low, which indicates a weak integration of Ukrainian volunteering into the global volunteer ecosystem. In the same survey (Povrar et al. 2023), to the question of whether the respondents are aware of effective mechanisms for supporting volunteer initiatives in foreign countries, they provided only single answers about the USA, Moldova, Poland, and the Czech Republic. For its part, the international community recognises the need to expand support for volunteers in Ukraine. In particular, UN Volunteers mentions that it will “strengthen its support to volunteer-led and community-based initiatives” (UN, 2022).

3.2 The portrait of volunteering in Ukraine

In January-June 2021, the state statistics bodies, for the first time, conducted a module of the Labour Force Survey on the work of volunteers (the module). The module program was developed with the methodological support of the senior statistician of the Department of Statistics of the International Labour Organization, Volodymyr Ganta.

Based on the data in Figure 4, we can determine the portrait of a typical Ukrainian volunteer. They are educated people between the ages of 25 and 64 with permanent jobs. These are mostly city dwellers who are personally involved in volunteering. According to the results of the study “Resilience during the war and in the post-war period: what Ukrainians rely on” conducted by the sociological group “Rating” on June 6-11, 2023. A survey of 1,200 respondents over 18 throughout Ukraine showed that 6% of respondents are constantly engaged in volunteering and another 43% - from time to time. (Sociological Group Rating, 2023)

Among the main reasons why people volunteer:

- The main reasons people volunteer include:
- Invaluable experience that can be useful in everyday life.
- The opportunity to change something in your life and other people’s lives.
- Desire to do good.
- Teamwork, communication with like-minded people, new acquaintances, and constant contact with interesting people.
- Application of one’s talents, strengths, and abilities.
- To see the country by travelling with volunteer units.

The volunteer movement in Ukraine began to form in 2014. Still, with the beginning of the full-scale invasion of Russia, almost immediately, Ukrainians began to unite their volunteer initiatives to help each other and the state, first - through personal connections (friends, relatives, colleagues, neighbours, previous acquaintances). However, very soon, special platforms appeared where citizens could unite and coordinate their efforts, such as <https://platforma.volunteer.country/>, <https://palyanytsya.info/>, <https://spivdiia.org.ua/> and others. So, volunteering in Ukraine has become more systematic and effective.

High self-organisation contributed to the fact that volunteers and volunteer organisations, to a large extent, began to specialise and compensate for the incomplete institutional capacity of the state in various areas. Their focus includes the material and technical support of fighters at the front, the provision of medical assistance to the wounded and injured, psychological service to internally displaced persons in the rear, and the provision of shelter for pets that lost their owners during hostilities. Such specialisation enables volunteers to be more effective in a specific direction and to develop permanent connections to solve particular tasks — for example, some supply military equipment, additional products and clothing, etc.

Figure 4. Characteristics and number of volunteers in Ukraine, thousands of people
 Source: Own processing, based on The State Statistics Service of Ukraine (2023)

Thus, we can observe that the volunteer movement has turned from a chaotic solution of minor problems into a powerful social force. It is confirmed by the results of the study, which showed that 59% of respondents consider the volunteer movement to be one of the most effective public institutions in the country today. Of the 49% of respondents who are volunteers, 82% are ready to personally participate in solving community or city issues in the future. (Sociological Group Rating, 2023). These numbers show

that volunteers are willing to solve social problems within their communities actively and can form sufficient human capital to develop the social economy and social entrepreneurship.

3.3 Interconnection between the VE and the SEE: using volunteering capacity to drive social entrepreneurship

OECD (2018) suggests evaluating the efficiency of the existing SEE through 7 dimensions: social entrepreneurship culture, institutional framework, legal and regulatory framework, access to finance, access to markets, skills and business development support, and the way the system manages, measures and reports impact.

Volunteers can support the ecosystem in at least three of the mentioned above dimensions see Fig. 5):

Figure 5. Participation in different forms of work

Source: own processing based on The Better entrepreneurship policy tool (2023)

- *Social entrepreneurship culture:* an active civil society is a prerequisite for a healthy social entrepreneurship culture. Volunteers representing this part of the society engaging with them gives SEE an opportunity to demonstrate to volunteers the potential path for further development beyond voluntary activity and from the necessary human capacity reserves for the ecosystem. These reserves will already obtain the energy and thrive for solving social issues and the appropriate skills and knowledge about the challenges of their communities. This experience can be essential for aspiring social entrepreneurs in Ukraine who want to impact society through their ventures positively.

- *Access to markets:* volunteers in Ukraine are engaged in solving urgent issues and working at the forefront of emerging social challenges from a vast network of contacts from the public and private sectors who are the most in need of solving these challenges. Cooperating with VE will provide SEE with easier and more trustful access to potential markets. Moreover, social enterprises can get access to market testing of their innovative ideas and models on a smaller scale at lower technology readiness and market readiness levels (TRL and MRL). By engaging with communities and beneficiaries, volunteers can gather feedback and assess the viability and impact of social innovations.

- *Skills and business development support:* volunteers can provide insights for identifying customer needs and developing appropriate business models for social enterprises, as well as information about the target audience’s characteristics. Through volunteering, individuals can gain first-hand insights into their communities’ pressing social issues and needs. This direct exposure allows them to identify specific problems that can be addressed through innovative and entrepreneurial approaches. By understanding these needs, volunteers can develop ideas and solutions that can later be transformed into sustainable social enterprises. Having participated in solving the aroused issues, they better understood the puzzle’s missing particles, the community’s real needs, and the skills needed to approach the target audience successfully. In addition, volunteers are good at networking. By interacting with fellow volunteers, community leaders, and non-profit organisations, aspiring social entrepreneurs can build a strong network of like-minded individuals who share similar goals and values necessary for further business development.

To ensure that the capacity of volunteers and their experience is used for the good of social entrepreneurship, it is essential to build relations between these two ecosystems and arrange joint initiatives, learning programs, networking events, etc. In Ukraine, this process has already started and has several forms:

- Training for volunteers on social entrepreneurship, e.g., “Social entrepreneurship: opportunities for volunteers” by the Future Development Agency (Public space, 2022), educational programs of the Ukrainian Social Academy (Ukrainian Social Academy, 2020) “Help once. Or once and for all. Social entrepreneurship for public and charity organisations”.
- Involvement of volunteers as social enterprise workers. In 2017, out of 150 self-reported social enterprises in Ukraine, 44 had volunteers among their staff (The Catalogue of Social Enterprises of Ukraine, 2016-2017, 2017). But we should be careful with stimulating such processes. They need to be temporary, and volunteers should not replace all social enterprise workers. Otherwise, it will rather demotivate volunteers from future social entrepreneurial activities.

Volunteering allows individuals to make a positive difference in their communities. By contributing their time, skills, and energy, volunteers can address social issues, support vulnerable populations, and contribute to the betterment of society. Volunteering strengthens the social fabric of communities. Volunteering brings together individuals from diverse backgrounds, experiences, and perspectives. This diversity fuels innovation by providing a range of ideas, insights, and approaches to addressing social issues. When people with different perspectives collaborate, they can generate new and innovative solutions to complex social problems. Volunteering contributes to the development of social capital, which refers to the networks, relationships, and trust within a community. Volunteering can help tackle poverty, inequality, environmental degradation, and access to education and healthcare. It is very important during the war.

Now Ukraine has an extensive network of volunteers, which generates trust in society, helps to solve military, social, and health problems during the war and man-made disasters (for example, the explosion of the Kakhovskaya hydroelectric power station). Volunteers solve problems without profit, but social entrepreneurship has a business model to solve social issues. Therefore, the government must create a mechanism for transforming volunteers into social entrepreneurs. Governments can play a crucial role in stimulating the transformation of volunteering into social entrepreneurship. Here are some ways they can support and encourage this transition see Fig. 6.

Figure 6. Ways of state support the transformation of volunteering into social entrepreneurship.

Source: own processing (2023)

By implementing these measures, governments can create an enabling environment that encourages the transformation of volunteering into social entrepreneurship. Such an environment, in turn, can stimulate innovations, job creation, and positive social impact within communities. Currently, the

governments of many EU countries have legislated the work of social enterprises in the form of cooperatives, the main feature of which is a democratic form of management and the mandatory distribution of company shares between founders, volunteers, and beneficiaries. In other countries, the form of non-commercial association is predominant. (Kamenko, 2020) Studying and applying such an approach can be very interesting for entrepreneurs in Ukraine.

4. Discussion

The data collection methodology on volunteering in Ukraine differs from the international one, so we cannot compare them. To be able to carry out a comparative analysis, it is necessary to unify Ukrainian approaches with them. In addition, most scientific researchers focus on volunteering among young people, while the “portrait of a volunteer” in Ukraine indicates completely different trends.

Volunteers’ motivation in Ukraine is in line with the reasons volunteers acknowledge across the globe, with “making a difference” and “useful contribution” being the predominant reasons, followed by “learning new skills and gaining new knowledge” (Schech et al., 2020, Kehl et al., 2016). At the same time, when a closer look is taken at voluntary actions taken during crises, additional aspects define the motivation, e.g., individual emotions (Domaradzki et al., 2022) or political preferences (Fleischmann & Steinhilper, 2017). It should be considered when generalising policy approaches and tools to enhance the cooperation of volunteers and social entrepreneurs.

Regarding crisis phenomena, it can be stated that the activation of volunteering took place in different ways. So, for example, volunteer organisations aimed at solving environmental problems have specific characteristics. They act systematically, have a clear organisational structure and work plan. It is quite different - during large-scale disasters like earthquakes and hurricanes. Volunteer activity was short-term and aimed, first, at solving humanitarian problems. During the COVID-19 pandemic, all “offline” volunteer projects were suspended. Instead, many online initiatives appeared, to which everyone was invited. Humanity has not seen a full-scale war taking place in Ukraine for many years, so the experience of Ukrainian volunteer organisations is unique, as it covers a vast range of problems.

Other studies also determine the importance of interaction between volunteers and social entrepreneurs. OECD (2022) recognises civil society’s and all stakeholders’ potential in addressing social and economic challenges. Its latest recommendations include at least two principles, where we can identify volunteers as the input into the social economy and social innovation. Firstly, OECD emphasises that actions should be taken to enable civil society initiatives to be transformed into social economy organisations. Secondly, they outline the necessity for networking building and cross-sector partnership development.

Conclusion

The created foundation of the volunteer ecosystem gives reason to believe that volunteering will become a driving force for developing social entrepreneurship in Ukraine. Volunteers have the most active age, sufficient education, know how to self-organise, have knowledge and skills to solve various types of problems successfully, believe in the values of social responsibility and are ready to participate in solving social issues. But for this, it is important that such elements of the volunteer ecosystem as community organisation and enabling organisation are more clearly formed, as well as to introduce elements of institutional support for transforming volunteerism from pure philanthropy to entrepreneurship.

Also, it is crucial to activate such state support mechanisms as Develop Incubators and Accelerators, Foster Collaboration and Networking, Support Research and Evaluation, Incorporate Social Entrepreneurship in Education, and Raise Awareness and Recognition. These mechanisms can become a basis for volunteering in The Strategy of sustainable development of Ukraine.

The direction of further scientific research can be the study of the transformation of volunteering into social entrepreneurship and the sustainability of this process. Because there are still many upheavals in the world, such a mechanism will compensate for solving social problems where the state cannot react quickly and effectively.

Abstract

Research background: Financial technology (FinTech) has become increasingly popular, providing users with more applicable and efficient financial services. User motivation and technology acceptance are crucial factors that affect the adoption and usage of FinTech and service solutions. However, the impact of these factors on user behavioural intentions in this context remains to be seen.

Purpose of the article: The study aims to investigate the direct and indirect effects of user motivation on behavioural intentions and the mediating role of user motivation in the relationship between interface usability and behavioural intentions with a modified Technology Acceptance Model (mTAM).

Methods: This study employs a quantitative research design, using a self-administered questionnaire to collect data from LinkAja E-wallet users in Denpasar City, Indonesia. A structural equation modelling (SEM) approach is used to analyze the data and test the proposed research model.

Findings & Value added: The results indicate that user motivations have significant positive effects on behavioural intentions of technology acceptance. Furthermore, user motivation partially mediates the relationship between interface usability and behavioural intentions. Specifically, the study finds that higher levels of user motivation strengthen the relations between presentation, navigation, and behavioural intentions. The results imply that FinTech providers should focus on enhancing consumers' motivation and approval of the technology to promote user adoption and usage, which has practical implications for the development and marketing of FinTech and service solutions.

Keywords: FinTech, user motivation, technology acceptance, behavioral intentions, mediating role

JEL classification: O33, G2, D12, D91

5. Introduction

Have you ever considered how the growing popularity of FinTech is changing how we manage our finances and influencing the future of banking? This question immediately engages the reader and sets the stage for discussing the importance of user motivation and technology acceptance in adopting FinTech. The global FinTech market has expanded by more than 25% per year over the past ten years, upending financial systems and altering how people interact with money (Varma et al., 2022).

FinTech is the application of innovative technologies to improve and automate the delivery and use of financial services (Mention, 2019). Meanwhile, artificial intelligence, machine learning, big data analytics, blockchain, and mobile computing have all laid the groundwork for the development of FinTech solutions over the last decade (Iluba & Phiri, 2021). These advancements have transformed the financial services industry by making financial transactions and services faster, more efficient, and more user-friendly. The popularization of FinTech has significantly impacted the traditional financial services industry (Török,

* Corresponding author: mate.domician@eng.unideb.hu

2020). Meanwhile, FinTech startups that provide innovative and agile solutions pose a threat to traditional financial institutions. Likewise, FinTech has increased financial inclusion by giving earlier underserved populations access to financial services, allowing them to participate in the formal economy and potentially escape poverty (Lagna & Ravishankar, 2022).

There needs to be more research to understand how user attitudes, perceptions and the influence of financial technology acceptance on behavioural intentions interact. Understanding user motivations can be based on the conceptual framework of a modified Technology Acceptance Model (mTAM) (Ho & Bodoff, 2014; Müller et al., 2021). However, to bridge this gap, more empirical research is required to examine these variables' precise interactions and influences on behaviour while exploring the mediating role of user motivation and other pertinent fields. This study seeks to answer the following research questions: (RQ1) What is the relationship between user motivation and behavioural intentions in the FinTech context? (RQ2) How does technology acceptance affect user behavioural intentions in the FinTech industry?

The purpose of the study is to identify the factors affecting behavioural intentions toward FinTech services. An in-depth understanding of user motivations and perceptions regarding their engagement with FinTech (E-wallet) services will be obtained through quantitative methods. The goal of the study is to investigate the experiences of working as independent contractors in the "gig" economy, especially those under the age of 30. By focusing on the younger generation, the study is expected to capture their unique perspectives and FinTech-related behaviours. The benefits of FinTech services of LinkAja are examined, along with the influence of user motivations, e.g. the ease of use and perceived usefulness, on their convenience-seeking behaviours. Additionally, the study investigates the influence of interface usability of FinTech, including factors such as presentation and navigation to engage with FinTech services.

5.1 Theoretical Framework

The following theoretical framework is a foundation for understanding the relationships between user motivation, technology acceptability, and behavioural intents in the FinTech sector. The widely used TAM, which Davis first suggested in 1989 (Davis, 1989), examines how users embrace and accept new technology. It focuses on technology acceptance by perceived ease and usefulness as crucial determinants of behavioural intentions (Song et al., 2017). The TAM posits that users are more likely to adopt technology if they perceive it as helpful in enhancing their work or achieving their goals and if they find it easy to use (Marangunić & Granić, 2015). Perceived usefulness refers to the extent to which users believe utilizing a particular technology will enhance their job performance or make tasks more manageable. The system's functionality, features, and possible advantages are among its influences. Perceived ease of use refers to the degree to which users perceive technology as free from effort and user-friendly. This perception is affected by system complexity, user support, and learning easiness (Davis, 1993). The TAM contends that consumers' attitudes about adopting technology are directly impacted by their perceptions of its usefulness and ease of use. Positive attitudes raise the chance of intention to use, increasing the possibility that technology will be included (Olushola et al., 2017).

H1: User motivation positively affects behavioural intention, indicating that higher levels of perceived ease of use and usefulness and attitude to use are associated with increased intention to engage in a specific behaviour or use a particular financial technology.

Over time, researchers have expanded and altered the TAM to include additional external variables and contexts, such as the social influence and system design characteristics that affect technology acceptance (Bagozzi, 2007). It has been investigated how the perceived usability perspective and the technology adaption model relate to how users perceive usability and how they respond to technology. A subjective evaluation of a technology's usability is recognized as perceived usability (Lah et al., 2020). Measures of perceived usability and the elements of the modified TAM have been compared in research, focusing on perceived usefulness and usability. The successful integration and use of technology by users are referred to as technology adaption, and it is frequently influenced by elements including hardware and software compatibility, self-efficacy, and supportive environments (Alamsyah et al., 2022; Mokhtar et al., 2020). Perceived usability, which encompasses elements like ease of use, user interface design, and user experience, has been shown via research in various fields to significantly impact people's acceptance and adoption of technology (Kusumadewi et al., 2021). The intention of users to utilize FinTech services is strongly influenced by perceived usefulness and ease of use, with a considerable positive impact (Singh et al., 2020). In order to encourage E-wallet customers to adopt and customize their FinTech, businesses can concentrate on improving the perceived usability of their platforms, providing enhanced user experience, and effectively explaining the advantages and ease of use. The proposed conceptual framework is depicted in Figure 1.

H2: User motivation intervenes in the positive impact of interface usability on behavioural intention, indicating that the strength or direction of the relationship between FinTech adoption and behavioural intention varies depending on the level of user motivation.

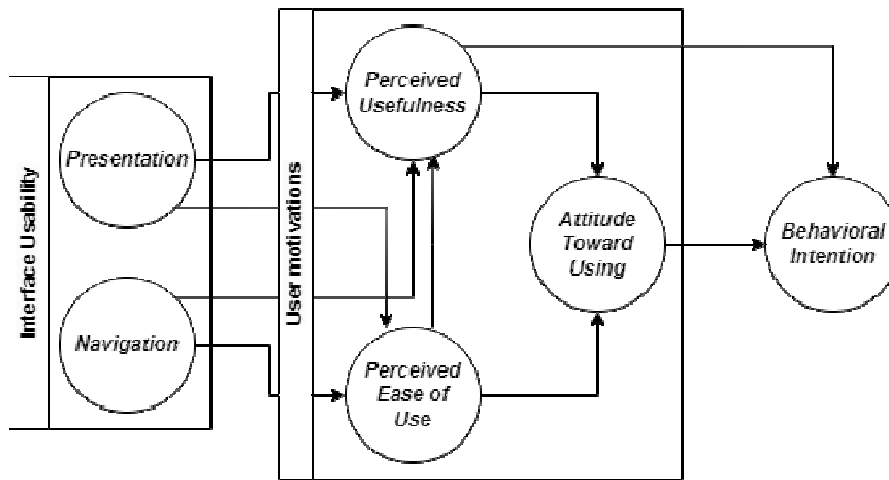

Figure 1. Proposed conceptual framework of mTAM

6. Materials and methods

This study employs a quantitative research approach to examine how user motivation and interface usability impact behavioural intentions in a FinTech environment. The LinkAja E-wallet customers in Denpasar, Indonesia, are surveyed using a self-administered survey to gather information. User motivation, technological acceptance, interface usability, and behavioural goals are all included in the questionnaire.

For this study, 120 individuals were chosen using a non-probability sampling technique called convenience sampling. Users of LinkAja E-wallets in Denpasar City were approached to participate by adhering to the required ethical principles of voluntary participation, anonymity and ensuring respondent confidentiality. The self-administered questionnaires are distributed to the participants as part of the data-gathering procedure. Depending on the participants' accessibility and choices, the surveys are provided personally or online. The participants receive explicit instructions on completing it and are guaranteed that their answers will be kept private and anonymous.

The questionnaire includes validated (Five-Point Likert) scales to measure the constructs of interest, where 5 indicates the most decisive agreements. Technology acceptance is assessed using a modified version of the TAM, including constructs such as perceived usefulness and ease of use, attitude toward using and interface usability measured through presentation and navigation items. Behavioural intentions are assessed using items that capture the participants' intention to adopt and continue using the LinkAja E-wallet. The descriptions and sources of items are shown in Table 1.

Table 1. Sources and abbreviations of a FinTech (E-wallet) interface usability and the users' motivation items and behavioural intention indicators

Factors/Items	Descriptions	Abbr.	Sources
<i>Interface Usability</i>			
Presentation (PRES)	I like the outline of the LinkAja page	PRES1	(Scholtz et al., 2016)
	I feel the information provided by LinkAja is complete	PRES2	
	I feel the information provided by LinkAja is clear	PRES3	
	I feel the information provided by LinkAja is accurate	PRES4	
	I feel the information provided by LinkAja can be easily understood	PRES5	
	I feel the arrangement of the menu displayed by LinkAja is well structured	PRES6	

Navigation (NAV)	I can easily access the information I need on LinkAja	NAV1	(Scholtz et al., 2016)
	I can find the LinkAja feature that I will use quickly and easily	NAV2	
	I feel the displayed icon on the LinkAja already explains the functions	NAV3	
User Motivations			
Perceived Usefulness (PUS)	I feel that the payment process is becoming easier when using LinkAja	PUS1	(Davis, 1989)
	By using LinkAja, I can process transactions through mobile applications faster.	PUS2	
	I feel that using LinkAja can speed up the payment process	PUS3	
Perceived Ease of Use (PE)	Learning to operate LinkAja was easy for me	PE1	(Davis, 1989)
	I find it easy to use LinkAja to do what I want	PE2	
	My interactions with the LinkAja system are straightforward for me to understand	PE3	
	It is easy for me to become skilled in using LinkAja	PE4	
	LinkAja system is flexible for transactions.	PE5	
Attitude toward Using (ATT)	I feel comfortable when interacting with the LinkAja E-wallet.	ATT1	(Suh & Han, 2002)
	I feel happy to download E-wallet LinkAja.	ATT2	
	I prefer using LinkAja E-wallet over other E-wallets.	ATT3	
Behaviour Intentions			
Behavioural Intention (INT)	I always intend to use LinkAja	INT1	(Suh & Han, 2002)
	I intend to continue using LinkAja in the future	INT2	
	I intend to use LinkAja as much as possible.	INT3	

Source: author's compilation

A Structural Equation Modeling (SEM) method examines the data. By incorporating user motivation as a mediator in the relationship between interface usability and behavioural intentions, SEM enables the analysis of both the direct and indirect effects of the variables in the proposed research model. This relationship is then tested using the appropriate statistical techniques. The SEM analysis sheds light on the potency and importance of the assumed connections between the examined factors. This research used a reflective modelling approach for the latent constructs.

7. Results

In a preliminary stage, six blocks—presentation, navigation, perceived usefulness, perceived ease of use, attitude toward using, and behavioural intention—were evaluated (Table 3). The Cronbach's Alpha Values for checking the internal consistency of indicators for each latent variable are high and acceptable (>0.7), especially Behavioral Intention (0.864). Following the descriptive statistics, factor loadings before and after exclusions are examined. INT2 and INT3 had the highest values per block, followed by PE2 and PE3, ATT1 and ATT2, PUS1 and PUS3, NAV1 and NAV2, and PRES5 and PRES6. These factors were only preserved if they were 0.7 or higher. As a result, PRES1, PRES3, PRES4, and PE5 were excluded from the Final Path Model. PE1 should also be removed from the model to get the best Saturated Model (Model Fit) result with an acceptable SRMS value (<0.08). After exclusion, almost all other loads in the final model improved. The best way to describe navigation (NAV2) is with "feature" items (0.889). Information that is simple to understand is mostly connected with the latent presentation variable (PRES5) (0.819). "Faster transaction procedure" is how perceived usefulness (PUS2) might be summed up (0.841). Perceived ease of use (PE4) is best explained by "easy to become skilled" (0.865). Attitude toward using (ATT2) is best described as "happy to download" (0.856). Moreover, the latent behavioural intention variable (INT3) is mainly correlated with "intend to use as much as possible" (0.913). Variance Inflation Factor (VIF) is used to assess multicollinearity in a multiple regression analysis. Each is less than threshold 3 (Johnston et al., 2018).

Table 2. Descriptive statistics, loadings, and collinearity statistics of the items.

Latent variables (Cronbach's alpha)	Manifest variables	Mean/median	Factor loading before exclusion*	Factor loading after exclusion*	VIF
Presentation (PRES) (0.748)	PRES1	3.892/4	0.649	0.809	1.395
	PRES2	3.750/4	0.775		
	PRES3	3.800/4	0.694		
	PRES4	3.675/4	0.622		
	PRES5	3.875/4	0.762		
	PRES6	3.867/4	0.756		
Navigation (NAV) (0.790)	NAV1	3.900/4	0.813	0.816	1.688
	NAV2	3.875/4	0.891	0.889	1.913
	NAV3	3.867/4	0.809	0.809	1.537
Perceived Usefulness (PUS) (0.751)	PUS1	4.000/4	0.842	0.777	1.526
	PUS2	4.008/4	0.825	0.841	1.808
	PUS3	4.092/4	0.779	0.827	1.418
Perceived Ease of Use (PE) (0.789)	PE1	3.992/4	0.789	0.826	1.617
	PE2	4.025/4	0.838		
	PE3	3.908/4	0.784		
	PE4	3.925/4	0.841		
	PE5	3.233/3	0.208		
Attitude toward Using (ATT) (0.766)	ATT1	3.842/4	0.794	0.794	1.401
	ATT2	3.700/4	0.855	0.856	1.917
	ATT3	3.308/3	0.827	0.825	1.678
Behavioral Intention (INT) (0.864)	INT1	3.617/4	0.848	0.848	1.922
	INT2	3.683/4	0.898	0.898	2.471
	INT3	3.650/4	0.913	0.913	2.558

Source: author's estimations

Table 3 displays the results of the Fornell-Lacker criterion's calculations for discriminant validity. The correlation of latent constructs is compared with the square root of the average variance extracted (AVE). AVE values met the requirements and were more significant than 0.5. In contrast to the variance of other latent constructs, its indicator should better explain the variance of a latent construct. The results indicate that all latent constructs (AVE) have more excellent value than correlations with other latent constructs. The highest correlation value among the latent variables is 0.887 for the behavioural intention variable (INT).

Table 3. Fornell-Larcker Criterion measures discriminant validity

Latent variable	ATT	INT	NAV	PE	PUS	PRES
ATT	0.825					
INT	0.663	0.887				
NAV	0.329	0.315	0.839			
PE	0.594	0.674	0.452	0.839		
PUS	0.528	0.489	0.412	0.602	0.815	
PRES	0.276	0.333	0.653	0.403	0.494	0.815

Source: Authors' estimations. The primary diagonal of the matrix's numbered columns is highlighted in bold.

The parameter estimations for the models are displayed in Figure 2. The parameters obtained using the mean and standard errors of the path coefficients were verified using a bootstrap simulation. The main benefit of PLS-PM, i.e., is the ability to differentiate between direct, indirect, and aggregate (total) impacts on behavioural intention (Table 4). After looking at the direct and indirect correlations, it was determined that the direct effect of ATT was significant (total=0.562; SE=0.077; t=7.257; p<0.001). PE's indirect effect on INT (0.408; SE=0.067; t=6.105; p<0.001) is positive and significant. PUS direct (0.192) and indirect (0.151) and total effect (0.343) on INT is significant (SE= 0.095; t=3.594; p<0.001) and positive. PRES's indirect effect on INT (0.180; SE=0.073; t=2.455; p=0.014) is positive and significant. However, NAV indirectly affects INT (0.133; SE=0.072; t=1.839; p=0.067), but insignificant. The strongest

correlation between the ATT and INTT was discovered (total=0.562; SE=0.077; t=7.257; p<0.001), and PE and PUS (total=0.481; SE=0.077; t=6.273; p<0.001).

8. Discussion

The study's findings significantly impact researchers, FinTech professionals, and politicians. First, the results imply that FinTech businesses should prioritize user motivation when creating and promoting their products (Meyer et al., 2022). It is accomplished by highlighting the technology's usage and simplicity and cultivating a favourable attitude toward utilizing it. FinTech businesses may raise the probability that

customers will adopt their technology and engage in the desired behaviour, ultimately resulting in higher usage and fruitful commercial outcomes.

Secondly, the study stresses the significance of considering user motivation as a potential mediator of the association between interface usability and behavioural intention. The strength or weakness of the impact of interface usability on behavioural intention may depend on the degree of user motivation. As a result, FinTech businesses should adjust their marketing strategies and design their user interfaces to cater for the various levels of customer incentives (Barbu et al., 2021).

Thirdly, the results have practical implications for policymakers interested in promoting the adoption of FinTech. By understanding the factors that influence users' behavioural intentions, policymakers can implement policies and initiatives that incentivize the development and adoption of FinTech that is user-friendly, useful, and positively perceived.

Finally, the study also adds empirical support for the significance of user motivation in the context of FinTech adoption, which further advances the academic literature. The study contributes to the body of research that aims to comprehend the elements that drive the adoption and usage of FinTech by evaluating the influence of user motivation and technology acceptance on behavioural intentions.

The study acknowledges certain limitations, such as convenience sampling, which may limit the generalizability of the findings. Additionally, the study focuses on a specific FinTech context (LinkAja E-wallet) and geographical area (Denpasar City, Indonesia), which may restrict the generalizability of the results to other FinTech platforms or regions.

Conclusion

In conclusion, this study provides evidence that user motivation and technology acceptance are crucial factors that affect the adoption and usage of FinTech solutions. The results show that higher perceived usability, usefulness, and attitude toward utilizing Fintech influence user motivation, enhancing the probability of engaging in particular behaviours or using an E-wallet Fintech solution. Moreover, user motivation partially mediates the relationship between technology acceptance and behavioural intentions. In order to encourage user acceptance and usage, the study emphasizes the significance of FinTech providers increasing customer motivation and acceptability of the technology. Overall, these findings exploring additional mediating factors that influence the relationship between user motivation, technology acceptance, and behavioral intentions can provide a more comprehensive understanding of the underlying mechanisms. Trust, perceived risk, and social influence could be examined to assess their role in shaping users' behavioral intentions in the FinTech context.

Abstract

Research background: This article delves into the importance of analyzing and comprehending web user behavior, especially with the vast amount of digital content being generated and circulated online. The article emphasizes the significance of web content analysis and identifying web users based on their online activities. Furthermore, it suggests that understanding a web user's socio-demographic characteristics interests various disciplines, particularly those studying social interactions on the web.

Purpose of the article: The purpose of this study is to examine web content analysis and its possible applications, to enhance our comprehension of the capabilities and constraints of this technology. It also aims to investigate the role of web content analysis in shaping our digital future.

Methods: This writing delves into the extensive research and publications on web content analysis and web data mining. The users have carefully examined various types of web analytics and their practical applications. Additionally, users have provided real-life examples of how web analytics techniques are employed in diverse industries such as e-commerce, marketing, and healthcare.

Findings & Value added: This article delves into the significance of web content analysis and how it benefits various industries like marketing, psychology, and law enforcement. However, the article also highlights the challenges faced when conducting web content analysis such as safeguarding the privacy and security of web user data and ensuring the accuracy and reliability of the analysis tools used. The authors stress the importance of taking a multidisciplinary approach when studying virtual identity and self-presentation in online communities. By providing an overview of the current state of web content analysis and its potential applications, this article aids researchers and practitioners in selecting the appropriate methods for a specific task.

Keywords: web mining, user, identification, online community, web content, user behavior, analytics

JEL classification: M3, O350

1. Introduction

The rapid development of social media has created an unprecedented amount of digital content that is generated and distributed online. With billions of people accessing and interacting with this content, there is a growing need to analyze and understand web user behavior. One of the most effective ways to gain insight into the characteristics of a web user's social and digital identity and their likely behavior and predict their actions is to analyze web content (Krippendorff, 2019; Herring, 2009). Web content analysis is the process of studying and extracting valuable information from the content of online communities, including websites (Tiurmenko, 2022), social media platforms, and other digital sources. By analyzing this content, researchers better web users' interests, preferences, and behavior understand the interests, preferences, and behavior of web users (Loyola, Roman, & Velasquez, 2012; Fedushko & Davidekova, 2019; Fedushko & Ustyianovych, 2022). In addition, web content analysis is used to identify web users (Yang, 2010) based on their online activity and content consumption habits. The combination of socio-demographic characteristics and digital behaviors and traces that are unique to a person in the context of their online presence and activities form a socio-digital identity.

* Corresponding author: solomiia.s.fedushko@lpnu.ua

Identifying web users based on their online behavior is crucial for multiple industries like marketing, psychology, and law enforcement. Web content analysis is used by marketers to create targeted advertising campaigns, psychologists to study the association between online behavior and mental health, and law enforcement to identify individuals who can be a threat to public safety. However, this approach faces challenges such as ensuring data privacy and security of users (Gautam & Bansal, 2023; Hu, et al., 2021; Hu, et al., 2020) and assessing the reliability and accuracy of web content analysis tools. This article gives an overview of the importance of web content analysis and the identification of users based on the analysis of their web content.

The purpose of the article is to review the current state of web content analysis, discuss the challenges associated with this approach, and explore the potential applications of this technology in various fields, which will contribute to a better understanding of the potential and limitations of web content analysis and its role in shaping our digital future.

A wide range of academic disciplines, including but not limited to sociology, political science, psychology, cultural studies, management, ethnology, forensics, rhetoric, and economics, are interested in the socio-demographic traits of the web personality (Cantuaria & Blanes-Vidal, 2019) who interacts with others online. In light of this, an interdisciplinary approach is necessary for a thorough investigation of virtual identity and self-presentation in online communities. To analyze the many identities, self-presentation strategies, and web-personality protection employed by network users in the virtual world, such an approach is required.

The field of web data mining (Sharma & Sharma, 2021) is experiencing fast-paced growth. The main focus of this field is to extract valuable information and knowledge from web sources. The volume and complexity of web data in recent years have dramatically increased, resulting in the urgent need for more efficient and effective mining methods. Web data mining, as defined by Fiet (2007), refers to the process of collecting, analyzing, and using information from web resources, such as machine learning, statistical analysis, natural language processing, and other technologies that extract knowledge from web data. Web data mining is beneficial for various purposes, such as information retrieval, trend prediction, user behavior analysis, sentiment analysis, and enhancing business strategies. (Dadhich & Thankachan, 2021; Rahman, et al., 2021; Fadhli, et al., 2022). This tool is used for various purposes, including researching social media content, e-commerce, marketing, and other fields. The discipline of web data mining is rapidly evolving, with novel techniques and applications emerging frequently.

Web analytics entails extracting useful data from internet sources. There exist various types of web mining, each concentrating on different web data features. Web content mining (Ibrahim & Obaid, 2021) is among the most crucial research areas in web analytics, involving extracting relevant insights from internet pages.

Extracting structured data from web pages is made possible by the use of web content mining techniques. In addition, this method is also useful in extracting unstructured data such as text and images, which is beneficial in fields like sentiment analysis and topic modeling. Another important area of research in web analytics is web structure analysis, which focuses on analyzing hyperlinks on the internet. This type of analysis is used in studying the relationships between web pages, identifying communities of web pages, and detecting inconsistencies in hyperlink structures found online. The analysis of web page usage is another important area of research in the field of web analysis (Norguet, Zimanyi, & Steinberger, 2009; Pujar & Mundada, 2021). This field focuses on analyzing Internet usage data, such as web server logs, to extract patterns and trends in the behavior of web users. This approach identifies popular web pages, user navigation patterns, and potential security threats. Multiple types of web analytics exist, each of which offers valuable insights into web data. Comprehending these analytics and their applications allows researchers and practitioners to make informed decisions regarding which methods to use for a specific task.

The field of social media data mining is expanding rapidly, as it focuses on uncovering valuable insights from popular platforms such as Twitter, Facebook, Reddit, and Instagram. By examining content created by users, techniques employed in social media data mining can pinpoint trending subjects and analyze how information is disseminated across these platforms.

Web data mining finds essential use in various fields, such as e-commerce, marketing, and healthcare. Web analytics techniques, for instance, are utilized to investigate the conduct of online customers, to create advertising campaigns targeting specific online crowds, and to identify possible health threats by analyzing online content.

Web content mining involves obtaining valuable information from web pages, including both structured and unstructured data. Structured data comprises names, addresses, and phone numbers, whereas unstructured data pertains to text, images, and videos. To serve various purposes such as sentiment analysis, topic modeling, and content recommendations, data extraction techniques of content intelligence are applied. The analysis of hyperlink structure on the Internet is the primary focus of web structure analysis. Patterns in the interlinking of web pages, communities of web pages, and anomalies in hyperlink structure are identified using this analysis. The techniques of web structure analysis are extensively utilized for web page ranking and search engine optimization.

User behavior patterns can be identified through the analysis of web server logs. Data mining helps in identifying popular pages, user navigation patterns, and security threats. Social media data mining is useful in extracting trending topics and information spread, among other things. Web opinion mining extracts the opinions and sentiments expressed in web content. These types of analyses are widely used in e-commerce, website design, social media marketing and analytics, market research, and product development.

Web content mining retrieves valuable information from online sources. The sheer volume and complexity of online data have significantly increased, calling for more effective mining techniques. One of the critical areas of research aims at extracting structured information, including names, addresses, and contact numbers, from web pages. This technique is commonly used in data integration and web search and has been the subject of extensive research.

The gaps still exist in current research, including the requirement for more efficient and accurate methods of data extraction. Research on web content mining also aims to extract unstructured data, like text and images, that are frequently used in sentiment analysis, topic modeling, and content recommendation. Despite significant progress, gaps still exist, including the need for more accurate and efficient analysis methods and addressing issues related to language and cultural differences.

Web content analysis techniques assist organizations and individuals in making informed decisions based on the information obtained from web data. Businesses analyze web content to identify customer preferences, novel trends, and patterns, which enables them to devise focused advertising campaigns and gain a competitive edge over others. Web content mining is a rapidly advancing field that is being enriched with innovative techniques and applications. The literature review reveals trends, research gaps, and benefits of web content mining techniques. Making use of these benefits and addressing research gaps can lead to significant advancements in the field. Web content mining involves deriving valuable knowledge and information from the vast amount of content that is accessible on the internet. As the volume of online data rapidly expands, web content mining has become a crucial tool for individuals and organizations seeking to comprehend the abundance of information available on the web.

Table 1. Web content mining methods

Method	Description	Example
Web Scraping	Extracting data from web pages by parsing the HTML structure and retrieving specific elements or patterns of content (Bradley & James, 2019; Chaulagain et al, 2017).	Scraping product information from an e-commerce website.
Text Extraction	Extracting relevant text content from web pages, excluding HTML tags and other non-textual elements.	Extracting the text of an article from news websites.
Sentiment Analysis	Analyzing text data to determine the sentiment expressed, such as positive, negative, or neutral.	Analyzing social media posts for customer sentiment towards a product.
Named Entity Recognition	Identifying and classifying named entities, such as names, organizations, locations, and dates, in text data.	Identifying individuals, locations, and institutions referred to within news articles.
Topic Modeling	Identifying hidden topics or themes within a document collection can assist in arranging and comprehending the material.	The grouping of news articles into categories such as politics, sports, and entertainment.
Image Recognition	Examining images on web pages to recognize and classify objects, scenes, or patterns featured within them.	Identification and labeling of objects in product images on an e-commerce platform.

Method	Description	Example
Link Analysis	Analyzing the relationships between web pages based on hyperlinks to determine popularity or relevance (Carullo & Binaghi, 2010).	Page ranks are calculated to determine the most influential web pages in a network.
Social Network Analysis	Analyzing relationships and interactions between individuals or entities within a social network (Lappas, 2011).	Analyzing social media connections and influence among users.
Web Usage Mining	The analysis of user behavior and interaction on a website helps understand patterns, preferences, and trends (Ehikioya & Zeng, 2021).	Tracking and analyzing user clicks and navigation paths on an e-commerce website.

Source: own processing (2023)

Web content mining encompasses a variety of techniques and approaches that facilitate the extraction, analysis, and interpretation of information from online resources such as web pages, documents, and images. With the help of these methods, individuals, businesses, and researchers gain valuable insights, identify patterns, and acquire knowledge from web-based content. Among the many methods used in web content mining, web scraping is a primary technique that involves parsing the HTML structure of web pages to extract precise data. This technique is useful for retrieving publicly available data such as product details from e-commerce sites, news articles from online publications, and other relevant information on the internet. When it comes to analyzing web content, text extraction is a vital technique that involves extracting relevant textual content from web pages while leaving out HTML tags and non-textual elements. This technique is crucial, especially when dealing with large volumes of textual data. It helps gather customer reviews from online forums and extract article text from news websites, thus making it a valuable tool in web content analysis. Sentiment analysis is another popular application of web content mining that involves analyzing text data to determine the sentiment expressed, such as positive, negative, or neutral.

This method is useful when it comes to understanding customer sentiment towards products or services by analyzing social media posts, online reviews, or comments on discussion forums. In addition to standard web mining techniques, web content mining involves utilizing strategies such as topic modeling, image recognition, link analysis, social network analysis, and web usage mining. These methods allow researchers and companies to uncover hidden themes within document collections, identify objects or scenes within images, examine the connections between web pages or social network entities, and gain insight into user behavior on websites. The extraction, analysis, and interpretation of information from the vast and diverse web-based content available today are made possible through the powerful tools and techniques of web content mining. Individuals and organizations make informed decisions, gain valuable insights, and leverage the wealth of knowledge present on the WWW by utilizing these methods.

2. Methods

The socio-demographic traits of a web user's socio-digital identity are mirrored in their online behavior, online activity, and digital footprint. The phrase acknowledges the reality that a person's online interactions and presence disclose significant facets of their social and personal identity that may not be obvious in interactions with others in the real world. The term "socio-digital identity" refers to a variety of socio-demographic traits that may be deduced from a person's online activities, including age, gender, place of residence, education, occupation, hobbies, preferences, and beliefs. Researchers may learn about how people engage with online communities and material as well as how socio-demographic factors affect this behavior by examining socio-digital identity.

The practice of web content mining is prevalent in multiple industries, including e-commerce, education, healthcare, and social media analysis. A significant advantage of web content mining is the ability for organizations to obtain valuable insights and knowledge from the vast amounts of data accessible on the internet. Through the analysis of web content, organizations can gain a better understanding of their customers' needs, preferences, and behaviors. For instance, e-commerce businesses use customer feedback analysis to recognize patterns and trends that can aid in enhancing their products and services. Similarly, educational institutions analyze student feedback to improve their teaching methods and curricula. Another reason for the popularity of web content mining is its ability to help

organizations make data-driven decisions. By analyzing web content, organizations identify patterns and trends that are used in the decision-making process. For example, financial institutions use web content analysis to detect potential fraud or to assess the creditworthiness of customers. Healthcare providers use web content mining to identify patterns in patient data that help them improve their treatment methods.

Web content mining is utilized for conducting sentiment analysis, which involves determining the sentiment or emotional tone conveyed in a given text. This is useful for analyzing customer reviews, social media posts, and news articles. By analyzing web content sentiment, organizations better understand how their customers or the general public feel about a particular product, service, or event. The benefits of web content mining are many and varied, making it an important area of research and development in data science.

It's crucial to compile a dictionary of the linguistic and communicative characteristics used in online communication to comprehend the socio-digital identities of web community members. In the virtual environment, this gets accomplished by examining phonetic and visual markers, word construction, and lexical and semantic elements in their speech (see Figure 1).

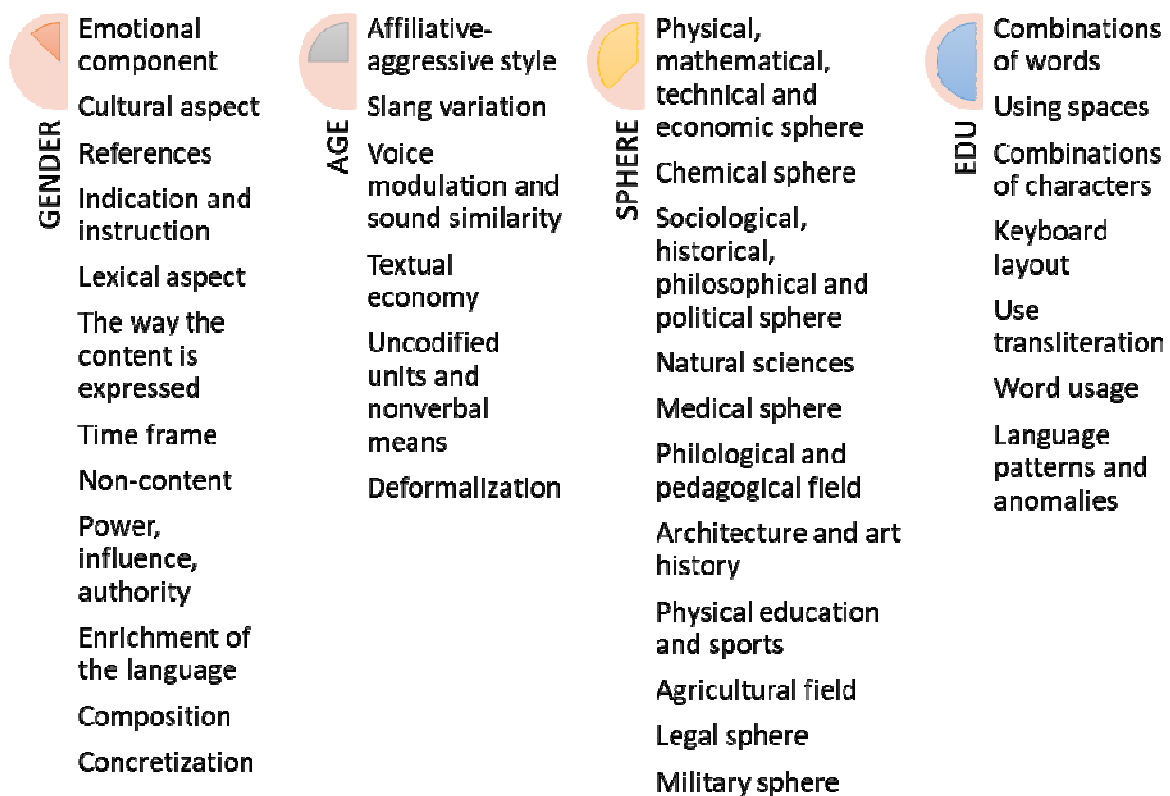

Figure 1. Classification scheme of linguistic and communicative indicators of web user characteristics
Source: own processing (2022)

The automated search for markers of socio-digital identity characteristics is carried out using the developed specialized software. The marker scissors determine the affiliation of a web forum participant to a certain value of socio-digital identity characteristics. Given the complexity and time-consuming nature of analyzing the information traces of web community members, this process requires automation, which greatly simplifies the work and increases the reliability of the results.

Based on typical grammatical, lexical-semantic, and lexical-syntactic indicators used in online communication, experts have created indicative characteristics for users of web communities. Age, gender, line of work, and educational background have all been used to collect linguistic information that may be used to categorize people according to their traits. The research, scientific ideas, and ideologies of eminent researchers in the domains of philology, sociology, linguistics, psychology, and computer science have been used to develop these qualities. In addition, specialist dictionaries covering terminology used in the workplace, youth slang, and computer and network jargon have been reviewed. In order to compile these elements, the material of Ukrainian-language web communities has also been examined.

Common errors in online communication are linguistic characteristics of a web community member that reveal their degree of knowledge. Scientists have created several algorithms for both English and Ukrainian to look for and rectify this collection of faults, but not as completely. Given this, it is not essential to create a new automated method for identifying and correlating problems in online material. An automated program that analyzes the text, filters words, picks out words with problems, and corrects them is the best way to handle this issue. Combining the linguistic and communicative aspects of online communication is the method's primary goal.

To do this, sets of linguistic and communicative indicators are formed by classifying the indicative traits into intuitive semantic groupings. The categorization of linguistic and communicative markers for each characteristic value is then used to illustrate the findings.

Through computer-linguistic analysis of the information content of web communities, experts employ these sets of linguistic and communicative indicators to develop a matrix of indicators. For each value of social and digital identity, this matrix was created.

At the conclusion, we are given a matrix of linguistic and communicative indicators for each value of specific socio-digital identification attributes.

$$LCI^{(SDI,VC)} = \begin{pmatrix} I_{1,1}^{(SDI,VC)} & \dots & I_{1,j}^{(SDI,VC)} & \dots & I_{1,N_{VI}(SdCh,VC)}^{(SDI,VC)} \\ \dots & \dots & \dots & \dots & \dots \\ I_{i,1}^{(SDI,VC)} & \dots & I_{i,j}^{(SDI,VC)} & \dots & I_{i,N_{VI}(SdCh,VC)}^{(SDI,VC)} \\ \dots & \dots & \dots & \dots & \dots \\ I_{N_{Ind}(SDI,VC),1}^{(SDI,VC)} & \dots & I_{N_{Ind}(SDI,VC),j}^{(SDI,VC)} & \dots & I_{N_{Ind}(SDI),N_{VI}(SDI,VC)}^{(SDI,VC)} \end{pmatrix} \quad (1)$$

where N_{Ind} is a function that determines the number of linguistic and communicative indicators of this value of the characteristic of socio-digital identity for each value of the characteristic; N_{VI} is a function that determines the number of values of this characteristic of socio-digital identity for each characteristic.

The matrix is made up of rows with vectors of indicators for language and communication that stand in for many facets of socio-digital identity.

$$I^{(SDI,VC)} = \left(I_{1,1}^{(SDI,VC)} \quad \dots \quad I_{N_{Ind}(SDI,VC),j}^{(SDI,VC)} \quad \dots \quad I_{N_{Ind}(SDI),N_{VI}(SDI,VC)}^{(SDI,VC)} \right) \quad (2)$$

The column of the matrix (3) is a vector of indicators of a certain value of the socio-digital identity characteristic of the studied web community:

$$LCI^{(SDI,VC)} = \begin{pmatrix} I_{1,1}^{(SDI,VC)} \\ I_{i,1}^{(SDI,VC)} \\ I_{N_{Ind}(SDI,VC),1}^{(SDI,VC)} \end{pmatrix} \quad (3)$$

Using this principle, we form a matrix for each web participant. To calculate the distance from the reference value of the socio-digital identity characteristic to each possible value of the socio-digital identity characteristic of the atomic k-th web community member, we use the formula for determining the Euclidean distance (4):

$$\rho_j^{(k)}(Value, User) = \sqrt{\sum_{i=1}^{N_{Ind}(SDI,k)} \left(I_{i,j}^{(SDI,VC)} - I_{i,j}^{(SDI,U)} \right)^2 * w_i^{(SDI)}}, \quad (4)$$

where $k \in 1 \dots N_{VI}(SDI,VC)$; $w_i^{(SDI)}$ is the weight coefficient of a specific linguistic and communicative indicator of a specific value of the socio-digital identity characteristic.

As a result, we choose the value of the socio-digital identity characteristic for which $\rho^* = \min(\rho_k)$ is true. Moreover, the matrix $LCI = (I_{ij})$ is universal for all values of a certain characteristic of the socio-digital identity of a particular web community for which the models are synthesized. Depending on the

topic and type of web community, a model is synthesized for each of the values of socio-digital identity using an automated information and analytical monitoring system (Golub & Avramenko, 2013).

The weights of the linguistic and communicative indicators (5) are presented in the vector:

$$W^{(VI,SDI)} = (w_1^{(VI,SDI)} \quad \dots \quad w_j^{(VI,SDI)} \quad \dots \quad w_{N_{Ind}(SDI,VC)}^{(VI,SDI)}) \quad (5)$$

The vector of weighting coefficients of the indicators of the characteristics of socio-digital identity. The value of the characteristics of socio-digital identity-*VI*, obtained as a result of the work of the automated information and analytical monitoring system.

The importance of linguistic and communicative indicators is determined by weighting coefficients. The results of the analysis differ depending on the specifics of the web community. The larger the coefficient, the more important the linguistic and communicative indicator is for verifying the relevant characteristic of social and digital identity in a particular web community.

Multilevel computer monitoring is an information system that is used to calculate the weighting factors for linguistic and communicative markers of socio-digital identity (Holub & Avramenko, 2013). To find markers that make up sets of linguistic and communicative indicators for a particular community and issue, the procedure starts by gathering and analyzing the information traces of online community members. The multilevel monitoring system's input data needs are then met by organizing these indicators into a matrix. The input data must consist of a matrix of numerical features that are sufficient for the synthesis of models in order for the system to produce a qualitative multidimensional model (Ibrahim & Obaid, 2021). The information trace of a member of an online community should also include the frequency characteristics of the markers of each linguistic and communicative indication. This data collection is often processed using mathematical and statistical techniques. However, this approach has limitations in terms of its capacity to develop a complete information system for confirming the personal information of web community members.

The software tool for verifying the socio-demographic characteristics of a web user helps to establish their social and digital identity. This tool uses linguistic and communicative indicators from online interactions to verify the user's socio-demographic values. By creating an information schema, developers use diagrammatic and structural modeling to build the tool. Advanced web technologies play a crucial role in developing this tool for forming the socio-digital identity of web community members.

3. Results and Discussion

Since it depends on a number of variables and is subject to change over time, it is impossible to pinpoint the gender distribution of an online user's social and digital identity. Furthermore, privacy issues and the voluntary nature of sharing such information make it difficult to get precise data on the gender distribution of internet users' identities. Facebook and Instagram pages are split into male and female sections according to gender.

We have analyzed the age and gender distributions of the Facebook and Instagram pages of the Department of SCIA at Lviv Polytechnic (Figure 2) and IntelliGo - Scientific Cluster (Figure 3).

Figure 2. Gender and age distributions of the Facebook page of the Department of SCIA at Lviv Polytechnic

Source: <https://www.facebook.com/SCIADepartment> (2023)

Figure 3. Gender and age distribution of Facebook and Instagram pages of IntelliGo - Scientific Cluster
Source: <https://www.facebook.com/ScieClusterIntelligo> (2023)

After analyzing the age and gender distributions of the Facebook and Instagram pages of the Department of SCIA at Lviv Polytechnic, the following results were obtained:

- 81.4% of the page's users are women, and 18.6% are men;
- the most active users of the page are participants aged 25 to 34.

In addition, there are noticeable discrepancies in the gender and age distribution of users of the Facebook and Instagram pages of the IntelliGo - Scientific Cluster, according to the profiles of those who use them. Facebook has a far smaller user base, and 83% of its users are women as opposed to 17% of men. And on the Instagram page, 45% of users are women and 55% of users are men. The age range of active users, in terms of age distribution, is 18 to 44.

Accurately identifying the social and digital identity of network participants is important for ensuring reasonable community moderation. This is accomplished using a formal model based on the characteristics of the participant. Two other components provide data to the module responsible for this function: one generates sets of linguistic and communicative indicators, and the other creates an information trail.

The verification component subsequently verifies the reliability of socio-demographic characteristics associated with web community members. A specialized dictionary of markers, which is continuously updated, is used to form sets of linguistic and communicative indicators. The main purpose of identifying social and digital identity is to detect false information in web community member accounts through computer-linguistic analysis of their information track.

Conclusion

Verifying the personal data of web users has become increasingly important in today's digital age due to privacy, security, and regulatory compliance issues. However, it can be a difficult task when users provide false or inaccurate information. To improve verification accuracy and efficiency, this article proposes a web data mining method based on content markers from a web community member's specialized dictionary. This method analyzes consolidated web data related to a user's data, including social media profiles and publicly available information. By using this method, false or inaccurate personal data can be identified. The benefits of this method are two-fold: it reduces the time and resources required for verification, making it more efficient and cost-effective for organizations and individuals, and it provides a more accurate and reliable way to verify personal data, improving privacy and security protection for web users.

Identifying web users' data is an important task that has significant implications for privacy, security, and compliance. The proposed method uses web content analysis techniques to improve the accuracy and efficiency of the verification process, providing a more reliable means of verifying personal data. The method is a valuable tool for organizations and individuals who need accurate and reliable verification of personal web data.

Limitations. Generating and analyzing digital content across various online platforms is challenging due to its sheer volume, diversity, dynamic user behavior, rapidly evolving trends, and constantly changing communication styles. Standardizing methodologies for content analysis is difficult due to the influx of new platforms and languages, which may lead to inconsistent or biased interpretations.

Outlining future research opportunities. An exciting avenue for exploring innovative techniques in data integration begins with this article. With digital ecosystems continuing to grow, future research will

explore the integration of various data sources, including social media, web browsing history, and mobile app interactions, to gain a more extensive understanding of user behavior. Using the power of big data analytics and advanced machine learning algorithms, researchers will uncover complex patterns and correlations within users' online activities. This will bring to light the intricate interplay between individual preferences, socio-demographic factors, and digital content consumption. By using emerging technologies, promoting interdisciplinary collaboration, and combining quantitative and qualitative methodologies, researchers access new dimensions of insight into web user behavior. This approach improves the accuracy of socio-demographic profiling and provides more profound insights into the underlying psychological and sociocultural dimensions that shape virtual identities and online self-presentation.

Acknowledgments

We would like to thank the Armed Forces of Ukraine for providing security to perform this work. This work has become possible only because of the resilience and courage of the Ukrainian Army and its people. This study is funded by the National Scholarship Program of the Slovak Republic and EU NextGenerationEU through the Recovery and Resilience Plan for Slovakia under project No.09I03-03-V01-000153.

³ Lviv Polytechnic National University, Institute of Economics and Management, Bandera 12, 79000 Lviv, Ukraine

Abstract

Research background: The article discusses the relationship between humans and pets and the availability of online resources for pet owners in Ukraine and other countries. It also covers laws related to animal welfare and liability for animal cruelty.

Purpose of the article: The aim is to analyze the current state of online resources for pet owners and propose the development of a new information resource to facilitate the search for potential mates for pets.

Methods: The article employs a literature review of scientific and educational sources and an analysis of laws and regulations related to animal welfare. It also examines existing online resources for pet owners, such as websites, blogs, forums, and mobile applications, and compares the trends in the use of such resources in Ukraine and other countries.

Findings & Value added: The article finds that online resources for pet owners are in demand, and their number is increasing every year. The analysis of available information resources reveals a need for a system that would allow pet owners to quickly find potential mates for their pets. The proposed information resource would provide a platform for pet owners to publish information about their pets and to search for a friend for their pet. The article contributes to the development of the field of pet care in Ukraine by proposing a new tool that would be useful for pet owners.

Keywords: mobile application, online resources, pet care, online platform, innovation, internet

JEL classification: M3, O350, O350

1. Introduction

With each passing year, the number of pets in Ukrainian families is growing. A large number of people want to acquire elite breeds of pets and therefore are looking for a suitable match for them. Abroad, it is popular to find a match for your pet using special apps that contain potential pet profiles. In Ukraine, there are no such services, so it was decided to develop an online resource that would help people quickly find a match for their pet. In the contemporary world, pets are viewed as companions (Bowlby, 1970; Mohammed et al, 2022) and have explored the attachment and relationship between animals and humans. Pets play a significant social role in people's lives. Accordingly, people spend a lot of time, effort, and money on communication and appropriate care of their pets (Wicaksono et al., 2019), and therefore, it is necessary to develop various supporting information resources that will simplify the lives of their owners and improve the quality of interaction between them.

Researchers are investigating the benefits of having a pet for physiological, emotional, and psychological health (Hodgson & Darling, 2011; Krause-Parello, 2012). Every year, more and more people around the world have pets. The popularization of pets is evidenced by the following statistics: dogs are the most popular, owned by (33%) of respondents, cats (23%), fish (12%), birds (6%), and other types of pets (6%) are rated much lower (Growth from Knowledge, 2016). Unlike the European experience, mobile apps for pets and their owners have recently become popular in Ukraine. The functions of proper nutrition, medical services, care, and saving significant time for the animal are automated using

* Corresponding author: yurii.o.sierov@lpnu.ua

mobile applications (Kumar et al., 2017; Luayon et al., 2019; Akbar&Purnama, 2023), such as AnimalID, 11Pets, Pet Care Diary, Dogo App, Petset, and Petsi. A comparative analysis of the advantages and functionality of mobile applications for animals and their owners is presented in Figure 1.

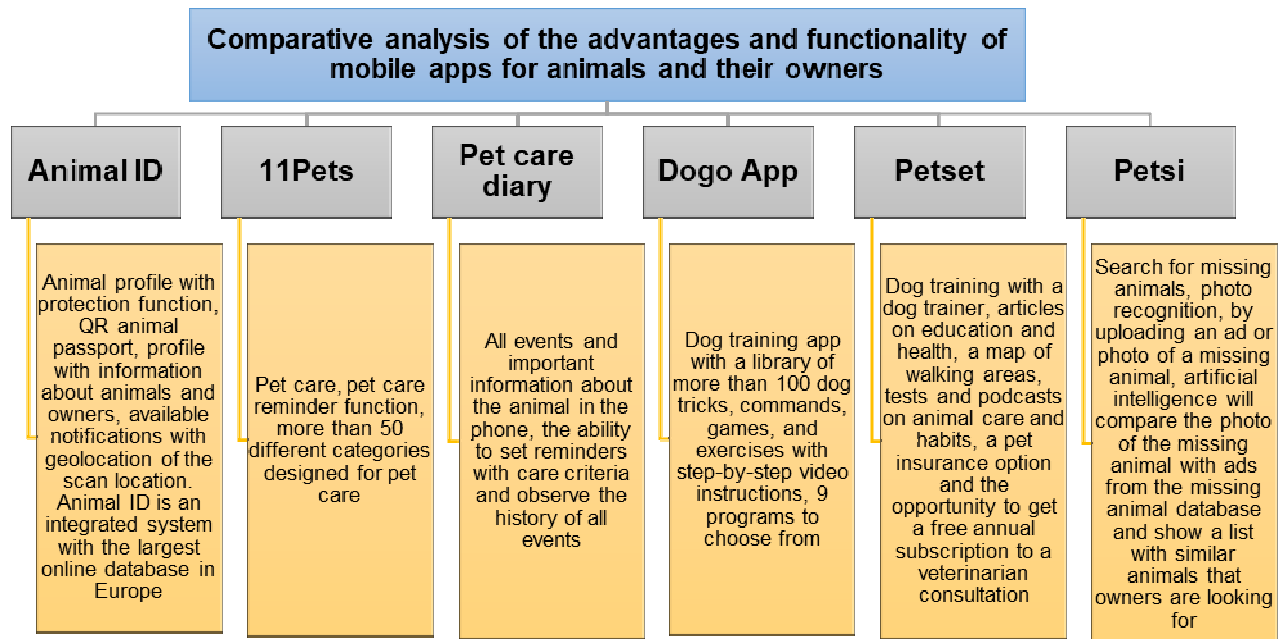

Figure 1. Comparative analysis of mobile applications for pet care
Source: own processing (2023)

To facilitate pet care, owners are presented with a large number of different applications that facilitate and help provide the necessary assistance to the animal in a timely manner. The analysis of applications for pet owners is presented in Table 1.

Table 1. Analyzing apps for pet owners

Apps mane	Number of active users	Evaluation of the app
Animal ID	100 000+	4*
11Pets	500 000+	4,6*
Pet care diary	500 000+	4*3
Dogo	400 000 000	4,8*
Petset	50 000+	3,8*
Petsi	10 000+	4*

Source: own processing (2023)

To protect your pet (dog or cat), you can use the Animal ID app. The apps will help you take care of your pets and keep track of important events related to them: 11Pets and Pet Care Diary. Dog training without a dog trainer is possible with the help of Dogo and Petset apps.

Raenu Kolandaisamy (Kolandaisamy, 2016) studied the issue of reducing the number of stray animals in Malaysia by introducing and creating a mobile application that is convenient and useful for use. The strengths and weaknesses of existing mobile applications for stray animals are described in Table 2.

Table 2. Analysis of the strengths and weaknesses of existing mobile applications for stray animals

Program title	Strengths	Weaknesses
Dogly	an attractive interface; the ability to share and explore, put and receive "likes" from other users; make a donation for the highest total love for the shelter each month	availability of functionality that cannot be shared on social media; some features (e.g., user account) are unstable; too many categories to throw users off their search, they can also upload photos
Doggy Rescue	able to search for animals by breed; ability to show a list of pets for adoption; allow sharing on social media sites	does not provide authorization; some functions (e.g., settings) are unstable; the complex interface, as there are too many elements in one interface; users are not allowed to upload pets for adoption
Dog Finder	able to search by breed is allowed; city selection is allowed; sharing in a social network is allowed	incapable functions that are unable to search, view information about animals, etc.; no permission is granted; confusing interface as there are no categories

Source: own processing (2023)

Each program is adapted for one main goal - to reduce the number of stray animals in the world. In Ukraine, the number of stray animals has decreased over the past 10 years, but their presence can still be found in markets, neighborhoods, and garbage dumps, and this needs to be addressed. Yarlykova (2018) describes Ukrainian organizations involved in animal protection in different cities of Ukraine. The organizations include various charitable foundations and projects, volunteer animal protection societies, and animal shelters. Unfortunately, pets are not protected by Ukrainian law, so cases of animals being thrown out on the street are common. The Internet is a popular source of information for human and animal health (Fernandez et al., 2019; Odeh&Hijazi, 2023; Varshney & Vetter, 2002), but the information it provides is not always completely truthful and verified. Pet owners use the Internet to get information about the health and care of their pets more often than they use information from their veterinarians. It can be said that pet owners most often look for information about the health and medical problems of 61.3% of their pets and the nutrition and diet of 58.5% of their pets. Despite the fact that pet owners often use the Internet to find relevant information about their pet, they also discuss it with their veterinarian, 40.5% compare the information with other websites, 27.3% consult friends and family, and 13% check with another source. Animals are treated responsibly abroad, just like people. 45% of American owners spend the same amount of money as themselves or more on medical care and grooming for their pets. In Ukraine, this trend is present, but unlike in the United States, the figures are quite low. According to statistics from Statista (Bedford, 2022), shown in Figure 2, the annual spending on the pet industry in the United States increased significantly from 2005 to 2021.

Figure 2. Pet industry expenditure in the United States from 1994 to 2022(in billion U.S. dollars)

Source: Statista (2022)

The increase in pet ownership in the United States has led to a rise in spending on the pet industry in recent years. Over the past decade, the amount of money Americans spend on pets has more than doubled, from \$50.96 billion to \$123.6 billion a year. In 2021, \$50.0 billion of the total amount per year was spent on food and medicine, \$29.8 billion on supplies, pet purchases, and over-the-counter medications, and another \$34.3 billion on veterinary care and sales of products, as well as \$9.5 billion on other services (APPA, 2022). Every year, American citizens spend more and more money on keeping animals, and the popularity of animals is growing there. Given this popularity, owners use web-based pet care applications (Wang et al, 2018; Rafida, Arfyanti, & Hidayat, 2022; Uddin, 2022) and therefore the development of such applications is relevant.

Using mobile applications and websites in pet care services and business perspective.

Pet care businesses can benefit greatly from mobile apps and websites, which provide a direct line of communication to their customers. These platforms offer features such as real-time appointment scheduling, virtual consultations, and personalized pet profiles, all of which help to build stronger relationships and improve customer loyalty. ICT solutions streamline operations through online booking and payment systems, inventory management, and automated appointment and medication reminders. This not only reduces administrative burdens but improves the overall customer experience.

Mobile apps and websites generate valuable data on user behavior, preferences, and trends. By leveraging this information, businesses make informed decisions, tailor their services, and create targeted marketing campaigns. Data analytics also enable businesses to monitor and optimize their performance over time. However, not all pet care businesses have the technical expertise required for app or website development and maintenance. Overcoming these barriers requires investing in skilled personnel or outsourcing to technology partners. Collecting and storing sensitive customer and pet data poses potential risks. Therefore, businesses must prioritize robust cybersecurity measures and comply with data protection regulations to safeguard user information. Encouraging pet owners to adopt new technologies is challenging. Clear communication about the benefits of using mobile apps and websites, along with user-friendly interfaces, is crucial to drive adoption.

Mobile apps and websites offer personalized recommendations, pet health insights, and reminders tailored to individual pets' needs, which enhances the value proposition for pet owners. Integrating e-commerce functionalities expand revenue streams beyond traditional services.

Emerging technologies, such as IoT-enabled devices and wearables, enable pet owners to monitor their pets' health remotely. Businesses capitalize on these trends by offering related services and support. By leveraging enhanced customer engagement, operational efficiency, data-driven insights, and a commitment to addressing challenges, pet care businesses establish a robust digital presence that augments their overall success. Technology plays a pivotal role in fostering growth and enriching the lives of pets and their owners in the digital age.

2. Methods

In Ukraine, there are a large number of information resources for pet owners and pet lovers, including, for example, categorized websites, phone apps, social media communities, blogs, and forums for pet owners.

P2Pforum is a conference for pet owners and pet industry professionals (held once a year). At the conference, specialists from various pet industries (veterinarians, pet behaviorists, caregivers, animal psychologists, and nutritionists) talk and advise owners on the proper maintenance and care of pets, on the behavior and nutrition of cats and dogs, and on their physical education. It is a place of like-minded people and many hours of communication between participants, guests, and speakers of the conference. Its goal is to increase and provide high-quality and relevant information to owners to improve the understanding between them and their pets. For those who love elite animals, there is an online club called Zooclub. This information resource contains a lot of different and useful information on various topics for dog and cat owners. It has sections: All for Dogs, All for Cats, Exotics, and Pet Services. Animal owners and lovers are provided with information on: breeds and sales of cats and dogs, exhibitions, and data on kennels and breeders. There is a forum for people to communicate and interact with each other, which has many different sections for communication, and it is also a great resource for getting the information that pet owners and lovers need. The variety and ranking of websites for pet owners in Ukraine, which are presented in the web service Similarweb (Similarweb, 2021), is shown in Table 3.

Table 3. Rating of websites about pets

Ranking	Website name	Category	Time of visit	Average page traffic	Bounce rate
1	 Masterzoo.ua	Pet store	00:03:33	4,39	57,37%
2	 Fishmarket.org.ua	Goods for fish	00:03:45	5,89	50,91%
3	 Trixie.kiev.ua	Goods for pets	00:09:22	14,23	23,85%
4	 Happypaw.ua	Homeless animals	00:01:34	3,47	69,34%
5	 Optimeal.eu	Pet food	00:01:14	1,75	72,71%
6	 Usnasuperbio.com.ua	Goods for farm animals	00:01:06	1,46	85,48%
7	 Royalcanin.com.ua	Food for dogs and cats	00:01:15	1,70	67,09%
8	 Basalt.net.ua	Veterinary medicines for animals	00:01:55	1,95	59,48%
9	 Club4paws.com	Care for dogs and cats	00:01:08	2,93	47,13%
10	 Zoocomplex.com.ua	Pet store	00:01:16	2,21	75,28%

Source: own processing (2023)

The highest average page traffic on the sites: Masterzoo.ua, Fishmarket.org.ua and Trixie.kiev.ua. The lowest traffic on the sites: Club4paws.com, Usnasuperbio.com.ua and Optimeal.eu.

According to the statistics of the Similarweb web service (Top Websites Ranking, 2022), Tablebws 4 presents a ranking list of websites for pets and other animals in the world.

Table 4. Ranking list of websites for animals in the world

Ranking	Website name	Category	Time of visit	Average page traffic	Bounce rate
1	 Chewy.com	Pet food and supplies	00:04:15	5,86	46,22%
2	 Petfinder.com	Pets	00:05:21	7,69	42,73%
3	 Petco.com	Pet food and supplies	00:03:06	3,86	49,14%
4	 Petsmart.com	Pets	00:03:31	3,76	48,89%
5	 Dopebox.to	Pet food and supplies	00:09:33	4,58	32,56%
6	 Racingpost.com	Pets / horse racing	00:11:59	10,67	31,26%
7	 Wamiz.com	Pets	00:01:05	1,64	55,18%
8	 Ironsourc.mobi	Food and other products	00:00:27	1,24	55,36%
9	 Akc.org	Pets	00:01:59	2,26	71,74%
10	 Kiddl.com	Pets / birds	00:01:38	1,64	71,91%

Source: own processing (2023)

Popular pet websites in 2022 are Chewy.com, Petfinder.com, and Dopebox. The average amount of time a user spends on a website is 4 to 9 minutes, and they see an average of 4.58 to 7.69 pages per visit, and 32.56% to 46.22% of visitors leave the website after viewing only one page. Racingpost.com has the longest visit duration of almost 12 minutes, with an average number of page views of 10.67. It has the lowest abandonment rate of the entire ranking, with 31.26% after viewing the first page. Every year abroad, the tendency to arrange a private life for a pet is increasing through online applications, unlike in Ukraine. The most popular online pet dating apps in Europe are Tindog and Fetchadate, and there was also Pinder, which is now on hold because Tinder closed it for being associated with it or any of its subsidiaries.

Tindog is similar in name and functionality to the human dating app Tinder, but it is designed for dogs only. FetchaDate is an information service that allows you to select a potential match for your pet based on certain criteria. Each of the selected apps is interesting and useful. Their functionality meets the requirements of users and is easy to use, which makes them popular among others.

3. Results

The completed questionnaire on the Pet-dating website is used to generate posts on the Pet Profiles page. The data from this questionnaire is sent to the Crowdsignal.com website, where in the Results menu, in the Overview item, you can see the number of completed surveys - 14, the completion rate - 88%, and the number of incomplete surveys - 2. A world map is shown showing the countries from which the completed questionnaire was sent. The right side of the page shows information about the most recently completed surveys. The page with the overview of completed questionnaires is shown in Figure 3.

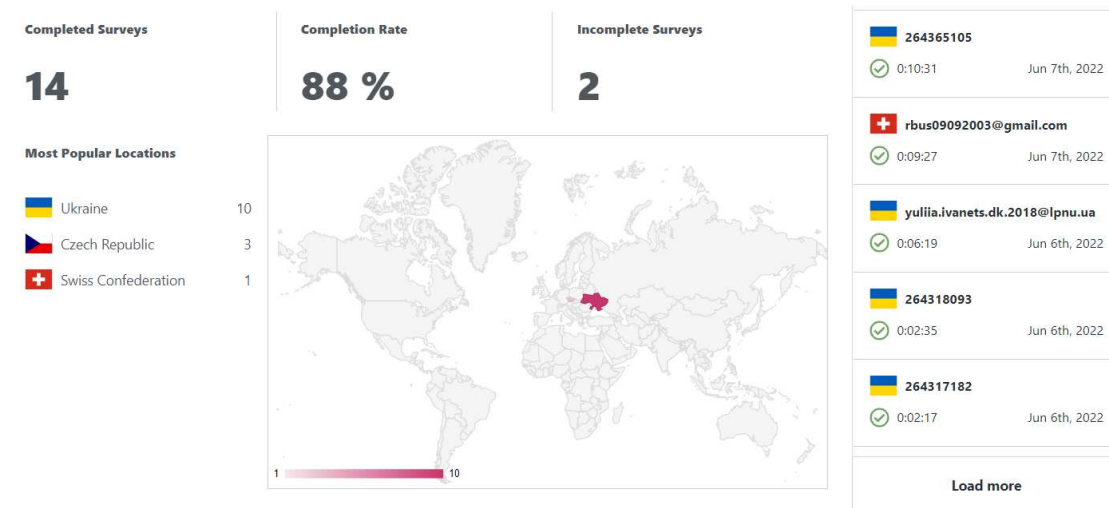

Figure 3. General overview of the survey results
Source: Crowdsignal.com (2023)

To see the data from the questionnaire, go to the Participants section and click View Answer next to the participant's name, where a summary of the answers will open. To ensure high-quality and fast website promotion (Pawade, 2021), you will need to analyze the target audience and choose methods of its popularization. All this will be decided later, not at this stage of work. Analyzing all the data from the questionnaire provided by the owner, you can create a post about this animal on the Animal Profiles page. The Blog page has been selected from the template, to edit it, you need to click on the image, after which the editor will open and you can enter your information. The display of the post template has been changed to Large Tile in the Style section. The created posts with pet profiles that are posted on the Pet-dating website are shown in Figure 4. Using the Nibbler tool to analyze and check the effectiveness of the Pet-dating website, the program generated a report for the site. It showed the overall score of the site in terms of Accessibility and Technology.

Nibbler SEO audit for pet-dating2.webnode.com.ua

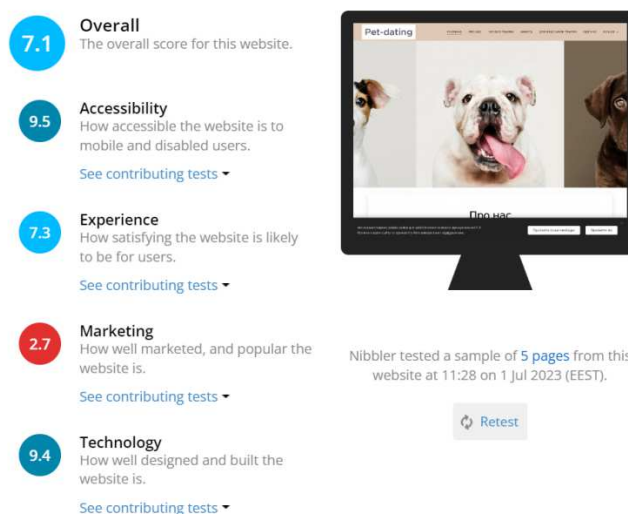

Figure 4. Website accessibility and overall rating according to Nibbler
Source: Nibbler (2023)

The Pet-dating website is perfectly optimized for mobile viewing, but its popularity is still low because it is a newly created website. To improve the site, you can connect to Google Analytics and register a Twitter account, and you need to improve the quality of incoming links to the site. The study presents the implementation of the task of creating a dating site for animals called Pet-dating (<https://pet-dating2.webnode.com.ua>). The results obtained from the questionnaire on the Crowdsignal.com website was analyzed and the effectiveness of the created website was analyzed in the Nibbler program.

To create an online Pet-dating resource, a good technological solution is to use website builders, which are online services that help you create a full-fledged website without knowledge of programming languages. Using ready-made templates, blocks, and elements, users can make their resources unique and develop their own designs by editing elements according to their own requirements. Advantages of using online website builders: speed of development of a software solution, functional simplicity, lower development cost, and availability of support service. Analysis of existing services for creating online resources without programming knowledge. SitePro is a free website builder with more than 200 templates on various topics. The functional part is simple and understandable even for beginners, and thanks to the site's adaptability, the online resource will work both in a browser and on mobile devices. The builder uses the drag-and-drop function. The advantage of SitePro is the use of your own domain name and the ability to transfer the site to your own hosting.

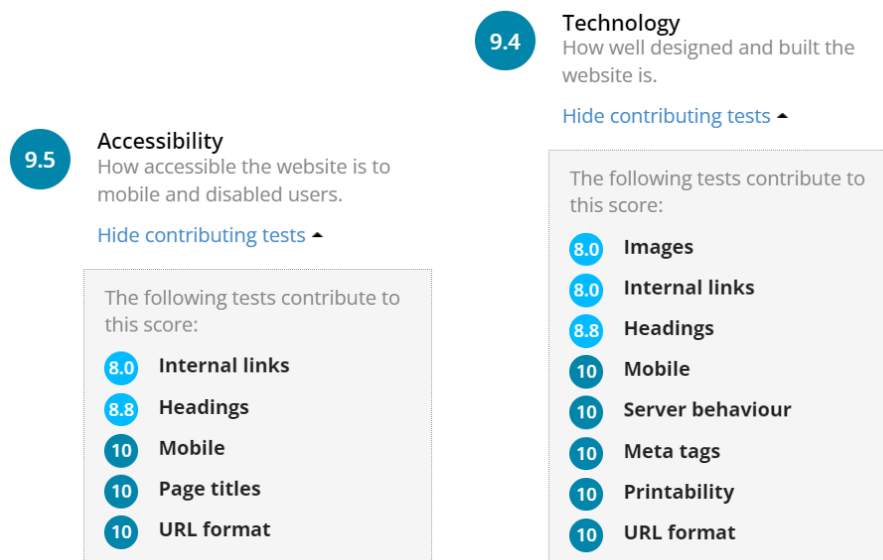

Figure 5. Accessibility and Technology analytics according to Nibbler
Source: Nibbler (2023)

Wix is a professional, popular, and multifunctional website builder that can be used by a person with no experience in web development and an experienced developer (using the Corvid developer mode). The platform has a wide range of tools, it is possible to connect your own databases and choose the way to create a website, using Wix ADI artificial intelligence or using design templates.

Weblium is a classic online platform for creating a website without knowledge of programming languages. The use of templates and artificial intelligence will help to automatically customize the appearance of the website and speed up its creation. The intuitive interface, wide functionality, and speed of creating an online resource are the advantages of Weblium.

Jimdo is another option of a simple and intuitive website builder for creating a free website. The platform has a large number of templates and they are interchangeable, which makes it possible to switch to other templates. Also, not the entire template can be edited, when you select it, you can see which parts can be changed and which cannot. The Jimdo builder is best suited for creating online stores. Its disadvantages are that it is inconvenient to edit small objects and the view of existing templates is poor.

Bloxy is a service for creating websites on the Internet quickly and easily. The website builder pre-designs website pages in sectional blocks that already contain a ready-made set of designs, and you only need to edit the graphic and textual material according to your own requirements. The Bloxy platform uses more than 800 available and accessible sections, which saves time in website development because each of the blocks performs its own task.

Nethouse is a popular website builder that is simple and easy to use and is well-suited for commercial websites. The wide functionality of the builder and a large selection of templates allow users to create any type of website, develop their own design and have their own domain. Webnode is a full-featured free website builder with drag-and-drop capabilities and an available HTML editor. The platform is popular, as evidenced by the fact that they have over 30 million users. The website builder can be used in 20 different languages. The advantages of using the Webnode service are more than 500 templates in the database, not loaded interface, integration with Google Analytics, a user-friendly editor, and integration into social networks.

Figure 6. Experience and Marketing analytics according to Nibbler
Source: Nibbler (2023)

Based on the analysis of various website builders, the Webnode platform was chosen to develop the Pet-dating online resource. To fill in the first column, we added text describing the purpose of this application. Next, we uploaded a photo of the application and configured it, setting a link to download it from Google Play and its name. Following similar steps, 5 such publications were created, on different topics, including mobile applications for pet owners.

4. Discussion

Online resources (Nicholas, Crook, & Sargan, 2011) are a powerful tool used to improve pet owner education and positively impact pet welfare. Information on the Internet can positively or negatively influence an owner's decision, so determining its reliability and veracity is crucial. When researching various information resources for pet owners, we can say that they are in demand among owners. The number of such online resources on the Internet is increasing every year (Molnár, Molnár, Kryvinska & Greguš, 2014; Laszig, 2000). Owners can choose from a wide variety of websites, blogs, mobile applications, and forums that provide them with the necessary information and assistance in caring for their pets. Trends in the use of such online resources in Ukraine and abroad differ; it is more popular abroad than in our country, but now such resources are gaining momentum among users in our country. The number of breeders in Ukraine is increasing, and therefore the number of people who want to buy a purebred animal is increasing, but it is difficult and expensive to keep such an animal. Constant communication with the veterinarian can significantly affect the owner's budget. If you are planning to get a purebred dog or cat, it is better to contact a specialist, namely a breeder, who will tell you which breed to choose, tell you how to properly care for the animal, and answer any questions.

Caring owners care about the life of their pets and their future offspring. Searching for a match for your pet on the Internet, among friends, etc. takes a lot of people's time, and these searches may not always be successful. The analysis of available information resources shows that there are many different resources for animal care that help the owner in this, but there are none that could facilitate the search for a future partner

for their pet. A system that will allow the owner to quickly find a potential match for their pet is needed. Animal profiles will be all in one place, with the owner's contact information for further communication, which will be a great solution to the information problem for the pet owner. Users will not only be able to search for a friend for their pet but also provide information for publication about their pet. Such an information resource is needed and useful in Ukraine, and it will be popular among pet owners. Users choose online resources to use based on the principles of reliability, efficiency, security, and integrity. To create such a resource, it is better to develop a website because there are significant advantages, such as complete freedom of action on the site, independence, creation of your own comfortable interface, development of an individual design, and the ability to implement your own rules, rather than agreeing to the rules of a social network. After researching a variety of online information resources for pet owners, it was determined that a website should be developed. As there are no similar analogs in Ukraine, the popularity of animals in Ukrainian families is increasing every year, so people are looking for help and answers to their questions on the Internet. Abroad, most people use mobile applications for animal care.

Conclusion

The result of the work is an analysis of existing mobile applications for pet owners and the development of an online resource that would facilitate the search for a potential match for a pet owner. The developed analytical review showed the general state of the subject area related to animals and information. The online resource Pet-dating is an interesting and original solution for pet owners that will promote their pet on the Internet, communicate with other owners and establish their pet's personal life. This resource will simplify and save search time for the owner, as all pet profiles are in one place. The Pet-dating website contains useful, reliable, and relevant information for pet owners. The Animal Profiles page contains potential publications with data about the animal that came from the questionnaire filled out by the owners. Users will be able to send their suggestions and wishes for improving the site's functioning.

Limitations. The study's focus on online platforms inadvertently excludes segments of the population with limited internet access or technological literacy, that overlook a significant portion of pet owners who rely on alternative means of seeking information and companionship for their pets. The rapidly evolving nature of technology and online trends render the study's results to temporal obsolescence, potentially requiring frequent updates to maintain relevance.

Possibilities for further research in the future. Future research endeavors address understanding the development dynamics between pet owners and online resources. Investigating the potential barriers and opportunities for inclusive access to online resources would contribute to more equitable dissemination of pet care information. Assessing user satisfaction, successful pet pairings, and any unintended consequences would provide a holistic assessment of the resource's effectiveness and implications for the broader pet care landscape.

Acknowledgments

We would like to thank the Armed Forces of Ukraine for providing security to perform this work. This work has become possible only because of the resilience and courage of the Ukrainian Army and its people. This study is funded by the National Scholarship Program of the Slovak Republic and EU NextGenerationEU through the Recovery and Resilience Plan for Slovakia under project No. 09I03-03-V01-000121.

Digital Technologies as a University Competitiveness Factor in the 21st Century

Olena Rayevnyeva^{1,*}, *Silvia Matúšová*¹, *Iveta Dudová*¹, and *Vojtech Kollár*¹

¹ Bratislava University of Economic and Management, Department of Economics and Finance, Furdekova 16, 851 04 Bratislava, Slovakia

Abstract

Research background: A specific feature of the 21st century is the digitalization of all processes of civilization development. The higher education system is at the centre of these processes, as it plays a key role in the formation of future generations, and the formation of specialists with competencies for the current and future needs of the labour market.

Purpose of the article: The article is devoted to the assessment and analysis of the level of development of digital processes in Slovakia and Ukraine as an external environment for the activities of the university, as well as the development of a model for the transformation of a traditional higher education institution into a digital university.

Methods: Research methods are systematic and conceptual approaches, methods of monographic and comparative analysis, methods of analysis and synthesis, statistical methods, and visualization tools.

Findings & Value added: It is substantiated, that the processes associated with COVID-19 and the total instability of the world development have become a trigger for significant changes in the practice of doing business and social institutions, in particular universities.

The study focused on the evolution of the development of the global higher education system from the aspect of the transformation of a traditional university into a digital one. A conceptual model for the implementation of digital technologies in the areas of the university's activities has been developed, which creates competitive advantages for it. Data from the World Bank and the UNESCO Institute for Statistics (UIS) were applied.

Keywords: global educational system, innovation-active university, digital technology, conceptual model, index

1. Introduction

The modern world is a world of global transformations that take place in all spheres of the life of civilization. These transformations are of global nature, radically changing the methods, approaches, and tools for the functioning and management of all socio-economic systems, bringing to life the effect of fragmentation of the world. As experts of the World Economic Forum in Davos (2023) note, today the world is at the point of a systemic crisis caused by significant technological and technical innovations that provoke immediate and significant changes (WEF Annual Meeting, 2023). The emergence and spread of the digital society phenomenon have created certain challenges that require bold and collective action to adapt modern business and society to the new conditions for the development of civilization.

The global processes of the Covid-19 pandemic and the increase in the level of global political instability, for example, the Russian-Ukrainian military conflict, have become a trigger for the rapid diffusion of digital technological innovations into all areas of socio-economic development. Today, technology has become an important means that connects people with each other and enables effective business interaction by offering hybrid forms of cooperation.

As it was emphasized in the World development report 2016 "Digital Dividends", digital technologies are rapidly spreading in most countries of the world. However, they provoke different consequences (World development report, 2016). In some countries, they stimulate economic growth,

* Corresponding author: olena.raev@gmail.com

expand opportunities, and improve the provision of a variety of services (including educational ones), in others, they deepen the unevenness of society and increase the polarization of the labour market and the digital divide, especially in the field of Internet access. We talk about the digital maturity of society and the readiness of the government to create an effective legislative environment and technical capabilities to stimulate and implement digital technologies in all areas of society by adapting the workers' skills to new requirements.

Under these conditions, the global system of higher education plays a key role as it creates specialists with new competencies for the new requirements of the labour market. Higher education systems form the foundations of digital literacy of future specialists; they develop young people's skills when working with digital technologies and science, engineering, and mathematics, and form the ability to apply critical thinking when working with data. This has been confirmed by the labour market requirements. According to the forecasts of the US Department of Labor, the most of the 20 fastest-growing professions in the decade 2016-2026 will require digital knowledge and skills from their workers. The European Centre for the Development of Vocational Training (Cedefop) has determined that in the EU in the next decade (2020-2030) an 11% increase in the employment of workers in professions related to information and communication technologies is to be expected (World Economic Forum, 2023). All this forms a research problem, namely, the search, creation, and implementation of new conceptual frameworks, paradigms, tools, mechanisms, and models for the transformation of a traditional university into a digital, innovatively active university.

To achieve the above goals, a systemic transformation of all types of university activities is required based on the widespread introduction of digital technologies and new ways of interaction between participants in the educational process. Higher education institutions should have an elevated level of sensitivity to digital innovations and should work ahead of labour market demands, considering the lag structure of the educational process. It depends on the level of their readiness for such changes, that is, the possibility of developing new curricula or increasing the relevance of current curricula, introducing pedagogical innovations and new forms of conducting the educational process, including the readiness of teachers to update their personal digital skills and knowledge. Besides, the level of development of the digitalization of society as an external environment for the activities of universities, which creates opportunities for the effective diffusion of digital technologies into all processes of universities, has a significant impact.

The article is devoted to the assessment and analysis of the level of development of digital processes in Slovakia and Ukraine as an external environment for the activities of the university, as well as the development of a model for the transformation of a traditional higher education institution into a digital university.

1.1 Literature review

The analysis of digital trends in the world development and modernization of higher education system is the subject of research and development by both individual researchers and world organizations.

The study (Trier et al., 2023) is dedicated to the analysis of the spread of digital technologies and processes in society. The authors note the deep penetration of digital tools into all spheres of human activity. Researchers (Senyo et al., 2019) are studying the emergence of digital business ecosystems which are a socio-technical network between organizations and technologies and together they create new value for society.

To study new trends in the development of higher education system, Horizon group experts analysed changes in five main areas - social, technological, economic, higher education, and political (EDUCAUSE, 2020). Social trends include Well-being and mental health, Demographic Changes, and Equity and Fair Practices. Technological trends include Artificial Intelligence, Next-Generation Digital Learning Environment, Analytics, and Privacy Questions. Universities that seek to strengthen their competitive advantages in the national and international education markets quickly respond to technological innovations and, therefore, their transformation corresponds to the trends of civilization transformations. Economic trends reflect the modern mission of universities as innovative and active organizations that have a significant impact on the development of the economy, the environment, and the future development of civilization. Within higher education trends, the experts single out "Changes in the student body", "Alternative paths to education", and "Online education". The trends identified in the EDUCAUSE Horizon Report define the specific features of a future model of higher education and highlight the need for new techniques, practices, and teaching and learning tools.

The authors (Bettinson et al., 2023) explore the relationship between the quality of higher education and its value to potential employers and business school graduates. Based on the establishment of an idiosyncratic connection between the definitions, it is determined that quality is the internal side of the activity of the university, and the value of higher education is created in the client area. The values of higher education for individuals, the economy, and society are highlighted in a study (Varblane, 2022). Against the backdrop of significant social transformations, the landscape of higher education is changing significantly and is determined by four main trends - digitalization, internationalization of education, individualization and flexibility of the form, place, and time of education, as well as the increasing role of universities in solving the problems of society development.

The authors (Ferede et al., 2023) investigate the impact of information and communication technologies on the quality of education in developing countries, in particular, in Ethiopia. The results show that the impact is positive but not strong enough to fundamentally change the existing approaches and methods of education in the country.

An important moment in the transformation of a traditional university into a digital one is its readiness for the widespread introduction of digital technologies in all areas of its activity.

The article (Cai et al., 2023) is devoted to the study of the features of a sustainable entrepreneurial university in new innovative ecosystems, highlighting its main roles and advantages over traditional universities. Organizational and administrative changes in the entrepreneurial university are studied by the authors (Tuunainen et al., 2023). The authors analyse the political and economic conditions of society and identify effective managerial methods of communication at universities.

As a result of studying the causes and trends of inequality between countries and within countries, the article (Hill et al., 2018) emphasizes that higher education in the conditions of expansion of digitalization in the educational process (via online / distance education) acts in a new function - as a means of the economic well-being of the population of countries. This thesis is substantiated by the specifics of the current stage of development of the world system of higher education - the digitization and the mass character of higher education.

The authors (Joosten et al., 2020) identified seven major and three secondary trends in digital education innovation. The main trends include Adaptive Learning, Open Education, Gamification and Massive Open, Resources Game-based, Learning Online Courses, Learning Management Systems (LMS), and Interoperability, Mobility, and Design Mobile Devices. Blended learning, dashboards, virtual reality, and artificial intelligence were noted as secondary trends. The trends are based on various digital innovations in the educational process.

The study (Matt et al., 2015) emphasizes that regardless of the type of activity, the organization is characterized by 4 specific elements - the use of technologies, changes in value creation, structural changes, and financial aspects. The financial aspect acts as both a driving force and a limitation of these transformations. In the context of a significant reduction in budget funding, universities are faced with the need to transform into entrepreneurial organizations that must seek their own sources of funding for their functioning. The article (Zhou et al., 2023) is devoted to the main aspects of the adaptation of digital technologies in higher education in the context of the Covid-19 pandemic. It has been proven that the digitalization of the educational process stimulates the skills of teachers and students but has positive and negative consequences. Wahab (2020) concluded that universities around the world are increasingly moving to online learning or e-learning in the new conditions for the functioning of universities. In these conditions, in addition to resources, the readiness of staff, confidence, accessibility, and motivation of students play a vital role.

Thus, a comparative analysis of various sources led to the conclusion that a characteristic feature of the development of the higher education system of the 21st century is the digitalization of all areas of the university, which proves the relevance of the research goal.

2. Methods

To achieve the goal of the study, it is necessary to solve the following tasks:

- a) Form the methodological basis of the study, namely a set of hypotheses and a conceptual model.
- b) Build a portrait of the development of digital processes in Slovakia and Ukraine, conduct a comparative analysis of the ranking places of countries.
- c) Build a tuple model of an integral indicator for assessing the level of digitalization of processes at the university.

As the literature review showed, the process of transforming a traditional university into an entrepreneurial digital university is a complexly structured process that requires diverse research.

The study is based on the following hypotheses:

Hypothesis 1: The world and national systems of higher education should be sensitive to modern trends in the development of civilization and society. This reflects their key role in the process of shaping the future development of the economy and society.

Hypothesis 2: The university is the main component of the higher education system and the competitiveness of the entire higher education system of the country depends on the quality of its activities.

Hypothesis 3: The transformation of a traditional university must comply with global trends in the development of the economy and society, and, with digitalization trends.

Hypothesis 4: The formation of an entrepreneurial-type digital university depends on the digital maturity of society, the readiness of the university to implement digital transformations, and create new digital skills.

Hypothesis 5: The transformation of a traditional university into a modern innovation-active organization requires the development of a change in the management system and effective assessment and analysis instrumentation.

Research methods are systematic and conceptual approaches, methods of monographic and comparative analysis, methods of analysis and synthesis, statistical methods and visualization tools.

The conceptual model of the study is shown in Figure 1. To determine the labour market preferences, the study used the Future of Jobs Report 2023; and international digitalization indices for the period 2013-2021 served as the basis for determination of digitalization trends and digital maturity in Slovakia and Ukraine. To assess trends in the development of the external environment, two indices were utilised - IMD World Digital Competitiveness Ranking, created by the International Institute for Management Development (Switzerland), and The Cisco Digital Readiness Index, developed by Cisco to holistically measure the level of digital readiness of the country. Table 1 includes the characteristics of the indices.

Table 1. Characteristics of the Global Competitiveness Index and The Cisco Digital Readiness Index

Purpose of analysis	Number of countries	Index components
IMD World Digital Competitiveness Ranking		
The index measures the capacity and readiness of countries to adopt and explore digital technologies for economic and social transformation	64	Knowledge, Technology, Future Readiness Uses 52 indicators
The Cisco Digital Readiness Index		
This index assesses the level of readiness of countries for digital transformation and shows a relationship between digital readiness and GDP per capita demonstrating the importance of economic value and digital readiness.	146	Basic needs of the population, Human capital, Favourable environment for doing business, Business and public investment, Environment for start-ups, Technological infrastructure, Technology adoption

Source: compiled by Rayevnyeva based on [IMD World Digital Competitiveness Ranking 2022, Digital Readiness Index, 2023]

Management of digitalization processes at the university is impossible without effective economic and mathematical tools. Therefore, the study proposes to use an integral indicator of the level of digitalization, the calculation of which is based on the level of development method (Плюта, 1989).

The choice of this method is justified by the following considerations. The process of digitalization of the activities of the university is a complexly structured process that includes all types of activities of a higher educational institution. Each activity type is described by a variety of indicators, which, using the method of mathematical convolution, can be represented by one indicator. This indicator, on the one hand, will include the overall influence of a range of factors, and on the other hand, its dynamics can be interpreted as a trend in the development of digital processes at the university. Besides this, integral indicator has a good economic interpretation due to its scaling. The values of this indicator vary between [0 ÷ 1], and the greater the value of the integral indicator tend to 1, the higher is the level of digitalization of the university's activity processes. Formula (1) presents the tuple type of the proposed indicator:

$$I_{digital\ total} = \langle I_{knowledge}, I_{technologies}, I_{readiness} \rangle \quad (1)$$

where $I_{digital\ total}$ - General integral indicator, which reflects the level of development of digitalization processes at the university;

$I_{knowledge}$ - Local integral indicator for assessing the digitalization of the quality of education;

$I_{technologies}$ - Local integral indicator for indicator for level of introduction of digital technologies to the process of university activity;

$I_{readiness}$ - Local integral indicator for evaluating the readiness of the university for digital transformations.

Figure 1. The conceptual model of the study

3. Results

In the context of the global digitalization of all processes, the requirements of the labour market for the necessary professions and skills are changing significantly. Based on a survey of enterprises and organizations, groups of professions with growing, stable, and declining demand from business structures were identified, as well as key skills that future specialists should possess (Table 2).

Table 2. Needs in professions for the next 5 years

Key roles for business transformation		
<i>Roles/Professions</i>	<i>European growth</i>	<i>Global growth</i>
Business Development Professionals	28%	24%
General and Operations Managers	17%	14%
Assembly and Factory Workers	18%	17%
Business Services and Administration Managers	20%	17%
<i>Roles/Professions</i>	<i>European decline</i>	<i>Global decline</i>
Managing Directors and Chief Executives	20%	17%
Accounting, Bookkeeping and Payroll Clerks	32%	29%
Administrative and Executive Secretaries	35%	35%
Core skills		
Self-efficacy	27%	23%
Cognitive skills	25%	26%
Technology skills	14%	16%

Source: compiled by Rayevnyeva, based on [Future of Jobs Report 2023]

Table 2 shows that a specialist who will be in demand on the labour market in the next 5 years should combine soft and hard skills, and technical skills are a priority among hard skills. They are directly related to new digital technologies and means of visualizing business results. In addition, according to the results of a study by experts from the World Economic Forum for 2023, the key role and the 1st place among all skills is occupied by Analytical thinking, which combines a combination of soft and hard skills. 68% of surveyed enterprises indicated that this skill is the core skill of their business employees, 72% of enterprises diagnosed that Analytical thinking increases the value of an employee in the company, and 42% of companies believe that this skill is a priority in employee development programs. Therefore, the university must be prepared to provide students with the acquisition of these skills.

With the aim to build a portrait of the digital maturity of Slovakia and Ukraine, the study used world rankings to assess the digitalization processes of countries. Figure 2 presents a comparative description of the level of development of digitalization processes in Slovakia and Ukraine using the IMD World Digital Competitiveness Ranking for the period 2013-2021.

Figure 2. Comparative description of the level of development of digitalization processes in Slovakia and Ukraine

Source: compiled by Rayevnyeva based on [IMD World Digital Competitiveness Ranking. 2017, 2021]

This index is calculated for 63 countries, Slovakia and Ukraine are included in the cluster of countries with a ranking below the average. This means that both countries need to intensify these processes, create favourable conditions for all business entities to introduce digital technologies into their activities.

To determine the strengths and weaknesses of countries, we will analyse the components of this index. Figure 3 shows the situation in Slovakia.

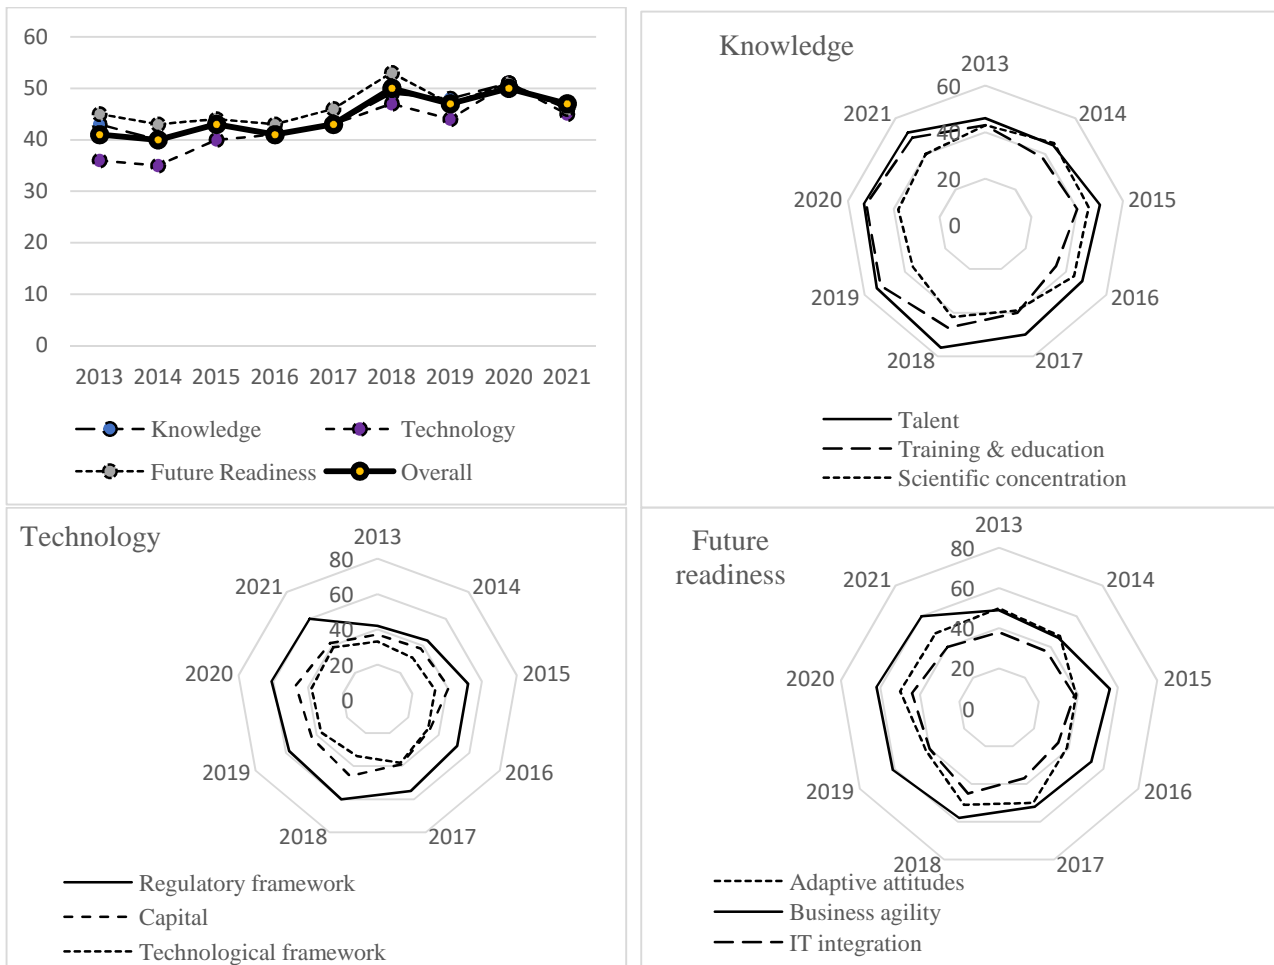

Figure 3. Dynamics of changes in IMD World Digital Competitiveness Ranking Slovakia index components

Source: compiled by Rayevnyeva based on [IMD World Digital Competitiveness Ranking. 2017, 2021]

The analysis of data in Figure 3 led to the following conclusions:

1. The trend of changing the value of the index and its components for the analysed period is unidirectional. Index values fluctuate in the range of 40 - 50 rating places. Since this is below the median value for the analysed group of countries, this means the need to intensify the processes of digitalization of society. In the Knowledge component, it is necessary to increase the indicators Foreign highly skilled personnel, Digital/Technological skills, International experience, Employee training. In the Technology component, attention should be paid to the indicators Development & application of technologies, Scientific research legislation, IT & media stock market capitalization, Funding for technological development, Immigration laws, Intellectual property rights. In the Future readiness component, it is necessary to control the indicators Intellectual property rights, Knowledge transfer, Opportunities and threats, and Cyber security.

2. The strengths of the development of digital maturity in society are represented by several indicators:

In the Knowledge component - Pupil-teacher ratio (tertiary education), Female researchers. In the Technology component - Country credit rating, Internet broadband speed, Investment in Telecommunications. In the Future readiness component - World robots' distribution, and Software piracy.

Figure 4 reflects the situation in Ukraine.

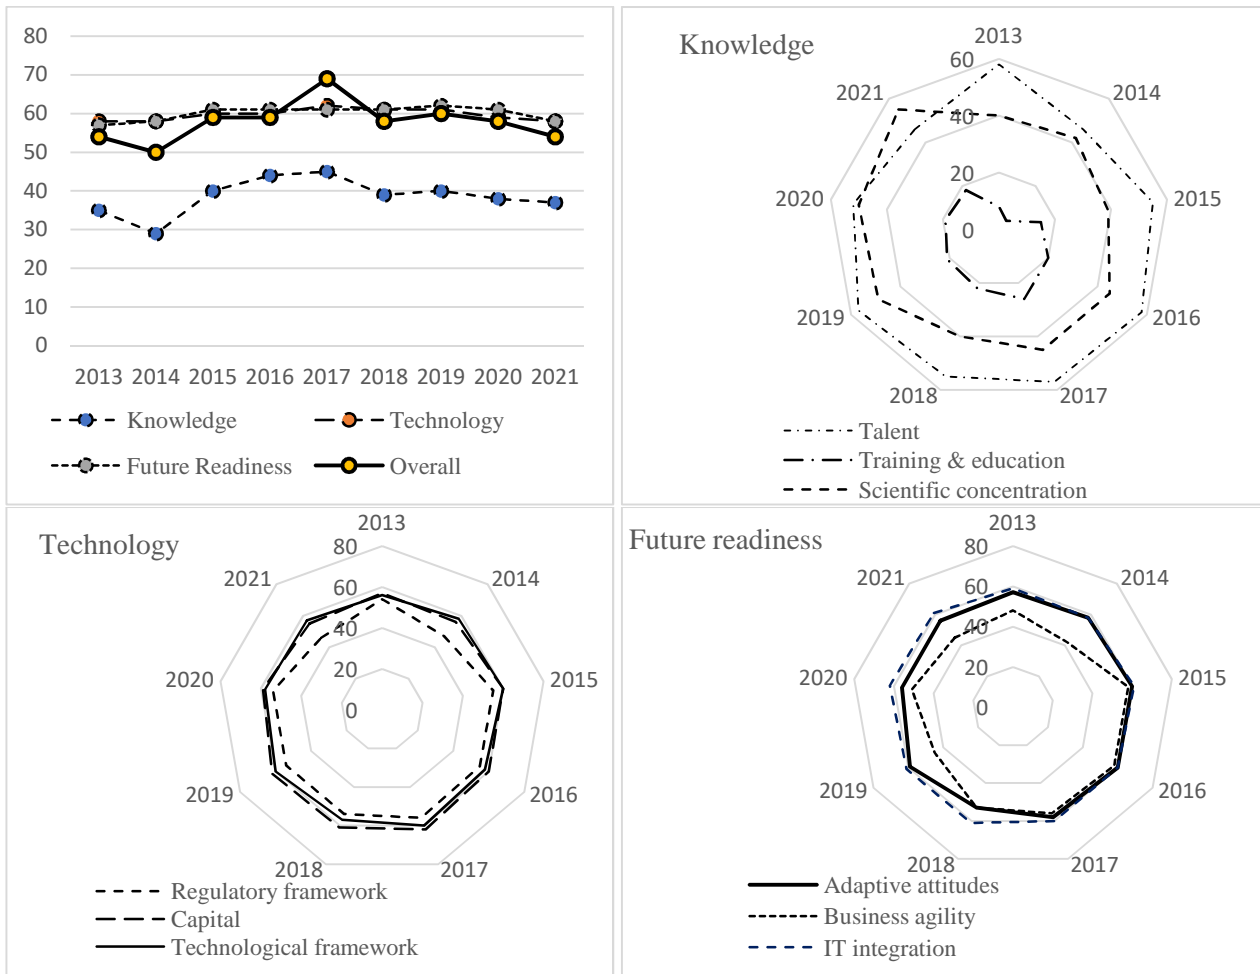

Figure 4. Dynamics of changes in IMD World Digital Competitiveness Ranking Ukraine and index components

Source: compiled by Rayevnyeva based on [IMD World Digital Competitiveness Ranking. 2017, 2021]

The analysis of data in Figure 3 led to the following conclusions:

a) Even though Slovakia and Ukraine are in the group of countries below the median value the index for 2021, the position of Ukraine is worse. The country ranking values for the analysed period of fluctuate within 54-60. Considering that 63 countries are participating in the survey, Ukraine has a lot of work to do to form the digital maturity of society.

b) The Knowledge component has the highest positions among the rating components. Its values vary in the range of 29-45, and among the indicators Training & education occupies the most stable position (ranking places vary in the range of 4-26), so it can be noted that the education system, in particular higher education, is the source of the formation of the country's digital competitiveness. This process is significantly influenced by the indicators as Total public expenditure on education, Pupil-teacher ratio (tertiary education), Higher education achievement, Female researchers.

c) The Technology and Future Readiness components have potential for improvement. The central government needs to pay attention to the indicators as Intellectual property rights, Country credit rating, Venture capital, Mobile Broadband subscribers, Wireless broadband, Knowledge transfer, Public-private partnerships, Software piracy.

The analysis of the external environment of the university allows us to conclude that the level of digital maturity of society in Slovakia is higher than in Ukraine. Slovak universities operate in a more stable digital economy and have wide potential and real opportunities for the digitalization of educational processes and transformation into an entrepreneurial type of organization. The most significant role in Slovak universities is now played by their internal readiness for change.

For Ukrainian universities, the situation is different. The overall level of digital maturity of the

society compared to the world peers is significantly lower than the average level; the country belongs to the group of countries with an emerging digital society. However, the real possibilities of the higher education system in terms of the level of digitalization of processes are approaching the level of developed countries. This indicates that Ukrainian universities are the drivers of the development of the digital society and long-term work in the conditions of crisis and bifurcations (overcoming the challenges of joining the standards of the Bologna Process, the COVID-19 pandemic, Russia's military aggression) have made it possible to form strong competitive advantages based on the widespread introduction of digital technologies in all areas of their activities.

The digital maturity of society is a complex concept and requires a systematic approach. That is why Cisco developers use a variety of factors as a component of the index that reflect the development and implementation of digital technologies in various areas of business and society. Figure 5 presents data related to all components of the Digital Readiness Index for Slovakia and Ukraine.

Figure 5. Index component values for Slovakia and Ukraine
 Source: compiled by Rayevnyeva based on [Digital Readiness Index, 2021]

The analysis of data in Figure 5 led to the following conclusions:

- a) The strongest components of the Digital Readiness Index for Slovakia and Ukraine are Basic needs and Human capital. These components are the drivers of the digital development of the countries.
- b) The Technology Adoption and Technology infrastructure components are well developed. As the data shows, Slovakia has a strong position in these components, and Ukraine has the potential to strengthen these components.
- c) These two countries have certain problems with the Start-up environment which fosters innovation within a community component. In this regard, it is necessary to pay state attention to the development of Venture Capital Investment, New Business Density, and Patents Granted & Trademarks Registered.
- d) Ukraine needs to create an environment to stimulate the development of the Business & government investment and Ease of doing business components to strengthen the basic infrastructure and policies needed to support business continuity and stimulate private and public investment in innovation and technology.

In accordance with the Digital Education action Plan 2021-2027, the availability and accessibility of information technology is the basis for digital education. However, these transformations in the university must be conducted systematically. This means that improving the quality of education requires organizational changes, the creation of an infrastructure for the introduction of digital processes, and the formation of a digital culture based on pedagogical principles and values. The key task of digitalization of the educational process is the operational monitoring and reasonable updating of digital technologies, and the formation of a digital strategy for the development of the university. All this relates to the readiness of the university for digital transformations and corresponds with financial readiness.

4. Discussion

The process of transforming a traditional university into a digital university of an innovative and entrepreneurial type is a modern trend in the modernization of the world's higher educational system and corresponds to the global processes of building a digital society. For the HEI to gain new competitive

advantages, systematic work is needed to introduce digital technologies in all areas of its activity, which is based on a combination of the capabilities of the external and internal environment.

The emerging tasks are so diverse that they require constant research, debatable discussion of the results obtained, and diffusion of the experience of leading universities into the practice of universities in different countries.

Based on hypothesis 5 of this study that the effectiveness of the transformational processes of introducing digital technologies requires the development of tools for evaluating and analysing these processes, the authors propose an integral indicator of the level of digitalization of the university's activities. Its construction is based on the method of convolution of indicators. The issue of choosing a convolution method and developing a set of local integral indicators remains debatable. The proposed model for constructing an integral indicator for assessing the level of development of the digital processes of the university is based on the methodological approach of constructing the Digital Readiness Index, and includes three components, namely Knowledge, Technology and Future Readiness. Such a monocausal approach to assessing the level of digitalization of processes deserves interest. However, a polycausal approach can also be used, which involves evaluating the level of digitalization of a university based on an assessment of the level of implementation of digital technologies in each type of university activity - organizational, educational, scientific, financial, etc.

The base of any assessment is a system of indicators. The development of a complexly structured system of indicators, the creation of a system for monitoring the development of internal digital processes at the university, and monitoring changes in the digital maturity of society are also important tasks of scientific discussions and future research.

Conclusion

The conducted research allowed to formulate the following conclusion:

1) Based on a literature review, it has been proved that the transformation of a traditional university into a digital university of an entrepreneurial type is a visible trend in the development of the global higher education system.

2) Elements of the methodology for such a transformation have been developed, namely, hypotheses, a conceptual model and research methods.

3) It has been proven that the construction of a digital university is based on the analysis of the digital maturity of society and the internal readiness of the university for changes.

4) An analysis of the digital maturity of Slovakia and Ukraine showed that Slovakia has a higher level of society's readiness for the implementation of digital technologies. Therefore, a key aspect of the transformation of Slovak universities is their internal readiness for change. Ukraine will have to continue systematic work to form the digital maturity of society. In this process, the key role is played by Ukrainian universities, which already have a high level of digitalization of their activities. The acquisition of these competitive advantages is associated with overcoming the challenges of the Bologna process, operation within the context of the COVID-19 pandemic and Russian military aggression.

Thus, based on the results obtained, Ukrainian and Slovak HEIs will be able to develop effective strategies and tactics for their transformation into innovatively active universities, that correspond to global trends in the development of society and the world higher education system. Assessing the digital maturity of society and the readiness of the external (national) environment for such transformations will allow universities to increase their competitiveness based on the widespread introduction of digital technologies in educational and scientific processes, building a corporate university management system, digital culture and the maturity of teaching and service personnel. The use of the developed integral indicator of the level of digitalization of university processes will make it possible to build a system for monitoring them and developing Key Performance Indicators for the activities of the university.

Acknowledgements

The study is funded by the EU program "Next Generation EU through the Recovery and Resilience Plan for Slovakia", under the project No. 09I03-03-V01-00083.

Incentives for Providers of Cataract Surgery depending on the Payment Mechanisms in the Czech Republic and Slovakia

Peter Pažitný^{1,*}, Daniela Kandilaki¹, and Kristina Randlová¹

¹ Prague University of Economics and Business, Department of Management, Faculty of Management and Business, Jarošovská 1117/II, 37701, Jindřichův Hradec, Czech Republic

Abstract

Research background: Cataract is the second most common cause of visual impairment and the first most common cause of blindness. Cataract development is closely associated with onset at an advanced age. As the population ages, so does the prevalence of cataracts.

Purpose of the article: The aim of this article is to compare the incentives for providers depending on payment mechanisms for cataract surgery in the Czech Republic and Slovakia in the context of quality (e.g. lens choice) and access to care (e.g. waiting lists).

Methods: The research methodology is based on a 10 year datasets from both countries supported by personal interview using a semi-structured questionnaire. The respondents were specialists in the field of ophthalmology, including practicing doctors, representatives of care providers, representatives of health insurers, and representatives of the Ministry of Health.

Findings & Value added: Payment mechanisms in both countries vary considerably providing different incentives for providers in the terms of quality (e.g. lens choice) and access to care (e.g. waiting lists). In the Czech republic, the bundled payment (so called package price where price of the lens is included in the reimbursement) increases the motivation of providers for more „business-like“ decisions and to seek for cheap and available lenses meeting required CE standards. In Slovakia, the reimbursement based on separation of surgery and lens prices leads to using the lenses that are categorized as cost-effective by Ministry of Health and the incentive for providers are more „medical-driven“. In the Czech Republic, the number of cataracts rose from 99 000 to 131 000 in last 10 years, which means 12 476 surgeries per million people in 2020. This is significantly higher than 5 976 surgeries per million in Slovakia (32 268 surgeries in total). Although this was heavily influenced by COVID-19 pandemics. In Slovakia the drop of surgeries between 2019/2020 was -24%, while in the Czech Republic only -6%:

Keywords: cataract, payment mechanisms, number of surgeries, prices, lense choice, waiting lists

JEL classification: I11, I13

1. Introduction

1.1 Cataract

Cataract is the second most common cause of visual impairment and the first most common cause of blindness. Cataract disease has a significant impact on the patient's quality of life. (Kuntorini et al., 2023) Cataract is a progressive eye disease that manifests itself slowly and painlessly. Due to the slow progression, a problem arises with the difficult early diagnosis of the disease since the patient is not aware of vision problems at the beginning or does not attach importance to them. Among the most common problems, Thompson and Lakhani (2015) say blurred vision, double vision, problems with glare during the driving at night, reduced visual acuity, changes in color perception and worsening myopia.

Ang and Afshari (2021) divides the causes of cataracts into uncontrollable and controllable risk factors. Uncontrollable risk factors include age, gender, or race. Among the uncontrollable factors, the authors include debatable factors such as smoking, alcohol and unhealthy diet or the influence of UV radiation. The authors also mention a higher risk of disease in people suffering from diabetes mellitus, hypertension, metabolic syndrome, kidney failure, hepatitis, celiac disease, atopic dermatitis, and other diseases.

* Corresponding author: peter.pazitny@vse.cz

Cataract disease causes, according to Kuntorini et al. (2023), reduction in the patient's quality of life, as due to reduced visual acuity up to blindness, there is a deterioration in the ability to perform normal activities and an increase in dependence on the help of another person, reduced social functioning. Cataracts have a negative effect on the mental health of the patients. Mencucci et al. (2023) draw attention to not only a reduction in the quality of life due to the loss of autonomy, the development of depression and worsening cognitive problems, but also an increase in the risk of falls in connection with cataracts. Cataract is a progressive eye disease that causes partial or complete clouding of the lens. The reduction in visual acuity caused by cataracts causes patients to have poorer orientation and a higher risk of falls. By solving the disease, it is not only possible to improve the state of the direct causes of the disease and improve the quality of life, but also to reduce the risk of subsequent consequences caused by the impact of falls of the diseased.

Cataract is connected not only with health and social consequences, but also with economic consequences. Cataract disease brings direct medical costs to the healthcare system, direct non-medical costs that threaten the budget of the patient and family, as well as indirect costs. Direct non-medical costs include trips to a medical facility, the time of informal caregivers or the acquisition of necessary medical devices and adaptations of the apartment for the needs of the patients with visual impairment. Indirect costs are associated with reduced productivity of both patients and their relatives in the roles of informal caregivers (Magrelli et al., 2020).

Thompson and Lakhani (2015) describe the course of patient care. Cataract is a treatable type of eye disease that can be treated with surgery. Before cataract surgery, patients complete a comprehensive ophthalmological examination, which will help to accurately identify the patient's health condition and rule out other causes of impaired vision. This is followed by a surgical solution under topical anesthesia. Currently, the most widely used method is Phacoemulsification, which represents the least invasive method of surgery, enabling rapid healing. The basic principle of the procedure is emulsification of the opacified lens of the eye with the help of an ultrasonic probe. During surgery, the extracapsular bag is preserved, which allows easy placement of a new synthetic lens. The lenses used can be divided into three basic categories - monofocal, thoric and multifocal. To minimize possible complications, which are very rare when performing phacoemulsification, as a rule, they are operated separately, with an interval of 1 to 4 weeks. The operation is followed by postoperative care, consisting of the application of eye drops containing antibiotic and anti-inflammatory substances, for a period of 3-6 weeks.

Cataract surgery can be performed either in hospitalization mode or in one-day or outpatient surgery mode. Currently, one-day or ambulatory surgery is the most frequently used regime. The shift from hospitalizations to short-term interventions without the need for multi-day hospitalization is demonstrated by Gianino et al. (2018), who describes a decrease in hospitalized cases and a significant increase in one-day and outpatient cataract surgery cases in 20 European countries over the period 2004-2014.

Ginel et al. (2023) deals with the issue of cataract from a cost perspective. Their systematic review shows that the cost of cataract surgery has decreased over the years; however, their cost-effectiveness should be carefully evaluated by country and population. A significant factor in the context of cataract surgery is the waiting time. Since vision loss has a significant impact on society, and at the same time caring for a blind person is more expensive than early surgery, the priority is to focus on early therapy and prevent as many cases of vision loss as possible. And since cataracts represent a treatable type of eye disease, the emphasis is on preventing blindness, early surgery, and at the same time strengthening further research into the treatment of eye diseases. Mencucci reports that while cataracts account for 50% of blindness in middle- and low-income countries, in developed countries, thanks to early intervention by doctors, cataracts account for only 5% of blindness.

1.2 The system of financing and providing health services in the Czech Republic and Slovakia

A compulsory public health insurance system is in the Czech Republic and Slovakia. The national health system, according to Tambor et al. (2021) covers 100% of the population in the Czech Republic and 94–96% in Slovakia. Uncovered individuals in Slovakia mainly include individuals working abroad. The appropriateness of the social health insurance system was discussed by Mikucki and Piotrowka (2021), who use the life expectancy indicator as one of the arguments for supporting the system. Both countries demonstrate an increase in life expectancy, which, according to the authors, indicates that the established care delivery system is working properly. In the Czech Republic, life expectancy increased from 70.0 years in 1970 to 79.1 years in 2017. In Slovakia, life expectancy increased from 70.0 years in 1970 to 77.3 years in 2017.

Most of the income of the public health insurance system consists of mandatory contributions from the wages/income of the insured. In the Czech Republic, levies amount to 13.5% of the assessed wage base, of which the employee pays 4.5% for health insurance. In Slovakia, levies amount to 14 % of the assessment base of wages, of which the employee pays 4% for health insurance. In both countries, a contribution from the public budget is paid for persons unable to pay the contribution (children, seniors, sick, unemployed). (Mikucki and Piotrowska, 2021, Dovera, 2023). Out-of-pocket forms a smaller part of the financing in both countries. Tambor et al. (2021) states that in 2018 the share of out-of-pocket value as % of current health expenditure reached 14.19% in the Czech Republic and 18.91% in Slovakia. In both countries, out-of-pocket is required mainly for dentistry and co-payments for medicines.

Predetermined health services are paid for from public health insurance funds. In the Czech Republic, there is a positive list of services, medicines and medical products that are covered by the public health insurance system. There is also a negative list of services expressly excluded. Services not on the positive list may still be covered based on individual patient needs. There are also exceptional cases where items on the negative list may be reimbursed. In Slovakia, there is a similar system of payment for selected services. A basket of basic health services is specified, which are covered by the public health insurance companies (Mikucki and Piotrowska, 2021).

Healthcare providers are public and private. Regarding availability, Tambor (2021) states that regional differences in the distribution of specialists are a problem in the Czech Republic. Regarding the number of healthcare workers, there are 4.0 doctors and 8.1 nurses per 1,000 inhabitants in the Czech Republic. In Slovakia, he cites problems with the lack of healthcare workers and their uneven distribution. In Slovakia, there are 3.5 doctors and 5.7 nurses per 1000 inhabitants.

The education of workers is also an important factor. Muttuvelu and Andersen (2016) addressed the issue of staff education in their article. The authors state that it is important to focus not only on having enough doctors, but also on the sufficient quality of their education in the specialty of cataract surgery. Young doctors without sufficient experience in the field can cause health complications to patients through unprofessional intervention, so it is necessary to use a sufficient process of acquiring information and new competences, to supplement the required knowledge, experience, and skills. However, the results of the study show that a highly decentralized and heterogeneous educational structure was identified in the selected analyzed European countries. Data for the Czech Republic states that there is no mandatory cataract surgery training in the country, nor are there any health authority regulations regarding training and no mandatory use of assessment tools. Employee training in the Czech Republic is mostly based on the apprenticeship model.

1.3 Prices and payment mechanisms of cataracts

Prices of cataracts surgery vary a lot among countries. As shown by Van C. Lansing et al. (2015) the prices calculated in 2012 USD prices cost from 178 USD in India up to 3557 USD in the USA. The Euro zone average based on prices from Finland, France, Germany, Italy, and Spain stood at 1968 USD. No country from CEE region was part of the study.

Cataract surgery in last decade is mostly performed in ambulatory settings and the payment mechanisms are changing accordingly. For example Medicare in New England started to use bundled payment in ophthalmology in 2014 (Thakore et al., 2015) and the HealthChoiceSelect Initiative started to use bundled payment for cataract removal in 2016 (Struijs et al., 2020).

2. Methods

Data from relevant statistical databases from both countries were gathered. In Slovakia, data from National Center for Health Information were used. In the Czech Republic, data from Center for Health Information and Statistics were used. The data were collected from open and public databases focusing on the years 2010 – 2020 and the latest available data.

In both countries 5 and 5 personal interviews using a semi-structured questionnaire were conducted to assess the incentives for providers based on the payment mechanisms. The personal interviews were conducted between June – October 2022 covering the situation in years 2020 – 2022. These years were also heavily affected by the COVID-19 pandemics.

For a comprehensive view, respondents from different stakeholders were selected, including doctors and representatives of providers, representatives of health insurance companies and funds, representatives of the Ministry of Health and other institutions. The characteristics of the respondents are shown in Table 1.

The results from the interviews were grouped and evaluated by the authors. In the comparison, emphasis was placed on the payment mechanism used, number of surgeries, prices, choice of the lens and waiting times.

Table 1. Information about respondents

Respondent	Info about respondent
CZ 1	Managing ophthalmology clinics for 22 years, since 2008 he is a owner of ophthalmology clinics in CZ and SK.
CZ 2	Payment mechanisms specialist for ambulatory sector in health insurance fund (9 years), last 5 years as leader of the ambulatory payment mechanisms department.
CZ 3	Drug reimbursement specialist in health insurance fund
CZ 4	CEO of international chain of ophthalmological clinics
CZ 5	DRG expert, 8 years at National Institute for Health Statistics
SK 1	Owner of a leading ophthalmologic clinic
SK 2	Reimbursement specialist in a privately owned public health insurance company
SK 3	Drug Reimbursement specialist at the Ministry of Health of the Slovak Republic
SK 4	Medical devices reimbursement specialist at the Ministry of Health of the Slovak Republic
SK 5	Data Analyst at the National Centre for Healthcare Information

3. Results

3.1 Ophthalmology in the Czech Republic

Ophthalmology in the Czech Republic is a mature market with stable market shares, which reflects the general incidence and prevalence of the diseases. Ophthalmological services are generally well accessible, services are provided by outpatient players and state hospitals. Competition is an important element in the ophthalmology market, the patient can choose the care provider. According to the interviewed experts, this competition is the main driver of quality improvement.

Healthcare services are predominantly covered by health insurance funds. Health insurance funds (HIFs) spend 2-4% of their expenses for ophthalmology in the institutional setting. Each year, health insurance funds negotiate their reimbursement prices with providers under the surveillance of the Ministry of Health (MZ ČR). The results of the negotiations are published in the so-called Reimbursement Decree. Since 2020, Association of Ambulatory Providers of Eye Surgery (SAPOCH) plays an important role during these negotiations.

SAPOCH represents the 17 biggest ophthalmological providers with 92% share of the total one-day-surgery volume (cataracts, refractions, vitreoretinal, transplantations) in the negotiations with HIFs and has become a reliable partner in these negotiations with a mandate to negotiate the reimbursement conditions.

There are 7 health insurance companies operating in the Czech Republic, providing public health insurance. In the negotiation process between SAPOCH and the 7 health insurance funds, there is always one health insurance fund acting as the main coordinator. Two agreements need to be negotiated at the same time. The first agreement is with Všeobecní zdravotní pojišťovna (VZP), which is the biggest health insurance fund with 60% market share. The second agreement is negotiated with the Health Insurance Association of the Czech Republic (SZP), which represents the remaining 6 HIFs with 40% market share.

Cataract-related medical services are predominantly paid as a bundled payment on a “package price” principle (so called OKA). The "package price" OKA is negotiated separately, and each health insurance fund negotiates separately with SAPOCH. Most of the treatments and lenses are fully covered by the health insurance funds, but there is still place for co-payments.

3.2 Cataract-related medical services in the Czech Republic

In 2022, there were 148 000 cataract surgeries in the Czech Republic as SAPOCH reported. Compared to 2018, when there was 130902 it is a significant increase. Unlike in Slovakia, the 2020 COVID-19 year did not mean a significant drop, because in 2019 there were 139 000 surgeries and year later 131 000, which is a drop by -6%. In 2020/2019 Slovakia reported a massive decrease of cataract surgeries by 24%.

Additionally, if we add approximately 11000 cataracts for foreigners through cross-border care (paid by another member state from their public resources) and self-payers (approx. 5 000-6 000). This

represents a cumulative growth rate of +3% per year from 2019 to 2022, indicating a mature market in Czech Republic.

Payment mechanism

Cataract surgeries are predominantly provided on an outpatient basis. According to the interview with one of the leading providers, the private sector dominates, because 83% of cataract surgeries are done in the private ambulatory sector as one-day surgeries. Health insurance funds pay the ophthalmological medical facilities with the so-called “package price” OKA. This package price is used by all providers doing cataract surgeries, except for one provider (Gemini – approx. 20% of all cataracts), who is paid by FFS (fee-for-service).

The OKA package price includes: the operation itself, and some elements of the preoperative and postoperative care (lens calculation, autorefractometer, clinical examination and postoperative control). The operation itself is calculated as payment for all care and materials used, including implanted lenses.

The price of the OKA package is the same for all providers who provide cataract-related medical services within the same health insurance. Historically, there have been price differences between health insurance funds. The prices of the eye package were introduced for the first time in 2010, when the first packages for some providers for CZK 8,250. Packages had volume limitations in the form of a maximum number of operations. The rest of the providers and HIFs used FFS.

The years between 2009 and 2019 were a decade of a double-digit point decline (from 1.09 to 0.69 CZK / 1 point). Overall, there was a 56% decrease in OKA "package price" value. From the original point value of CZK 1.09 (in 2009), it fell to the point value of CZK 0.69 (in 2019), which affected all outpatient providers. As a result, the overall HIF spending on cataract was 1.8 billion CZK (in 2009) and fell to 1.2 billion CZK (in 2019). This indicates that during the decade of 2010 – 2019, the cataract providers lost about 603 million CZK.

The situation changed in 2020, when different prices were set for packages with different lenses (hydrophilic, hydrophobic, and thoric). During the negotiations, the structure of the package was unified and price differences between health insurance funds were minimized. In 2020, the main increase in price (+ 21%) was reported in cataracts using thoric lenses, followed by hydrophobic lenses and hydrophilic lenses.

Furthermore, prices were adjusted for the second half of the year due to the COVID-19 pandemic. OKA prices increased by 16% in 2020. In 2019, the average price of OKA was 9906 CZK (413 EUR) and in 2020 it was 12017 CZK (501 EUR). These rapid increases added only in 2020 and + 421 million CZK (16,84 mil EUR) additional annual budget for cataracts. Another increase in first and second half of 2021 brought an additional +242 million CZK (9,68 mil EUR). Table 2 shows the development of the OKA reimbursement price in CZK in VZP, the largest health insurance fund in the Czech Republic.

Table 2. OKA reimbursement prices in CZK in VZP (60% market share)

	2010 - 2015	2016 - 2019	2020 (1H)	2020 (2H) – COVID-19 compensation	2021 (1H)	2021 - (2H) – COVID-19 compensation

Lens selection

Patient choice of lens is a complex issue. On the one hand, in terms of health insurance, since 2013 (the Constitutional Court ruling), it has been impossible to select the lens when it is reimbursed by public health insurance. Health insurance funds (HIF) declare, that for cataracts, when they are fully paid by the HIF, there is no co-payment. This is a „grey zone “ since co-payments are not banned or legislatively

regulated. Moreover, HIFs tolerate, that patients pay „co-payments”, especially for aspheric, thoric, or multifocal lenses and for presbyopia correcting intra-ocular lenses (PCIOL). This second view is supported by the Constitutional Court ruling from 2013, that co-payment can be charged, when there is substantial difference in the provided care/material. The providers can take any lens on the market (CE certificate is needed), the patient is not engaged. The choice of lens is more of a business decision with minimal quality CE certificate needed. Providers can import the lenses by themselves.

Availability of ophthalmic care

Access to cataracts differs, in large cities, there is a high concentration of eye clinics. In rural areas there are fewer ambulances, fewer clinics, and generally less competition. Officially, waiting times are not measured, but the estimate is about weeks in large cities and months in rural regions. With OKA “package price” as payment mechanism, the availability of cataracts is good, and the providers are not regulated compared to other specializations. There is no limit on cataract production, OKA is excluded from regulatory mechanisms.

Measuring the Quality of care provided

In the Czech Republic, no qualitative parameters are measured or controlled for cataracts. Instead, some sanctions are applied (when reporting to the health insurance fund). Quality is the question of the lens, but there is lack of revisions and controls. The provider has a full freedom to choose which producer or importer to purchase the lens from. It only must fulfil the CE criteria. In the documentation, the provider must provide a code and the origin of the lens. It must be specified what type of lens was used. HIFs expect only high-quality lens to be procured, but it cannot be properly checked. The quality criteria (measured by rehospitalizations) were applied only in one year of 2020, but now it is no longer implemented. Only patient complaints are episodically collected, but there is no other method to measure the quality.

3.3 Ophthalmology in the Slovakia

The Slovak ophthalmology market is mature market with a well-developed private sector. Ophthalmology has the strongest position in one-day surgery performing some 80% of all one-day surgeries. Moreover, 91% of cataract surgeries are already performed by private clinics. In 2019, the biggest 20 private clinics had an overall turnover of EUR 36 million with a cumulative profit of almost EUR 5 million.

Compared to other segments, ophthalmology is financially more stable, as the providers perform surgeries reimbursed both by (1) health insurance companies and by (2) clients' cash payments. The market is highly developed, and reimbursement is based on negotiations between health insurance companies and providers. There are 3 health insurance companies (VšZP, ZP Dôvera, ZP Union) and the negotiate the contracts with each ophthalmic clinic separately. Contracts are transparent and publicly available on the websites of health insurance companies.

Ophthalmology providers face many challenges. They have a persistent problem with a lack of top experts. Private clinics do not have the premises to teach young doctors, and the state hospitals do not have the time capacities. Eye clinics are often family run businesses. This is a very conservative society, closely connected, relations typical of "small Slovakia". The success of the clinic depends on whether it obtains a contract with health insurers or not. According to the legislation, the clinic first procures a location, staff members, and technological support before applying for a license, and finally for a contract with HIC. If the contract is not obtained by the eye clinic, it relies solely on self-payers. There is no dominant player or chain, so the market is fragmented with large number of clinics of various size.

Most services is fully or partially covered by health insurance companies, but sometimes this coverage is not sufficient. The reimbursement from health insurance companies is divided into two components: (1) payments for services performed and (2) payments for medical material, which is usually paid extra. This concept was also highlighted in the interviews, as this is a very good practice for payment mechanisms to separate the labor (human work, surgery) and the material (lens, tissue, etc.).

3.4 Cataract-related medical services in Slovakia

The number of cataracts is rising in cycles, and the COVID-19 pandemics caused a huge 24% drop between 2019/2020. The number of cataracts fell from 42,466 in 2019 to 32,268 in 2020. This is the

lowest number of cataracts since 2013, and since then there has been no change in the payment mechanism, which can be fully attributed to the change of consumers behavior during COVID-19.

Payment mechanism

Approximately 91% of all cataracts are performed on outpatient basis. The cataract treatment is organized very well, since the procedures (pre-op, surgery, post-op) are paid separately from the implant. So, the price of the implant (material) is paid extra and is usually fully reimbursed. This model „surgery” + „material” which works very well in cataracts should be used also in other ophthalmological procedures. Cataracts are reimbursed based on contracted price and follow the formula in Table 3.

Pre-op can be fully reimbursed by the HIC (16 EUR), or if not, the patient pays 40 EUR. The price of surgery and the lens is separated. The surgery is reimbursed around by 400 EUR from HIC. According to the providers, this is not sufficient, and the surgery price should be around 700-750 EUR. Lenses are fully reimbursed for 98% of the patients, according to XF group in categorization, and these people are very satisfied with the lens chosen/recommended by the doctor. Post-op can be fully paid by the HIC (5 controls), or if paid by patients, then 2 are free, and the other 3 are paid (each 50 EUR).

Table 3. Pricing and reimbursement formula in cataracts

	Pre-operation	Surgery	Lens	Lens co-payment	Post-operation
Patient pathway + payment method	covered by HIC (16 EUR) or 40 EUR paid by the patient	Usually a contracted price from HIC, around 380 – 480 EUR	Reimbursed by HIC according to categorization	According to categorization	covered by HIC (5x7 EUR) or by the patient. (2 controls paid by provider then 50 EUR per each control)
Example 1: Intraocular hydrophilic acrylic lens BioLine Yellow	40 EUR (Paid by patients)	396 EUR (Price of surgery, fully covered by HIC)	105,89 EUR (Hydrophilic acrylic lens – fully covered by HIC)	0 EUR (co-payment)	150 EUR (3 controls)
Example 2: Intraocular lens posterior chamber AcrySof® IQ Restor® multifocal 2,5D	40 EUR (Paid by patients)	396 EUR (Price of surgery, fully covered by HIC)	145,01 EUR (Multifocal lens, partial coverage by HIC)	556,79 EUR (co-payment)	150 EUR (3 controls)

Source: own research

Surgery prices are negotiated between HIC and providers - these change once a year. Surgery prices may vary between providers and health insurance companies since every provider is negotiating on its own.

Prices the of lenses are subject to categorization and reference pricing (MoH) and can be changed every quarter (1.1, 1.4, 1.7 and 1.10). The Ministry of Health plays a decision-making role in the categorization process. There are altogether 13 groups of lenses. Typically, only new products are added to existing subgroups (Cost minimalization analysis - CMA is enough). For opening a new subgroup, a Cost effectiveness Analysis (CEA) or Cost utility Analysis (CUA) is needed. The listing of lenses is free, but delisting costs 300 EUR, so out of 120 lenses in XF group, 34 items had 0 consumption in last 24 months (2020 – 2021). To improve the process, the listing payment should be introduced.

In every subgroup there is equal reimbursement for the whole sub-group, and there are lenses with no co-payment and lenses with co-payment. Each sub-category has a subgroup maximum reimbursement limit. The reimbursement from HIC cannot be higher than this maximum limit price. The categorization has the following specific rules according to whether the cataract (special medical material) complies with EU criteria (EC certificate) or not. Regarding the price – the importer needs to provide 3 prices (or at least 2) out of 28 EU countries, these 3 (or at least 2) prices should be the lowest, the choice of countries depends on the importer. There are no open databases of prices of special medical material (either cataract), only two countries have open databases –the Czech Republic and Belgium. The producers (importers) protect their price information.

Lens selection

The choice of lens at the provider level is a dialogue between the patient and the ophthalmologist. Basic lenses have no copayment, above the standard lenses have co-payments. Although, when the lens is fully paid, the decision is usually made by the doctor. The patient's preferences are reflected when there is a co-payment for the lenses.

Availability of ophthalmic care

In last ten years, we have witnessed a dramatic decrease of waiting lists from 1 291 to 54 patients in 2020 and a minimization of the average waiting times from 88 to 18 days. The low waiting times has been confirmed also by providers, according to them, the waiting times are 1-2 months (private providers) and 6 months (state providers). Since 2018 there are no financial limits on production and every cataract is paid. Ophthalmology providers face a persistent problem with a lack of top experts. The low number people on waiting list is a very positive sign, but need to be interpreted in context.

The number of surgeries per million people in Slovakia (5 976 in 2020) is approx. the half compared to the Czech Republic (12 476 in 2020). Moreover, in an international comparison, the highest rate of cataract surgeries is 14 000 surgeries per 1 million (Portugal) and Czechia belongs to TOP 5 European countries (OECD, 2016). Contrary, Slovakia ranks poorly compared to EU countries. Low number of surgeries combined with very short waiting lists in Slovakia may indicate a low diagnostic rate among people suffering on cataracts.

Measuring of quality of care provided

According to the health insurance company Dôvera, since 2019 all cataracts can be performed only as one-day surgeries (Code 1393). Price of the procedure varies according to „quality” criteria: satisfaction, regionality, rehospitalizations (not implemented yet), complexity of cases, FTE of surgeon (must be more than 0,8). These criteria form a MIN – MAX range for providers.

An important role is played by the Healthcare Surveillance Authority (HCSA), which is responsible for oversight over health insurance companies and providers. HCSA is obliged to perform control and oversight over the health insurers and the providers. The HCSA report from 20.12.2022 shows, that one ophthalmic clinic (iClinic group) has very high number of complaints in last 3 years. During 2020 – 2022 there were a total of 91 patients complaints in ophthalmology and 43 were addressed to clinics grouped in iClinic (ÚDZS, 2022). This surveillance function is important in relation to quality improvement.

3.5 Comparison of cataract care in the Czech Republic and Slovakia

The Czech Republic and Slovakia provide services related to cataract mainly in the form of ambulatory care and one-day surgery.

The payment mechanism in the Czech Republic is provided in the form of a package price "OKA", where payment for services and materials is combined in one package. This can lead to the selection of cheap material (lenses) at the expense of quality to reduce the cost of providing care. By introducing package price, the structure of cataract package was unified and the price variations between health insurance funds were minimized.

In Slovakia, the "surgery" + "material" reimbursement system is used, in which services and payments for materials (lenses) are separated. The tendency to use super cheap materials is gone, because the lenses are reimbursed extra in full price. The concept of separation of labor and material is very good practice for payment mechanisms and should be used in other ophthalmic procedures as well.

In both countries, the choice of lens is primarily up to the care provider. In the Czech Republic, the choice is limited only to the minimum quality CE certificate. Choice of lens is rather business decision. In Slovakia, the choice of lenses is limited by the categorization process. Entering the market is more difficult and there are no extra cheap lenses. At the same time, the process of categorization is more complicated since an international database for price cross-country comparison has not been created.

The Czech Republic and Slovakia do not have a financial limit to produce cataracts, which has a positive effect on the availability of the services used. This can be shown in Table 4 as in both countries the number of cataracts is rising and the number of cataracts is increasing. In the Czech Republic, the number of cataract rose from 99 000 to 131 000 in last 10 years, which means 12 476 surgeries per million people in 2020 which is significantly higher than 5 976 surgeries per million in Slovakia (32 268 surgeries in total). Although this was heavily influenced by COVID-19 pandemics. In Slovakia the drop of surgeries was -24%, while in the Czech Republic only -6%:

Quality criteria are not set in the Czech Republic. There is a need to set up a quality control system in the form of a pre-defined system and systematic tool for quality assessment. In contrast, quality criteria are set in Slovakia.

Table 4 summarizes the main findings regarding the type of care provided, payment mechanisms, material selection (lenses), availability of ophthalmological care and quality indicators in connection with the cataract-related medical services in the Czech Republic and Slovakia.

Table 4. Number of cataract surgeries financed from public sources (foreigners and self-payers excluded)

	Number of cataract surgeries		Number of surgeries per million people	
	Czech Republic	Slovakia	Czech Republic	Slovakia
2010	99 000	24 710	9 429	4 576
2011	100 000	22 430	9 524	4 154
2012	102 000	23 890	9 714	4 424
2013	97 000	29 835	9 238	5 525
2014	100 084	33 118	9 532	6 133
2015	110 002	34 996	10 476	6 481
2016	119 906	39 968	11 420	7 401
2017	129 605	35 863	12 343	6 641
2018	130 902	36 639	12 467	6 785
2019	139 000	42 466	13 238	7 864
2020	131 000	32 268	12 476	5 976

Table 5. Main incentives for providers depending of the payment mechanism used in the country

	Czech Republic	Slovakia
Predominant type of services	ambulatory care and one day surgery	ambulatory care and one day surgery
Payment mechanism	OKA package price that covers the price of surgery (+ pre-op and post-op services) and the price of medical materials (incl. lenses)	model „surgery” + „material” that separately covers the surgery and separately the payments for medical material
Lens selection	the choice of lens is mainly decided by the care provider, the patient is not involved	the choice of lens is a dialogue between the patient and the ophthalmologist, but the decision is usually made by the doctor
Availability of care	waiting times are weeks in large cities and months in rural regions. differences in access to care in urban and rural areas no limit on cataract production	waiting times are 1-2 months (private providers) and 6 months (state providers) a lack of top experts no limits on cataract production
Measuring the quality of care provided	in the Czech Republic, no qualitative parameters are measured or controlled for cataracts	quality criteria: satisfaction, regionality, rehospitalizations (not implemented yet), complexity of cases, FTE of surgeon. the Healthcare Surveillance Authority (HCSA) is responsible for oversight and control over health insurance companies and providers
Incentives for providers based on personal interviews	High productivity 12 476 surgeries per 1 million (no production limits) with high pressure on lowering cost of lenses, choice of lens is an important business decision, because its price is significantly influencing the level of profit. The high productivity was not affected by COVID-19 pandemics heavily – only -6% decrease.	Increasing productivity from 4576 to 7864 surgeries before COVID-19 (no production limits) with low economic pressure on lens choice. The choice of lens is a medical decision based on dialogue between provider and patient. The productivity was hampered by COVID-19 pandemics – massive drop by -24%

4. Discussion

Regarding pricing, the cataract surgery in the Czech Republic and Slovakia is quite inexpensive compared to other countries. In the Czech Republic, with OKA „package price“ the price range is 406 – 586 EUR depending on the lens used. In Slovakia, the surgery price is 560 EUR incl. the basic hydrophilic acrylic lens. And these prices are for the year 2021 and are far below the EuroZone average of 1968 USD, or the USA price of 3557 USD (Van C. Lansing et al, 2015). And these EuroZone and USA prices were calculated for the year 2012. Based on actual prices, according to www.myvision.org, the average cost of cataract surgery in USA is 3500 – 7000 USD per eye (MyVision, 2023). This is 5,5 to 11 times higher than an average cataract surgery in the Czech Republic or Slovakia.

It is important to mention that not only the total price, but also the payment mechanism itself takes important role. Different payment mechanisms are applied to individual types of services provided. Cataracts surgery in the Czech Republic is paid by bundled payment, which covers all pre-op, post-op services and the lens itself and all the costs are covered together in one package. In Slovakia, the "surgery" + "material" model payment mechanism is used, in which the surgery costs and costs of lenses are separated. This leads to different incentives for providers.

The impact of bundled payment on quality is discussed in academic literature. Struijs et al., (2020) point out, that according to their evidence, bundled-payment models have the potential to reduce medical spending growth while having either a positive impact or no impact on quality of care. The Czech Republic case of cataract surgery shows that the bundled payment provides incentives for costs reduction, choosing the lens by business criteria while the quality of surgeries is not measured. Since 2020, in the Czech Republic, the quality of care is supported by different package prices for three lens types. But the choice of lens is still rather a business decision.

In Slovakia it is a good practice to support the quality by separate payment for the lenses, which provides incentives for more medical than business choice of medical material. In Slovakia it is possible to choose from lenses that have passed the categorization system, which makes it difficult to enter the market and there are no extra cheap lenses. At the same time, the process of categorization is complicated by the need to identify lens prices in other countries, where the information is mostly not public.

Conclusion

Cataract is the second most common cause of visual impairment and the first most common cause of blindness. Early cataract surgery can improve patients' quality of life and prevent blindness. In connection with cataract-related health services, in the Czech Republic, the package price "OKA" payment mechanism is used, in Slovakia, the "surgery" + "material" model is used.

Both types of payment mechanisms combined with no production limits from health insurance funds support the high availability of care, thanks to the absence of financial limits and providing services mainly in the form of ambulatory care. Payment mechanisms in both countries vary considerably providing different incentives for providers in the terms of quality (e.g., lens choice) and access to care (e.g., waiting lists). In the Czech republic, the bundled payment (so called package price where price of the lens is included in the payment) increases the motivation of providers for more „business-like“ decisions and to seek for cheap and available lenses satisfying the required CE standards. In Slovakia, the reimbursement based on separation of surgery and lens prices leads to using the lenses that are categorized as cost-effective by Ministry of Health and the incentive for providers are more „medical-driven“.

To approximate, the price of a fully covered hydrophilic acrylic lens represents about 20 % of the cataract reimbursement in Slovakia. Given that the price of the lens in the Czech Republic depends on the provider, it is not possible to clearly determine the share of the price of the lens in the total cataract reimbursement.

Due to different payment mechanisms, the Incentives for providers differ in both countries. In the Czech Republic, there is high productivity (no production limits) with high pressure on lowering cost of lenses and meeting the CE criteria, choice of lens is an important business decision, because its price is significantly influencing the level of profit. In Slovakia, there is rising productivity reaching half of the levels in the Czech Republic (no production limits) combined with low economic pressure on lens choice. The choice of lens is a medical decision based on dialogue between provider and patient.

In the Czech Republic, the number of cataracts rose from 99 000 to 131 000 between 2010 - 2020, which means 12 476 surgeries per million people in 2020. This is significantly higher than 5 976 surgeries per million in Slovakia (32 268 surgeries in total). Although this was heavily influenced by COVID-19 pandemics, in Slovakia the drop of surgeries was -24%, while in Czech Republic only -6%:

4. Finance

Economic Aspects of Bankruptcies of the Business Entities in Slovakia in the Post-Covid Period

Ján Vravec^{1,*}, and Jaroslav Korečko¹

¹ University of Presov, Department of Finance, Accounting and Mathematical Methods,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The paper discusses the economic aspects of bankruptcies of Slovak business entities in the post-covid period. The COVID-19 pandemic caused Slovak business entities various financial, economic, personnel and other problems that complicated business activity. During the pandemic COVID-19, many Slovak business entities, particularly small and medium-sized enterprises, found themselves in very challenging economic situations, mainly due to the overall impact of government measures and state aid being relatively low, especially when compared to the strong negative economic impacts caused by COVID-19 pandemic.

Purpose of the article: The paper seeks to identify and analyse the diverse economic aspects of the COVID-19 pandemic, as well as the economic issues and consequences associated with the pandemic. Slovak business entities that did not have sufficient financial reserves available from previous years, and whose incomes dropped significantly during the pandemic, experienced a very turbulent business period. The most significant negative impact on business outcomes in Slovakia was undoubtedly the prolonged lockdown, which often led to business interruptions and, in some cases, bankruptcies.

Methods: The comparing data and the questionnaire survey.

Findings & Value added: The identification and analysis of weaknesses and problems of bankrupt business entities can contribute to the prevention of negative situations in other Slovak enterprises and the prevention of bankruptcies.

Keywords: corporate bankruptcies, financial problems of businesses, post-covid period

JEL classification: G33

1. Introduction

The COVID-19 pandemic has had a very adverse impact on a significant number of business entities worldwide, including in Slovakia. Many businesses have encountered serious financial problems, and some have even gone bankrupt. While it is true that the negative effects mostly affected economically vulnerable sectors and businesses with low efficiency and productivity, many successful enterprises also faced difficulties. Business entities with higher efficiency and productivity had a greater likelihood of receiving government aid and support, although usually with a lower proportion relative to their total revenue. As a result of the COVID-19 pandemic, financially unsustainable or declining companies received resources in lower volumes and with a lower probability.

Various economic analyses (such as Schivardi and Romano 2021 or Buchta et al. 2020) have shown that business entities may soon struggle with a liquidity shortage in connection with pandemic measures. The speed and scope of the economic shock related to the COVID-19 pandemic called for prompt and extensive responses. The threat of massive layoffs and declining investments motivated governments to take significant measures to prevent an excessive increase in business bankruptcies and unemployment in order to mitigate the economic downturn. The most common and significant measure adopted by EU member states was employment support in the form of subsidies to maintain jobs in companies. (Schivardi & Romano, 2021; Buchta et al., 2020)

* Corresponding author: jan.vravec@unipo.sk

The COVID-19 pandemic affected the entire European Union, but in different ways and in different spheres of the economy. In the area of the labor market and employment, the pandemic has affected almost all EU countries. In general, employment in all EU countries (except Romania) fell, which was a significant economic impact of COVID-19. In 2020, employment was most severely affected by COVID-19 in Sweden, Ireland and Spain. The biggest changes were recorded in Germany in all sectors of the economy. As expected, the largest decline in employment was recorded in wholesale and retail, transport, accommodation and catering services, and real estate activities. The pandemic years did not significantly change the structural picture of employment and economic differences between EU countries. (Markowska & Sokółowski, 2023)

The spread of COVID-19 caused a significant economic shock, especially for employment and other economic aspects. Incomes and employment were partially protected, but the long-term effects proved to be quite significant. Unemployment and economic problems will increase - it's just a question of how much it affects economic and business entities development. Government measures were needed primarily to get people back into work quickly, to minimize and to achieve an optimal match between the skills that individuals have and those that employers demand. The COVID-19 pandemic most threatened young people, pensioners and other vulnerable population groups. (Mayhew & Anand, 2020)

Bankruptcies of business entities can be predicted to a certain extent. Bankruptcy prediction models are very important for identifying business entities facing potential bankruptcy. The main purpose of these models is to help business entities determine whether they are at risk of bankruptcy in the near future. They were developed based on the results of scientific research and are mostly intended for a specific group of companies according to their field of activity. The essence of these models is that business entities have experienced anomalies for some time before bankruptcy, and the values of the indicators of prosperous enterprises differ significantly from the indicators of non-prosperous enterprises. Prediction models can provide business entities with a certain degree of probability of occurrence of a negative financial situation. (Horváthová & Mokrišová, 2020)

The external economic aspects and influences are very important, it is necessary to pay attention to the financial health of businesses, which is a prerequisite for their existence. Determining the state of financial health of a company as well as its competitive position in the industry is nowadays a significant challenge for all business entities. In order to determine the real financial condition of the business entities, it is necessary to apply adequate methods and tools. In our research, statistical and graphical tools, as well as a non-statistical DEA model, were applied. These offered some important information on how to increase the company's performance and ensure its financial health. (Štefko et al., 2021)

Various statistical models can be used to predict the risk of bankruptcy of a business entity. Classic linear discriminant analysis and logistic regression are effectively used to classify banks as business entities. Applied predictions can also be based on so-called classification trees and nearest neighbor methods. Empirical verification of the correct classification by given groups of methods of statistical analysis of bankruptcy from the point of view of their effectiveness showed that the methods and can be characterized as having a high quality of bankruptcy prediction. Various models make it possible to easily evaluate the threat of bankruptcy for a given group of business entities. (Brożyna et al., 2016)

A significant problem of bankruptcies of business entities is often also the legislative environment and its instability. Due to too frequent and repeated amendments to the bankruptcy legislation, the legal certainty of the participants in business and contractual relations is reduced, which leads to a decrease in investment activities. Based on the application of this principle, it is also necessary to examine the issue of the proposal to declare bankruptcy, filing of claims, creation and competence of creditor bodies and dealing with claims as the main areas of discussion of the decree. Legislative aspects of bankruptcy of a business entity are an important part of this process. (Kliestikova et al., 2017)

After the end of the COVID-19 pandemic, it will be necessary to take measures to revive the economy. Given that Slovakia has the highest corporate income tax rate in Central and Eastern Europe. The income tax rate (21 % in Slovakia) should be reduced in order to improve the conditions for business entities. The result could be an improvement of the business environment in Slovakia to make the country more competitive. Depreciation of fixed assets can support research and investment and increase the number of business registrations. In the long term, the government should support innovation and technological development. This has the potential not only to improve the productivity of SMEs, but also to contribute to the transition to a more sustainable knowledge-based economy, reduce regional disparities and increase employment. (Pažický, 2021)

1.1 Economic support for the business entities in Slovakia

The legislative adjustments and economic support for the business entities in Slovakia were implemented in such a way as to enable effective business operation and initiate the process of business recovery after the end of the COVID-19 pandemic. Temporary protection created conditions for the viability and operation of businesses after its termination. Despite several measures that were implemented on a broad scale, the institute of temporary protection is based on the possibility rather than obligation.

The use of temporary protection was considered mainly in cases where business entities needed such regulation primarily for protection against creditors. The current economic situation is characterized primarily by the complexity of relationships between suppliers and customers, including financing entities. Entrepreneurs have felt the impact of COVID-19 in the form of restrictions on operating a significant number of businesses. However, the effects of temporary protection should be balanced not only with regard to preserving the business but also considering the interests of creditors. Every entrepreneur with registered office or place of business in Slovakia, whose business authorization was established before March 12, 2020, and meets the requirements stipulated by law, was entitled to apply for temporary protection. The application was submitted through a designated court form, and if the applicant was a legal entity, the application was submitted electronically. (Deloitte, 2020)

The institute of temporary protection does not apply to selected financial institutions such as banks, insurance companies, reinsurers, health insurance companies, securities exchanges, and central securities depositories due to the special nature of these entities. The effects of temporary protection are intended to apply only to business entities that have or are likely to encounter an adverse situation solely as a result of the coronavirus pandemic and the declaration of a state of emergency.

A Slovak business entity must meet the material prerequisites for granting temporary protection, which are as follows:

- A significant increase in the number of receivables past the due date or a substantial decrease in revenues compared to the same period in 2019, significantly endangering the business operation. If the applicant did not conduct business during that period, February 2020 is considered period.
- The business was not bankrupt as of March 12, 2020, and there are no reasons for its dissolution.
- No bankruptcy proceedings or permission for restructuring have been initiated against the business.
- No enforcement proceedings were conducted against the business as of March 12, 2020, to satisfy a claim arising from its business activities.
- No enforcement of a lien on the business, property, right, or other asset belonging to the business had commenced as of March 12, 2020.
- In the calendar year 2020, the business did not distribute profits or other equity resources or eliminated the consequences of such actions.
- In the calendar year 2020, apart from measures aimed at mitigating the consequences of the spread of the dangerous contagious human disease COVID-19, the business did not take any other measures endangering its financial stability or eliminated the consequences thereof, maintains proper accounting, and fulfils the obligation to prepare financial statements. (Deloitte, 2020)

1.2 Profitability, solvency and liquidity of the business entities in Slovakia

The COVID-19 pandemic caused a temporary decline in the profitability of the business entities in Slovakia, but it did not have a long-term impact on the solvency of the corporate sector. This was mainly due to the ability of Slovak companies to compensate for the decline in revenues by reducing their costs to a large extent. Economic support from the state also contributed to mitigating the losses. The share of loss-making companies in Slovakia increased only slightly compared to the pre-crisis period, and the impact on solvency was very low. However, it cannot be completely ruled out that there may be some lingering effects of the crisis in the form of additional failures of certain corporate loans and bankruptcies of business entities. The pandemic support effectively contributed to mitigating the impact of the crisis on the corporate sector, especially for medium and large enterprises. Without economic support, the impact on business profitability would have been twice as large.

In 2020, the COVID-19 pandemic caused a revenue loss in all business size categories. The year-on-year decline in revenues was up to 10 % in most companies, while a quarter of micro-enterprises experienced a revenue drop of more than 50 %. Small and medium-sized enterprises faced a more significant decline in revenues, while the micro-enterprise segment, on average, had a smaller decline, but the development was more heterogeneous, with slower revenue growth in this segment even before the crisis. Companies were able to compensate for the revenue drop to a large extent by reducing costs.

In each size category, this cost reduction accounted for 85 % to 87 % of the revenue decline. This reduction primarily involved cutting regular variable costs, while reducing wage costs played a relatively small role. With the help of funds from state support schemes (First Aid / + / ++), companies covered an additional 3 % to 7 % of the revenue loss. Large and medium-sized enterprises recorded the highest coverage rate of revenue loss through cost reduction and state support. The remaining uncovered portion of the revenue loss almost entirely resulted in a decrease in profit or incurred losses. (NBS, 2021)

Slovak business entities are also striving to reduce their tax obligations. Some Slovak business entities are relocating their headquarters to tax havens. The number of Slovak business entities in tax haven countries has been increasing since 2008. Business entities are thus attempting to avoid tax obligations in Slovakia. In 2020, the number of Slovak companies in tax havens reached 5,274, which is an increase of 3,271 companies compared to 2008. In 2008, there were only 2,003 Slovak companies in tax havens. (Jenčová et al., 2021)

From a longer-term perspective, it is important to note that the coronavirus crisis did not pose a threat to the solvency of the majority of companies. The crisis had only short-term consequences for most companies, primarily resulting in a decline in profit and the postponement of investments in modernization, innovation, and efficiency improvement. On the other hand, the crisis did not cause a long-term deterioration in the situation (a decline in equity). However, compared to the pre-crisis year 2019, the share of companies in loss increased by only 2.2 %. Furthermore, the crisis did not lead to a significant increase in the number of companies with negative equity - the share of these companies increased only slightly by 0.3 %. (NBS, 2021)

2. Methods

The goal of the presented article is to identify and analyse the issue of bankruptcies of business entities during the COVID-19 pandemic and post-COVID-19 period in Slovakia. To achieve this goal, data comparison methods and a questionnaire survey method were utilized.

Comparison of secondary data:

The article utilizes relevant scientific methods, specifically the comparison of secondary data on newly established business entities and bankrupt business entities in Slovakia. The comparison was conducted for the period from 2012 to 2023 based on FinStat data. The aim of the comparison is to identify how the COVID-19 pandemic has influenced the establishment and closure of business entities.

Questionnaire survey:

A questionnaire survey was also conducted to investigate the opinions of entrepreneurial entities regarding the impact of the COVID-19 pandemic. A total of 225 business (Table 1) entities with headquarters in Slovakia participated in the survey. The respondents included small, medium, and large businesses from various sectors of the national economy. The questionnaire survey was carried out in the first half of 2023 across the entire territory of Slovakia, with the questionnaires being sent via email. Over 300 entities were approached, and 225 completed questionnaires were considered usable.

Table 1. Structure of questionnaire survey respondents (business entities)

Number of employees	Service companies	Wholesale and retail businesses	Construction companies	Manufacturing companies	Together
1 - 9	22	24	14	21	81
10 - 49	27	18	12	20	77
50 - 249	9	10	12	11	42
250 and more	4	6	8	7	25
Together	62	58	46	59	225

Source: Authors (2023)

The questionnaire survey focused on the following areas:

- The impact of the COVID-19 pandemic on Slovak business entities.
- Measures taken by business entities in response to the pandemic.
- Overall revenues and profitability of business entities.
- Satisfaction with government assistance and state institutions during the pandemic.
- Prediction of business development and prevention of bankruptcies of business entities.

3. Analysis of bankruptcies of the business entities in Slovakia

Bankruptcies of business entities associated with the COVID-19 pandemic period can be best analysed by comparing their frequency. For a more comprehensive analysis, it is necessary to consider not only bankruptcies, but also newly established entrepreneurial entities in the same observed period. The legal forms are included in the statistics on the creation and bankrupt of companies: limited liability companies, joint stock companies, simple stock companies, joint stock companies, public commercial companies, cooperatives and European cooperatives.

Based on the data obtained from InfoStat, it is possible to analyse the development of the number of newly established and ceased business entities for the period from 2012 to 2023. As can be seen (Figure 1), the number of newly established business entities in Slovakia from 2012 to the first half of 2023 was practically steady, hovering around 20,000 entities. A significant increase in the number of newly established entrepreneurial entities was recorded mainly towards the end of 2013, shortly before a legislative change regarding the required repayment of the basic capital of a business company. According to the new amendment to the Commercial Code, it was no longer possible to pay the basic capital in cash directly to the deposit administrator; it became necessary to transfer it to a separate bank account.

In 2014 and 2015, there was a period of decline in the establishment of new business entities due to the fact that their number was above average in 2013. From 2016 until the present, the number of newly established entrepreneurial entities in Slovakia has stabilized at around 20,000.

Figure 1. Number of newly established business entities in Slovakia for the period 2012-2023

Source: <https://finstat.sk/analyzy/statistika-poctu-vzniknutych-a-zaniknutych-firiem> (2023)

On the other hand, the number of bankrupt business entities in Slovakia is not as consistently uniform as their establishment. The number of bankrupt business entities reached its peak in the COVID year of 2021 (Figure 2). A high number of business closures (15,300) were largely caused by the COVID-19 pandemic, but legislative changes also contributed to this. In 2021, the goal of the Government of Slovakia was to clean up the Commercial Register from legal entities that should no longer be registered in the Commercial Register by their nature, as well as from inactive companies that have not fulfilled their obligations to state authorities over the long term.

Figure 2. Number of bankrupt business entities in Slovakia for the period 2012-2023

Source: <https://finstat.sk/analyzy/statistika-poctu-vzniknutych-a-zaniknutych-firiem> (2023)

An increased number of bankrupt business entities in Slovakia could also be observed after the introduction of tax licenses in 2013. From 2015 to 2017, the number of dissolved businesses in Slovakia remained at less than 9,000 entities. Since 2018, the number of bankrupted businesses in Slovakia has

decreased to values seen before 2014. Figure 2 shows a sharp increase in the number of dissolved businesses in 2021, when the so-called "cleaning up" of the Commercial Register took place, and undoubtedly, business entities that went bankrupt in connection with the COVID-19 pandemic also had a significant contribution to this increase. In the period of 2022, the number of bankrupt business entities in Slovakia has decreased significantly to 6,293, essentially reaching the pre-crisis level of bankruptcies.

4. Results of the questionnaire survey

The impact of the COVID-19 pandemic on Slovak business entities

The impact of the COVID-19 pandemic on Slovak business entities was assessed through questions regarding how the pandemic negatively affected their business activities. A significant negative impact related to the COVID-19 pandemic was experienced by 84.4 % of Slovak business entities. 67.1 % of business entities felt a significant negative impact on their businesses, while an additional 17.3 % of the surveyed entrepreneurs felt a slight negative impact. About 7.1 % of the surveyed business entities experienced a significantly positive impact from the pandemic, while 6.6 % experienced a slight positive impact. The pandemic did not affect 4.4 % of the companies in either a positive or negative way.

Measures taken by business entities in response to the pandemic

In response to the COVID-19 pandemic, the majority of Slovak business entities were forced to implement a wide range of measures to save their businesses and reduce losses. Entrepreneurs had to adapt their production to meet the new market needs. Nearly half (46.2 %) of the business entities in Slovakia had to adapt their goods and services to the new pandemic conditions. About 52% had to utilize their reserves from the past to sustain their businesses. One-third (35.1 %) of the surveyed business entities responded to the COVID-19 pandemic by reducing the working hours of their employees. A more drastic measure, such as employee layoffs, was used by almost a quarter (24 %) of the surveyed companies. The food service industry had the highest number of employee layoffs during the pandemic, with over half of the restaurants and food establishments (55 %) laying off their employees.

Overall revenues and profitability of business entities

Within different sectors of the economy, the decline in revenue was most pronounced in sectors that were heavily impacted by anti-pandemic measures, such as food services, hotels and other forms of accommodation, the creative industry, and entertainment. Up to 71 % of the surveyed business entities in Slovakia experienced a significant drop in revenue. During the pandemic, 12% of business entities experienced a slight decrease in sales, and 8% of business entities throughout Slovakia experienced no decrease. During the early stages of the second wave of the crisis, a larger number of entrepreneurs experienced smaller declines in revenue compared to the first wave of the pandemic. Half of the surveyed companies experienced a revenue decline of over 50 % compared to the same period before the COVID-19 pandemic. In Slovakia 80.4 % of the business entities experienced a decrease in profitability during the pandemic. Up to 62.2 % of entities recorded a significant decrease in profitability, profit did not decrease in more than 10 % of business entities in Slovakia.

Satisfaction with government assistance and state institutions during the pandemic

Regarding the implementation of anti-pandemic measures, several business entities expected more significant assistance. The results of the questionnaire survey showed that the assistance from the state and its institutions did not come close to compensating for the loss of revenue and profit that entrepreneurs had to deal with. The decline in revenue was significantly higher than the assistance provided by the state in almost half of the surveyed businesses (48.5 %). The situation was particularly dire among entrepreneurs in the gastronomy sector, where over two-thirds of the entities (66 % of entrepreneurs) experienced a significantly higher decline in revenue compared to the state aid. State aid and support were able to fully or partially compensate for the revenue loss caused by the outbreak of the pandemic in less than one-fifth of the businesses (17.8 %). For various reasons, about 33.7 % of the surveyed business entities have not utilized state aid and support so far.

Prediction of business development and prevention of bankruptcies of business entities

The field of predicting the future development of entrepreneurial activity is relatively favourable. Up to 62 % of business entities in Slovakia expect higher revenues and profits in 2023 compared to the pre-COVID-19 period. Only 3.1 % of business entities that have overcome the pandemic period are at significant risk of bankruptcy. A mild risk of bankruptcy is present in only 4 % of business entities in Slovakia that have survived the pandemic period. These results are very interesting, especially with regard to the overall financial and economic stability of Slovak business entities.

The seriousness of the COVID-19 pandemic in Slovakia is evidenced by various proposed measures to prevent the bankruptcy of business entities. Entrepreneurs primarily demand a reduction in payroll burdens (66.7 %), and nearly half of the business entities (49.7 %) prefer measures in the form of direct subsidies and grants for the business sector when the national economy is going through a crisis period (such as COVID-19). These findings clearly indicate the priorities on which the government in Slovakia should focus.

Table 2. Results of the questionnaire survey of business entities in Slovakia

Main groups of survey questions	Strongly disagree % (number)	Disagree % (number)	Neither agree nor disagree % (number)	Agree % (number)	Strongly agree % (number)
Negative impacts of the COVID-19 on the functioning of a business entity	5.7 % (13)	4.4 % (10)	5.3 % (12)	17.3 % (39)	67.1 % (151)
Positive impacts of the COVID-19 on the functioning of a business entity	61.8 % (139)	20.0 % (45)	4.4 % (10)	6.6 % (15)	7.1 % (16)
Adaptation of goods and services due to the COVID-19 pandemic	23.1 % (52)	20.4 % (46)	10.2 % (23)	18.2 % (41)	28.0 % (63)
Utilization of own financial resources due to the COVID-19 pandemic	18.7 % (42)	18.2 % (41)	11.1 % (25)	20.0 % (45)	32.0 % (72)
Reduction of working hours of employees of the business entity	37.3 % (84)	24.0 % (54)	3.6 % (8)	16.0 % (36)	19.1 % (43)
Dismissal of employees from permanent employment in the business entity	46.7 % (105)	28.0 % (63)	1.3 % (3)	9.8 % (22)	14.2 % (32)
Significant drop in sales of entities during the COVID-19 pandemic	8.0 % (18)	12.0 % (27)	8.9 % (20)	28.0 % (63)	43.1 % (97)
Significant drop in profitability of business entities during the COVID-19 pandemic	5.3 % (12)	4.9 % (11)	9.3 % (21)	18.2 % (41)	62.2 % (140)
Insufficient help and support from the state during the COVID-19 pandemic	6.2 % (14)	11.6 % (26)	33.7 % (76)	19.6 % (44)	28.9 % (65)
Higher sales and profits in 2023 than before the COVID-19 pandemic	11.1 % (25)	15.1 % (34)	12.0 % (27)	23.5 % (53)	38.2 % (86)
Business entities at risk of bankruptcy in the post-covid period	51.1 % (115)	34.2 % (77)	7.6 % (17)	4.0 % (9)	3.1 % (7)

5. Discussion

Based on the comparison, the number of bankrupt business entities reached its peak in the COVID year 2021 (Figure 2). The number of bankrupt business entities in 2021 reached up to 15,300 entities, which represented more than a threefold increase compared to the years 2018, 2019, and 2020. However, after overcoming the COVID-19 pandemic, the average annual number of bankrupt business entities in Slovakia returned to its original level. This means that the critical years for business entities were mainly 2020 and 2021 when companies faced serious economic and financial problems. As a result of these issues, the number of business bankruptcies increased, particularly in 2021.

According to a similar study by author Blahušíaková, many Slovak businesses gradually adapted to the COVID-19 pandemic, adjusted to the conditions, diversified their service portfolios, changed their work methods, and so on. This was also reflected in their revenue levels. While in the accounting period of 2020, nearly 60.6 % of entrepreneurs experienced a decline in revenue, in the accounting period of 2021, it was only 51.8 % of entrepreneurs. In the accounting period of 2020, 38.7 % of entrepreneurs reported a revenue decline of more than 21 %, while in the accounting period of 2021, only 32.8 % of entrepreneurs reported a revenue decline of more than 21 %. The situation has also improved in terms of business closures. In the accounting period of 2020, 26.3 % of establishments closed, whereas in the accounting period of 2021, it was 16.1 % of establishments. (Blahušíaková, 2022)

Based on various surveys and, especially, on our own questionnaire survey, it can be stated that Slovak business entities faced the greatest problems in terms of revenues and profitability during the COVID-19 pandemic. According to our own questionnaire survey, revenues significantly decreased in 71.1 % of business entities in Slovakia. Regarding the profitability of companies, profits decreased in over 80 % of entities operating in Slovakia. The assistance and support provided by the government during the pandemic proved to be insufficient. Business entities evaluated the support from the government and state institutions as inadequate. Half of the business entities in Slovakia considered state aid to be insufficient, and one-third of entities did not use it at all.

Regarding the future of business entities, more than 70 % of companies in Slovakia plan to achieve higher revenues and profits after the pandemic in 2023. The risk of bankruptcy for companies that have already overcome the issues associated with the COVID-19 pandemic is relatively low. Only 3.1 % of business entities have significant concerns about the risk of bankruptcy, and only 4 % have minor concerns about the risk of bankruptcy in Slovakia. Overall, the results of the questionnaire survey can be considered relevant and beneficial.

An interesting topic for further research could also be the impact of COVID-19 on the sphere of innovation. According to some studies, the pandemic COVID-19 crisis had only a minor impact on innovation spending, as well as on the main consumers of innovation. At the business entities level, the COVID-19 pandemic has affected the industry distribution of innovation. Also at risk are the costs of innovation in developing countries and more unstable business entities. An increased imbalance in access to funding for innovation is possible. (Gavrilko & Pobochenko, 2021)

Conclusion

In Slovakia, negative impacts and consequences of the COVID-19 disease pandemic are experienced by 75 % to 95 % of the surveyed business entities in various economic sectors, according to various surveys. According to a recent questionnaire survey, a significant negative impact on business was reported by a total of 67.1 % of Slovak business entities, and a slight negative impact by an additional 17.3 % of the surveyed Slovak businesses. Overall, 84.4 % of business entities in Slovakia felt the negative consequences of the COVID-19 pandemic. These findings emerged from a questionnaire survey on the impact of the COVID-19 pandemic, which involved a total of 225 respondents from small, medium, and large companies located throughout Slovakia.

The surveyed business entities adjusted their products to the new market conditions in order to keep their businesses running in 46.2 % of cases. More than a third (35.1 %) of the surveyed business entities responded to the COVID-19 wave by reducing their employees' working hours. A more drastic measure, such as laying off employees, was implemented by nearly a quarter of the entrepreneurs (24 %). Sales decline during the pandemic affected 71.1 % of Slovak businesses, and more than 80% of business entities experienced a decline in profits. A very interesting fact is that only 3.1 % of business entities that survived the COVID-19 period face a significant risk of bankruptcy. A mild risk of bankruptcy is faced by only 4% of business entities in Slovakia that survived the COVID-19 period. Overall, 7.1 % of business entities in Slovakia perceive the risk of bankruptcy in the post-pandemic period.

The limitation of recent questionnaire survey was primarily the number of respondents and the survey period. Further survey will require a larger research sample and a longer time period. In this way, the results of these survey could be more relevant and qualitative.

These surveys make it evident that COVID-19 significantly impacted the business environment in Slovakia. Within individual sectors of the Slovak economy, financial and economic problems were most pronounced in business entities that were most affected by anti-pandemic measures. These were mainly business entities in the service sector, especially tourism, catering and restaurant services, as well as art and creative industries. A significant decline in revenue and profitability during the COVID-19 period was observed in the majority of Slovak business entities.

Slovak business entities perceived the utilization of state aid and support as chaotic, unsystematic, and administratively demanding. Therefore, in many cases, they did not even request any form of assistance and support, although they would likely be entitled to it. In this regard, entrepreneurs would prefer targeted forms of assistance with clearly defined conditions and rules, primarily covering all fixed costs as well as the overall labour costs. The deferral of tax payments, insurance premiums, and loan instalments is considered counterproductive, as it only postpones the payment rather than forgiving it.

The COVID-19 pandemic significantly impacted the business environment in Slovakia, as evidenced by the increase in financial problems and the number of bankruptcies among business entities, especially in the year 2021. For these reasons, supporting business entities in Slovakia should be a priority for the Government of Slovakia as well as the members of the National Council of the Slovak Republic, as economic reforms, quality legislation, and effective measures can significantly support entrepreneurship and business entities in Slovakia.

Bankruptcy Risk Prediction using Artificial Intelligence: An Empirical Study of the Slovak Chemical Industry

Stanislav Letkovský¹, Marta Miškufová^{1,}, Sylvia Jenčová¹, and Petra Vašaničová¹*

¹ University of Prešov, Department of Finance, Accounting and Mathematical Methods, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: Bankruptcy prediction is important in business management, especially in the context of increasing competitiveness. Assessing the financial health of business entities using various models is an important area in not only scientific research, but also business practice. Comparing financial results and bankruptcy risk estimation is also important in economic practice.

Purpose of the article: This study aims to apply an artificial neural network (ANN) to predict the bankruptcy of non-financial corporations in the chemical industry of the Slovak Republic. We compared the results of artificial neural network with logistic regression.

Methods: We used multi-layer perceptron artificial neural network (ANN-MLP) with feed-forwarded connections and back-propagation (BP) type of learning for prediction the bankruptcy of non-financial corporations in the chemical industry of Slovakia. We tested nine prediction models on a sample of 663 chemical companies in Slovakia from 2020 and 2021, while we used five financial indicators. The results were compared with logistic regression.

Findings & Value added: An optimal neural network model was created for predicting risk bankruptcy in the chemical industry of the Slovak Republic. Our model can be applied in countries with undeveloped capital markets. We constructed an optimal network for the chemical industry using five financial indicators on the input layer in combination with one hidden layer (eight hidden nodes). All models achieved high accuracy.

Keywords: bankruptcy prediction, risk, chemical industry, artificial neural network, logistic regression

1. Introduction

In business management, it is important to understand the financial and economic situation and react promptly in the event of impending danger. Various simple models, more complex statistical functions, and artificial intelligence have been used to predict bankruptcy. One frequently used and successful technique is an artificial neural network (ANN). The existing models were created for the particular conditions of a given economy during a specific period. Therefore, they are not directly applicable to Slovak conditions. Adjusting these models to align with the unique conditions of Slovakia is essential. In this context, this study aims to apply an artificial neural network to predict the bankruptcy of non-financial corporations in the chemical industry of the Slovak Republic during the period 2020-2021. Slovakia has a strong tradition in all major segments of the chemical industry, including petroleum refining, production of chemicals, fertilizers, rubber and plastics production. The portfolio of products is also influenced by Slovakia's strong automotive and electronics sectors, which serve as constant clients for different companies from the chemical industry. Unlike in some other countries, the output of the Slovak chemical industry does not consist of one product or a group of few products, but includes a diversified portfolio of hundreds of different products, ranging from petrochemicals, agrochemicals, and primary organic/ inorganic chemicals, to rubber and plastic products. Chemical industry has traditionally been one of the largest sectors of Slovak economy, so we chose this sector for analysis.

1.1 Literature review

As a fundamental economic entity of a market economy, an enterprise is linked to its activity by various financial resources. Financial and economic analysis is used to evaluate the financial situation of a company. This analysis provides a summary of the company's performance during the evaluation period. Vochozka (2020) describes it as a formalized method that provides an understanding of a company's financial health with the advantage of an analytical and systemic approach to the company's activities. Lukáč & Rozkošová (2017) present it as a tool for uncovering strengths and weaknesses and evaluating the past, present and future state of the company. Financial indicators used to evaluate the company are classified into liquidity, activity, profitability, indebtedness, and market value.

Banks and financial institutions frequently employ bankruptcy prediction models to evaluate clients and determine the level of risk associated with their business. This helps to evaluate the creditworthiness and determine the classification of the company based on potential credit risk. Such models are also referred to as rating models, and their primary task is to estimate the probability of a borrower defaulting within a year. As an early warning system, companies frequently use the forecast for their own purposes. The first works comparing healthy and bankrupt company indicators date back to Fitzpatrick (1932) and Fisher (1936). The initial scoring functions were simple models such as univariate discriminant analysis applied by Beaver (1966) and Altman (1968), who used linear discriminant analysis based on five financial indicators. The next level of models included logistic regression (Ohlson, 1980) and probit (Zmijewski, 1984).

With the gradual development of technologies, other methods based on artificial intelligence are becoming more popular. The suitability of using an artificial neural network was proven in the work of Odom & Sharda (1990). Current models based on artificial intelligence are expanding and creating various hybrid models that increase their accuracy. Garcia (2022) reports that nonlinear models based on machine learning achieve better results and more accurately determine bankruptcy than traditional statistical methods.

One of the main issues with bankruptcy prediction data is the representation of individual samples in the analyzed set. Generally, the representation of bankrupt samples is much smaller than non-bankrupt samples, leading to the tendency of the model to fit non-bankrupt samples. The high imbalance of data is also confirmed by Wang & Liu (2021) and Garcia (2022), who try to compensate for the imbalance with various statistical methods (e.g., resampling, generation of synthetic samples).

The artificial neural network model is based on the simplified principle of the neural structure of the brain. Learning consists of gaining experience, and information is stored in patterns. The artificial neuron is the basic unit of the network, and its principle is to receive input signals, combine them, perform a non-linear operation (using the activation function), and then produce a signal at the output. By organizing the same nodes, layers (input, hidden, output) can be created, forming a network by connecting to each other. The input layer consists of input neurons that receive signals from the external environment. The neurons producing the output of the network form the output layer and all the others are the hidden neurons. The network consists of one input layer, one output layer, and a certain number of hidden layers (or none) (Grumstrup et al., 2021; Sahoo & Pradhan, 2021).

The most frequently used network structure for prediction is the multi-layer perceptron (MLP). Networks connected without feedback, i.e., information passes gradually through the individual layers only from the input to the output and does not get back, are referred to as feed-forward (FF). Conversely, when using feedback (recurrent networks), they are referred to as feed-back (FB) (Kabir, 2021). Table 1 shows a comparison of studies by various authors using this type of network.

Table 1. Comparison of bankruptcy prediction with ANN

Author(s)	Models	Number of indicators	Research set				Period	Country	Accuracy
			Number of businesses			ANN			
			Non-bankrupt	Bankrupt	Overall				
Kasgari et al. (2013)	ANN (Probit)	4	71	65	136	1999 – 2006	Iran	95 / 94	
Lee & Su (2015)	ANN (Logit)	10	60	60	120	2006 – 2009	Taiwan	96.3 / 82.3	
Hosaka (2019)	Convolutional ANN (LDA, SVM, MLP, AdaBoost)	6	2,062	102	2,164	2002 – 2016	Japan	84.8	

Thanh-Long et al. (2022)	ANN (SMOTE)	20	1,218	44	1,262	1970 – 2008	USA	80
Sigrist & Leuenberger (2023)	ANN (Tree Boost)	14	18,833	1,402	20,235	1961 – 2020	USA	93.1

Source: own processing

The selection of predictors is a crucial aspect of modeling as the resulting performance of the model heavily depends on them. However, there is no exact procedure for their selection indicated in the literature and most studies rely on using predictors that achieve the highest accuracy in the modeling process. Popular predictors from previous studies are also often selected or stepwise method is employed to choose a few strong predictors from a larger set of available ones. Vochozka (2020) notes the great variety of predictors used and the ambiguity in their selection. Hammond et al. (2022) attempt to identify prediction factors using expert methods, while Valášková et al. (2018) use multiple regression, and Mihalovič (2018) employs evolutionary algorithms to select suitable predictors.

2. Methods

This study aims to apply an artificial neural network to predict the bankruptcy of non-financial corporations in the chemical industry of the Slovak Republic. The total dataset consists of 1,683 non-financial corporations in the chemical industry of the Slovak Republic, classified as SK NACE 19, SK NACE 20, SK NACE 21, and SK NACE 22.

Type of network was selected as MLP (multi-layer perceptron) with feedforward connections only and back-propagation (BP) for learning. BP is part of the process in which the neuron weights are adapted according to the current output error signal. This process continues iteratively and makes the network 'learn' what is the response for actual inputs. This algorithm propagates the error toward the network input, where the error in some layers is defined as the sum of the errors in the next layer of neurons with corresponding weights.

For the calculation, we used the financial indicators of non-financial corporations in the chemical industry. Financial indicators were calculated based on absolute indicators from the financial statements of non-financial corporations. Absolute indicators were obtained from the Register of Financial Statements of the Slovak Republic for the years 2020 and 2021. From the dataset, 20 financial indicators were compiled and analyzed for each category (liquidity, profitability, indebtedness, and activity). From these financial indicators, five ratios were selected based on previous research and literature to predict bankruptcy. The stepwise method was used to construct neural networks models. We used the following five financial indicators as inputs for the neural network:

- *ROS* - return on sales,
- *TI* - total indebtedness,
- *FL* - financial leverage,
- *CL* - current ratio,
- *NWC/A* - share of net working capital to assets.

Samples with missing data for the selected indicators were excluded from the analysis. The interquartile range method was used to remove inconsistent samples (outliers) from the database. An outlier can be considered as an inconsistent observation in the dataset. This observation may not even be from the same statistical distribution as the rest. The inter-quartile range ($Q3 - Q1$) produces 50% of most represented data (the middle 50% of a distribution). The deviated observation must be at the end of the distribution. The boundaries are set at a fixed distance from this range. The information contained in the values outside the boundaries is extreme and creates suspicion of an abnormality. We considered the boundary as three times the inter-quartile range, and observations outside these boundaries were removed. The resulting set consisted of 663 samples, including 56 bankrupt and 607 healthy ones.

Modeling was performed using the statistical program IBM SPSS Statistics, which includes artificial neural networks (MLP – multi-layer perceptron). The scaling of the samples was performed automatically by the software using the standardization method (rescaling of data with a mean value of 0 and a standard deviation of 1). Scaling is a pre-processing step which generally moves the centre of the coordinate system and lengthens or shortens the scale on the axes. It is important for comparing measurements with different units. The sigmoid function was used as an activation function, and several artificial neural network models with different configurations were created for comparison purposes.

The network had five input nodes (according to financial indicators), and the output of the network was 0 for healthy businesses and 1 for bankrupt businesses. Act no. 7/2005 Coll. on Bankruptcy and Restructuring defines bankruptcy as the ratio of equity to debt, while Act no. 513/1991 Coll. The Commercial Code specifies the minimum ratio for each year. In the analyzed period, this ratio was set at 8%, and samples with an equity to total debt ratio of less than 0.08 were considered bankrupt. The neural networks were assembled with one hidden layer (number of hidden nodes was either 3, 8, or 20), and the ratio of training and testing samples was 60:40, 70:30, or 80:20, resulting in a total of nine models.

Logistic regression, a standard and frequently used prediction method, was also performed on the data sample to compare accuracy. Due to the logistic regression condition, which requires independent variables to be uncorrelated, the input indicators were examined for multicollinearity. The *FL* indicator (financial leverage) was removed from the model due to high correlation. In the case of logistic regression, the model consisted of only four independent variables.

3. Results

We create an optimal neural network for non-financial corporations in the chemical industry of the Slovak Republic for 2020 and 2021. Best model was network with 8 hidden nodes, 5 input nodes and his schema is in Figure 1. Figure 1 shows the connections between the neurons. Lines have different thicknesses and colours. When the weight between the variables is less than zero, the lines are blue. When the weight has a value greater than zero, the lines are grey. Lines are thinner (thicker) as one moves closer (farther) to zero.

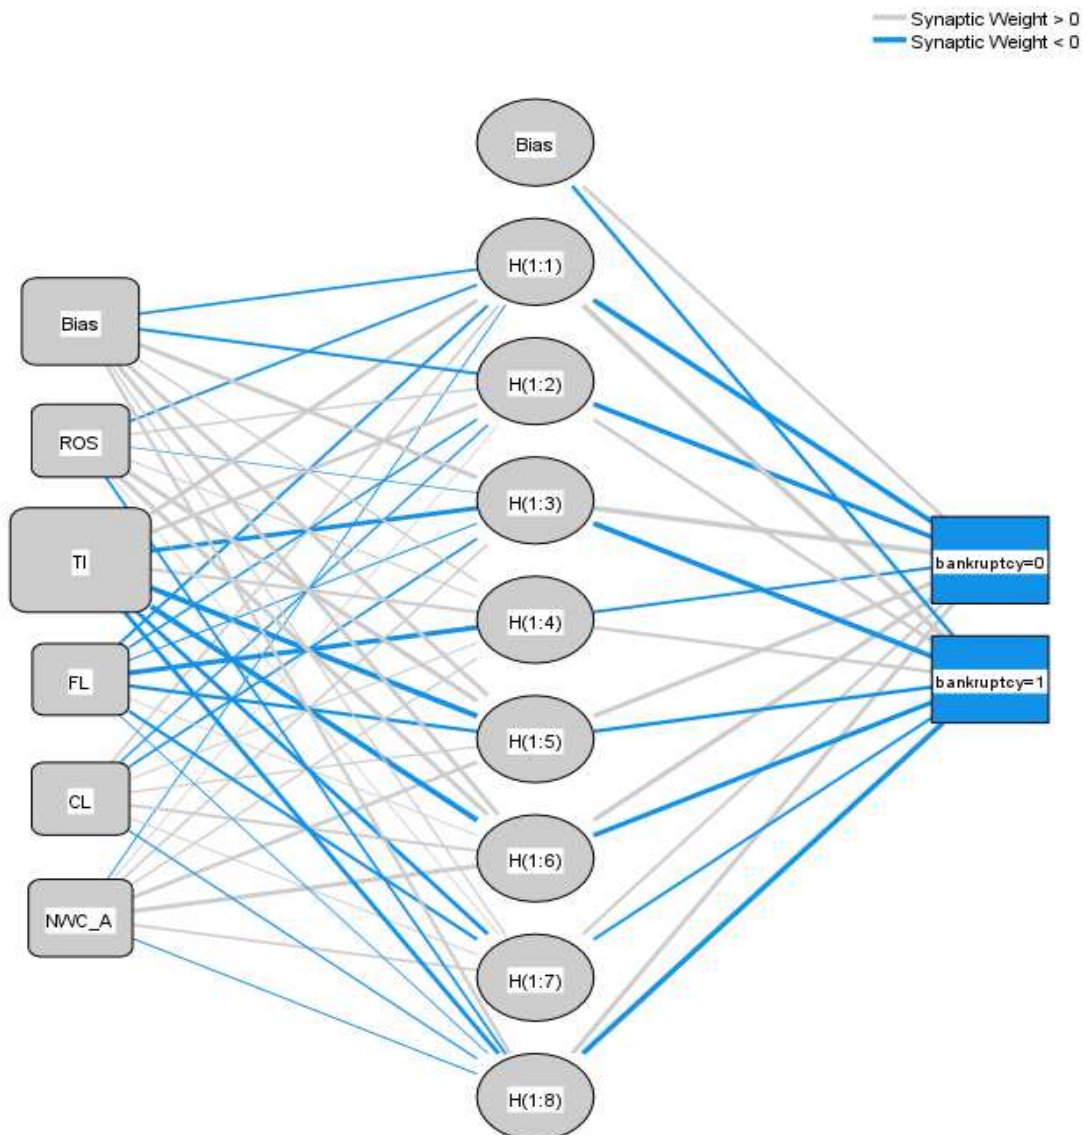

Figure 1. ANN bankruptcy prediction model for chemical industry in Slovakia
Source: own processing in SPSS

Predictors of profitability (*ROS*), indebtedness (*FL*, *TI*), and liquidity (*CL*, *NWC/A*) were used to estimate bankruptcy and an optimal neural network was created for the years 2020-2021 with one hidden layer with the number of hidden nodes 3, 8, or 20. The number of hidden nodes had no significant effect on the resulting accuracy. The *TI* predictor had the highest information weight (normalized importance over 90%), which is related to the fact that bankruptcy itself is defined by high indebtedness. Other predictors of *NWC/A* (23%), *ROS*, *CL*, *FL* were less than 10%. Estimated parameters for model are in Table 2.

Table 2. ANN prediction model parameters

Parameter Estimates											
Predictor		Predicted									
		Hidden Layer 1							Output Layer		
		H(1:1)	H(1:2)	H(1:3)	H(1:4)	H(1:5)	H(1:6)	H(1:7)	H(1:8)	[bankruptcy=0]	[bankruptcy=1]

All proposed models achieved high accuracy. The estimate of non-bankrupt samples was above 99% in all cases, probably due to their higher number of samples. The most important task of the model was to correctly identify bankrupt samples, which was also emphasized in this modeling. The best results were achieved by the model with 8 hidden nodes, which had only 37.78% accuracy of bankruptcy samples during learning, but 81.82% in the test set. The overall accuracy was 98.32% (Table 3). Area under the curve (*AUC*) was 0.865 for both predicted values (Figure 2).

Table 3. ANN prediction results

Hiddens		8		
Sample	Observed	Predicted		
		0	1	Correct
Training	0	438	1	99.77%
	1	28	17	37.78%
	Overall	96.28%	3.72%	94.01%
Testing	0	167	1	99.40%
	1	2	9	81.82%
	Overall	94.41%	5.59%	98.32%

4. Discussion

When we estimated the bankruptcy by logistic regression, overall accuracy was 95.17% (Table 4). The neural network model is more accurate, which is supporting by most studies (Kasgari et al., 2013; Lee & Su, 2015; Garcia, 2022). Like ANN, Logit estimated non-bankrupt samples with an accuracy above 99%, mainly due to the imbalance of the number of samples in the data set. Data imbalance was dealt in studies by Wang & Liu (2021) and Garcia (2022). They indicate that when the number of samples are equal, the prediction of bankrupt samples improves and the ratio of prediction of non-bankrupt and bankrupt samples also balances out.

Table 4. Logit prediction results

observed	Predicted		
	0	1	Correct
0	605	2	99.67%
1	30	26	46.43%
Overall	95.78%	4.22%	95.17%

Source: own processing

The importance of using five indicators in AAN follows from previous studies on company's financial aspects. First, the indebtedness indicators were represented by *FL* and *TI* (Purvinis et al., 2008; Kim & Kang, 2010; Nyitrai & Virag, 2019). *CL* and *NWC/A* belong to the liquidity indicators (Purvinis et al., 2008; Kim & Kang, 2010; Nyitrai & Virag, 2019). Finally, *ROS* is profitability indicator (Nyitrai & Virag, 2019).

Conclusion

This study dealt with the estimation of bankruptcy of non-financial corporations in the chemical industry of the Slovak Republic using an artificial neural network. As it is unlikely to create a general model that works under any conditions, several models applied to specific conditions have been proposed. The most frequently used type of network is the MLP (multi-layer perceptron) with back-propagation (BP), which was also used in this study. The aim of this study was to apply an artificial neural network to predict the bankruptcy of non-financial corporations in the chemical industry of the Slovak Republic. All proposed models used five indicators (four indicators in the case of Logit) and achieved high accuracy. Since there were only small differences in accuracy between models with different configurations, it is not

possible to determine the significance of increasing the number of nodes in the hidden layer. We found that a network with eight hidden nodes (one hidden layer, Sigmoid activation function) is the most optimal model after generalization.

The limitations of this work are mainly due to the short period of analysis (2 years), which was affected by the pandemic. Therefore, the results may differ from those in other periods. Qualitative data were not included in the model, and further studies could segment businesses by size or region. Additionally, the use of an unbalanced ratio of bankrupt and non-bankrupt samples is another limitation. Similar analysis could be conducted in other countries and sectors to compare the results. While these results can help financial analysts estimate risk, it is recommended to use multiple methods and compare the results for a more comprehensive assessment.

Dividend Policies Adopted by the Banks. Their impact on the prospects of the Greek Banking System

Pantelis F. Kyrmizoglou^{1,*}

¹ International Hellenic University - Thessaloniki,
14th km Thessaloniki - N. Moudania National Road, 57001 Thermi, Greece

Abstract

Research Background: The author got interested in the topic of the article after more than seven years of employment in the Greek Banking System and especially in Ergobank, which is the core of our current study. The lack of studies in the field of dividend policy of the Greek Banks and the familiarity of the author with the particularities of Ergobank, led us to deal with the specific topic.

Purpose of the article: We are dealing with observed practices adopted by Greek Banks, with special emphasis on the extremely “generous” dividend policy exercised by Ergobank (a medium-sized Greek Bank, small-sized with international standards) and evaluate the consequences of this particularity on the prospects of the specific Bank.

Methods: We have used a small scale survey to show the impact of dividend policy of Ergobank on the continuous increase of its share’s price. We also calculate the ROA, ROE and DPR ratios of the Bank for 25 years, relying in all the published financial statements.

Findings & Value added: Taking into account the answers of the interviewed former employees of Ergobank, regarding its dividend policy, we concluded that they are closer to the bird in the hand theory of Gordon and Lintner and not with the dividend irrelevance theory of Miller and Modigliani.

Keywords: dividend policy, banking system, banks, Ergobank, Greece

JEL classification: G35

1. Introduction

It is beyond any doubt that the dividend policy exercised by the management of any company shows the extent of interest of the management for the shareholders and (in our opinion) certainly affects them and the potential shareholders in their attitude towards buying or selling shares.

In the context of this paper, we will first describe the existing framework and restrictions ruling the dividend policy in Greece, and then we will refer to the case of Ergobank, which followed an “extreme” dividend policy. We will continue with the calculation of certain financial ratios of the specific bank and their evaluation and impact on the prospects of the bank. We have carried out a survey addressed to former employees of Ergobank in order to know their views concerning the followed by the bank dividend policy.

Finally, we will try to draw some conclusions regarding the role of the dividend policy of any bank in the prospects of the overall banking system.

1.1 The Existing Framework

It has been observed that the vast majority of the companies enlisted in the Athens Stock Exchange, do not follow a standard predetermined dividend policy. This is the case for all the companies including the banks, when the latter were distributing profits to their shareholders. Their unwillingness to distribute dividends is attributed mainly to the difficulties in raising funds through an increase of share capital. These difficulties have soared especially since 2010, when the problems of the Greek economy showed up. Of course in the case of banks, dividends have been vanished due to the losses or lack of sufficient profits or due to the recommendations of the central bank to avoid the distribution of dividends in times of successive recapitalizations.

* Corresponding author: pkirmiz@acc.teithe.gr

In Greece there are restrictions on the exercised dividend policy, which are imposed by the existing legislation. According to these restrictions, 5% of the net profits is channeled towards the creation of a necessary reserve capital. The obligation of the company stops when the necessary reserve capital reaches the 1/3 of the share capital . On the other hand, according to legislation, companies have to distribute an amount of at least 6% of the share capital (called first dividend). Of course legislation leaves room to the general assembly of the company to decide. Non-distribution of dividends requires a majority of 3/4 of the votes represented in the general assembly (Kiochos P.-Panagou V.)

2. The Case of Ergobank

Ergobank was a medium-sized Greek bank (small-sized with international standards), established in 1975. The founder of the bank (a charismatic personality) managed to convince a number of businessmen and other individuals to invest in the new bank, taking into account some restrictions regarding the amount of investment and the percentage of their participation in the share capital (nobody could initially have more than 5% of the total share capital) (Dritsa 2006).

In all the 25 years of its operation, the management of the bank achieved an impressive performance. Despite its small size and the lots of restrictions from 1975 to the end of the 80s, the bank managed to overcome the hurdles of administrative determination of interest rates and succeeded in outstanding profitability. In 1997, the magazine “The Banker” ranked Ergobank 10th in the world regarding its return on equity (ROE).

The failure of the effort to create a new bank up to its standards confirms the importance of the founder’s personality and the difficulty of repeating the successful model of Ergobank under different conditions and time periods(The effort took place in 2001, by former executives of Ergobank and failed in a few years). Ergobank was finally acquired by Eurobank in 1999.

3. Methods and Results

3.1 ROA, ROE and DPR for Ergobank from 1976 to 1999

In the following table, we have calculated the Return on Assets (ROA), Return on Equity(ROE) and Dividend Payout Ratios(CPR) from 1976 to 1999. The profitability of Ergobank was highly appreciated by the magazines “Business Week”(1986) and “The Banker “(1997).

Table 1. ROA,ROE, DPR for Ergobank

YEAR	ROA (%)	ROE (%)	Dividend Payout ratio (%)
1976	2,96	12,80	76,2
1977	2,50	17,11	75,7
1978	2,10	18,22	73,2
1979	2,02	19,41	65,1
1980	2,04	25,13	61,2
1981	1,75	31,02	65,7
1982	1,07	19,86	82,7
1983	0,90	19,61	84,3
1984	1,60	44,46	71,9
1985	1,95	54,84	49,9
1986	1,72	55,89	56,2
1987	2,10	78,83	52,6
1988	2,25	62,05	50,5
1989	3,55	59,38	50,3
1990	3,80	52,80	67,5
1991	4,52	69,41	61,3
1992	4,26	63,37	39,3
1993	3,90	62,95	39,1
1994	3,90	63,00	39,3
1995	3,71	60,88	39,2
1996	4,03	62,26	38,4
1997	3,92	48,71	37,3
1998	3,55	48,38	37,1
1999	4,23	37,54	34,5

Source: Author’s own calculations based on published financial statements (Kyrmizoglou P. 2020).

The previous table shows that the highest dividend payout ratios were implemented in 1982 and 1983, when Ergobank had lower net profits. On the contrary, the lowest DPRs were implemented in 1996, 1997, 1998, and 1999, when Ergobank had some of its higher net profits.

Such a contradiction in dividend policy shows the wish of management to attract investors in periods of relatively lower profits and their reluctance (or indifference) to convince investors about the value of the shares in periods of higher profits. Of course, we can not exclude that the above-mentioned reluctance was connected with the acquisition of Ergobank by Eurobank in 1999.

In general, all the relative ratios (P/E, PEG, P/BV, marketability ratio, beta coefficient, capitalization/turnover ratios) were very attractive during the entire life of Ergobank.

3.2 The Opinion of Ergobank's Employees

A small scale survey addressed to 52 former employees of Ergobank (living in Northern Greece) reinforced our argument that the generous dividend policy adopted by the management of the bank, led to the continuous spectacular increase of the price of Ergobank's share. From the total 52 participants, 48 responded. 46 of them expressed their view that the bank's exercised generous dividend policy gave a boost to the price of the bank's share.

On the other hand 43 out of the 48 employees who answered, believe that a less generous dividend policy could help Ergobank to play a much more important role in the Greek banking system. 41 employees expressed their full satisfaction from the salaries, promotions and bonuses (partly through the distribution of shares, so they might be biased in their opinion) they received during the years of their service in the bank. 42 employees stated that the priority of the bank was the financing of SMEs and the best service provided to the customer in the fields of exports and imports. That was confirmed by the fact that although Ergobank had a very small market share in the Greek banking system, around 2.5%-3.5 % regarding total assets, their market share in exports and imports ranged from 18% to 21%.

36 employees believe that some investments were neglected, due to the choice of a generous dividend policy. 32 employees believe that the acquisition of the bank by Eurobank in 1999, could have been avoided, if the amounts distributed as dividends in all those years, were reinvested in the bank. According to their opinion, they would be enough to make Ergobank one of the leading players of the system, by acquiring other banks.

The sample of the 48 employees is considered representative of the total population of the bank, with 21 graduates of secondary education, 25 graduates of higher education and 2 holders of Master degree. 39 of the respondents were males, and 9 were females. 27 ended their career as bank managers, 17 as heads of department, and 4 as ordinary employees. 32 of the respondents ended their career with more than 30 years of service and 16 with less than 30 years.

We have to take into account that the composition of the sample refers to people who retired more than 9 years ago. Therefore it reflects the profile of employees of those years. The views expressed by the former employees of Ergobank, regarding the bank's dividend policy seem to agree with the bird in the hand theory of Gordon and Lintner. On the contrary, they are opposed to the dividend irrelevance theory of Miller and Modigliani.

4. Discussion and Conclusions

Our small scale survey confirmed the impact of the dividend policy on the share's price. On the other hand, there is evidence that a less generous dividend policy could lead the specific bank to a more important role in the Greek banking system. Given the priority attributed by Ergobank in financing SMEs and favoring exporting activities, a more strict dividend policy might have a remarkable positive impact on the macroeconomic developments of the country.

Beyond the importance of dividend policy, in the case of Ergobank, it was proved that despite its small size, they managed to achieve an excellent financial performance, combined with effective communication with the customers. As we can see nowadays, the unstoppable evolution of technology does not necessarily lead to the better satisfaction of customers due to the bureaucracy existing in big organizations, the lack of sufficient control, and the confusion caused by wrong instructions. Therefore, we should not overestimate or underestimate the role of dividend policy. The problem is much more complicated, and the need for better management is imperative.

In any case, a more strict dividend policy could free up a lot of resources to the benefit of financing productive activities.

Criticizing the extremely generous dividend policy does not necessarily lead to the other extreme of zero dividend. Our objective should be a more balanced dividend policy that could benefit the bank itself and the whole economy of the country. A bigger bank can play a more important role in the economy, especially when it retains the advantage of monitoring and feeling the needs of the firms.

If all the banks adopt a more balanced dividend policy, more resources will be available to be channeled to productive sectors and have a positive impact on the whole economy.

Abstract

Research background: The issue of environmental pollution from fossil fuels is a current phenomenon. This paper seeks to find out to what extent, if at all, electricity production can be suppressed using tax instruments, and the problem we are going to try to describe has been dealt with to some extent by the world's leading economists, but we believe that there is still no sufficiently effective instrument to achieve at present a reduction in electricity production from these sources.

Purpose of the article: This research paper wants to reflect the rationale behind taxes as a tool to reduce externalities. It was hypothesized that after the introduction of the new tax, transaction costs would not increase beyond the proceeds of the tax.

Methods: We recalculated the emissions produced by power plants using coal and natural gas, and through this calculation we found out the volume of gross revenue of this tax. We have also compared and assessed electricity generation from different sources within the European Union over the period January to December 2022.

Findings & Value added: It can be concluded that the European Union would collect a certain package of funds from the Member States and their originators of negative externalities, but the transaction costs would exceed these revenues, and this would bring an unwanted effect to the final stage. The introduction of environmental taxes would, in certain circumstances, undermine the competitiveness of producers of electricity from the sources concerned.

Keywords: electricity, environmental taxes, natural resources, pollution

JEL classification: E23, F15, G18, H20, H26

1. Introduction

Externalities are a highly undesirable element in the economy, as they are the result of poorly defined property rights. Electricity generation has recently been experiencing a turbulent period, as its price has soared in the aftermath of the period. Many European Union countries have resorted to the return of fossil fuels as a source of electricity. But is such an approach the right one? Fossil resources such as coal and natural gas are the biggest polluters of all sources of electricity generation. This research paper aims to highlight this issue, using taxes as a tool to mitigate the impact of these resources on the environment. In this case, taxes could function as an incentive element to mitigate the effect of negative externalities.

We assume that the tax is the best tool to solve this problem. We use this tool for coal and natural gas because the production of electricity from these sources pollutes the environment very strongly, despite the fact that, according to the latest taxonomy of the European Union, natural gas and nuclear facilities are considered as a green energy source (ec.europa.eu, 2022), with which we also partially agree, as it is not possible to switch to purely renewable energy sources in the short term. Another objective is to describe why we currently must pay huge prices for electricity. Are these consequences the cause of the war in Ukraine or is the reason different? However, the introduction of environmental taxes on such commodities raises the issue of transaction costs. It would be interesting to observe the degree of willingness of the subjects concerned to pay the taxes imposed. It is also important to look at who is the originator of negative externalities from the point of view, whether they are representatives of the private sector or the states themselves.

Another important feature that we will be looking at is the degree of competitiveness of this sector after the introduction of environmental taxes – we will examine whether such a burden is too

* Corresponding author: juraj.valek@euba.sk

discriminatory and whether producers of electricity from cleaner sources are not at an undue competitive advantage. If such a situation were to arise, the introduction of taxes would miss its effect.

This research paper aims to reflect the rationale behind taxes as a tool to reduce externalities. It was hypothesised that after the introduction of the new tax, transaction costs would not increase beyond the proceeds of the tax. The hypothesis we tested is whether transaction costs would increase above the revenue from the tax after the introduction of the new tax and what impact this will have on competitiveness in the European Union environment. At the same time, we tried to find an answer to the question of whether the newly introduced tax will have a sufficiently punitive effect for the originators of negative externalities. The paper also deals secondarily with the issue of the importance of natural gas and coal as productive resources in the environment of the European Union.

We tested the hypothesis by taking empirical data on electricity source prices, based on the reference prices of model power plants for 2020. Then we recalculated the emissions produced by power plants using coal and natural gas, and through this calculation we found out the volume of gross revenue of this tax. We also compared and evaluated electricity production from various sources within the European Union for the reference period January to December 2022. We tested the hypothesis using empirical data on electricity resource prices based on model power plant reference prices for 2020. However, for the relevance of the data, we adjusted the prices of natural gas and coal to 1 MWh using a factor that reflects the current evolution of the exchange prices of these commodities in the market. As input data, we subsequently processed the volume of electricity production from individual sources for the monitored period. Subsequently, to simplify the data, we decided to introduce an environmental tax, the rate of which we set at: 1 euro = 1 t/CO₂. At this rate, we then calculated the emissions produced by power stations using coal and natural gas and, through this calculation, we found out the gross income of this tax. We then assessed, through a deduction, whether the tax introduced should, and if so, to what extent it would have an incentive effect on the originators of negative externalities and to what extent switching to other energy sources would be financially challenging in terms of the share of coal and natural gas in the total electricity production in its current form.

Environmental sources of electricity are incomparably less burdensome to the environment compared to fossil sources. Environmental taxes are needed to reduce the burden of using coal and natural gas. Electricity production in the EU is very uneven based on generation sources. Once the environmental tax is introduced, the proceeds from this tax, which would be wasted in the European Union's common purse, would amount on average to around EUR 30 million for coal and around EUR 20 million for natural gas. It all depends on the amount of electricity produced from these sources and on the number of emissions produced. It can be concluded that the European Union would receive a certain package of funding from the member states and their originators of negative externalities, but the transaction costs would exceed these revenues, bringing an undesirable effect to the final stage. It is likely that the introduction of such a tax would have to go through a long discussion and legislative process at supranational level, and it is not excluded that such a tax might not meet with understanding at all.

1.1 Literature Review

The importance of energy sector planning and energy demand modelling has increased significantly in recent decades, and scientists are trying to predict and model the most effective methods for transitioning to a sustainable energy system. To determine whether policy instruments and investments in certain projects are effective, it is important to measure and evaluate achievements in the fight against climate change. (Siksneelyte et al., 2019)

Despite environmental problems and competitive pressure from other fuels, coal is expected to retain a significant share of future global energy use. The role of coal in the use of energy around the world has changed over the decades from a fuel widely used in all sectors of the economy to a fuel that is now used primarily for electricity generation and in several key industries such as steel, cement, and chemicals. Although coal has lost market share in oil products and natural gas, it remains a key source of energy due to the dominant role it has maintained in its key markets and its success in penetrating emerging economies. For coal to remain competitive with other energy sources in the industrialised countries of the world, it is necessary to continue technological improvements in all aspects of coal mining (Balat, 2007).

As environmental degradation negatively and severely affects all landscapes and people, efforts to define the causes of degradation and propose potential solutions to prevent degradation and even improve the quality of the environment have intensively increased in recent years. In this way, various factors have been considered in the empirical review of the studies. Fossil fuel energy is the most important cause of

environmental degradation. According to data from British Petroleum and the World Bank, around 99% of total CO₂ emissions come from energy consumption. (Kartal et al., 2023)

Omokanmi et al. (2022), based on empirical findings, the studies recommend promoting cleaner energy sources by subsidizing renewable energy and raising people's income levels through investments in capital projects to support healthy life expectancy.

Despite growing concerns about increasing CO₂ concentrations and climate change, fossil fuels are always an essential driver of gross domestic product (GDP) growth in EU countries. In fact, countries are reluctant to reduce environmental pollution at the expense of higher incomes. In other words, continued economic development depends on greater energy consumption, which leads to increased CO₂ emissions. Renewable energy could provide a possible way to rebalance economic growth with environmental quality. (Radmehr et al., 2021)

Climate change has been one of the most pressing problems in the world in recent years due to its devastating effects on property and human lives. Greenhouse gas emissions are a major contributor to global warming, with CO₂ emissions gaining considerable attention as a pollution metric over the years. As a potential factor of CO₂, it plays a key role in the openness of trade, the use of renewable energy and GDP. Over the past few decades, economic expansion has been the main cause of CO₂ emissions, and there is an inverse U-shaped relationship between ecological deterioration and GDP. (Adebayo et al., 2022)

Urbanisation increases CO₂ emissions, but negatively affects emissions once it reaches a certain level. Economic growth and energy intensity increase CO₂ emissions, while openness to trade does not have a significant impact on CO₂ emissions. (Ahmed et al., 2019)

In most countries, many tools are used for various applications in the general field of environmental management. In many cases, the application itself limits the use of tools in a natural way. Cleaning of public spaces is provided as a "public good" in all countries. Many industrial processes are so complicated that they can hardly be regulated by taxation, but there can still be a choice between disclosure, labelling, liability, and licensing. Environmental taxation plays a more significant role in Europe than on other continents. This is partly but very imperfectly reflected in higher revenues from environmental taxes than a share of GDP. However, environmental taxes should be divided into two categories. In the first case, we have taxes related to energy and transport, at least partly motivated by global concerns such as climate change. We already have considerable revenue in this category and, in principle, even more potential if taxation were to be used as the primary way of achieving global climate objectives. The flexibility of energy use to price is limited but not insignificant, which means that high taxes and large revenues will be needed to achieve ambitious targets. The global nature of this environmental problem gives rise to numerous coordination problems between countries that are motivated by concerns about industrial competitiveness. The second concern may be if the incidence of taxes is regressive or harms politically influential groups. (Sterner, Köhlin, 2017)

According to Abbasi et al. (2021) electricity consumption has a positive and significant impact on economic growth. They note that generating and preserving electricity using renewable energy and avoiding fossil energy minimizes the cost of generating electricity and could be beneficial for economic growth. In addition, environmentally friendly electrical appliances should be used and the import of low-efficiency appliances that consume excessive energy, which can reduce the gap between growing electricity demand and problematic supply, should be banned. Finally, most importantly, the sustainable implementation and management of demand and supply by regulators can achieve the desired economic objective. However, they found that electricity prices have a negligible impact on economic growth due to unauthorised connections, electricity theft, etc. By addressing cause and effect, electricity prices can play a key role in boosting economic growth.

Wang et al. (2021) examine the dynamic interdependence between CO₂ emissions, real gross domestic product (GDP), renewable and non-renewable energy production, urbanization, and export quality for the top ten renewable energy countries and the top ten countries in the Economic Complexity Index. Long-term estimates indicate that in the ten largest renewable energy countries, only renewable energy production contributes to reducing CO₂ emissions, while other variables lead to an increase in emission levels in the long term. For leading complex economies, however, empiricism has highlighted the important role of renewable energy in mitigating carbon emissions. The quality of exports leads to a reduction in emission levels and real GDP, non-renewable energy and urbanisation contribute to the increase in emissions. Interestingly, for the top ten renewable energy countries, the analysis interprets the two-way short-term relationship between renewable energy production and export quality, and the one-

way causality from export quality to CO2 emissions. The adoption of clean renewable energy technologies could function as a key tool to improve export quality and mitigate CO2 emissions.

The reason why energy-intensive industries, despite all the environmental and economic logic, are wholly or partly exempted from environmental taxes is because of concerns about the negative impact of such taxes on the competitiveness of these industries. Competitiveness considerations are important for environmental policy for both economic and environmental reasons. **Economic** – if environmental policy has a negative impact on competitiveness, it will be associated with a corporate, sectoral, or national economic downturn, making it politically difficult or impossible to implement. **Environment** – if domestic "dirty" (environmentally demanding) industry declines, which is replaced by the growth of foreign "dirty" industry, the overall environmental impacts may not change.

In this context, it should also be borne in mind that the negative effects of the coronary crisis on the economy have been particularly pronounced in small and medium-sized enterprises, which are more sensitive to changes in business conditions. (Rabatinová, 2022)

If the environmental impact were local, then a cleaner domestic environment would be bought at the cost of losing competitiveness (and increasing foreign competitiveness would mean a worse environment there). If the environmental impact were global (e.g., greenhouse gas emissions), then the loss of national competitiveness would bring no environmental benefit at all.

In fact, the impact of a carbon tax on competitiveness will be determined by a few impacts, including: (Ekins, Speck, 1999)

- the size of the carbon tax and the nature and extent of offsets (a way of recycling income through the economy),
- carbon intensity of the product,
- intensity of trade in the product (ratio of exports plus imports to production).

If tax revenues are recycled back to the sectors concerned, there is no reason to believe that this will have any long-term effects on national competitiveness. Even those sectors that could be negatively affected **could offset the effects of the tax** if they were able to increase the rate at which they improved environmental efficiency in the areas affected by the tax. There are good theoretical and empirical reasons to believe that **the tax itself and the increase in the relative price of environmental inputs that it would generate would help to achieve such improvements.** To avoid costly early scrapping of capital, to allow time for industrial modifications and to influence future investment plans, **environmental taxes should be introduced at low levels and progressively increased according to a pre-announced timetable.** (Ekins, Speck, 1999)

In the context of escalating global environmental pressures, it has become increasingly clear that Europe's prevailing model of economic development —based on steadily growing resource use and harmful emissions —cannot be sustained in the long term. Therefore, one of the priorities of the European Union and the V4 countries that are the subject of our research is the transition to a resource-efficient and a low-carbon society. (Chovancová et al., 2021)

2. Methods

This study ranks among all these listed works. We will focus on the issue of increased transaction costs in terms of efficiency after the imposition of environmental taxes, an issue that has already been partially tested by Arrow. (1970). Furthermore, we would like to point out whether, even after the imposition of taxes, natural gas and coal would continue to be such important sources to produce electricity. The ideas of Sterner and Köhlin (2017) will help us to lean on the basic concept of our study, namely the justification for imposing environmental taxes on certain sources for electricity generation. Finally, we rely on a research paper by Ekins and Speck (1999), who argued that environmental taxes are not imposed on energy-intensive industries because it would undermine the competitiveness of the industries in question. We would like to use this study to find out if this is in fact the case.

The hypothesis that we would like to test is that after the introduction of the new tax, transaction costs would not increase beyond the proceeds of the tax. Then we examine the answer to the question: Will the newly introduced tax have a sufficiently punitive effect? In doing so, we will examine the importance of natural gas and coal as a productive resource in the European Union environment.

We chose the January-December 2022 range as our reference period. We tested the hypothesis by taking empirical data on electricity source prices, based on the reference prices of model power plants for 2020. (Lazard, 2021) However, for the sake of relevance of the data, we have adjusted the prices of natural gas and coal per 1 MWh using a coefficient that reflects the current market evolution of exchange prices

for these commodities. We then summarised the evolution of the environmental impact of these resources using the rate of greenhouse gas emitted into the atmosphere. (Balat, 2007) We then processed as input data the volume of electricity production from individual sources over the period under review.

Subsequently, to simplify the data, we decided to introduce an **environmental tax**, the rate of which we set at: **1 euro = 1 t/CO₂**

At this rate, we then recalculated the emissions produced by power plants using coal and natural gas, and through this calculation we found out the volume of gross revenue of this tax. We would like to point out that our calculation does not assume with administrative costs. (Stern, Köhlin, 2017)

We reflected the taxes that outsiders would have to pay in the prices for 1 MWh of electricity produced through coal and gas, and then compared the total costs before and after the tax. In the end, we compared this increase with the theoretically achieved tax revenue and evaluated the results.

We compared in detail the production of electricity from individual sources within the European Union over the reference period. Subsequently, we assessed, through deduction, whether the tax introduced should and, if so, to what extent it would have an incentive effect for the originators of negative externalities and how much the switch to other energy sources would be financially demanding in terms of the representation of coal and natural gas in total electricity production as it currently stands. (Balat, 2007)

3. Results

To compare the current state of electricity production before and after the imposition of environmental taxes, we will use price benchmarks to produce one megawatt-hour of electricity from individual sources for 2020, but we have recalculated fossil fuel prices to the ratio of current commodity market prices. It should be noted that the price values are only indicative for the need to construct a research model. The reference values are interpreted in the following table.

Table 1. Data on reference prices for electricity from selected sources (2020)

Resource:	Price of 1 MWh in EUR
Nuclear	144
Gas	597
Coal	156
Wind	35
Solar	33

Source: Lazard (2021)

According to the above data, the most demanding to produce is electricity from coal and natural gas, at 156 euros and 597 euros per 1 MWh, respectively. The production of electricity from coal and natural gas is currently reaching such high amounts that they are among the costliest sources for electricity generation. The table shows those sources that have the largest presence in the Slovak Republic. It should be noted that prices do not include subsidies or prices for emission permits. For the sake of simplification, the table also does not show the additional costs resulting from the volatility of solar and wind power plants. The data are reference based on model power plants, in fact, the prices of resources within the structure vary depending on the region and the availability of resources where electricity is produced from which source. In terms of environmental burden, those sources produce the following emissions shown in the table below.

Table 2. Emissions from selected sources in the European Union in the period 1/2022-12/2022

Production of emissions in Megatons					
Month	Solar	Wind	Coal	Gas	Nuclear
1/22	0,29	0,51	33,61	26,17	0,76
2/22	0,44	0,57	26,84	20,44	0,65
3/22	0,76	0,37	35,6	22,91	0,65
4/22	0,91	0,4	26,93	16,38	0,57
5/22	1,18	0,3	24,79	16,37	0,51

6/22	1,21	0,24	26,9	19,35	0,51
7/22	1,27	0,27	28,31	21,31	0,53
8/22	1,17	0,22	30,12	20,75	0,52
9/22	0,84	0,29	30,61	19,26	0,51
10/22	0,61	0,39	27,53	19,68	0,52
11/22	0,35	0,46	30,99	20,06	0,55
12/22	0,22	0,45	34,5	24,12	0,65

Source: own processing based on data from: <https://ember-climate.org/countries-and-regions/regions/european-union/> (2023)

The above indicators show that environmental sources of electricity are incomparably less burdensome on the environment compared to fossil sources. This table demonstrates that environmental taxes are needed to alleviate the burden of using coal and natural gas. A nuclear source is a positive exception for the environment, as it equals green energy with its burden. However, its overall disadvantage is the expensive technological procedure and the overall social dislike of nuclear power. However, we are of the opinion that, despite these disadvantages and the potential risk, nuclear energy is clearly a better alternative to fossil resources.

Electricity production in the EU is very uneven based on sources in production. Among the sources equated in this research paper, it is from nuclear sources that electricity generation is the largest represented, and it is interesting that nuclear energy has the largest presence in the EU, even though EU Member States have a long-term strategy to gradually reduce this resource. But the war in Ukraine has shown that this is not the happiest step. The details of the ratio of production from each source are explained in the following overview.

Table 3. Total production from selected sources in the EU for the period 1/2022 - 12/2022

Production of electricity in Terawatt hours					
Month	Solar	Wind	Coal	Gas	Nuclear
1/22	6,02	46,72	40,02	53,99	63,46
2/22	9,14	52,36	32,73	42,05	54,44
3/22	16,00	33,96	43,34	47,19	54,44
4/22	19,07	36,28	32,85	34,02	47,32
5/22	24,53	27,05	30,24	33,94	42,29
6/22	25,24	21,56	32,87	40,09	42,55
7/22	26,48	25,20	34,82	45,05	43,86
8/22	24,38	20,92	36,99	43,98	43,25
9/22	17,32	27,14	36,93	40,12	42,76
10/22	13,15	36,61	32,42	41,49	43,26
11/22	7,34	41,93	37,79	40,89	46,16
12/22	4,44	40,65	42,07	49,22	54,29

Source: own processing based on data from: <https://ember-climate.org/countries-and-regions/regions/european-union/> (2023)

With the introduction of an environmental tax, the rate of which would be set at 1 ton of emissions produced = 1 euro, the proceeds of this tax, which would flow into the common purse of the European Union, would amount to an average of around EUR 30 million for coal and around EUR 20 million for natural gas. It all depends on the amount of electricity produced from these sources and the number of emissions produced. It should be noted that the model envisages maintaining the purchase of emission permits, while trying to use taxes as an incentive element. Based on the reference prices chosen by us, the total revenue from the introduction of environmental taxes for 2022 would bring EUR 603,53 million to the common European coffers, which is not at all a negligible item. For interpretation, we give a detailed overview of the environmental tax revenue in the table below.

Table 4. Total revenues from the environmental tax introduced for the period 1/2022 – 12/2022

Tax revenue in EUR		
Month	Coal	Gas
1/22	33 610 000,00	26 170 000,00
2/22	26 840 000,00	20 440 000,00
3/22	35 600 000,00	22 910 000,00
4/22	26 930 000,00	16 380 000,00
5/22	24 790 000,00	16 370 000,00
6/22	26 900 000,00	19 350 000,00
7/22	28 310 000,00	21 310 000,00
8/22	30 120 000,00	20 750 000,00
9/22	30 610 000,00	19 260 000,00
10/22	27 530 000,00	19 680 000,00
11/22	30 990 000,00	20 060 000,00
12/22	34 500 000,00	24 120 000,00
Total	356 730 000,00	246 800 000,00

Source: own processing based on the data in tab 2 (2023)

However, it would be wrong to believe that the originators of negative externalities in the form of producers of electricity from fossil sources would not pass these items on to the cost of 1 MWh of electricity. The price increase is interpreted by the following report.

Table 5. Price increase for one MWh of electricity after tax for the period 1/2022 – 12/2022

Price increase for 1 MWh in EUR		
Month	Coal	Gas
1/22	1,2196	2,0409
2/22	1,2194	2,0411
3/22	1,2197	2,0410
4/22	1,2195	2,0409
5/22	1,2194	2,0403
6/22	1,2212	2,0408
7/22	1,2197	2,0404
8/22	1,2195	2,0410
9/22	1,2195	2,0405
10/22	1,2194	2,0412
11/22	1,2194	2,0404
12/22	1,2194	2,0406
Average	1,2196	2,0408
Price after change	157,220	599,0400

Source: own processing based on the data in tab 3 and 4 (2023)

When converted with the reference prices, after averaging the price of electricity produced from coal, the price of electricity produced from coal would rise by EUR 1.22 per 1 MWh and the reference price from the natural gas source would increase by EUR 2.04. For the volumes of electricity produced from these sources, this price increase caused by the introduction of the tax is far from negligible.

In the graph above, we can see how the tax introduced would affect the supply and demand of electricity from coal. There would be a dead-loss cost effect, so that neither the producer nor the consumer would benefit from part of the tax introduced. From the foregoing, we can conclude that the introduction of an environmental tax would not have the desired effect in this case. The same scenario would be observed with the introduction of an environmental tax on natural gas.

Figure 1. Evolution of electricity demand and supply from an angle before and after the tax

Names of abbreviations:

- **P** – price
- **Q** – quantity
- **E** - equilibrium
- **S** – supply
- **D** – demand
- **Q*** - quantity in baseline
- **Q₁** – quantity after the change

In the following reviews, we will take a closer look at the total cost of generating electricity from the sources we have selected, focusing on showing the impact of the introduction of an environmental tax on the level of these costs for coal and natural gas.

Table 6. Total costs from individual sources of electricity before tax is levied for the period 1/2022 – 12/2022

Total costs with resources (million EUR)					
Month	Solar	Wind	Coal	Gas	Nuclear
1/22	221,10	1 634,15	6 394,44	31 885,77	9 136,80
2/22	300,96	1 827,70	5 105,88	24 906,84	7 839,36
3/22	525,36	1 185,80	6 773,52	27 915,72	7 839,36

Source: own processing based on the data in tab 1 and 3 (2023)

The total cost of electricity generation is directly proportional to how much is produced from each source and the price per 1 MWh. Price is influenced by various conditions such as the value of the commodity on the stock exchange, the geographical conditions where the energy is produced, the availability of the given resources, and so on.

In the review that shows us the evolution of the total cost before the imposition of the tax, we see that the cost of production from coal and natural gas holds a dominant position. Among them, the costs from

the nuclear source were still entangled. This development is paradoxical in that the prices of these three units are the highest based on a long-term trend, but these sources also hold the most dominant position in electricity generation. This is due to a few factors, such as the availability of given resources, national policies, and others.

With the introduction of environmental taxes, production from coal and electricity will become significantly more expensive. However, the consequences could be positive in the long term, as the incentive in the form of overpricing of production can be an incentive to switch to another type of production. In the conditions of the European Union, this could be, above all, wind and solar energy, although it is true that production from these sources can be very volatile and unpredictable, since production from these sources depends on natural and climatic conditions and is therefore not applicable to the entire territory of the European Union, or there could be resentment from the Member States in terms of the initial high financial complexity.

Table 7. Total costs from individual sources of electricity on the imposition of tax for the period 1/2022 – 12/2022

Total costs with resources after impact of environmental tax (million EUR)					
Month	Solar	Wind	Coal	Gas	Nuclear
1/22	221,10	1 634,15	6 444,44	31 994,77	9 136,80

Source: own processing based on the data in tab 3 and 5 (2023)

In the table below, we can see to what extent production from coal and natural gas will become more expensive for market participants. Apart from the preventive incentive, there is a significant inefficiency in the tax introduced. This is since in the market modelled by us, the costs would increase up to 2.59 times compared to the tax revenues based on a cumulative point of view. Thus, the introduction of an environmental tax can be viewed from two perspectives:

- if countries do not start using alternative sources, and nuclear energy is also considered an alternative source, the tax introduced will make electricity significantly more expensive, which will cause a further negative externality in the form of overpricing for the final consumer, be it households or businesses.
- If these taxes had an incentive effect on the countries that are the biggest contributors to negative externalities and they resorted to infrastructure reform, then these taxes would have a significant societal contribution to mitigating the creation of harmful externalities in the form of greenhouse gases.

Table 8. Level, by which costs would increase in absolute terms for the period 1/2022 – 12/2022

Level of cost increases after tax in EUR		
Month	Coal	Gas
1/22	49 993 196,20	108 996 667,17
2/22	39 918 939,05	85 140 253,78
3/22	52 956 930,44	95 425 653,57
4/22	40 053 099,86	68 222 403,74
5/22	36 869 829,74	68 161 181,12

6/22	40 065 296,29	80 589 372,53

11/22	46 090 336,28	83 528 058,18
12/22	51 310 411,42	100 445 908,22
	530 642 590,92	1 027 846 122,22

Source: own processing based on the data in tab 6 and 7 (2023)

The graph below explains to the extent to which the European Union is using sources of electricity from individual sources over the period under review, and it is clear from the data that the most used source is nuclear energy, but behind it are near our coals and natural gas, with an average of around 40% of the population from all sources. Nuclear production is at the forefront, despite long-term efforts to reduce it. This is since the potential of this energy can only be altered in the long term, and we believe that the European Union's intentions will remain unfulfilled.

Figure 2. Ratio of electricity use in the European Union for the period 1/2022 – 12/2022

Source: own processing based on data from: <https://ember-climate.org/countries-and-regions/regions/european-union/> (2023)

If, as things stand, the European Union wanted to shut down fossil electricity sources altogether, member states would have to spend very heavily on changing infrastructure. This is particularly the case in countries such as Poland, Italy, and Germany, where thermal power plants have the most significant presence. However, it is precisely these countries that would benefit from change because the environment of these countries is the hardest hit by the impact of greenhouse gases.

Green energy is characterised by a high volatility in production, which is influenced by the current climate situation and season. With the size of countries such as Poland, Italy and Germany, there would be a threat of production volatility and thus countries would be reliant on electricity imports from third countries, otherwise they would run the risk of electricity disruptions to final consumers.

4. Discussion

Our study confirmed Arrow's assertion (1970) that introducing taxes to mitigate the impact of negative externalities would incur large transaction costs. Arrow argued that the cost varies from system to system. One of the advantages of a pricing system over bargaining or some form of authoritative allocation is usually indicated by the economy in the cost of information and communication. Our model

interprets that transaction costs are indeed indicated by the economy, and in our case, this is precisely the introduction of an environmental tax.

Balat's theory (2007) was confirmed on the scale that even the introduction of environmental taxes would not prevent coal from being displaced as one of the primary sources of production. Despite the European Union's strategies, the current situation has caused the return of coal as one of the main sources after a prolonged phase of decline. Also, on the issue of natural gas, it will not be possible to conduct such a fundamental technological reform in the short term.

Sterner (2017) appropriately described the impacts of environmental taxation and noted that in many countries there are levels of regulatory and policy instruments, which means that when comparing instrument choices between countries, the main difference may be rather the degree or emphasis placed on one type of instrument, such as taxes, compared to other instruments in the policy mix applied. However, we share his view that, in the long term and in terms of stimulus, taxes are one of the most effective tools for mitigating the impact of negative externalities. With increasing digitisation and the need for digital transformation of the tax administration, the ways of communication between the taxpayer and the tax administration are changing. (Ihnatišinová, 2022) This is also where the so-called data pollution arises - which will need to be addressed soon.

Ekins and Speck (1999) conclude that the reason why energy-intensive industries, despite all environmental and economic logic, are wholly or partly exempted from environmental taxes is because of concerns about the negative impact of such taxes on the competitiveness of these industries. Competitiveness considerations are important for environmental policy for both economic and environmental reasons. Following this, our research question confirms that the imposition of an environmental tax on the sector, as things currently stand, would indeed have a negative impact on the competitiveness of the sector, while artificially putting other producers from other sources at a competitive advantage. At the same time, we have shown, with the help of instruments, the possibilities of redistributing the revenue of this tax, which would significantly affect the situation on the electricity market and, at the same time, put several countries at a competitive disadvantage, which would be of an incentive nature for them, thus confirming the authors' assertion that if the environmental impact were local, then a cleaner domestic environment would be bought at the cost of losing competitiveness and increasing foreign competitiveness would again, it meant a worse environment there. If the environmental impact were global (e.g., greenhouse gas emissions), the loss of national competitiveness would bring no environmental benefit whatsoever.

Since, based on our findings, a tax constructed in this way would not bring the desired effect, an alternative approach could be, for example, subsidies from the European Union to individual member states in an even broader form than is currently the case. We can imagine that, with an appropriate policy at supranational level, individual member states, especially those that are the largest producers of electricity from fossil fuels, would have an incentive to change their strategy, even if it would be technologically demanding at first, while it is not excluded that the return on these investments would be in the long term. Another alternative is to encourage households and companies, where possible, to generate their own electricity from renewable sources, such as photovoltaic panels, thereby reducing demand for fossil fuel resources, as this alternative is currently not sufficiently attractive, especially for companies, and this investment does not provide them with a sufficiently fast return and possible compensation at national level. However, this could be the subject of possible further research.

Conclusion

It can be concluded that the introduction of an environmental tax would only partially bring the desired effect. On the one hand, the European Union would collect a certain package of funds from the Member States and their originators of negative externalities, but the transaction costs would exceed these revenues, and this would bring an unwanted effect to the final stage.

Environmental sources of electricity are incomparably less burdensome for the environment compared to fossil sources. Following the introduction of an environmental tax, the rate of which would be set at 1 tonne of emissions produced = EUR 1, the proceeds from this tax, which would be wasted in the European Union's common purse, would amount on average to around EUR 30 million for coal and around EUR 20 million for natural gas. It all depends on the amount of electricity produced from these sources and on the number of emissions produced. Based on our chosen reference prices, the total revenue from the introduction of environmental taxes would bring a significant item to the common European treasury. When converted with reference prices, after averaging the price of electricity generated from coal, the

price of electricity generated from coal would increase by EUR 1.22 per 1 MWh and the reference price from a natural gas source would increase by EUR 2.04 per 1 MWh.

Another conclusion to be noted is that coal and natural gas currently have a major influence on electricity generation, since in some countries it is precisely these sources that hold a dominant position. It follows that, as things stand, these resources would be difficult to exchange for alternative sources, mainly because the initial investment in infrastructure would be very costly. Another argument in favour of these sources is the current seasonality and unreliability of alternative sources of electricity, such as wind and solar power plants, which depend on the geographical conditions of the territory, while the construction of such power plants requires a high initial cost of capital.

The introduction of environmental taxes would, in certain circumstances, undermine the competitiveness of producers of electricity from the sources concerned, resulting in an overall increase in the market price of electricity for consumers and, at the same time, there is the possibility of generating excessive profits for electricity producers from sources on which the tax would not be imposed. There would be a dead-loss effect, so that neither the producer nor the consumer would benefit from part of the tax introduced. From this we can conclude that the introduction of an environmental tax would not have the desired effect.

The main conclusion is that if countries do not use alternative sources, such as nuclear energy, the tax introduced would make electricity significantly more expensive, causing another negative externality in the form of overcharging for the final consumer, be they households or businesses. If these taxes had an incentive effect on countries that contribute most to negative externalities and resorted to infrastructure reform, then these taxes would make an important societal contribution to mitigating the creation of harmful externalities in the form of greenhouse gases.

The challenge for further research in this area is to deal with the reform of the entire tax system, not just the introduction of a special-purpose tax. A carbon tax could have a significant impact and, in our view, setting it up effectively would be a better across-the-board incentive for the originators of negative externalities to switch to alternative sources, as well as contributing to a change in political behaviour in general. This tax could replace some of the current taxes, while the effective setting and introduction of an alternative tax mix could be the subject of further study.

Taxing coal and natural gas as sources of electricity would entail high transaction costs that would exceed the revenue from the tax thus imposed. At the same time, the introduction of an environmental tax would reduce competitiveness for producers of electricity from these sources. It follows from the above that the introduction of an environmental tax would not have the desired effect but would aggravate the current situation in terms of price levels, and it is therefore necessary to find another way of reducing the emergence of negative externalities, while tax imposition should serve only as a supporting tool and not as a primary tool.

Financial Reporting in the Public Sector in the Republic of Bulgaria under the Conditions of European Harmonization and Global Legitimacy of IPSAS

Daniela Feschiyan¹, and Radka Andasarova^{1,*}

¹ University of National and World Economy in Sofia, Department of Accountancy and Analysis, December 8th st., 1700 Sofia, Bulgaria

Abstract

Research background: The progress made in the development of accounting theory, as well as the accumulated experience of EU Member States, illustrate the growing advantages of public sector accounting systems based on the accrual based over cash-based accounting. The adoption and application of accounting standards based on an accrual basis and in accordance with the requirements of the IPSAS poses important questions for accounting harmonization within the Union. The various existing practices in the public sector are considered when choosing an accounting model. A challenge to the European harmonization of accounting systems in the public sector is also the differences between the national accounting systems based on a modified cash basis and the adopted methodological principles of the European System of National and Regional Accounts 2010.

Purpose of the article: The purpose of this article is to enrich and further develop in a theoretical aspect the European debate on the key issues in the public sector, analyzing the modern trends and challenges facing financial reporting in Bulgaria - as a member state of the EU, in conditions of accounting harmonization and growing legitimacy of the IPSAS in a global aspect.

Methods: The major research method used in the study is the theoretical review of the European and national legislation and the practice in the field of public sector financial reporting.

Findings & Value added: The Conceptual Framework is the starting point of reference for creating a system of pan-European harmonised standards for the public sector in full compliance with accrual-based accounting principles.

Keywords: financial reporting, public sector, harmonization, IPSAS, accrual basis principle

JEL classification: M41, M48

1. Introduction

Public sector reform which originated towards the end of the 1980s and the beginning of the 1990s of the past century was primarily guided by the application of market-oriented management models intended to incite economic effectiveness of public management. (Melo et al., 2022)

The introduction of management mechanisms and instruments from the private sector into the management of the public sector is at the root of the *New Public Management concept*. A basic feature of the concept is *the enhancement of the quality of financial reporting in the public sector*. (Christiaens et al., 2015)

More specifically, an important stage of the extensive reform in the state administration is the implementation of an *accrual-based* accounting system and budgeting. *Cash-based reporting which is characterized by cash-based recognition of the effects of transactions and events* is regarded as an antipode to accrual-based accounting.

The concept of interrelation between the frameworks for statistical and financial reporting presumes the requirement for the application of accrual basis principle in accounting. The European regulatory framework adopted for business entities requires the application of IFRS on a mandatory basis by the exchange-traded companies registered in the territory of the EU when preparing the consolidated

* Corresponding author: r.a-georgiva@unwe.bg

financial statements. *Financial statements prepared on the basis of IFRS appear to be the main source of information about the corporate activities in the national accounts.* Similar to business organizations, *the information contained in the financial statements of public sector entities is used for the purposes of national accounts for the General Government.* The latter presumes proper knowledge of the International Public Sector Accounting Standards (IPSAS) developed by the International Public Sector Accounting Standards Board (IPSASB) – a requirement adopted in Regulation (EU) No. 549/2013 of the European Parliament and of the Council on the European system of national and regional accounts in the European Union (ESA 2010). There is no European regulation for mandatory implementation of IPSAS by the Member States what implies the application of national legislation. In this connection, the differences between the national accounting legislations and the various existing accounting practices are the main challenge for the global transition to financial reporting harmonization in the public sector.

2. Methods

The major research method used in the study is the theoretical review of the European and national legislation in the field of public sector financial reporting. The method of summarization and analysis was applied in a number of aspects, for example, in the examination of the European public sector accounting practices, the outcomes of the public sector reform and its reflection on the level of European harmonization in reporting and the legitimacy of IPSAS. The observation of facts method and the method of comparison were employed in the examination of country's governmental policy conducted under the impact of the institutional environment at a macro level. The documents officially issued to international organizations and governmental institutions, as well as the research studies of the academic community published in the internationally reputed databases were used as sources of information.

The main limitation to this research affects its scope. The study is focused on the public sector reform of a single EU member state, namely the Republic of Bulgaria. The fact taken into consideration was that some considerable changes occurred in the national legislation over the years of transition from centralized planned economy to market economy, and the accession of the Republic of Bulgaria to the European Union in the year 2007. In addition to the above, the research is limited to public sector entities. Public enterprises (commercial public sector entities)¹ and business organizations are excluded from its scope.

3. Results

A contemporary characteristic of the development of public sector financial reporting is the *standardization of accounting*. The global tendency towards standardization of public sector accounting is reflected in the establishment of a certain set of generally accepted rules and their implementation by the national governments at different levels of management and by international organizations including the European Commission (EC), North Atlantic Treaty Organization (NATO), United Nations Organization (UN) and others. The objective of the International Public Sector Accounting Standard Board (IPSASB) is to “serve the public interest by contributing to the development, adoption and implementation of high-quality international standards and guidance; contributing to the development of strong professional accountancy organizations and accounting firms, and to high quality practices by professional accountants; promoting the value of professional accountants worldwide; and speaking out on public interest issues where the accountancy profession's expertise is most relevant.” (International Public Sector Accounting Board, 2022)

Daniela Feschiyan (2018) maintains the statement that „Standardization of public sector accounting is an objectively determined dynamic process that provides for the establishment and application of generally accepted rules for the regulation of the accounting system and the creation of a uniform structure and content of the financial statements that meet all public interests with regard to obtaining reliable information about public finances.“ The result of author's thesis being proven is a prerequisite for the realization of another scientific study dedicated to the applicability of standardized models for accounting of infrastructure assets based on the philosophy of IPSAS in the accounting systems of public sector entities in the Republic of Bulgaria. The empirical results confirm the benefits of the implementation of suggested new accounting models in the public sector practice in the Republic of Bulgaria. (Feschiyan & Andasarova, 2022)

¹ The specification of *public enterprises* was introduced to the regulatory practice of the Republic of Bulgaria with the promulgation of the Public Enterprises Act and the Regulation on its implementation.

Despite the initial proposal by the European Commission for adoption of IPSAS, after a series of professional debates and the continuing practices of some member states, including *Bulgaria, in the application of budget-oriented and modified cash basis accounting systems*, the European Parliament reached a compromise by providing an opportunity for conducting preliminary assessment of IPSAS “appropriateness” in separate jurisdictions within the EU. IPSASB at the International Federation of Accountants (IFAC) does not possess legal powers to demand from the EU member states to implement the requirements of IPSAS into their national accounting legislations. The Board relies on some convincing evidence and good practices for attaining legitimacy of public sector standards in a global aspect.

A number of scientific research studies have been dedicated in support of the reforms for improving accountability and transparency of public sector entities through the implementation of a set of generally accepted accounting standards (IPSAS) in separate jurisdictions. (Chan, 2006; 2008; Manes Rossi et al., 2014; Biondi & Soverchia, 2014; Ismailia et al., 2021)

Over the past several decades, increased research interest has been observed within the academic community towards analysing the evolution of public sector accounting standardization based on accrual accounting principles. (Brusca & Condor, 2008; Martí, 2006; Christiaens et al., 2015; Schmidhuber, et al., 2022; Farshadfar et al., 2022)

According to Isabel Brusca et al. (2012), research studies addressing the development and propagation of IPSAS are principally focused on the countries applying the Anglo-Saxon model of accounting.

Countries like Australia, New Zealand, the USA and the United Kingdom have been pioneers in the realization of a far-reaching reform in state administration as early as in the 1980s of the past century which is known under the name of „*New public management*“. The public sector reform in these countries involves essential changes both to financial reporting and to the budgeting processes, which reform is accomplished through the transition to accrual based financial reporting and budgeting (Pallot, 1994; Likierman, 2003; Newberry & Pallot, 2006)

On the other hand, the governments of some continental Europe countries such as Austria, France, Spain, Portugal, and Switzerland have also started a similar reform in the public sector by adapting their national accounting systems to the requirements of IPSAS retaining the traditional budgeting model based on the cash principle and on the modified cash basis of accounting. (Brusca et al., 2015)

There is a group of authors who perform an extensive scientific research dedicated to the challenges associated with the transition of the Organisation for Economic Cooperation and Development (OECD) member states to accrual based financial reporting and budgeting on the one hand, and on the other hand – with regard to the applicability of IPSAS in individual jurisdictions of the member states. The research data definitively highlight the differences in the manner of perceiving the public sector reform by OECD member states, in the context of the transition to accrual based financial reporting and budgeting. More specifically, the preferences of OECD member states to the *accrual based financial reporting* (i.e. decisions at the level of organizational field) have been confirmed when compared to the adoption of *accrual based budgeting* by individual agents in Organization’s member states among which are accountants, state officials, governmental bodies and politicians (i.e. decisions at an organizational level). A statement has been expressed that, in OECD member states, which have adopted a sector-neutral approach for the implementation of accounting standards, i.e. a uniform set of accounting standards (IFRS) in different sectors of economy, there are favourable conditions generated for the approximation of the national accounting systems to IPSAS. On the other hand, the authors substantiate the need of adopting IPSAS in the potential member states of the Organisation (such as Bulgaria, *author's note*) in terms of the lack of applicable public sector accounting standards within their jurisdictions. (Adhikari & Gårseth-Nesbakk, 2016)

The traditional approach applicable by the researchers when conducting similar research studies aims at tracing the entire process of public sector reforms. In 2015, Isabel Brusca and her team published a collective scientific paper addressing the results of public sector reforms in 14 countries, the greater part of which are EU member states, taking into account that Bulgaria is not part of the extensive study. The empirical results outline the contemporary challenges facing the international harmonization in the field of financial reporting, budgeting, and public sector auditing. (Brusca et al., 2015)

The national specifics of the European countries concern a number of limitations which impede the process of harmonization and the achievement of comparability among the financial statements of public sector entities. Summarisations in the research study come out to be a serious theoretical basis for evaluating the effects of IPSAS adoption by the European countries over the implementation of national accounting standards.

An analogous study has been conducted by M. Kowalczy and J. Caruana (2022) among other two EU member states – Malta and Poland. The authors arrive at the conclusions that, in response to the reform intended to enhance the reporting and budgeting in public sector, the two countries demonstrate dissimilar accounting and budgetary practices at central government level regardless of the institutional environment influence at a macro level on the part of EU and IMF.

As at present, Bulgaria has been strictly adhering to the improvement of the *budgeting process* with focus of the implementation of the European framework for statistical reporting and fiscal data presentation based on the methodology of the European System of Accounts (ESA 2010) and the Government Finance Statistics Manual of the International Monetary Fund. ***This change is realized on the account of postponement of governmental decisions for an accounting reform in public sector entities within the context of accounting standardization and full-fledged implementation of the accrual principle.***

To analyze the specifics of the reform in public sector accounting of the Republic of Bulgaria is the main task of this research the conducting of which aims at identifying the important perspectives facing the national government on its way to the European accounting harmonization and growing legitimacy of IPSAS on a global scale. The more noteworthy of them are as follows:

- ***Regulation of public sector reporting by national laws, subordinate legislation, as well as mandatory orders and instructions.*** The country-specific national financial reporting regulation in the public sector involves the application of rules contained in the Law on Accounting, Public Finance Law and the multitude of instructions drawn by the Ministry of Finance. The existing tradition in the country for ***not applying public sector accounting standards*** is an apt example of the ongoing influence of the regulatory economic theory in the accounting of these entities.
- ***Implementation of a budget-oriented accounting system based on the modified cash principle.*** Under the impact of ***national legislation***, the accounting practice is “sealed” as a dominating and acceptable model excluding any possibility for implementation of alternative accounting models. In response to the regulatory function of the state is the accounting practice existing for decades in Bulgaria on the implementation of the ***accounting principle of cash-based recognition*** of some kinds of revenue and expenditure (for example, tax revenue, social security contributions, budgetary credits). The accrual basis principle founded on the European System of Accounts (ESA-2010) standard and adopted by the European practice differs from the national requirements for modified cash-basis reporting.
- ***Lack of accounting practice for the preparation of accrual-based consolidated financial statements.*** As far back as in the year 2016, Daniela Feschian, in a paper titled „On the need of adjusting public sector financial statements to the requirements of IPSAS”, brought forth the problems associated with not preparing consolidated financial statements in the public sector and provided some projections for their improvement.
In addition, it could be indicated that „consolidation of financial statements is a process of combining and subsequent synchronisation of data from the statements of a certain group of entities for the purpose of presenting summarised information on a consolidated basis about the assets and financial position, about the financial performance, the cash flows, and about the changes that have occurred in group’s equity, in a single pack of reports.“ (Nachkova, 2020)
“It is necessary to develop some additional internal bylaws for clearer decisive regulatory requirements to the organization and methodology of accounting, the applicable chart of accounts, as well as specific procedures and techniques for preparing financial statements.“ (Nikolova, 2020)
- ***The decisions of the national government on the implementation of accrual-based accounting system pursuant to the principles of IPSAS and the lack of real reforms for translating them into action are intended for the purposes of institutional legitimacy.*** On a nationwide scale, the practice for preparing specific cash-based statements is maintained by public sector entities for the purposes of financial reporting and the consolidated fiscal programme. The existing regulatory texts in the Public Finance Law on the preparation and presentation of annual financial statements based on accounting standards developed in consistence with IPSAS and the lack of recognised and published public sector accounting standards in the Republic of Bulgaria are quite contradictory as at present.
- ***The link between public sector financial reporting and government’s political incentives.*** Public sector financial reporting in Bulgaria has a relatively lengthy history associated with undertaking a ***political commitment*** rather than as an effective contemporary accounting system based on global accounting standards.

- ***The reform in the public sector of the Republic of Bulgaria*** evolved in 2013 with the publication of a monography concerned with accounting standardization and the models of reporting fixed assets in the public sector. The author, D. Feschiyan (2020), maintains the thesis about „the need of accounting standardization in public sector entities with full application of the accrual principle and of the rules and provisions of IPSAS.“ ***Subsequently, the government of the country undertook significant changes to the accounting legislation for public sector entities among which accrual of depreciation, recognition of a strategic group of resources within the public assets such as public infrastructure, military equipment, heritage assets, etc. and inclusion of income statement as a mandatory component of the general purpose annual financial statements.*** The undertaking of this first step of the government towards reforms in the public sector is acceptable and refers to the usefulness of the information in financial statements for the purposes of taking managerial decisions in the process of implementing governmental policies and achieving transparency of public finance.

4. Discussion

For all the EU member states, particularly those that are currently using only cash-based reporting or reporting based on the modified cash principles, the implementation of the Conceptual Framework and IPSAS will mean a substantial reform. Some of the problems that might spring up and which, in our point of view, will affect Bulgaria are:

- conceptual and technical accounting problems;
- expert knowledge of employees and consultants, training skills;
- communication with managers and decision makers, as well as their training;
- connection with auditors, as well as their training;
- correction and modernization of IT systems;
- adaptation of the existing national legal frameworks.

If the adoption of IPSAS based on the accrual accounting principle and the philosophy of the Conceptual Framework in the EU member state is initiated, Bulgaria will find itself in a stressful and unequal situation. (Feschiyan, 2010)

Due to the non-application and lack of IPSAS knowledge and understanding, as well as owing to the overall lack of standardization in the public sector accounting system (Feschiyan, 2012), trainings will need to be organized, as well as exchange of expert knowledge, support to the government on conceptual and technical issues, coordination and exchange of plans of reforms for the public sector accounting with member states having greater depth of experience. Our reservations are that due to the lack of adaptation of public sector accounting to the Conceptual Framework and IPSAS, Bulgaria will be treated as a state with substantial and obvious drawbacks, failings and inconsistencies in the financial management information systems across the public sector. Therefore, it is expedient to carry out urgent reforms and innovation in the accounting system (Feschiyan & Raleva, 2013)

Extensive research, approval and implementation of the Conceptual Framework and IPSAS need to begin immediately and turn into an incessant process which should be realized within a certain period of time. This has to be accomplished gradually by laying the initial focus on the accounting issues where the harmonization is of utmost importance, for instance:

- full observance of the accrual accounting principle;
- internationally harmonized financial statements;
- compatibility with the philosophy of the Conceptual Framework and the provisions of IPSAS.

In view of the fact that IPSAS are the conceptual basis for the development of national accounting standards in distinct jurisdictions, our country will have much higher methodological preparedness and significant degree of readiness for the transition. Review and categorisation of the adopted accrual based IPSAS should be performed and they can be classified in three categories:

- standards which can be applied directly or with minimum adaptation;
- standards that need adaptation or a selective approach;
- standards that need substantial amendment in order to be implemented.

The transition to IPSAS, the philosophy of which incorporates the complete implementation of accrual accounting principle, will provide for the adequacy of the national accounting framework in the process of harmonization and integration of Bulgaria into the European Union. This is some sort of

innovation in the public sector accounting system. Such innovation will reduce the possibilities for financial data manipulation what makes the cash basis possible (for example, a payment can be carried forward in time or deferred in order to be presented in a period selected by the entity of the public sector). The accrual accounting principle, however, is not intended to remove or replace cash based reporting for the purposes of budgeting and budget control. At a macroeconomic level, accounting standardization will ensure timely and reliable financial and fiscal data and an opportunity for greater comparability of financial statements. Thus, good conditions can be created for the implementation of most of the principles laid down in the Directive on budgetary frameworks (EC 2011/85/EU).

Conclusion

The existing scientific debates most assertively illustrate the usefulness of the implementation of accounting standards in the public sector based on the accrual accounting principle. The existence of various accounting practices in separate countries raises important questions related to the expected level of European harmonization of the public sector accounting systems.

Extensive study and application of the Conceptual Framework of IPSAS which regulates the specifics in the public sector accounting systems is required. That way, a variety of differences in the accounting treatment and in the financial statements of public sector entities in different jurisdiction will be eliminated. The Conceptual Framework of IPSAS is the starting point of reference for creating a system of pan-European harmonised standards for the public sector in full compliance with accrual-based accounting principles.

Abstract

Research background: In a modern economy, ensuring a business' financial stability, and increasing its competitiveness, has become especially difficult. To measure firms' economic sustainability, researchers need to connect traditional and modern metrics. Monitoring the company's financial situation and predicting its future development becomes important. Therefore, searching for applicable models to predict bankruptcy is important not only in scientific research, but also in the practice of business entities.

Purpose of the article: The aim of the paper is to apply selected bankruptcy models in the teaching of financial subjects. The intention is to compare individual bankruptcy models and their use in teaching financial subjects.

Methods: The paper will focus on the comparison of models that were created using multivariate discriminant analysis, logistic regression, and neural networks.

Findings & Value added: In business management, it is important to understand the financial and economic situation and react promptly in the event of impending danger. Various simple models, more complex statistical functions, and artificial intelligence have been used to predict bankruptcy. Financial analysts should simultaneously use multiple methods to compare the results. Managers and business owners can use this paper to guide their firms and inform future business plans.

Keywords: bankruptcy models, financial subjects, logistic regression, multivariate discriminant analysis, neural networks

JEL classification: C45, G33

1. Introduction

In an increasingly dynamic world, ensuring a business's financial stability and sustainability has become increasingly difficult. Assessing the financial health of business entities using various models is an important area in not only scientific research, but also business practice. Crucially, estimating a risky company or its probability of bankruptcy is always very important not only for creditors but also for the managers or owners themselves. The bankruptcy models can provide warning signals of impending danger and allow early intervention.

Bankruptcy itself is the result of several causes that lead to insolvency. Furthermore, owing to the impact of globalization and the dynamically changing business environment, we need to constantly update prediction models and increase their accuracy and efficiency. Finally, prediction of future development requires an expansion of the range of mathematical and statistical methods because several methods to clarify a company's financial health.

The prediction of the financial situation of business entities began in the 1930s, when the first studies on the adverse manifestations of insolvency of business entities were developed. Fitzpatrick (1932) was the first, who dealt with the prediction of the financial health of business entities. In his study he compared the financial indicators of solvent and insolvent enterprises. Beaver, Netera and Tamari are considered the founders of the prediction of the financial health of business entities. Two significant trends can be observed in the field of bankruptcy prediction. The first tendency is oriented towards the description of the conditions when a business entity fails financially, by revealing the symptoms of failure (Jo, Han & Lee,

* Corresponding author: marta.miskufova@unipo.sk

1997). The second tendency in the field of solving this issue is to compare the prediction accuracy of individual prediction models (Jo & Han, 1996).

Many statistical estimation methods have been developed and used for this, especially for understanding financial risk. One such method is discriminant analysis, which allows the variables to differ from known groups of statistical units in the file and helps formulate classification rules. The aim of discriminant analysis is to design a discriminant function as a linear combination of various discriminatory variables. Multidimensional discriminant analysis functions include Indexes IN, Altman's model, Springate's model, Taffler's model, Fulmer's model, Chrastinova's Ch-index, and Gurcik's G index (Kliestik et al., 2018).

Logistic regression analysis is one of the basic methods for estimating enterprise failure. Models based on logistic regression assume a log probability distribution. In our context, the estimated result is the value of the probability of bankruptcy in the range of 0 to 1. Its advantage over discriminant analysis is that logistic regression does not require the fulfilment of certain assumptions, such as normality of financial indicators (normal distribution of independent variables) and homogeneity of variance-covariance matrices (Jencova et al., 2020).

However, as non-linear models for bankruptcy estimation, logit and probit models have some limitations, including the restriction of the outcome by bias of the regression function, sensitivity to exceptions in bankruptcy, and implicit Gaussian distribution in most conclusions (Neves & Vieira, 2006). With technological advancements and improvements in computing performance, artificial intelligence has helped in designing new prediction models or improved the precision of existing models. For instance, an artificial neural network (*ANN*) is considered a good instrument for bankruptcy prediction.

Kalinova (2021) saw that the current economic system often shows instability and is changing dynamically. Therefore, it is important to look for new procedures and models for estimating the financial and economic conditions of businesses and their future prospects. Classical prediction methods are often insufficient mainly because of the lack of useful information in historical data, which arises from the dynamics of the economic system. The authors found the use of *ANN*-based prediction procedures to be better owing to their nonlinearity and ability to recognise complex relationships between indicators.

The artificial neural network model is based on the simplified principle of the neural structure of the brain. The advantage of neural networks is that they do not require the fulfilment of assumptions such as linearity, normal distribution, or independence of variables. They transform inputs into desired outputs by adjusting the weights of the signals between neurons (Jencova et al., 2020). There are two basic types of neural networks: feed-forward (*FF*) neural networks, which spread signals in only one direction, and recurrent neural networks, which have synapses oriented in different directions (Kabir, 2021; Privara & Rievajova, 2021).

One of the most important problems of such an analysis is the diversity of the input data for prediction, besides the different models and network settings. The authors found that individual studies compared *ANN* with discriminant analysis, logistic regression, and heuristic models. The results are not unambiguous: some show approximately the same accuracy of the *ANN* prediction as the compared classical model, while some found significantly higher success rate in the *ANN*. Interestingly, no study showed a statistically significant higher accuracy of the classical model compared to *ANN* or excluded its use for prediction.

2. Methods

The aim of the paper is to apply selected bankruptcy models in the teaching of financial subjects. The intention is to compare individual bankruptcy models and their use in teaching financial subjects. The paper will focus on the comparison of models that were created using multivariate discriminant analysis, logistic regression, and neural networks.

Multivariate discriminant analysis forecasts the financial situation of a company using various characteristics, i.e., using a certain set of indicators, which are usually assigned different weights. In the discriminant analysis models, various financial indicators and variables are applied, which form one aggregate number - the multidimensional discriminant scores. The main benefit of this method is the inclusion of companies in groups based on discriminant scores. Most studies that deal with this method are based on the assumption that a low value of the discriminant score signals poor financial health of the company.

The impact of individual explanatory variables can be expressed using the standardized canonical discriminant function coefficients as well as the correlations coefficients between discriminating variables and the standardized canonical discriminant function. Standardized coefficients are used to determine which explanatory variables have the best discriminatory ability.

The quality of the discriminant model can be assessed using the statistical significance of the discriminant function. If the created canonical discriminant function distinguishes between prosperous and non-prosperous enterprises, the model is statistically significant. The distinction between these groups of enterprises is because the differences in the mean values of the variables that are included in the model are statistically significant. The statistical significance of each discriminator is tested by analysis of variance. Wilk's Lambda can be applied as a test statistic. The classification ability of the discriminant model is assessed based on the confusion matrix. This matrix contains the absolute and relative numbers of enterprises classified into individual groups correctly and incorrectly.

Logistic regression is used to model the unilateral dependence between variables when the dependent variable is not continuous but discrete (categorical). Independent variables can be continuous, discrete, or categorical (Jencova et al., 2020). Here, the logit-score lies between zero and one, which indicates the probability of a company's bankruptcy. Logistic models are extremely sensitive to the problem of multiple regression; therefore, it is necessary to avoid the inclusion of highly dependent variables. To use a logistic regression, the dependent variable was transformed into a continuous value by calculating the logarithm of the odds ratio:

$$\text{logit}(p) = \ln \left(\frac{p(Y=1|X)}{p(Y=0|X)} \right) = \ln \left(\frac{p}{1-p} \right) \quad (1)$$

By logit transformation we go from non-linear to linear dependence, and the equation of the logarithmic model has the following form:

$$\ln \left(\frac{p}{1-p} \right) = \ln \left[p^{(\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k)} \right] = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k \quad (2)$$

The logistic function takes the form of an exponential function:

$$p = \frac{e^{\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k}}{1 + e^{\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k}} = \frac{1}{1 + e^{-(\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k)}} = \frac{e^z}{1 + e^z} = \frac{1}{1 + e^{-z}} \quad (3)$$

where β is the vector of the estimated parameters and x_i is the individual input value. Estimates of the logistic model parameters were obtained using non-linear maximum likelihood estimation.

The basic element of an ANN is a neuron. The principle of a neuron is to obtain signals from an environment or other neurons, combine them in some way, make a non-linear operation (activation function), and produce the result on its output:

$$y = f(\sum_n x_n \cdot w_n) \quad (4)$$

where y is an output, x_i are inputs, w_i are synaptic weights, and f is an activation function. The activation function converts the inputs to a specific output depending on the type of network (or activation function used). These functions can vary from linear to non-linear. The most common transfer functions are step, threshold, sigmoid, htan, and *RBF*. The learning process consists of adjusting weights to minimise the error in the associated known input-output pairs (training data set):

$$w_{ij} = w_{ij}^f + \Delta w_{ij} \quad (5)$$

where new weights (w_{ij}) are the sum of the old weight (w_{ij}^f) and new delta (Δw_{ij}) (referred to as the generalized delta rule). The new delta (Δw_{ij}) is proportional to the negative change in the sum of squared errors (*SSSE*) with respect to the change in weights (∂w_{ij}):

$$\Delta w_{ij} \propto - \frac{\partial SSSE}{\partial w_{ij}} \quad (6)$$

3. Results and Discussion

In this section, we offer an overview of selected bankruptcy models that can be used in the teaching of financial subjects. We mainly focused on bankruptcy models based on multivariate discriminant analysis, logistic regression and neural networks. Table 1 shows the multivariate discriminant analysis models.

Table 1. Multivariate discriminant analysis

Author(s)	Country	Sample	AUC
Pervan, Pervan & Vukoja (2011)	Croatia	156 differently sized companies from manufacturing and wholesale/retail trade industry	-
Karas & Reznakova (2014)	Czech Republic	2,956 manufacturing companies for the years 2010-2013	93.91%
Kliestik et al. (2018)	Slovakia	74,957 companies in 2015	77%
Yakymova & Kuz (2019)	Ukraine	50 municipal companies during 2014-2017, test sample consisted of 71 companies operating in Bulgaria (3), Croatia (3), Czech Republic (7), Poland (2), Romania (6) and Ukraine (50)	94%
Musa (2019)	Slovakia	companies in 2015	-
Valaskova et al. (2020)	Slovakia	3,329 agricultural companies over the years 2016-2018	86.3%
Svabova et al. (2020)	Slovakia	75,652 SMEs during 2016-2018	93.4%
Noga & Adamowicz (2021)	Poland	72 wood enterprises	89.0%
Horvathova, Mokrisova & Petruska (2021)	Slovakia	444 companies in the field of heat supply	84.0%

Source: own processing

Horvathova, Mokrisova & Petruska (2021) used financial indicators in their multivariate discriminant analysis model, average collection period, inventory turnover, total assets turnover ratio, return on assets, return on costs, equity to debt ratio, equity to fixed assets ratio, and cost ratio. Noga & Adamowicz (2021) used current assets/current liabilities, total income/mean assets, equity capital/total debt, profit from operating activity-depreciation to sales ratio, and operating cost/short-term commitment. Svabova et al. (2020) used sales/total assets, current assets/current liabilities, net income/shareholders equity, operating profit/total assets, (non-current+current liabilities)/total assets, cash & cash equivalents/total assets, cash flow/total assets, cash flow/(non-current+current liabilities), cash flow/sales, net income/sales, and non-current liabilities/total assets. Yakymova & Kuz (2019) used absolute liquid ratio, working capital to current assets ratio, debt to equity ratio, return on equity, and current asset turnover ratio. Kliestik et al. (2018) used current ratio, cash ratio, return on assets, return on equity, debt to assets ratio, debt to equity ratio, number of days of receivables, number of days of payables, inventory turnover, net assets, and retained earnings to total assets ratio. Table 2 shows the logistic regression models.

Table 2. Logistic regression

Author(s)	Sample	Country	AUC
Jakubik & Teply (2011)	757 non-financial firms for the period 1993-2005	Czech Republic	-
Pisula (2012)	205 transport companies during 2004-2012	Poland	94.8%
Vochodzka, Strakova & Vachal (2015)	12,930 transportation and shipping companies during 2003-2012	Czech Republic	91.75%
Gulka (2016)	120,854 companies during 2012-2014	Slovakia	80.81%
Brozyna, Mentel & Pisula (2016)	47 companies in TSL sector (transport, spedition, logistics) during 1997-2003	Poland, Slovakia	95.0%
Kovacova & Kliestik (2017)	1,000 companies	Slovakia	97.0% on training data, 86.7% on test data

Jencova (2018)	856 electrical engineering corporations in 2017	Slovakia	95.35%
Horvathova & Mokrisova (2020)	343 companies active in the field of heat supply for the year 2016	Slovakia	95.0%
Svabova et al. (2020)	75,652 SMEs during 2016-2018	Slovakia	93.4%

Source: own processing according to Pavlicko, Durica & Mazanec (2021)

Horvathova & Mokrisova (2020) used financial indicators in their logistic regression model, current liability/total assets, net income/total assets, working capital/total assets, earnings before interest and taxes/interest expenses, and equity/debt. Jencova (2018) used accounts payable turnover ratio, return on sales, quick ratio, financial leverage, net working capital/assets. Kovacova & Kliestik (2017) used net return on total income, current ratio, net working capital ratio, retained earnings to total assets ratio, total debt to total assets ratio, current debt to total assets ratio, equity to assets ratio, current assets to total incomes ratio. Gulka (2016) used cash ratio, turnover of working capital, share of financial accounts, equity ratio, credit burden, liabilities towards state institutions/total assets, EBITDA/total assets. Jakubik & Tepy (2011) used financial leverage, interest coverage, gross profit margin, inventory ratio, cash ratio, return on equity. Table 3 shows the artificial neural networks models.

Table 3. Artificial neural networks

Author(s)	Country	Sample	Accuracy
Virag & Kristof (2005)	Hungary	156 industrial companies	86.5%
Purvinis, Sukys & Virbickaite (2008)	Lithuania	230 companies	-
Lin (2010)	Russia	565 banks	53.8%
Bagheri, Valipour & Amin (2012)	Tehran	80 companies	-
Vochozka & Rowland (2015)	Czech Republic	128 construction companies	94.5%
Brozyna, Mentel & Pisula (2016)	Poland, Slovakia	47 transport companies during 1997-2003	95.0%
Horvathova, Mokrisova & Petruska (2021)	Slovakia	444 companies in the field of heat supply	98.3% on training data, 95.9% on test data

Source: own processing according to Kliestik et al. 2019

Based on publicly available information, FinStat (2022) evaluates the financial health of Slovak companies using its credit model for assessing the bankruptcy risk in the next accounting period, i.e., the FinStat score (accuracy 83%). The model includes total indebtedness, equity ratio, financial accounts to assets ratio, return on assets, and debt repayment period to sales. The value of the FinStat score ranges from 0% to 100%. The higher the value, the greater the bankruptcy risk of the company. If the value of the FinStat score is lower than 30%, the company is financially stable. A score higher than 70% indicates the company faces a high probability of bankruptcy. There is a grey zone between these limit values. In the accounting year 2021, 8% of companies (from 245,000) show a high probability of bankruptcy. Almost 64% of trading companies can be considered financially stable. 28% of companies are in the grey zone. Most of the financially stable companies are in public administration (88%), information technology (80%), healthcare (77%), projecting and engineering (76%), but also in education and training (75%). On the other hand, companies from the tourism sector and gastronomy (20%), food industry (13%), public administration (13%), retail (12%), and sale and maintenance of vehicles (10%) have high a probability of bankruptcy. 50% of companies from the automotive industry are in the grey zone. On the contrary, no company from the public administration is in the grey zone (Hrncarova, 2023).

Figure 1. Evaluation of the probability of bankruptcy of companies by industry in 2021
Source: Hrnčarová (2023)

Conclusion

Estimating the riskiness of company or the probability of its bankruptcy is important, especially for investors and creditors, besides business owners. Therefore, searching for applicable models to predict bankruptcy is important. This is an important area not only in scientific research, but also in the practice of business entities. In essences, corporations must identify and prevent instability over time. Therefore, it is necessary to evaluate the financial health of companies using appropriate models.

The aim of the paper was to apply selected bankruptcy models in the teaching of financial subjects. The intention was to compare individual bankruptcy models and their use in teaching financial subjects. The paper focused on the comparison of models that were created using multivariate discriminant analysis, logistic regression, and neural networks.

In business management, it is important to understand the financial and economic situation and react promptly in the event of impending danger. Various simple models, more complex statistical functions, and artificial intelligence have been used to predict bankruptcy. Financial analysts should simultaneously use multiple methods to compare the results. Managers and business owners can use this paper to guide their firms and inform future business plans.

The Rolling SML-based Portfolio Strategy

Martin Užík^{1,*}, and Sebastian Block¹

¹ Berlin School of Economics and Law, Badensche Straße 52, 10825 Berlin, Germany

Abstract

Research background: The Security Market Line (SML), also known as the Capital Asset Pricing Model, offers investors a simple and excellent way to identify current market pricing as over- or undervalued. Based on this information, the investor can make appropriate investment decisions. However, most of the literature focuses on CAPM anomalies. The best known CAPM anomalies include the zero-beta effect (Black et al. 1972), the book-to-market value anomaly (Basu 1977) and firm-size effect (Banz 1981).

Purpose of the article: In contrast to the approach in the literature, we focus on the original over- or undervaluation idea of the SML. Investment portfolios are formed in which individual assets are either bought or sold short. The objective is to check whether the portfolio formed can outperform a benchmark.

Methods: Selected asset classes are either bought (in the case of undervaluation) or sold short (in the case of overvaluation) in line with the momentum strategy. A portfolio is formed and portfolio performance is determined on a rolling basis. This is compared to a benchmark and checked for outperformance using a two-sample test for significant differences. The intervals we use for the rolling are defined as quarters. The study period is 20 years and starts in 2000.

Findings & Value added: Within the framework of the empirical analysis, an outperformance of the SML base rolling portfolio was determined. This is also statistically significant in part.

Keywords: CAPM, portfolio management, Rolling momentum strategy, security market line, SML

JEL classification: G11, G12, G15, G17

1. Introduction

Portfolio managers search for returns like the Knights Templar search for the Holy Grail. The problem with returns, however, is that once identified, they disappear through active trading. Therefore, the scientific community is encouraged to investigate new methods and trading strategies. This is also the objective of our contribution, in which we examine the following research question: Can an analysis of the cost of capital and the company returns, which make it possible to identify under- or overvaluations according to theory, also be used as an investment strategy?

To investigate this, a BUSO (buying undervalued, selling overvalued) portfolio is created. This leads us to the following hypothesis:

H_0 : Identifying existing over- or underperformance based on the SML and analogously use it to invest according to the momentum strategy does not outperform the MSCI World Index.

The Security Market Line (SML) also known as the Capital Asset Pricing Model (CAPM) (Sharpe, 1964; Lintner, 1965; Mossin, 1966) provides investors with a simple and excellent way to identify the current market pricing of stocks as overvalued or undervalued. The SML determines if the stock is expected to generate higher or lower returns than the actual market (Sinha, 2012). Based on this information, the investor can make appropriate investment decisions. The rolling momentum strategy (Užík et al., 2021) focuses on identifying stocks that have shown positive price trends over certain periods of time such as a couple of weeks or months. The rolling momentum strategy assumes stocks with positive price trends will likely perform better in the near future as well. The main idea is to include and keep stocks in your portfolio that have a positive price trend and exclude stocks that have been performing poorly.

* Corresponding author: martin.uzik@hwr-berlin.de

However, most of the literature focuses on CAPM anomalies. The best known CAPM anomalies include the zero-beta effect (Black et al. 1972), the book-to-market value anomaly (Basu 1977) and firm-size effect (Banz 1981). CAPM anomalies have been subject to research thoroughly (Lewellen and Nagel 2006; Emiger 2018; Cederburg and O'Doherty 2015).

1.1 CAPM

The Capital Asset Pricing Model (CAPM) was developed almost simultaneously and independently by William F. Sharpe (1964), John Lintner (1965) and Jan Mossin (1966). It is based on the portfolio theory of Markowitz (1959), who assumed that all forms of investment involve risk. Investors' preferences for expected return and risk are represented by indifference curves. The CAPM extends portfolio theory by assuming risk-free investments such as fixed-rate federal bonds. These provide a safe return with a certain expected value and a standard deviation of zero. The inclusion of the risk-free rate opens up new investment opportunities for investors by allowing them to build their portfolio of risk-free and risky assets. The investor has to decide on the ratio of risky securities in his portfolio and the weighting of the risk-free investment. Since its inception, CAPM has been subject to research in many different approaches. In the first wave of research, assumptions regarding the CAPM were mainly researched (Lintner 1969; Brennan 1970; Black 1972) and more recently Acharya and Pedersen (2005). Later empirical tests were the main subject of research (Fama and MacBeth 1973; Fama and French 1993, 1996; Jagannathan and Wang (1996). The third wave consisted of the search for economic transmission channels (Campbell and Vuolteenaho 2004).

The capital market line, which is the tangent between the risk-free rate and the efficiency curve, helps determine efficient portfolios. The market portfolio that lies at the tangent point of the line is held by a rational and efficient investor. The capital market line includes all efficient portfolios that can be obtained by combining the market portfolio with the risk-free investment. The CAPM answers the question about the expected return of a portfolio in the presence of a risk-free investment if the investor is willing to take some investment risk. The security market line (SML) describes the relationship between the expected return of a security in the market portfolio and the risk of the market portfolio, measured by the covariance of returns. The expected return is composed of the risk-free interest rate and a risk premium. The risk of a security is represented by the beta factor, which measures systematic risk.

CAPM provides the theoretical basis for determining the expected return of an investment based on its systematic risk, while the SML visualizes this relationship by plotting the required return based on the beta of the investment. The SML serves as a tool to evaluate the attractiveness of investments and to determine whether they are overvalued or undervalued relative to their risk.

The Capital Asset Pricing Model (CAPM) is built upon several underlying assumptions:

- The planning period is considered to be a single period.
- All investors are risk-averse and evaluate portfolios based on the expected return and standard deviation of security returns.
- Investors share the same expectations regarding the expected returns, standard deviations, and covariances of security returns. Stock returns are assumed to follow a normal distribution.
- All risky securities are freely traded in the capital market and can be divided into any desired quantity.
- A risk-free interest rate exists, allowing investors to borrow or lend capital without restrictions.
- The capital market operates without constraints, transaction costs, or taxes. All relevant information is available to investors and already reflected in market prices (Užík, 2004).

It is evident that the CAPM assumes a perfectly efficient capital market, although these assumptions diverge from the realities of real-world capital markets. Consequently, valuation inefficiencies arise, significantly impacting the allocation function of capital markets. This work assumes the availability of all information and its continuous integration into market prices.

The equity return corresponds to the cost of equity in terms of the minimum required return from shareholders' perspective. Capital can be invested or borrowed at the long-term risk-free interest rate. The risk-free interest rate is typically aligned with the long-term government bond yield, often based on a ten-year period. The market portfolio refers to a portfolio that includes all investment instruments.

1.2 Momentum Strategy

To begin with, the focal point for momentum strategy as a procyclical investment strategy resides in the hypothesis that the winning shares of the past will reasonably grow in the upcoming future with identical assumption for the performance of loser shares. (Bajgrowicz & Scaillet, 2012; Asneset al. 2013). Subsequently, as an investing strategy, investors purchase securities that are rising and sell them when they appear to have reached their prime. However, the idea of selling losers & buying winners is highly provocative, but it strikes sharp contrast with the tried & tested Wall Street proverb "buy low, sell high." (Barone, 2021)

Portfolios are built using straightforward regulations in the Momentum strategy. On the basis of previous price levels, equities are chosen within a formation period under the return standard, subsequently, the stocks with best & worst return on equities in formation period are combined into winning and losing portfolios, each with the same number. Therefore, the final phase consists of acquisition of the winning portfolio which is held for the duration of the investment with the loser portfolio being sold short simultaneously (Brock et al. 1992).

Furthermore, Momentum strategy can be viewed & is established as market-proven phenomena, from the standpoint of investment, the momentum effect empowers the development of corresponding investment strategies for market outperformance.(Chordia & Shivakumar, 2012; Celiker et al., 2016). Thus, the key to momentum investing is being able to capitalize on volatile market trends.

2. Methods

For the purpose of this study, we focused on companies listed on the EURO Stoxx 600. Since its introduction in 1998, the STOXX Europe 600 has become one of Europe's benchmark indices. The period of investigation extends from 2000 to 2022 and amounts to a total of 22 years whereby we use data since March 31, 1999 and until September 30, 2022. This shift in the period is due to the methodology.

The empirical analysis combines two financial concepts to enable portfolio construction. On the one hand, the CAPM and its security market line, which serves as a reference comparison with respect to the identification of over- or undervaluation.

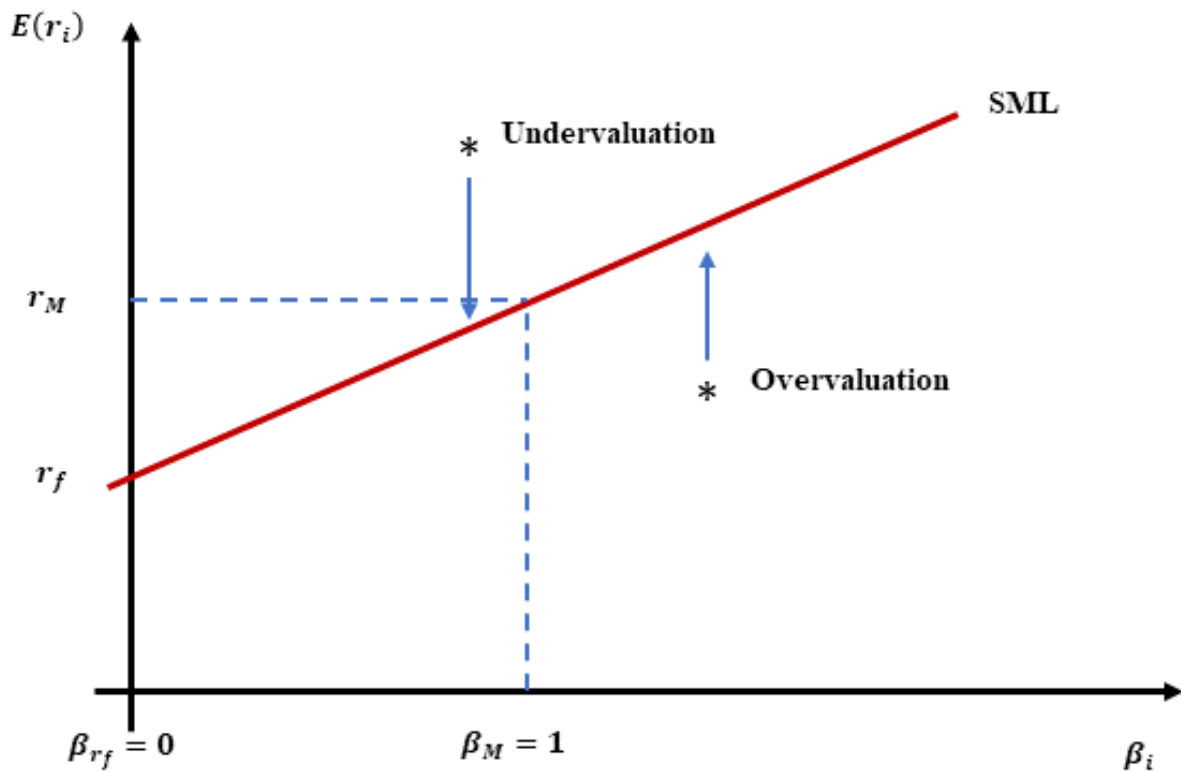

Figure 1. Security Market Line. Over- and undervaluation of assets.
Source: own processing (2023)

This assumption exploits the functional relationship between asset prices and their returns.

$$r_i = \ln\left(\frac{P_t}{P_{t-1}}\right)$$

If the return is lower than the theoretical CAPM return, investors sell the asset, which leads to falling prices. As prices fall, the return of market participants increases, which also shifts the return below the SML toward the SML line. The same is true for undervaluation. Thus, if an asset class is undervalued, which is associated with a low entry price, market participants will continue to buy these assets as long as the return on the assets has not reached the SML.

Second, this paper makes use of the assumption that, analogous to the momentum strategy, we buy the undervalued assets and sell the overvalued ones short. This approach was implemented in this paper on the basis of quarterly returns. The first step was to calculate the expected CAPM return for each asset at the end of the quarter. We used daily returns for a period of one trading year (260 trading days) and the MSCI World Index as the market portfolio to calculate the beta value. The risk-free returns as well as the market returns are taken from the website www.marktrisikoprämie.de and were also recorded at quarterly intervals.

$$r_{CAPM} = r_f + (r_M - r_f) \times \beta$$

Where:

$$\beta_i = \rho_{i,M} \times \frac{\sigma_i}{\sigma_M}$$

r_{CAPM} = Expected return according to the Capital Asset Pricing Model

r_f = Risk free rate

r_M = Market Return

β_i = Beta (systematic risk)

$\rho_{i,M}$ = Correlation between the returns of the asset and the market

σ_i = Volatility of the asset's returns

σ_M = Volatility of market returns

Finally, according to the momentum strategy for first quarter 2000, the expected return was calculated according to CAPM and compared with the actual return of the asset. The following rules were followed:

$$r_{CAPM,t} > \ln\left(\frac{r_{i,t}}{r_{i,t-1}}\right) \quad \text{then go short and sell the asset}$$

$$r_{CAPM,t} < \ln\left(\frac{r_{i,t}}{r_{i,t-1}}\right) \quad \text{then go long and buy the asset}$$

For portfolio returns, the following applies:

$$BUSO_{t+1} = pr_{t+1} = \begin{cases} \sum_{i=1}^{n=600} \ln\left(\frac{r_{i,t+1}}{r_{i,t}}\right) & \text{if } r_{CAPM,t} > \ln\left(\frac{r_{i,t}}{r_{i,t-1}}\right) \\ \sum_{i=1}^{n=600} -\ln\left(\frac{r_{i,t+1}}{r_{i,t}}\right) & \text{if } r_{CAPM,t} < \ln\left(\frac{r_{i,t}}{r_{i,t-1}}\right) \end{cases}$$

Where:

$BUSO_t$ = Buying Undervalued Selling Overvalued

pr_t = Portfolio return

3. Results

In the empirical analysis, the focus is placed on the entire BUSO strategy. This will also be tested empirically.

Figure 2. BUSO cumulative portfolio return.
Source: own processing (2023)

Figure 3. BU cumulative portfolio return.
Source: own processing (2023)

Figure 4. SO cumulative portfolio return.
Source: own processing (2023)

Finally, according to the momentum strategy for first quarter 2000, the expected return was calculated according to CAPM and compared with the actual return of the asset. The following rules were followed: The Accumulated Portfolio Returns formed show the overall BUSO strategy in the upper left panel. The top right shows the pure Buing Undevalueed and the bottom left the Selling Overvalueed performance. The straight line for comparison is the performance of the MSCI World Index over the period under consideration. It should be noted that the returns of the MSCI index are also calculated on a quarterly basis. For better clarity, the MSCI World is shown alone at the bottom right. To illustrate the impressive performance of the BUSO strategy, it is necessary to focus on currency performance rather than return performance. While the MSCI World Index increased from 1377.72 to 3101.8 from 2000 to 2021, which is 125.14%, the BUSO strategy achieved the profit performance 2766.43 in 2000 and cumulative value 719333.35 in 2021 on the basis of the profits in currency units, so the total performance was 25902.21%. Also impressive are the clear outperformances of the Selling Overvalueed strategy in the crisis periods of the dotcom bubble and the financial crisis of 2008.

4. Discussion

The statistical analysis of the results is based exclusively on the BUSO strategy as a whole. Even without statistical analysis, the performance charts show that the Selling Overvalued strategy only generates positive outperformance in times of crisis. The same applies to the Buying Undervalued strategy, which can be assumed to generate statistically positive outperformance from around mid-2002 onwards.

This means that the overall BUSO strategy takes a somewhat more conservative view, as the combination of the two individual strategies means that the overall performance is lower. The outperformance is always measured against the MSCI World. In table 1 above, the mean values represent the difference in the respective quarterly return of the BUSO strategy compared to the quarterly return of the MSCI World index. In only five of 87 quarters was BUSO performance negative compared to the MSCI-World. In contrast, it was positive in 82 quarters. The statistically significant values are marked in bold.

Conclusion

This paper deals with a newly developed strategy, in which the existing over- or underperformance based on the SML is used analogously to investing according to the momentum strategy. The generated BUSO portfolio shows a general and partly statistically significant outperformance compared to the MSCI World Index. Considering these results, the H_0 hypothesis can partially be rejected for the bold market pairs in table 1. Overall, the results regarding the newly developed methodology are to be verified by further work. The extension of the intervals to single months or weeks can be considered as recommendable.

Abstract

Research background: The paper highlights fundamental screening use in investment portfolio creation.

Purpose of the article: The article aims to test the performance of the selected active approach to managing investments into equities in a historical time horizon, which captures various stages of development in financial markets, alternating periods of boom and crisis. We monitor performance by comparing portfolio, risk and risk-weighted returns with the same parameters of selected benchmarks.

Methods: The research focuses on the Growth at a Reasonable Price (GARP) investment strategy applied to the universe of stocks in the S&P 500 index. The results of the tested strategy are compared with the selected benchmark.

Findings & Value added:

Our results demonstrate that using fundamental screening and the GARP investment strategy can outperform passive forms of investing and factor indexes focused on value or growth stocks in terms of cumulative and annualized returns. We have shown that the selected screening criteria defining the combination of value and growth style formed concentrated portfolios achieving higher returns than the S&P 500 index approximately 70% of the time. A higher average annual return than the S&P 500 index was realized by our GARP portfolio and the ETF GARP strategy, which describes a combination of Value and growth style. Considering that during the monitored period of 19 years, various economic cycle periods alternated, the results indicate that the GARP strategy has the potential to outperform the average returns of a more broadly defined market.

Keywords: fundamental screening, market efficiency, GARP strategy, portfolio

JEL classification: G00, G11, G12, G14

1. Introduction

Long-term civilizational trends that can currently be observed include the extension of the average human age and the increase in the standard of living worldwide. The trends mentioned above are closely related to the increase in demand for high-quality investment management services due to the need to refinance the living costs of an unproductive or less productive population and the rising middle-class wealth management. As Choi *et al.* (2017) wrote, the quality of investment management is manifested, among other things, by the ability to adapt investment goals to the specific needs of individual investors, whether individual or institutional. The goals in the field of investment management are primarily based on the investment horizon, which changes over time. The primary level of adaptation to goals in investment management is asset allocation, whether classic, such as shares and bonds, or alternative, such as real estate or commodities or dynamic (Woon Jeong *et al.*, 2023; Kontosakos *et al.*, 2023; Ma *et al.*, 2023). The hierarchically following level of adapting to investment goals is deciding on the investing style, i.e. how much to invest, for how long to invest, actively or passively, or in a semi-active/semi-passive form of factor investing within the limits defined by the allocation to selected assets (Tao *et al.*, 2023). If, for example, a decision has been made to invest actively into equities, there is a vast space for applying diverse investment approaches, such as sector and factor rotation, fundamental, technical and quantitative approaches, absolute returns vs. relative and many others (Chen, Jin, 2023; Braga *et al.* 2023; Bessler *et al.*, 2021; Platanakis *et al.* 2021).

This article aims to test the performance of the selected active approach to managing share investments in a historical time horizon, which captures various stages of development in financial markets, alternating periods of boom and crisis. We monitor performance by comparing portfolio returns, risk and risk-weighted returns with the same parameters of selected benchmarks. We assume that the asset allocation decision has already been made in portfolios. When choosing an active approach, we tried to consider a certain degree of originality, which we integrated through a combination of classic Growth and value style while applying a purely systematic approach to stock selection. We have used a specific approach to selecting stocks for our portfolios, fundamental screening, which combines elements of value and growth investment styles.

2. Methods

The subject of the investigation is the use of fundamental screening based on the Growth at a reasonable price (GARP) investment strategy (Rabener, 2019; Fernández *et al.*, 2019). We combine the value and growth approach when creating investment portfolios and comparing the performance of a defined systematic active strategy with selected passive indices. The strategy identifies companies that can be expected to grow above average but are still traded at a reasonable price relative to earnings and growth potential. In the beginning, we defined the screening criteria for selecting stocks for the portfolio, specifically PEG (Price to Earnings Growth), ROE (Return On Equity), EPS (Earnings Per Share), D/E (Debt to Equity), see (Robinson *et al.*, 2009; Sevastjanov & Dymova, 2009; Pinto *et al.*, 2022). These criteria were defined strictly and were not modified during the analysis. Each year, a new portfolio was created for the past 19 years (2004-2022). A total of 19 portfolios were analyzed. Securities for the portfolios were selected by screening the historical universe of the S&P 500 index of the given year. Subsequently, equal weight was assigned to each title in the portfolio (Elton *et al.*, 2019; Fabozzi *et al.*, 2016; Baines *et al.*, 2021; Gârleanu *et al.*, 2022). The number of stocks in the portfolio was limited to a maximum of 30. The minimum number was not determined so that we could create relatively concentrated portfolios. Rebalancing did not take place during the year. The portfolio structure remained unchanged during the year. Backtesting of the strategy was performed automatically on out-of-sample data. The performance of the portfolios was measured for each year. The results are compared with benchmarks based on absolute and risk-adjusted return (Sharpe Ratio).

The paper used the following comparative benchmarks: iShares Core S&P 500 ETF, iShares S&P 500 Value ETF, iShares S&P 500 Growth ETF, and S&P 500 GARP ETF.

The data was obtained from the Yahoo Finance Inc. Website, and the historical composition of the S&P 500 index was downloaded from the file from GitHub. Adjusted close prices of stocks and ETFs were obtained from the Yahoo Finance Inc. Website. The data were then processed and filtered in MS Excel. All financial data is on an annual basis. Stock and ETF prices are monthly data in USD.

3. Results

We present the results of our analysis for the following portfolios: our proposed portfolio (GARP Portfolio), iShares Core S&P 500 ETF (S&P 500), iShares S&P 500 Value ETF (S&P 500 Value), iShares S&P 500 Growth ETF (S&P 500 Growth). The results for the portfolio S&P 500 GARP ETF (S&P 500 GARP) are not presented due to the unavailability of the data from 2004-2011. Table and 2 represent the annualized return, volatility and Sharpe Ratio (Fabozzi *et al.*, 2016; Funtek, 2023).

The macroeconomic environment during the year 2004 was presented by stable economic Growth. US GDP grew by 4.4% in the third quarter of 2004, the fastest pace in nearly 20 years. The unemployment rate in December 2004 was at the level of 5.4%. The Federal Reserve raised interest rates four times in 2004, from 1% to 2.25%. We have selected stocks based on the results of fiscal year 2003 by the fundamental screening. We obtained seven stocks to create our GARP portfolio for the year 2004. The portfolio generated the highest return and Sharpe Ratio in 2004 compared to all other benchmarks. Although the growth style has not been successful this year, our GARP portfolio has been successful due to the selection of suitable value stocks with growth potential. Stable economic Growth continued in 2005.

The country's GDP grew by 3.5% in the third quarter of 2005. The unemployment rate was 5% in December 2005. The Federal Reserve raised interest rates eight times from 2.25% to 4.25% to curb inflation. We created our GARP portfolio based on the results of fiscal year 2004 again. Screening filtered eight stocks for 2005. Seven stocks of them achieved positive returns. This year, the primary value style did well, and our GARP portfolio again achieved the highest yield and Sharpe Ratio among all other benchmarks. The high volatility of the portfolio was directly related to its high concentration.

The US economy in 2006 was characterized by slowing job growth, an eroding housing market and rising federal debt that underscored the fragile state of economic Growth. The Great Ease ended when a decade-long expansion in the US housing market peaked in 2006, and residential construction began to decline. The Federal Reserve raised interest rates from 4.25% to 5.25%. Our GARP portfolio this year included 19 stocks. However, up to 10 of them had a negative yield. Our GARP portfolio lost in all aspects this year compared to other benchmarks. The portfolio included stocks whose returns were negatively affected by the second year of interest rate increases and the slowdown in economic Growth. Looking at the results of the other ETFs, we can conclude that the weaker performance of the portfolio was caused by stock selection rather than the macroeconomic situation, as the other ETFs had a successful year. Value stocks and the traditional S&P 500 were the best performers. The US economy in 2007 was characterized by losses on mortgage-related financial assets, which began to cause tension in global financial markets. The US economy went into recession in December 2007. The FED cut interest rates from 5.25% to 4.25%.

Table 1. Comparison of the performance of the analyzed portfolios during the period 2004-2011

		GARP Portfolio	S&P 500	S&P 500	S&P 500
				Value	Growth
2004	Return	30.23%	6.03%	10.14%	1.31%
	Volatility	13.27%	7.13%	7.33%	7.73%
	Sharpe Ratio	2.14%	0.58	1.17%	-0.08
2005	Return	21.46%	9.92%	11.29%	8.51%
	Volatility	14.69%	8.17%	7.94%	8.42%
	Sharpe Ratio	1.21%	0.77	0.97%	0.58
2006	Return	6.70%	14.76%	19.52%	10.08%
	Volatility	12.25%	5.63%	5.71%	6.64%
	Sharpe Ratio	0.14%	1.74	2.56%	0.78
2007	Return	21.22%	-2.70%	-3.80%	-1.78%
	Volatility	13.10%	11.45%	10.65%	13.01%
	Sharpe Ratio	1.27%	-0.63	0.78	-0.49
2008	Return	-38.54%	-38.26%	-44.36%	-32.17%
	Volatility	31.27%	21.16%	22.97%	21.11%
	Sharpe Ratio	-1.29	-1.89	-2.01	-1.67
2009	Return	65.68%	32.70%	34.76%	30.61%
	Volatility	24.18%	21.30%	24.01%	18.04%
	Sharpe Ratio	2.7	1.59	1.43	1.67
2010	Return	9.22%	22.28%	21.13%	23.08%
	Volatility	19.51%	18.46%	18.86%	18.60%
	Sharpe Ratio	0.46	1.19	1.1	1.22
2011	Return	-1.51%	4.18%	0.97%	7.14%
	Volatility	18.84%	17.11%	18.72%	15.94%
	Sharpe Ratio	-0.09	0.23	0.04	0.44

Source: own processing (2023)

These economic conditions caused the screening to select 21 shares. Shares of five companies recorded significant losses, but these were more than compensated by the excellent performance of other shares. The results show the absolute dominance of the portfolio for the year 2007 compared to other indices. In 2008, the US economy was characterized by a deep recession caused by the financial crisis of 2007–2008. From late 2007 to mid-2009, it was the most prolonged and deepest economic downturn in the United States since the Great Depression (1929).

The FED reduced interest rates from 4.25% to 0%. Even our GARP portfolio recorded losses. A yield was -38%. On a relative basis, the portfolio's performance was satisfactory, especially concerning the value indices. In contrast, from the point of view of the risk-weighted return, expressed by the Sharpe Ratio value, the portfolio achieved the best result among all the compared indices (see Table). The US economy was characterized by a continuing recession in 2009, with GDP falling by 2.5%, with the cycle bottoming out this year and the conditions for a recovery in the following year beginning to form.

The FED kept interest rates at 0%. Our GARP portfolio achieves high returns and the best Sharpe ratio values compared to other benchmarks. Such positive results were mainly due to the expansionary monetary policy and the previous market slump. The portfolio was composed of 30 stocks. The results indicate that when the economy moves from a recession to a recovery phase, the GARP strategy combines the positives of both investment styles and brings investors a return above the rate of a passive investment method.

The GDP growth rate of 2.71% characterized the US economy. US employment grew, the layoff rate fell, and the average wage (adjusted for inflation) rose. Inflation was at the level of 1.64%. The FED kept interest rates at 0%. At the beginning of 2010, fundamental screening selected ten stocks for the portfolio, half ending the year with a negative return. The most successful growth strategies benefited from cheap capital and the economy's recovery after the recession. Compared to the other benchmarks, our GARP portfolio significantly lagged. In 2011, the pace of US economic growth slowed significantly. GDP grew by 1.55%. Inflation was at the level of 2.96%. FED rates remained at 0%. Our GARP portfolio once again lagged behind other benchmarks. Growth stocks performed best. We could attribute the portfolio's poor performance this year to the overall state of the stock markets and the fact that, at this time, the orientation towards value characteristics deprived us of a better return.

Table compares the performance of the analyzed portfolios from 2012-2022. After a decline, the US economy grew by 1.5% in 2012. The unemployment rate fell from 8.5% to 7.9%. However, at the end of 2012, the debt-to-GDP ratio was 100%, higher than ever since World War II. Inflation was 2.01%, and the FED kept rates at 0%. Since 2012, data for the GARP ETF is also available, which allows us to compare our GARP strategy with Invesco's GARP ETF. Our GARP portfolios are generally constructed according to different criteria than the GARP ETF. Screening in the GARP ETF takes place quarterly, and the rules are set to allow more stocks to be included in the portfolio. Our GARP portfolios are more concentrated and thus more exposed to idiosyncratic influences. In 2012, however, up to 30 shares entered our GARP portfolio.

Although the absolute results were attractive, our GARP portfolio offered the worst results relative to other benchmarks. The annual GDP growth rate at the end of 2013 was 2.5%. The inflation rate in the United States reached 1.5%. The unemployment rate in December 2013 was 6.7%. FED rates were again at the level of 0%. As we have seen in previous years, after 1 or 2 years of weaker portfolio performance, a year comes to the scene that overwhelms other comparative benchmarks. In 2013, 22 shares were included in the portfolio, and none recorded a loss at the end of the year. The year 2013 was overall the most successful from the point of view of the achieved Sharpe ratio. The annual GDP growth rate at the end of 2014 was 2.4%. The inflation rate was 0.8%. The unemployment rate in December 2014 was 5.6%.

FED rates remained at 0%. The screening generated an 11-member portfolio. The portfolio had an average year compared to other benchmarks. The GARP ETF fared best in all respects. Regarding return, it beat the S&P 500 index, both value funds and the Pure Growth fund. The annual GDP growth rate at the end of 2015 increased to 2.9% compared to 2014. The inflation rate was 0.7%. The unemployment rate fell to 5.0% in December 2015. Again, the FED did not change interest rates and remained 0%. Under these economic conditions, our screening filtered only eight companies into the portfolio, but the portfolio results were the worst this year compared to other benchmarks. In 2016, compared to the previous year, the US economy showed a decline, on the one hand, in the year-on-year growth rate of GDP, which fell to 1.6% at the end of this year. The inflation rate fell to 2.1%, and the unemployment rate was 4.7% in December 2016. FED rates remained at 0%. As of 2015, our GARP portfolio consisted of only eight shares. This year, the result from the previous year was repeated, and the portfolio achieved the worst results compared to other benchmarks.

The change occurred the following year in the year-on-year GDP growth rate when, at the end of 2017, it was 2.3%. The inflation rate in the United States was 2.1% in 2017, and the unemployment rate was 4.1% in December 2017. The FED raised the interest rate to 1.5%. Only four actions passed the screening. The highly concentrated portfolio offered the highest return, combined with the highest volatility, reflected in a lower Sharpe ratio than other benchmarks. In 2018, the annual GDP growth rate

was 2.9%. In December 2018, the inflation rate was 1.9% and unemployment rates were 3.9%. The FED reacted by raising the rate from 1.5% to 2.5%. The fundamental screening selected only five stocks for the portfolio in 2018. All stocks saw significant losses at the end of the year. Too narrow a concentration and strict screening criteria caused problems, especially during interest rate increases and FED braking. The annual GDP growth rate at the end of 2019 was 2.3%. In December 2019, the inflation rate was 2.3% and the unemployment rate was 3.5%. The FED lowered the rate to 1.75%.

Table 2. Comparison of the performance of the analyzed portfolios during the period 2012-2022

		GARP Portfolio	S&P 500	S&P 500	S&P 500	S&P 500
				GARP	Value	Growth
2012	Return	10.26%	16.61%	15.85%	19.26%	14.20%
	Volatility	18.25%	10.61%	12.35%	11.68%	10.03%

	Sharpe Ratio	-0.12	-0.44	-0.1	0	-0.79

Source: own processing (2023)

This year, the portfolio recorded the highest absolute return for the monitored period but with an average level of Sharpe ratio. Growth stocks fared better. In 2020, the economy was affected by the COVID-19

pandemic, which was reflected in the year-on-year GDP growth rate of -3.4% at the end of 2020. The inflation rate in the United States was 1.4% in 2020. The unemployment rate was 6.7% in December 2020. The FED responded to the pandemic and lowered the interest rate to 0%. Our GARP portfolio consisted of 3 stocks. Only one of the shares recorded a positive return at the end of the year, which was also reflected in the result of the portfolio, which ended the year with a negative return (Table). The situation is repeated when the screening criteria also remove suitable candidates from the portfolio, and then, despite good market results and a favourable monetary policy, the portfolio loses significantly. A weak year can also be due to the inclusion of companies with value characteristics in the portfolio, which also experienced a weak year. Overall, we observed high volatility in the market, which best corresponded to growth stocks. The annual GDP growth rate at the end of 2021 was 5.7%. The inflation rate in the United States was 6.8% in December 2021. The unemployment rate was 3.9% in December 2021. The FED kept interest rates at 0%. Again, our GARP portfolio consisted of 3 successful companies. The portfolio earned an above-standard return of almost 50%. From the point of view of risk-weighted return, value stocks also did well after the previous disappointing year. The slightly weaker performance of growth stocks could be attributed to the sentiment of investors who slowly realized that the FED would have to intervene soon. The year 2022 is the last observed year in our analysis. The annual GDP growth rate at the end of 2022 was 2.1%. The inflation rate in the United States was 6.5% in December 2022, and the unemployment rate was 3.7%. The FED increased the interest rate to 4.5%. The fundamental screening selected 21 shares. The markets' performance reflected the sharp increase in interest rates in the US, which hurt growth stocks the most. The portfolio survived the year almost without a loss, which is positive considering the abovementioned situation. In particular, value stocks had the advantage, as they were the only ones able to create a profit. The financial markets were undoubtedly affected by the situation in Ukraine and the uncertainty in geopolitics.

To evaluate our strategy, we can say that it lacked higher diversification and greater consistency in performance. Despite this, the strategy we proposed ended in loss only six years out of 19, while two years could be considered instead in terms of the amount of loss than years when we did not lose or gain. We observed the highest yield after the dips in the economic crisis when the portfolio reached almost 67% yield in 2009. Conversely, the worst year was the previous year, 2008, when the portfolio lost over 38% of its Value (Figure 1).

Figure 1. Cumulative portfolio return over the period 2004-2022
Source: own processing (2023)

Our investment strategy explored in this article achieved a cumulative return of 686.65% over 19 years. For comparison, the growth portfolio recorded a cumulative return of 565.67% (see Figure 2). We compare our GARP portfolio with the S&P 500 GARP (see Figure 3) and note that data was available from 2012. Until 2018, we copied the S&P 500 GARP almost precisely. A minor deviation appeared in 2016 when the portfolio was inexplicably favourable conditions. It lost significantly compared to the benchmarks. The S&P 500 GARP obtained the final rebound when our GARP portfolio was insufficiently diversified and experienced two disappointing years in 2018 and 2020. Given the market sentiment, if we had constructed a more diversified portfolio in these years, we would probably have achieved a similar result to the S&P 500 GARP. Interestingly, on the horizon since 2012, the ETF using the GARP strategy was the most successful in terms of cumulative, annualized, and risk-weighted returns. Since the S&P 500

GARP uses fundamental screening and rebalances the portfolio quarterly, we can confirm the assumption that thanks to fundamental screening, it is possible to obtain a return above the level of passive investing, which is the S&P 500 in our case.

Figure 2. Comparison of the cumulative performance of portfolios over the period 2004-2022

Source: own processing (2023)

Figure 3. Comparison of the cumulative performance of portfolios over the period 2012-2022

Source: own processing (2023)

4. Discussion

Fundamental screening is becoming a popular strategy among investors because it does not require as much time investment as, for example, fundamental analysis and can yield a return above the level of the underlying index.

Table 3. Overall performance of individual portfolios

	Measures	2004-2022	2012-2022
GARP Portfolio	% Return	14.20%	14.10%
	Volatility	20.41%	21.80%
	Sharpe Ratio	0.59	0.85
S&P 500	% Return	10.40%	13.50%
	Volatility	14.79%	15.50%
	Sharpe Ratio	0.98	1.37
S&P GARP	% Return		16.20%
	Volatility		15.76%
	Sharpe Ratio		1.37
S&P Value	% Return	9.50%	12.00%
	Volatility	14.24%	14.03%
	Sharpe Ratio	0.74	1.16
S&P Growth	% Return	10.90%	14.60%
	Volatility	14.12%	14.40%
	Sharpe Ratio	0.94	1.39

Source: own processing (2023)

Table gives the overall performance of individual portfolios. The best values in individual categories are highlighted in bold. During the period 2004-2022, our GARP portfolio realized the highest average annual returns with significant differences compared to other benchmarks (+3.8% p.a. vs S&P 500, +4.7% p.a. vs. value S&P 500 and 3.3% p.a. vs. growth S&P 500). Like returns, the volatility of our GARP portfolio was the highest compared to other benchmarks, ultimately resulting in the lowest Sharpe ratio of our GARP portfolio. The GARP strategy, representing a combination of growth and value approach, ensured the highest return. Comparing the volatilities of the individual basic approaches (S&P 500, Value S&P 500 and growth S&P 500), it is possible to conclude that there were no fundamental differences between them. At the same time, it is interesting that the S&P 500 index had the highest volatility among the three approaches mentioned. Although our GARP portfolio consists of strategies with lower volatility than the broad market, its volatility was the highest, which we attribute precisely to its high concentration

(13 stocks on average). From 2012-2022, it was possible to track the performance of the GARP S&P 500. This ETF recorded the highest return with a significant difference from other strategies. Our GARP portfolio realized higher returns than the S&P 500 index and the Value S&P 500. It is, therefore, possible to conclude that even in this shorter period, the GARP strategy did better than the broad market, which is supported by our concentrated portfolio and the actual ETF representing the GARP strategy. Similar to the more extended period, the growth strategy outperformed the Value and broad market (S&P 500) regarding returns in this shorter period.

Interestingly, the growth strategy lagged behind the GARP S&P 500 regarding returns, while GARP also includes the value factor, which recorded the lowest return. We attribute this characteristic to the GARP S&P 500's ability to select value stocks with higher growth potential. The adverse effect of the high concentration of our GARP portfolio was again reflected in a significantly lower Sharpe ratio compared to all other strategies, specifically against the GARP S&P 500. We see that the Sharpe ratio of the GARP S&P 500 reached the second highest Value, only very closely behind the growth strategy. We attribute the more favourable values of the Sharpe ratio of the GARP ETF to our GARP portfolio values to the higher degree of diversification of the ETF.

Figure 4. Potential sources of profitability of individual strategies
Source: own processing (2023)

Figure 4 serves us in the discussion about the potential sources of profitability of individual strategies. The left vertical axis shows the return percentages of the two strategies (our GARP portfolio "% Return" and the broad market represented by the S&P 500 index "% Return S&P 500"). The right vertical axis shows the percentage rates of inflation, US GDP and FED interest rates. The horizontal axis shows the shift in time. The figure highlights five periods in which our GARP portfolio has underperformed the S&P 500. Approximately 70-75% of the time over the more extended period under review, our GARP portfolio outperforms the broad market regarding returns. To identify the potential causes of the relative performance of our GARP portfolio against the broad market, we used the development of the essential macroeconomic variables of inflation, GDP and FED interest rates. We monitor the interaction of variables and returns in selected five periods (higher returns of the broad market) based on the assumption that possible signals will be more assertive in such defined exceptional periods (only 25-30% of the total time). Let's look at each period in more detail.

1/Period 2006/2007: FED rates are on an upward trend and are approaching the ceiling. The average FED rate level has increased and exceeded the 4% mark. GDP had a downward trend. Inflation was above the required level of 2%, had an upward trend and has not yet reached the ceiling.

2/Period 2010/2011: FED rates are stably low. GDP is in a downward trend; during this period, a trend from the original increasing to decreasing occurs. In the monitored period, there is also a change in the inflation trend, a sharp increase from zero values to a level exceeding the required rate of 2%.

3/Period 2015/2016: Change in the trend of FED interest rates, the beginning of their increase as a reaction to increasing inflation. GDP, on the other hand, reaches a ceiling level and begins to decline.

4/2018 Period: FED rates are on an upward trend, approaching the ceiling. Inflation and GDP reach ceiling values.

5/Period 2020: Changing trends in GDP, inflation and FED rates caused by the recession due to the Covid-19 pandemic.

Summarizing the knowledge from the development of the interaction of essential macroeconomic variables and the performance of the GARP portfolio concerning the performance of the broad market, we formulate the following main conclusions:

- The lower return of the GARP portfolio was realized in the years before the FED interest rate ceiling was reached.
- The lower return of the GARP portfolio was realized in years in which the GDP recorded a downward trend/recession or there was a reversal or approach to a reversal of the trend from increasing to decreasing.
- The sensitivity of the GARP portfolio to changes in the GDP trend is higher than the sensitivity of the broader market to said changes.

Conclusion

The objective of the analysis presented in this paper was to examine the ability of a strategy based on a combination of value and growth investment styles to consistently outperform the broader market, as defined by the S&P 500 index. The period covered was from 2004 to 2022. The universe of securities to which the screening was applied was the S&P 500 index. The screening criteria were defined systematically and did not change during the entire period. The portfolios were created new at the beginning of each year, and the selected titles were weighted equally. The average number of shares in the portfolio was 13.

The analysis showed that the selected screening criteria defining the combination of value and growth style formed concentrated portfolios that achieved higher returns approximately 70% of the time than the S&P 500 index. A higher average annual return than the S&P 500 index was realized by our GARP portfolio and the following ETF GARP strategy, which describes a combination of Value and growth style. Considering that during the monitored period of 19 years, various economic cycle periods alternated, the results indicate that the GARP strategy has the potential to outperform the average returns of a more broadly defined market. The higher volatility of the returns of the generated portfolios was probably directly related to their higher concentration, which harmed the lower values of the Sharpe Ratio compared to the broader market. Unlike our GARP portfolios, the ETF following the GARP strategy achieved the same Sharpe Ratio values as the broader market, which is likely related to the greater diversification of the GARP ETF compared to our GARP portfolios. The analysis of the periods in which the return of the portfolios according to the chosen strategy was lower than the return of the broader market indicated a negative relationship between the peak of the economic cycle and the chosen strategy. The strategy achieved below-average performance in the very year that preceded the reaching of the FED interest rate ceiling and the turning point in the GDP trend.

We recommend viewing the analysis results in the context of the following limiting factors.

In the article, we considered a relatively short historical period, which reduces the explanatory power of the analysis. The stocks in our GARP portfolios were equally weighted compared to the market capitalization weighting of the S&P 500. As a result, the size of the companies may have affected the results. The relatively high concentration of generated portfolios, which resulted from rigorous systematic screening, resulted in above-average exposure to idiosyncratic influences. The universe of selected titles represented the S&P 500 index, from which it follows that the generated portfolios could be influenced by, for example, the size factor of the companies. As part of the analyses, we selected in-sample and out-of-sample periods. We created the portfolios based on screening the previous year's results and monitoring performance in the following year. A different combination may have produced different results.

We assume that it will be possible to follow up on our analysis, for example, by modifying the aforementioned limiting factors, such as choosing a more extended period of data collection, modifying the screening criteria enabling the generation of more diversified portfolios, changing the universe of selected titles so that the generated portfolios more accurately express the essence of the Growth and value strategy, by adjusting the ratio of periods in-sample versus out-of-sample, or by a more detailed analysis of the relationship between changes in the economic cycle and the performance of the GARP strategy.

Innovative Tools for Financing Municipalities

Július Golej^{1,*}, and Daniela Špirková¹

¹ Slovak University of Technology in Bratislava, Institute of Management,
Vazovova 5, 812 43 Bratislava, Slovakia

Abstract

Research background: The lack of financial resources for local governments is a social problem. Local governments in Slovakia have recently come under significant economic and budgetary pressures as a result of the refugee and energy crisis, but also through various legislative amendments. The current municipal financing model is inefficient. The model is poorly differentiated, and municipalities are largely dependent on the collection of a single type of tax. All these crises were accompanied by relatively poor government stability, which had no effect on the predictability of local government revenues. These pressures can be found mainly through management modernisation. This should include a high-quality design and implementation of the necessary structural reforms, the removal of existing obstacles, and support for innovation.

Purpose of the article: In the following contribution, we present innovative tools for financing municipalities. It is a set of tools that are necessary to restore the financing of public infrastructure in order to preserve the necessary budget of municipalities for other important tasks, such as social housing or health care.

Methods: These tools are part of the value capture issue and were investigated by the authors within the COST project and the study by the OECD and Lincoln Institute of Land Policy. Due to the lack of information on this issue, theoretical and methodological frameworks were first created. The subsequent investigation was carried out through several discussions with various stakeholders - experts from the public administration but also from the private sector, such as developers, architects, spatial planners, and economists.

Findings & Value added: As part of the project and study mentioned above, a comprehensive analysis of tools to capture public values in Slovakia was developed, an overview of which is offered in this contribution.

Keywords: value capture, municipalities, public finance, real estate tax, development fee

JEL classification: H13, E62, G23

1. Introduction

The current crisis in the field of public financing, not only in Slovakia, but also in other European countries, forces municipalities to approach significant cuts in their budgets. Among the main reasons in Slovakia, we can include a significant increase in energy costs, high inflation, and various current legislative changes (caused by cuts in personal income tax, or a jump in wages for pedagogical and non-pedagogical staff in education, which are borne by local governments from their budgets). Furthermore, these reasons are accompanied by insufficient compensatory measures from the state, which caused a systemically inadequate position of local governments in the system of power. If one adds to all this the very weak and inefficient use of financial resources from European funds, it represents a serious existential problem for Slovak municipalities. Furthermore, it cannot be forgotten that the biggest challenge for local governments in the coming decades is adaptation to the impact of climate change.

Modernising governance is a way to relieve economic and budgetary pressures, to design and deliver needed structural reforms, to remove existing barriers, and to foster innovations. Public value capture (PVC) is an essential phenomenon to improve the refinancing of public infrastructure and keep the necessary budget for other important duties like education, health and social care. (Halleux et al., 2023, p.

* Corresponding author: julius.golej@stuba.sk

13) According to Weitkamp and Hartmann, value capture is meant to pursue public goals. How these goals are formulated and achieved depends on the focus of each municipality. (Halleux et al., 2023, p. 5)

The authors of this contribution actively participated in the project Cost Action CA17125: Public Value Capture of Increasing Property Values (PuVaCa) and in the preparation of the study for OECD: Global Compendium of Land Value Capture Policies (OECD and Lincoln Institute of Land Policy, 2022).

1.1 Theoretical concept of public value capture

In the scientific literature, the field of PVC is addressed by several authors (for example, Hendricks, 2017; Havel, 2017; Alterman, 2012; Smolka, 2013; Muñoz Gielen, 2012; Ingram & Hong, 2012; Van der Krabben & Needham, 2008; Munoz-Gielen et al., 2022; Vejchodská, E., et.al., 2022; and others), while this issue from a historical point of view is not new. The first contemporary research related to this topic appeared in the second half of the 1970s. It should also be noted that there has been no uniform definition or clear terminology within this topic for a relatively long time.

Hendricks et al. describe PVC as a method or a strategy to capture value increase to use it for specific purposes, e.g., for improvement of public infrastructure through local development. (Hendricks et al., 2017) According to Munoz-Gielen, public value capture is when public bodies transfer the costs of public infrastructure and affordable housing (the costs of land and construction) to developers while capturing the benefits of development, i.e. the increase in economic value that accrues from re-zoning the site. (Munoz-Gielen, 2014) The definition of PVC according to Valtonen et al. comprises a wide range of methods that public authorities can use to capture part of the land value increment from landowners. (Valtonen et al. 2018) Authors Munoz-Gielen and van der Krabben lead a discussion regarding the concepts of land value capture (LVC) and PVC and compare their meanings. LVC refers not to the capture of value created by the efforts of the landowner himself, because there is no discussion of whether this value belongs to him. LVC thus refers first to the capture of the land value created by efforts of public bodies. The authors consider whether LVC should also refer to the capture of the land value created not by public bodies, but by other private parties than the owner. Another discussion regards whether LVC can be considered a tax or not. While PVC includes all instruments that capture all possible increases of the value of land and properties, whether they are considered taxes or not. PVC thus includes LVC and more. (Munoz-Gielen & van der Krabben, 2019)

OECD (2022) presents a definition of land value capture as a policy approach that enables governments to recover and reinvest land value increases that result from public investment and government actions. This can happen through recurrent taxes, one-time charges, or in-kind contributions from landowners or developers to a public entity. Land value capture is rooted in the notion that public action should generate public benefit.

The definitions of PVC used in the literature are many, and they may differ. Based on this, one of the goals of the aforementioned Cost project was to create a common definition of PVC, which is as follows: The term public value capture includes all instruments that capture all possible increases of the value of land and buildings, whether they are considered as taxes or not. It focusses primarily on capturing unearned benefits resulting from actions other than the landowner. The resulting funds may be earmarked for specific purposes (e.g. recovery of development costs or provision of affordable housing). (Halleux et al., 2023, p. 19)

We consider it important to understand the concept of PVC to understand the causes of the increase in land value. These causes have been investigated by several authors, including, e.g., Hong and Brubaker (2010), Smolka (2013), Ingram & Hong (2012) and Hendricks et al. (2017), and others. Hong and Brubaker (2010) divided the main causes of land value increase into the following categories:

1. the original function of the land, the original value of the land in the current function of its use,
2. changes in the functional use of land, extension of ownership rights (for example, changing the function of land from agricultural to construction),
3. public interventions in the form of investments in the territory in the form of building infrastructure and services in the territory (e.g., building roads and ensuring their service through public transport),
4. private investments in the territory in the form of territorial development (e.g., residential or commercial development projects that affect the value of the surrounding land),
5. population growth and economic development (the influence of economic factors such as demand and supply for real estate in a given area - too high a demand, e.g. for housing, which cannot be

satisfied by the current supply, can have an enormous impact on the value of all real estate in a given location, including land).

It should be noted that under Slovak conditions, the term of "public value capture" is relatively unknown; this issue in the context of PVC has so far not been examined at all and is also absent in the Slovak scientific literature.

1.2 Classification of PVC tools

There are several classifications of PVC tools in the literature, which differ from author to author. We present the classification that was created within the project COST CA17125.

The basic division of tools is divided into recurring and non-recurring forms of PVC. Recurring forms are further divided into annual payments (e.g. real estate tax) and payments in case of sale or purchase (real estate transfer tax). Non-recurring forms are further divided into: one factor increase in value (development fee) or multiple factor increase in value (e.g. developer agreements). (Halleux et al., 2023, p. 27)

Recurring forms may include real estate tax, real estate transfer tax, tax for unbuild plots, capital gains tax, inheritance tax, gift tax, and others.

Non-recurring forms may include: development fees or lieves (for new development or infrastructure), developer agreement, tax or levy on planning gains, real estate consortium, land reallocation / land readjustment, interim acquisition / land banking, cooperative development by urban contracts, contract models / developer obligations, and others.

An important factor for the functioning of these instruments is the legal framework, the basis of which is anchored in the constitution in the form of the definition of property rights (in the Slovak constitution: Article 20 - Property rights - Second Section, Second Title, Constitution of the Slovak Republic) and then at the level of local governments (in Slovakia: e.g. Act no. 447/2015 Coll. Act on the Local Development Fee and on Amendments to Certain Acts).

2. Methods

As part of the research carried out during the years 2018 - 2023 through the COST CA17125 project, a conceptual framework focused on the typology of PVC tools was created, the detailed classification of which was described above. A common definition of PVC was also created to ensure a better understanding of the issue of public value capture, which has not yet been sufficiently researched in several European countries, including Slovakia. Subsequent examination of the current state of this issue was carried out in Slovakia through several discussions with various stakeholders, experts from public administration, actors from the private sector, such as real estate valuers, real estate developers, architects, civil engineers, spatial planners, economists, and also municipal politicians. Subsequently, a comprehensive analysis of existing public value capture tools was developed in the Slovak Republic. The authors used the typology of tools to analyse and integrate individual PVC tools used in the Slovak Republic and describe the current situation of this issue as a newly created public policy under our conditions. In addition, simultaneously ongoing research on the study for the OECD and Lincoln Institute of Land Policy "Global Compendium of Land Value Capture Policies", in which one of the authors also participated. Research was carried out in the form of a detailed questionnaire survey focused on specifics related to the topic of land value capture and specific case studies from the Slovak practise.

This article provides an overview of individual PVC tools in the context of the Slovak Republic.

3. Results

3.1 Analysis of PVC tools in the Slovak Republic

This section presents an analysis of the available PVC tools in Slovakia. These are relatively common tools, available in several EU countries. The instrument is divided into two groups for recurring and non-recurring forms of PVC, according to the typology mentioned above.

The following sub-chapter is devoted to selected innovative tools that are used mainly in the western countries of Europe.

3.1.1 Recurring forms of PVC

Among the **recurring forms** of PVC that are made on the basis of **annual payments**, there is the Real Estate Tax. The real estate tax is a local tax imposed by a city or municipality. The jurisdiction is

determined by the place where the property is located. The municipality determines in its generally binding regulation the details of the amount of tax, reduction, or exemption from tax. The tax includes houses, apartments, and non-residential premises, and land. The real estate tax return is mandatory for entities that have changed the real estate they own, rent, or use. Changes mean the purchase or sale of real estate, acquisition by gift, inheritance, acquisition of real estate at auction, divorce, and subsequent court decision on property settlement, obtaining a valid building permit or a valid approval decision, obtaining a valid permit for changes in the use of a building, demolition of a building, land adjustments, a lease relationship with the Slovak Land Fund, and a long-term lease relationship, which is registered in the cadastre. It is possible to be exempted from paying tax or to get a real estate tax discount in the following cases due to age, disability, social disadvantage, and limited use of the given property (e.g., due to reconstruction). The law regulating real estate tax is Act no. 582/2004 Coll. on local taxes and a local fee for municipal waste and small construction waste. It is followed by other laws, the most important of which is Act No. 563/2009 Coll. on tax administration.

Another *recurring form* of PVC, but this time based on *payments in case of sale or purchase*, is the Real Estate Transfer Tax and Capital Gain Tax.

The Real Estate Transfer Tax is regulated by Act no. 554/2003 Coll. on the tax on the transfer and the transition of real estate. This law regulates the taxation of consideration transfer and consideration transition of real estate. For the purposes of this law, apartments and non-residential premises are also considered real estate. The subject of the tax is the chargeable transfer or chargeable transition of ownership of real estate in the territory of the Slovak Republic and real estate deposits in business companies and cooperatives. The tax rate is 3% of the tax basis. The basis of the tax is the agreed price for real estate, but at least the general value of real estate determined according to a special regulation. The tax administrator is the tax office in whose territorial district the real estate is located.

The Capital Gains Tax is a local tax. The tax is calculated by the tax administrator (city or municipality) who, based on the data provided by the taxpayer, such as the area of the apartment, land or the number of floors of the building, etc. Capital gains from the transfer of real estate are subject to a personal income tax of 19% or 25% as part of the taxpayer's annual income. The tax rate depends on the tax base that is formed according to the partial income tax base. If the tax base for 2022 does not exceed € 38,553.01, a tax rate of 19% applies. A tax rate of 25% applies to that part of the tax base that exceeds € 38,553.01. Profit from the sale of real estate is exempt from tax if certain conditions are met. The capital gains tax is paid by natural and legal persons who own, manage, or rent real estate with a lease period of at least 5 years or the user of the real estate. The tax is paid annually according to the assessment issued by the local authorities according to the cadastral territory in which the property is located. The transfer of buildings within 5 years of their construction (issuance of approval decision/permit) is subject to 20% VAT, transfers of real estate more than 5 years after their construction are exempt from tax. Profit from the sale of real estate is subject to corporate income tax in the Slovak Republic as business income. Business income is taxed at a 21% (15%) tax rate depending on taxable income (i.e., income that is subject to tax) for the tax period exceeding the amount of 49,790 euros (in 2022). The taxation of income from the sale of real estate in the Slovak Republic is regulated by Act No. 595/2003 Coll. on income tax.

3.1.2 *Non-recurring forms of PVC*

Non-recurring forms of PVC are divided from the point of view of focussing on single-factor value increase or multifactor value increase.

The single factor value increase in Slovakia includes the developer's contribution to the local infrastructure and the development fee.

Developers contribution to the local infrastructure in Slovakia is not enshrined in legislation or laws, and thus it is not enforceable. We can also call them forced investments from the point of view of the municipality, which the developer bears and often transfers these associated investments to the end user of the property. This means that the increased costs of development projects in the form of the completion of greenery, parks, road infrastructure, or social infrastructure, which are directly related to the given project and, ultimately, overpriced prices, will be paid by apartment buyers. The municipalities' requirements are formulated in the form of an agreement with the developer. These negotiations with the developer are purely within the competence of the municipality. There are cases, in particular, of small, less developed municipalities that do not ask developers for any contribution to urban infrastructure for fear of discouraging the developer from investing in their territory. It should also be added that the developer, through these associated investments in the immediate vicinity of his project intention, only often makes

his project more attractive in terms of marketing (more greenery and cycle paths), thereby increasing its market price, from which the developer ultimately benefits the most.

The development fee is enshrined in Act no. 447/2015 Coll. Local Development Fee Act. The purpose of development fees is to increase municipalities with additional resources to build new infrastructure so that new construction brings immediate benefits to old settlers. The fee, unlike the above-mentioned contribution to the infrastructure, can be considered predictable for the developer, since he knows in advance that he will have to pay the city a legal, predefined fee for each square metre of the above-ground part of the building, the price range from €10 to €5. The municipality can decide whether to introduce it and in what amount by adopting a generally binding regulation (in most cases set at the upper limit of the rate of €35). According to the law, municipalities must spend funds from the development fee only on capital investments for the purposes specified by the law. The purpose of development charges is to provide municipalities with additional resources to build new infrastructure so that new construction will bring immediate benefits to existing city residents. However, the developer has no way of influencing what the city will use the said fee and when it will be used. In addition, current practise shows that local governments are not able to effectively use the income from this fee, and its utilisation is relatively weak, while the most frequent argument heard from local governments is that the fee is low and insufficient for the costly investments for which it is to be used. In conclusion, it should be added that the development fee institute was created in order to replace and make transparent the aforementioned forced investments by developers in local infrastructure. Instead of abolishing individual bargaining with developers about their contributions, both approaches are now in place in practise, resulting in a double financial burden for developers, who once again pass everything on at prohibitive prices to the end users, who ultimately pay for it all.

Multi-factor value increases in Slovakia include: development according to the Urban Planning Legislation, and land reallocation.

Development according to the Urban Planning Legislation. These are relatively inflexible regulations and it is not possible to change them due to the complexity of individual development projects. The municipality can collect suggestions for changes or additions to the spatial plan and can from time to time approve a summary change or supplement to the spatial plan (and not for each parcel). The process of incorporating the proposed changes could take several years, so the statutory plans are quite rigid at first glance. For example, the current regional plan of Bratislava establishes certain conditions for the mixing of functions in the territory of the city, which absolutely do not reflect the needs of the current development of the city. It is a consequence of the low flexibility when the city needs the construction of new housing, but the spatial plan prescribes large areas of civic amenities. Therefore, developers build complexes that are not defined directly by law. The law distinguishes only residential and non-residential premises. Therefore, developers often bypass existing zoning regulations without requesting a change in the zoning plan or its zoning. The second option is often very time-consuming and more expensive because developers have to prepare extensive studies as a basis for changing the zoning plan.

Land reallocation. In 2019, the Slovak government approved land reallocation after almost a decade of complete stagnation. The government approved the list of cadastral territories for the years 2022 and 2023, but nothing has been actively done on them so far. Land reallocation in Slovakia is divided into two categories. The first category is "Complex land reallocation", which covers the entire area of the rural zone of the cadastral territory. The Ministry gives its consent to their implementation, and the costs of their implementation are covered by the state. To the maximum extent possible, land consolidation is carried out, as well as the design of common facilities and measures (public improvements). The second category consists of a simple land reallocation. This includes only a selected part of the cadastral territory, the so-called territory of interest. Land reallocation of this type is paid for by owners or investors who apply to the district office, land and forest department for permission to simply redistribute land. Land reallocation in the phase of processing the initial documents, land reallocation procedures also enable the government to identify the intentions of land owners and users (tenants) and thereby define and condition further steps in the land adjustment of their position. This makes it possible to address discrepancies and inconsistencies in land use and create seamless land use plans, better access to land, and direct payments. Sometimes owners do not agree with the land reallocation. To prevent the land reallocation process from being stopped due to the disagreement of individuals or a smaller group of owners, the law conditions the validity of the land reallocation process on the consent of the participants with at least two thirds of the area of the land on which the redistribution will take place. The reason for the implementation of simple land improvements for investment purposes is the quality of investment actions and their compliance with

spatial planning. A suitable example for the application of such reallocation is, in addition to residential construction, the construction of industrial parks or highways. The application of this type of land reallocation is currently the most widespread type, thanks to which the towns and cities are expanding with new residential zones. (Halleux et al., 2023)

3.2 Innovative PVC tools from selected countries

In the following section, we present several examples from European countries that use tools other than those mentioned above. However, it should be noted that all these examples come from developed western countries that have a long-term, stably developed institutional environment that, unlike Slovakia (and other countries in Central and Eastern Europe), did not undergo such dynamic changes. During the 19th century, the economic and institutional environment of Slovakia was affected by major political transformations that significantly affected the ownership system. The development of the arrangement of land ownership in Slovakia was influenced by the belonging to the Austro-Hungarian monarchy and, after 1945, to the countries of the eastern bloc. With the advent of socialism, property rights and their registration were pushed to the background until 1990, when the socialist regime fell and turned into a democracy. The transformation of society after 1990 brought about a change in the economy from a centrally planned to a market economy and the related need to return to private property, which was violently suppressed and suppressed by the collectivist form of management in the socialist era. In the early 1990s, massive privatisation occurred. The biggest problems and challenges were caused by these changes in agriculture, land ownership, and real estate (especially in the state housing sector). All these factors had a huge impact on the development and shaping of the current institutional environment of ownership and public policies in Slovakia, which must be reflected in the considerations of possible inspiration regarding the selected tools and their implementation in our conditions.

In *Austria*, municipalities now have the opportunity, based on state planning laws, to use planning contracts, for example, to ensure satisfactory development within a certain time frame, to agree on additional fees for infrastructure development, or to grant preemption rights. Moreover, in Vienna, the regulation allows to agree on additional services provided by developers in exchange for higher building density or similar. (more Schindelegger and Mayr, 2023)

Belgium has introduced special city taxes, especially on empty buildings or undeveloped building plots. Belgium has also introduced refund and urbanisation taxes, which are a mandatory levy of the local authority for a service performed, which is related to public improvements in the area of infrastructure (roads, sidewalks, sewerage) that benefit the adjacent land. Thus, only the owners who are directly affected by the public improvement are tax payers. The calculation of taxes is related to the costs of the work performed. In some Belgian regions, taxes on planning gains have been introduced, where the principle applies that the tax must be paid when a non-building plot becomes a building plot in the master plan. The contribution is therefore applied if the public authority decides to rezone the territory.

Furthermore, in Belgium, income from property tax in 2019 represented a share of 1.2% of GDP, the average in the EU was 1.6% of GDP in the same year, while Slovakia is among the countries with the lowest income from property tax with a share of only 0.4% of GDP. (more Halleux and Lacoere In: Halleux et al., 2023)

In Belgium, they are also considering the introduction of a special tax for development projects that do not meet current sustainability standards (especially from an environmental and energy point of view). A higher tax will be imposed on such projects and properties.

In the *Netherlands*, *Sweden*, and *Finland*, municipalities are actively involved in land trading on local land markets and are actively involved in public land development. The municipality acquires raw land through voluntary purchase, pre-emption or expropriation, develops a detailed local plan, builds the necessary infrastructure and sells (or leases) the serviced building plots to developers, thereby capturing all the plan-induced value increases. (more Falkenbach, Riekkinen, Viitanen In: Halleux et al., 2023)

In *Germany*, one of the PVC tools is interim acquisition. Municipalities create land reserves that they use to have land available for public purposes within the framework of urban development. The main advantages of this tool are the absolute control of future land owners and the capture of the entire increase in price between purchase and sale. Another tool are contract models, which are agreements on certain obligations of the private partner in exchange for subsequent construction rights. They may include planning contracts (e.g. draft of a preparatory or legally binding spatial plan) and contracts for the preparation of construction activities (e.g. demolition of old buildings, removal of plants or contaminated soil). They can regulate the use of land (e.g., the type and degree of authorised use, the obligation to

complete the construction in a given time period), ecological compensation, provision of housing for segments of the population that have extraordinary difficulties in finding adequate accommodation, or the offer of housing for local residents. (more Hendricks In: Halleux et al., 2023)

4. Discussion

We think that Slovakia could look for inspiration in these mentioned examples. A self-evident condition is that each instrument requires clearly defined and transparent rules, anchored in a legal framework in accordance with the constitution and the issue of ownership included in it. Additionally, there must be clear regulations that must be sufficiently known and fully accepted at the municipal level. All this must be supported by a mature institutional environment, whose existence in Slovakia is more than debatable from the point of view of its historical development.

The city of Bratislava has prepared a pilot agreement on cooperation with selected developers. The contract is supposed to ensure mutual cooperation between developers and the city, in exchange for apartments, there will be a change in the existing code of functional use of the territory in the spatial plan. This means that with such cooperation, it is possible to reduce the percentage for civic amenities in favour of housing. This is a pilot package of changes in favour of rental housing, with which the city is trying to expand its housing stock. The changes concern six developers in roughly eight locations that are owned by the city but also owned by developers, where the municipality will acquire a share in the form of rental apartments in its ownership. According to estimates, the city could get 140-150 rental apartments. It is questionable why cooperation concerns only selected developers, and clear and transparent rules are not set equally for everyone. It is to be hoped that this will happen soon, right after the implementation of these pilot projects.

Conclusion

Decentralisation of public administration performance, the issue of balance in the area of competences, and their set financing is relatively different in each country. Despite this, almost all municipalities are united by the issue of lack of financial resources from the state for transferred competences. In addition, research by Holíková, Meričková and Muthová (2022) confirmed that Slovak municipalities do not even have information about the real costs of transferred public competences; therefore, they do not even know how to budget these activities.

Slovak municipalities and cities are quite critical of the reform of territorial administration currently being prepared by the Ministry of the Interior of the Slovak Republic. It will focus on district offices, transferred performance of state administration, local and regional self-government, and two-level administration of the capital city of Bratislava and the second largest city of Košice. The most common arguments are warnings about their unfair funding and ongoing underfunding.

The issue of PVC and its specific tools present opportunities for local governments to address the current lack of funds. We can look for ideas and inspiration in countries like Belgium or Germany, where they have well-developed tools to capture value, as a result of public investments and interventions.

Active versus Passive: The Case of Slovak Guaranteed Pension Funds

Matúš Padyšák^{1,*}

¹ Comenius University, Faculty of Mathematics, Physics, and Informatics,
Department of Applied Mathematics and Statistics, Mlynská dolina F1, 842 48 Bratislava

Abstract

Research background: Active and passive investing are continuously compared, but there is no constant winner. Bond funds in Slovakia are criticized for their low returns, which opens the question of whether investing in a diversified global bond index is not a more viable alternative.

Purpose of the article: The research paper aims to compare the Slovak guaranteed pension funds with the global benchmark and with other randomly generated asset allocations to compare active and passive approaches. Secondly, the return is not the sole objective, and the paper aims to study the effect of the risk (volatility) on the utility of both savers and pension companies.

Methods: The key method is simulating fictive pension funds with corresponding fees and monthly contributions based on the gross wage in Slovakia. The performance for comparisons is either driven by the returns of global benchmark, random allocations, or the geometric Brownian motion.

Findings & Value added: The results of comparing active funds and the passive strategy of investing to the global index during 2014-2023 show that the passive approach lags professional fund managers in terms of returns, with much higher volatility and drawdowns. During the bond bull market, the prospect of beating random allocations based on return is low for most funds and high during the bear market, but active funds are less risky. We have shown that the higher risk is undesirable as it can lead to higher breaches of guarantees and lower utility of the savers.

Keywords: pension funds, benchmarks, guarantees, risk-return analysis, active versus passive

JEL classification: G11, G23, D81, G01, C15

1. Introduction

There is an ongoing dispute in financial markets about whether passive or active investing is superior. Passive investing has become easily accessible with the evolvement of low fee ETFs. According to Bessembinder, Cooper, and Zhang (2023), the passive style is getting more profitable as the percentage of active US mutual funds outperforming passive ETF that tracks widely followed S&P 500 index substantially decreased over the past 30 years. Similar results were found by Dichev and Yu (2011) in the notoriously active hedge fund universe, as dollar-weighted returns of hedge fund investors are lower than those of the S&P 500 index. On the contrary, Gereakos, Linnainmaa, and Morse (2021) studied active asset managers and identified that active institutional asset managers are skilled and outperform market returns in both the equity and bond universe.

We examine “the passive versus active debate” in Slovak pension funds managed by pension management companies (Dôchodkové správcovské spoločnosti – DSS in Slovak). This research aims to examine Slovak guaranteed bond funds as they hold a significant market share. Partially, the substantial share might be caused by a political decision that transferred clients from risky equity funds to safe bond funds. For the review of legislative changes in the Slovak pension system, we refer to Miřková and Mlynarovič (2021). Nonetheless, Slovak investors are highly risk averse. Evidence from the Slovak survey of investing behavior (Baláž, 2010) shows that more than 70% of respondents perceive financial loss as remarkably negative. In addition, only 7% of respondents in the base sample had previous experience with equity, mixed or real-estate funds. Approximately 80% of investors are risk-averse and unwilling to invest in riskier financial vehicles. Most investors, who perceive the loss significantly negatively, would prefer riskless and guaranteed investment.

* Corresponding author: matus.padysak@fmph.uniba.sk

On the contrary, professionals and academics (for example, see Jakubík, Melicherčík, and Ševčovič (2009), Šebo, Melicherčík, Mešťan, and Králik (2017), Fodor and Cenker (2019) or Černý and Melicherčík (2020)) suggest investing in more risky funds, especially when the savers are young. The bond funds should be used to stabilize the investment, and according to the law, the savers are transferred into safer bond funds several years before their retirement. Therefore, the saver ought to look for minimal risk and volatility, and a thorough analysis of guaranteed bond funds is of great necessity.

To some extent, guarantees in Slovak pension funds have been studied by Mlynarovič (2011), where the Constant Proportion Portfolio Insurance method is studied in the context of pension funds with moving investment horizons. The research presents several simulations and applications of portfolio insurance methods but does not evaluate the performance of existing funds and their performance in the presence of guarantees.

1.1 Benchmarks for pension funds

The literature has offered several benchmarks for pension funds. Šebo, Mešťan, and Králik (2016) study the market risk using the VaR and the Expected shortfall in the second pillar of the Slovak pension system. For the static benchmark in guaranteed funds, the authors propose the Xtrackers II Eurozone Government Bond 3-5 UCITS ETF, and for the dynamic benchmark, several Eurozone bond ETFs are suggested. Ódor and Povala (2019) compare bond funds with the Bloomberg Barclays Global Aggregate index with returns adjusted for implementation costs of 30 basis points (0,3%) per year. The adjustment fee corresponds to the maximum management fee of capital in DSS, which was at the level of 0,3% per year in 2019 (Act no. 43/2004 coll.). The comparison is focused on the period from March 2005 until June 2019, comparing the average real annual returns (net of inflation) of funds: Aegon (merged with NN) - 0,02%, Allianz -0,14%, Axa (Uniqa) -0,29%, Poštová Banka (365 life) 0,63%, NN -0,3% and VÚB-Generali 0,35% with the real return of the Bloomberg Barclays Global Aggregate index: 2,5%. We examine if the suggested global index would have outperformed the active management. Based on simulations of fictive pension funds, during the recent years (from 31.5.2014 to 26.4.2023), the index allocation had a lower return than an average DSS, accompanied by higher risk, evaluated as either volatility or maximum drawdown.

1.2 Randomly generated benchmarks

According to Malkiel (2020), "A blindfolded monkey throwing darts at a newspaper's financial pages could select a portfolio that would do just as well as one carefully selected by experts." One strand of the literature proposes passive investing and the efficient-market hypothesis, stating that it is almost impossible to outperform passive index investing (Malkiel, 2020). These pseudorandom allocations give the motivation to evaluate the skills of fund managers and the performance of funds based on random asset allocations. Using several ETFs or indices as investment universes to proxy opportunities of fund managers, we randomly choose investments to create 30 000 fictive pension management funds. The investment universe is an expanded set of Šebo, Mešťan, and Králik (2016) since it also includes other European, non-government, or non-European ETFs/indices. The aim is to examine if professional fund managers can perform better than random investments. The results show that the likelihood of beating the return is low on average during 2014-2021, which could be characterized as a bond bull market. Despite lower returns, funds managed the risk well, which has materialized in a crisis period of 2022-2023. Actively managed funds had higher returns than most random allocations with lower risk. Mešťan, Šebo, and Králik (2017) also compare bond funds, but with a focus on comparing funds across countries. The results for comparable pension systems of Latvia, Estonia, and Slovakia also point to the favorable performance of Slovak bond funds. Based on Sharpe or Sortino ratios, Slovak funds outperform their peers in Latvia and Estonia, especially after the Financial crisis of 2007-2008. Miřková and Mlynarovič (2021) compare conservative, balanced, growth, and index funds. The authors' comparison is closely related to our research; the notable differences include different methodologies. We compare the funds based on returns, volatilities, maximum drawdowns, and risk-adjusted returns while the authors construct efficient frontiers and use returns and CVaR throughout the research. Kopa, Štutienė, Kabasinskas, and Mešťan (2019) analyze the performance of Slovak pension funds primarily using stochastic dominance relations.

1.3 Volatility and guarantees

Lastly, we examine how volatility affects the probability and size of breaching individual guarantees. After a pension reform in 2022, the pension companies must guarantee that the clients will get at least the

cumulative sum of their contributions. In a theoretical setting based on the simulated fictive funds, we show that if the performance is driven by the geometric Brownian motion, then the high volatility is undesirable for pension companies as it increases the probability of breaching guarantees. From the point of view of the saver, the higher volatility can lead to a higher payout as the profits of the saver are skewed to the right. The average profit of the saver increases with volatility. However, the median, on the contrary, declines. Therefore, the optimal strategy for the saver is individual and depends on the perception of risky lottery-like payouts versus more stable but lower payouts.

2. Methods

We further study and compare the performance of the Slovak funds with the global benchmark in a prolonged sample. The passive index investment is simulated using a fictive pension fund from 26.3.2014 to 26.4.2023. The simulation includes realistic assumptions of fees before 2023: an account management fee of 1% applied to contributions, a management fee of 0,3%, and a performance fee of 10% (only if the actual unit value is higher than its previous day's three-year maximum). As a result of the legislature change, the fees have changed in the year 2023: there are no performance and account management fees, and the management fee is 0,45%. We started the sample in 2014 as it solves the discrepancy of investment possibilities as the system had six months guarantees in the past, which has caused that the funds were mainly composed of money market instruments.

The key for our research is a simulation of pension funds where we assume that at the start of the period, the NAV is 100 000 000 euros, the fictive fund has 150 000 clients, and the value of one share of the fund is one euro. We also assume that the number of savers is constant, and each month the contribution of the saver is based on the social security contribution to the second pillar from the average gross monthly wage. In exchange for contributions, the fund invests in assets and issues additional shares for savers. The gross wage and contribution to the second pillar are defined in Table 1.

Table 1. The gross wage and contributions to the second pillar from 2011 to 2023. The gross wage for 2023 was estimated using linear regression, where the gross salary is explained by a constant and lagged gross wage by one year.

Year	Gross wage	Contribution
2011	786	4%
2012	805	4%
2013	824	4%
2014	858	4%
2015	883	4%
2016	912	4%
2017	954	4,25%
2018	1013	4,5%
2019	1092	4,75%
2020	1133	5%
2021	1211	5,25%
2022	1304	5,5%
2023	1407	5,5%

Source: Ministry of Labour, Social Affairs and Family, own processing

For fictive funds for the upcoming years of 2023-2032, the average gross wage grows by 5,16% yearly (based on a linear model where the gross wage for the current year is explained by that of the previous year without intercept); social security contribution to the second pillar is equal to 5,5% in 2023 and 2024, 5,75% in 2025 and 2026, and 6% in the rest of the sample (sourced from the Ministry of Labour, Social Affairs and Family); and the management fee is equal to the planned 0,4% yearly.

For all cases where we simulate fictive funds, we need a return series of assets that drive the performance of all funds. We define the performance drivers in the following sections.

2.1 Performance of fictive funds based on the global index

The fictive pension fund that tracks the global index invests solely in the Bloomberg Global Aggregate Bond Index, which returns are represented by the currency-hedged total return series of the index up to 21.11.2017 and by EUR hedged accumulating iShares Core Global Aggregate Bond UCITS ETF since 22.11.2017. In practice, the most common way to gain exposure to an index is by investing in ETFs as direct replication would be costly, e.g., the proposed ETF has 12433 holdings as of 11.5.2023 (sourced from iShares). It is necessary to use the hedged version of the index as its top geographical allocation includes US, Japan, and China, with a weight of approximately 60%, the index is frequently published denominated in US dollars, and the currency unhedged investments in guaranteed funds can form 5% of the funds at maximum (Act no. 43/2004 coll.). Usage of the USD return series of the index would lead to spurious results as it would include currency risk.

As it is common practice that passive funds that only track benchmarks do not charge performance fees, we propose two scenarios. The realistic scenario (Scenario 1) matches the fees with the fees charged by pension companies to fairly compare the performance net of fees and the active management of fund managers and that of the benchmark. The second scenario (Scenario 2) does not charge the performance fee. The real performance comparison is based on the period from 26.3.2014 to 26.4.2023 since the first three years are used to generate enough data to be able to compute the performance fee, as the fee is computed based on the maximal value of one share in the fund during the past three years, which is compared to the current value (Act no. 43/2004 coll.). It is assumed that one calendar year consists of 260 trading days. Although the period is reduced by three years, it ensures that the main funds' compositions are not bank saving accounts but rather bonds, bond mutual funds, and ETFs. Finally, we compare the pension funds available in the Slovak market and the theoretical average pension fund denoted as "Average DSS," which performance is calculated as an equally-weighted average of all pension funds, as a representative case of all funds.

2.2 Performance of randomly generated benchmarks

The investment universe, i.e. the instruments that could be randomly selected into portfolio include: ETFs tracking government bonds of Eurozone of following maturities: 0-1 years (X01), 1-3 years (X13), 3-5 years (X35), 5-7 years (X57), 7-10 years (X710), 15-30 years (X1530) from iShares, ETF tracking aggregate euro government bonds across different maturities/countries (EU.AGG) from iShares, ETF tracking benchmark euro investment grade corporate bonds (Corp) from iShares, ETF tracking euro investment grade corporate bonds with maturity of 1 to 5 years (Corp15) from iShares, Bloomberg Euro-Aggregate: Financials Index (CorpFin) that tracks the euro financial bonds adjusted for a total expense ratio of 0,2% for a comparable investable ETF (ETF does not have historical data that covers the whole sample of the paper), Bloomberg US Aggregate Bond Index (US.AGG) that tracks investment grade government and corporate bonds to proxy for the US bond market (the returns are hedged to EUR and the index is adjusted for a total expense ratio of 0,3% for a comparable investable ETF), indices for Slovak (SVK): S&P Slovakia Sovereign Bond Index, Italian (Italy): Bloomberg Italy Treasury Bond Index, Spanish (Spain): Bloomberg Spain Treasury Bond Index, government bonds as a proxy for individual bonds. The Slovak bond market is a key market as it is the domestic market for Slovak pension funds. Spain and Italy represent the riskier government bonds in Eurozone. Lastly, we include the global benchmark mentioned above: Bloomberg Global Aggregate Bond Index (Global). All ETFs and indices track only investment-grade bonds. They are denominated in EUR or are hedged to EUR as pension funds are bounded by law to hold only investment-grade bonds, and the maximal foreign currency exposition is 5%. Furthermore, all returns are total return series to represent the bonds' coupons better. Using price series for distributing ETF would flaw the research design if the price series were not adjusted.

We design our simulations such that the random allocations do not include investments with a higher duration with the same probability as those with a lower duration. We argue that this is an important step in the design if we want to compare the skills of the fund managers as we could easily obtain most allocations with a duration that is too high that would be much more profitable during the bull market in the first part of the sample but would largely suffer at the end of the sample. Moreover, the research design still includes high-duration funds, but their occurrence is less probable compared to a design without the duration adjustment.

We first estimate the average duration of all bond funds across the sample period from monthly reports and an estimate of the duration of all ETFs/indexes. The rounded estimates are as follows: average for Slovak bond funds: 2,5; X01: 0,5; X13: 1,5; X35: 4; X57: 5,5; X710: 8; X1530: 16; EU.AGG: 7;

Corp15: 3; Corp: 4,5; CorpFin: 4; US.AGG: 6; Spain: 7; Italy: 6; Global: 6,5; SVK: 6,5. As a first step, we attribute weight to each asset j as follows:

$$w_j = \frac{d_{DSS}}{\sum_{i=1}^{15} d_i} \quad (1)$$

where d_{DSS} is the average duration of bond funds managed by pension companies, and d_j is the duration of j -th asset.

Nextly, each random allocation (a) is a result of two random distributions:

$$n_i = u_i s_i, \quad (2)$$

$$a_i = \frac{n_i}{\sum_{j=1}^m n_j}, \quad (3)$$

where u is a vector with a length equal to the number of instruments, and each element has uniform (0,1) distribution and s is a vector with a length equal to the number of instruments, and j -th element has alternative distribution with values either zero with the probability of $1 - w_j$ or one with the probability of w_j .

2.3 Performance of funds driven by the geometric Brownian motion

We examine how the volatility affects the utility of both savers and pension companies in a theoretical setting where the geometric Brownian motion drives the performance of the fund. We explore several scenarios where the drift can be 1%, 2%, or 3% yearly, and the volatility could be 1%, 2%, 4%, or 8% (as the performance is simulated daily, all variables are scaled to a daily horizon in simulations).

Our design of the simulations allows us to evaluate the cumulative sum of contributions, fees, and the final value of the client's savings. Subsequently, we can evaluate if the guarantees were broken (the final value of the savings for a client was lower than the sum of his contributions). If the guarantees are broken, the pension company must pay the difference between the contributions and the final value of the savings. In the case of broken guarantees, the profit of the saver is zero as he only gets back his contributions, and the difference is a loss for the company.

3. Results

3.1 Fictive funds based on the global index

The performance, volatility, and maximum drawdown are compared in Table 2. The table includes performance metrics of both scenarios mentioned above, the pension funds available in the Slovak market, and the theoretical average pension fund denoted as "Average DSS," which performance is calculated as an equally-weighted average of all pension funds.

Table 2. Performance comparison of actual and fictive funds from 26.3.2014 to 26.4.2023.

Fund	Performance	Volatility	MDD
Scenario 1	-1,30	4,26	-18,25
Scenario 2	-1,25	4,27	-18,25
VÚB-Generali	0,46	1,22	-11,34
Allianz	0,11	1,18	-8,77
NN	-0,21	1,45	-11,93
Uniqa	0,21	1,01	-4,84
365 life	0,9	2,99	-14,35
Average DSS	0,3	1,29	-10,02

Performance is annualized cumulative return, volatility is annualized, and MDD denotes maximum drawdown. All variables are in percentage points.

Source: Individual funds, Národná banka Slovenska, own processing

Actively managed funds would have been a much better investment compared to the passive benchmark as it offers lower returns with higher volatility. It is essential to note that the global index has a much higher duration of approximately 6,69 (duration of iShares Core Global Aggregate Bond UCITS ETF – the ETF that tracks this benchmark as of June, source: iShares). The duration is extremely high compared to the bond funds in Slovakia (the average duration during the sample period is approximately 2,5, source: monthly reports of pension funds), which is a key driver of the underperformance as our sample ends in the period of bond crisis since the yields have risen sharply in 2022. Figure 1 shows that performance was not great even before the crisis, as both scenarios ended the year 2021 at similar levels as they had started.

Figure 1. Performance comparison of scenarios and the average DSS fund from 26.3.2014 to 26.4.2023.
Source: own processing

3.2 Random allocations

Firstly, we generate 30 000 random allocations based on equations (1)-(3). Next, we rank each allocation based on the absolute cumulative return, and the performance is evaluated for two periods: from 26.3.2014 to 31.12.2021 and from 1.1.2022 to 26.4.2023. The first three years before 2014 are used to generate enough data to compute the performance fee. The years 2014-2021 can be characterized as the bond bull market with a short covid crisis. The second part of the sample can be characterized as the bond bear market, as the yields have risen steeply.

For the comparison, deciles or the best 3000-th, 6000-th, ..., 30 000-th strategies/funds, as we use these terms interchangeably, are examined based on cumulative returns. The strategies are denoted as 10%, 20%, ..., and 100% (the strategy characterized as 10% has a return greater or equal to 10% of all the strategies).

Figure 2. Comparison of return, volatility, and maximum drawdown for random and standard allocations from 31.5.2014 until 31.12.2021.
Source: own processing

In the pre-crisis period, the comparison of funds managed by pension companies and random allocation varies from company to company, but there is a clear trend that the actively managed funds are

significantly less risky. In the case of a return, the 365.life was the most profitable fund with a return better than 60% of random allocations. The second best is the Vúb Generali, with a return slightly lower than the fifth decile. Other companies have returns lower than second decile, but the return to risk is significantly better for all companies.

Albeit the returns of pension funds on average were not higher than random allocations in 2014-2021, the risk was lower, which materialized in the crisis period as shown in Figure 3. Returns were higher than 70% of random allocation for every company, and the risk was also lower than the majority of random allocations.

Figure 3. Comparison of return, volatility, and maximum drawdown for random and standard allocations from 1.1.2022 until 26.4.2023.

3.3 Funds driven by the geometric Brownian motion

For each combination of drift and volatility in section 2.3, we simulate 3000 fictive funds for 2023-2032. As already mentioned, we can compute both the profit of the saver and loss of the company for each scenario (combination of drift and volatility), which allows us to examine the utility of both the pension company and individual saver: the probability of breaking the and the profit distribution of both saver and company. Although we report the absolute values of profit/loss for both company and saver, the loss/gain can be easily compared to a total sum of contributions of 10477,89 in our theoretical setting. Consequently, calculating relative profit over the saving period for the client is straightforward. However, the company's profit would need an assumption of costs for the pension management company, which is out of the scope of this research.

The results show that the profit of the pension company is negatively skewed as the mean tends to be lower than the median. The median is positive across all scenarios, but the distribution shows that there is a tail risk that the company would suffer a large loss, which is why companies should expect much lower profits on average. Moreover, there is a clear trend that with increasing volatility, the probability of breaches is rising, same as the maximal loss, mean value, and first quartile are also decreasing, and the third quartile or the maximum profit do not change a lot. To sum it up, the companies should be rather conservative as the risks outweigh the potential gains.

Table 3. The probability of guarantee breaches in various scenarios of drift and volatility, profit of the pension company (Panel A), and profit of the saver (Panel B).

Panel A: Profit of the pension company							
Scenario	P	Min	1Q	Median	Mean	3Q	Max
$\mu = 1, \sigma = 1$	4,3%	-148	196	198	195	199	207

$\mu = 3, \sigma = 8$	23,3%	0	85	1167	1564	2532	9418

Source: own processing

The distribution of the savers' profits is the opposite of that of the companies. The median is lower than the mean, and the distribution is positively skewed. As a result of the individual guarantees, the savers do not risk their contributions, and their worst scenario is that their profit would be zero. With an increasing volatility minimum, first quartile and median are decreasing (or remaining constant at zero). On the other hand, mean, third quartile, and maximum are increasing. The data shows that higher volatility relates to lottery-like payoffs where the savers exchange a highly probable profit for a chance of a big payoff at the expense that the profit would probably be small or zero.

4. Discussion

The results show that contrary to Ódor and Povala (2019), the global index would not have been more profitable compared to actively managed pension funds in Slovakia. Based on a fictive pension fund that would have been investing only to the global benchmark with matched fees, the global benchmark would be beaten by every fund in Slovakia. Even with more favorable fees for a passive fictive fund, where the performance fee would not be charged, the active funds have easily beaten the passive alternative. Moreover, the Slovak funds had lower risk measured as volatility or maximum drawdown. Such results align with other research, such as O'Neil and Muñoz (2022), that identified that most actively managed funds are beating their benchmarks after expenses or Clare, O'Sullivan, Sherman, and Zhu (2019) with a finding that mutual bond funds outperform their benchmarks in both gross and net of fees returns.

We obtain similar results regarding risk when we generate 30 000 random asset allocations composed of benchmark-like investments in which active managers can invest. In the pre-crisis period of 2014-2021. the returns of most actively managed funds are below the median, but the active funds had a lower risk. In the crisis period of 2022-2023, the lower risk materialized, and the active funds achieved much higher returns and were, to some extent, able to protect the savers by minimizing the losses. The results show that choosing a benchmark for pension funds is a complex issue, as it is critical to assess our expectations. In the pre-crisis period, the most profitable fictive fund had the highest duration and risk as it was composed only from long term euro government bonds, but it suffered the most during the crisis.

On the contrary, the least profitable fund during the bond bull market performed the best in the crisis and period of the sharp increase in interest rates since it has the lowest duration. As a result, any comparison of Slovak pension funds and benchmarks is sensitive to the chosen time frame, and hence, it could be misinterpreted. If we compare the whole period, the average DSS would have outperformed 87,2% of random allocations during the whole sample of 2014-2023 based on return. The high number only underlines that the comparison is sensitive to the period. The actively managed funds tend to have higher returns compared to passive during crises but lower during bull markets. Therefore, it is crucial to differentiate between these periods as active funds can be presented as extremely successful once compared at the bottom of the crisis or as extreme laggards if they are compared at the top of the bull market.

Additionally, we show that actively managed funds are much better in risk management, and they are less risky measured by the volatility or maximum drawdown. In practice, the lower risk has materialized during the crisis, but it could be much more important in the upcoming years as the legislative change has brought individual guarantees. In a theoretical setting, we show that if the performance is driven by the geometric Brownian motion with several scenarios of different drifts and volatilities that high volatility could be an undesirable component of investing for pension companies. The probability of breaching the individual guarantees increases with rising volatility, while the expected return of the pension company decreases with increasing volatility. For savers, the higher volatility induces lottery-like payouts as the volatility leads to a higher dispersion in returns, and savers might profit from extremely positive outcomes while being protected from the worst outcomes as their contributions are protected and the return cannot be negative. However, the best strategy for savers depends on individual preferences, whether it is more desirable to have a smaller profit with a higher probability or a small chance for a high return with a high chance of no return at all. Risk and volatility in investing and potential breaches of guarantees is an important research topic for further studies as it is systematically new in the Slovak pension system, and the guarantees might be a key driver of the sustainability and profitability of the Slovak pension companies.

Conclusion

We have shown that compared to the global bond market benchmark, the actively managed funds were able to provide better returns for the Slovak savers with lower risk. Furthermore, we have identified that even when we randomly generate asset allocations from benchmark-like indexes or ETFs, the fund managers can deliver reasonable returns with lower risk compared to these allocations. We have emphasized that the returns depend on the chosen period to compare. The actively managed funds have been more profitable during a crisis, while the passive allocation has been more profitable during a bull market.

The lower risk of the Slovak pension funds could be increasingly more important in the upcoming years as the regulation has imposed individual guarantees, where the funds are obliged to guarantee non-negative performance. We have shown that with higher volatility, the probability of breaches increases, the pension companies' expected profit decreases, and the saver's return becomes lottery-like.

Impact of Fiscal rules on Government capital expenditure: Evidence from EU countries

Matej Boór^{1,*}

¹ University of Economics in Bratislava, Department of Finance, Faculty of National Economy, Dolnozemská cesta 1, 852 35 Bratislava, Slovakia

Abstract

Research background: Many countries today have persistent problems with rising government debt and are unable to ensure healthy public finance. Fiscal rules are implemented by countries precisely to ensure the long-term sustainability of public finances, and the implementation of these rules brings with it several other effects. Fiscal rules can prevent increases in government expenditure and limit politicians from adopting populist measures. However, there is also a downside to this, namely that politicians with limited sources of funding may resort to trying to ensure the financing of the basic tasks of the state (in form of government consumption expenditure) at the expense of government capital expenditure.

Purpose of the article: The aim of this paper is therefore to clarify the relationship between fiscal rules and government capital expenditure, or whether the fiscal rules in place reduce the level of government capital expenditure to comply with the fiscal rules in question.

Methods: Using correlation analysis, we have shown a negative relationship between the strictness of fiscal rules (measured by the fiscal rules strength index) and the level of capital expenditure in the European union over the period 1995-2021.

Findings & Value added: In countries with stricter fiscal rules, the share of government capital expenditure in total public expenditure is decreasing, which may have long-term adverse effects on the economy and reduce the level of economic growth. For this reason, the discussion can be opened about further reform, and mitigation the strictness of fiscal rules in the form of exempting government capital expenditure from the assessment of fiscal compliance could also take place.

Keywords: capital government expenditure, fiscal rules, fiscal rules strength index, public investment

JEL classification: H11, H50, H83

1. Introduction

Fiscal rules are a public finance management tool that, in most cases, set upper limits for selected budgetary and fiscal aggregates. In this respect, it can be said that, as a rule, fiscal rules limit the use of fiscal policy in influencing the development of the national economy. The main objective of fiscal rules is to ensure the long-term sustainability of public finances, which is mostly challenged by the arrival of an extraordinary event such as a financial or economic crisis. For this reason, we have seen an upsurge in the implementation of fiscal rules after the financial crisis of 2007-2009 and the subsequent debt crisis in the euro area. In the European Union, the situation regarding fiscal rules is slightly more complex because, in addition to national fiscal rules, there are also supranational fiscal rules in force, laid down by the Stability and Growth Pact, which serve to coordinate the fiscal policies of individual Member States. In addition to the main objective of the fiscal rules, which is to achieve long-term sustainability of public finances, these rules have several spill-over effects. One of these spill-over effects is the impact on government capital expenditure. The main argument for the existence of this impact is that policymakers, with limited allocative possibilities, will resort to cutting government capital expenditure rather than cutting current expenditure intended to ensure the proper functioning of the state. Thus, fiscal rules may appear to be detrimental to public investment and, consequently, to the country's economic growth. The main objective of this paper is therefore to shed light on the relationship between national fiscal rules and government capital expenditure through a correlation analysis across European Union countries. Our research question

* Corresponding author: matej.boor@euba.sk

is whether there is a relationship between fiscal rules and government capital expenditure. Consequently, our hypothesis is derived from our research question, which posits that the ratio of government capital expenditure to total government expenditure decreases under the influence of the implementation of national fiscal rules.

The structure of the article is as follows, the first part deals with a review of the literature and a theoretical definition of the problem. The second part deals with the working procedure and methodology, through which we test our assumptions and hypothesis. The next part presents the achieved results of empirical research, which are then conceived into discussion and conclusions.

1.1 Theoretical background and literature review

As already mentioned, fiscal rules have several effects in the national economy. One of them is the effect on the composition of public expenditure. Dahan & Strawczynski (2013) showed that fiscal rules have a negative effect on the ratio of social transfers to total government consumption in 22 OECD countries. Similarly, a change in the composition of public spending can also occur in the case of capital and current expenditures by the government. IMF 2018 and Guerguil, Mandon, and Tapsoba (2017) have pointed out that efforts to comply with fiscal rules can lead to a reduction in capital spending as it is a more politically transitory solution than cutting current spending. This relationship is both obvious and logical, but empirical studies have not conclusively confirmed the negative impact of fiscal rules on public investment, as this relationship may depend on additional factors (in terms of significance and intensity). A listing of all the available literature would be very extensive indeed, and for this reason we focus in the following section on the most relevant studies that are directly related to the present paper and our research.

Wijsman & Crombez (2021) focused on national fiscal rules and constructed a panel regression model of the EU 28 between 1997 and 2016. Based on the results, they showed that fiscal rules have a negative impact on public investment and their ratio to GDP decreases. In contrast to others, this study focuses on national fiscal rules expressed in the form of FRI (Fiscal rules index constructed by the European Commission) and not on supranational fiscal rules contained in the Maastricht Treaty (e.g., Turrini, 2004; Balassone & Franco, 2000). Thus, this study is also relevant for lower levels of government. In particular, the impact of fiscal rules on public investment at the subnational EU level has been addressed by Mühlenweg & Gerling (2023). In their research, they showed that one standard-deviation increase in fiscal rules stringency index reduces overall public expenditure by up to 1.28%, while investment declines by more than 4%. Thus, there is a disproportionate distribution of public spending and the ratio between public investment and current spending.

The impact of different types of fiscal rules on public investment across 35 OECD countries over the period 1995-2015 was examined by Tkachev (2020). Based on his research, he confirmed that the expenditure rule negatively affects both the amount and the share of public investment in total public expenditure. On the other hand, the results for the budget balance rule are inconclusive and depend on whether public investment is exempted from the assessment of rule compliance (e.g. in the form of escape clauses).

Basdevant et. (2020) came up with interesting findings. The first finding showed that the presence of numerical fiscal rules reduces the level of public investment, and this holds across all income categories of countries. The second finding is related to the volatility of public investment, expressed through the standard deviation of public investment as a share of GDP. Higher volatility of public investment is characteristic of developed and emerging economies, suggesting that public investment may be subject to expenditure adjustments to comply with numerical fiscal rules. In low-income countries, however, fiscal rules are typically accompanied by lower volatility of public investment, although the difference is small. When it is necessary to make cuts on the expenditure side, low-income countries and emerging economies make larger cuts on the public investment side. The opposite situation can occur in advanced countries where the public financial management system is more developed and hence public investment is more protected from spending cuts, e.g., in the form of the implementation of a medium-term budgetary framework. Thus, low-income countries and emerging economies need to be cautious and prudent in periods of fiscal consolidation when public expenditure levels need to be reduced.

Similarly, Kell (2001) confirms that in the case of fiscal consolidation or budget constraints, government capital spending is cut first, followed by current spending. He argues that such a situation should have occurred in the United Kingdom in the period 1980 -1990.

Based on the results of the studies mentioned above, we can conclude that in general the fiscal rules in place limit the amount of capital expenditure, and the strength of this relationship may vary according to the maturity of the country. However, almost all these authors (Wijsman & Crombez, 2021; Kell, 2001; Basdevant et. al., 2020; Tkachevs, 2020) agree that properly set fiscal rules need not jeopardize public investment and the introduction of the golden rule can support these efforts.

2. Methods

To test our hypothesis that fiscal rules can lead to a reduction in government capital expenditure, we used correlation analysis based on time series (disaggregated data at the level of individual European Union countries) and panel data (for the whole European Union). We also focused on assessing the impact of fiscal rules at the level of the European Union but split between "new" (countries that joined the EU after 2004) and "old" members of the European Union (countries that joined the EU before 2004). To capture the specific conditions relating to the single monetary policy condition, we have focused on testing this relationship separately also within the Eurozone, i.e., in countries that currently use the Euro as legal tender. The observed time period covers the years 1995-2021, while the dataset is balanced. The following table provides information on the individual variables used in the correlation analysis.

Table 1. List of variables

Variable	Abbreviation	Expression (frequency)	source/database
Fiscal rules index	FRI	Aggregated fiscal rules strength indices (annual)	a)
Government capital expenditure	GCE	Percentage of total expenditure of General government (annual)	b)

Source: a) European commission.; b) ECB data portal

Descriptive statistics using panel data for the whole European Union can be found in the table below.

Table 2. Summary statistics

Metrics/Variable	Mean	Median	Minimum	Maximum
FRI	0,15963	0,03478	-1,0181	2,824
GCE	0,11275	0,10602	0,01458	0,39228
Metrics/Variable	Standard deviation	Coefficient of variation	Skewness	Ex. kurtosis
FRI	1,0012	6,2719	0,50957	-0,60613
GCE	0,039219	0,34785	1,6951	6,5087
Metrics/Variable	5% Perc.	95% Perc.	IQ range	Missing obs.
FRI	-1,0181	1,9593	1,8097	0
GCE	0,066821	0,17961	0,047993	0

Source: own calculations based on data retrieved from EC and ECB

The Fiscal Rules Index (FRI) variable is compiled annually by the European commission. The Fiscal rule strength indices (FRSI) are aggregated to one index (FRI) per country and year, creating the fiscal rule index. Effectively, the FRI is calculated using equal weights for all its components. This index is standardized with an average of zero and a standard deviation of one, meaning that negative values occur. (Enzinger, 2015). According to the European commission Fiscal Rule Strength Index (FRSI) is calculated considering five criteria:

- 1) legal base,
- 2) binding character,
- 3) bodies monitoring compliance and the correction mechanism,
- 4) correction mechanisms,
- 5) resilience to shocks.

, and the methodology is based on the empirical study by Deroose, Moulin and Wierts (2005). The analysis and description of the development of the Fiscal Rules Index has been dealt with in a number of studies, e.g., Hodžić & Bečić (2015).

To test the relationship in question between fiscal rules and government capital expenditure, we used several metrics such as covariance and correlation. Covariance measures whether variables evolve in a common direction or inversely proportional. In other words, covariance expresses the linear relationship of two variables and whether as one variable increases, the values of the other variable also increase and vice versa. The basic formula for calculating covariance can be written as follows:

$$Cov(x, y) = \frac{\sum(x_i - \bar{x})(y_i - \bar{y})}{n}$$

, where x represents the values of the x -variable and y represents the values of the y -variable, where \bar{x} and \bar{y} represent the mean values of these variables, n represents the number of observations.

From the covariance value, we can determine the direction of the linear relationship, but we cannot determine the strength of the linear relationship, so in the next step, we also calculate the Pearson product-moment correlation coefficient (Pearson product-moment correlation coefficient). The equation for calculating the correlation coefficient can be written as

$$r = \frac{\sum x_i y_i - n \times \bar{x} \bar{y}}{\sqrt{(\sum x_i^2 - n \times \bar{x}^2)(\sum y_i^2 - n \times \bar{y}^2)}}$$

, where r can take values ranging from 1 (full direct dependence) to -1 (full indirect dependence). If r is equal to 0, there is no dependence between the variables. (Zlacká, 2004)

To ensure robust estimation and avoid errors of first and second order we used non-parametric tests, namely Kendall's tau and Spearman's rho to evaluate relationship based on panel data. Spearman's rho can take values between -1 and +1, and similarly to Pearson's coefficient, the sign also determines the direction of the correlation. If the values obtained are close to 1 or -1, then there is a perfect dependence between the variables. If the obtained value is equal to 0, then the variables are independent of each other. A similar interpretation is given in the case of Kendall's tau.

3. Results

The first step in our analysis will be to calculate the covariance and correlation coefficient for each member country of the European Union. In the table below we present the calculated values for countries where there is a positive (directly proportional) relationship between the Fiscal Rule Index (FRI) and the share of government capital expenditure in total government expenditure.

Table 3. Results of the correlation analysis in the presence of a positive relationship

Country	Covariance	Correlation

As we can see from the correlation analysis for individual member states, there is a negative correlation between fiscal rules and government capital expenditure in EU countries (19:8). In other words, the greater the strength of fiscal rules, the smaller the share of government capital expenditure in total government expenditure. These results are consistent with our assumptions and hypothesis.

In a second step, we also estimate the given correlation for the European Union as a whole and in several subgroups ("new" and "old" EU members and the Eurozone), and we report the results in the following table.

Table 5. Correlation analysis results for country (sub)groups

(Sub)Group	Pearson's coefficient	Spearman's rho	Kendall's tau
European Union	-0,2319*	-0,2701***	-0,1861***
Eurozone	-0,2555*	-0,2974***	-0,2054***
Old members	-0,3458*	-0,3768***	-0,2591***
New members	-0,0649	-0,0432	-0,0299

Note: *** p<0.01, ** p<0.05, * p<0.1

Source: own calculations based on data retrieved from EC and ECB

As we can see from the results of the correlation analysis, for all groups of countries there is a negative correlation between the Fiscal rule strength index and the share of government capital expenditure in total government expenditure. This correlation is statistically significant for all country groups except for the new member countries, where the tightness is very low to non-existent.

4. Discussion

In the present paper, we demonstrate and confirm our hypothesis regarding the impact of fiscal rules on government capital expenditure. Strength and stringency of fiscal rules may play a role in the composition of public spending to the detriment of public investment. This may be primarily because in the case of fiscal consolidation, policymakers' resort to reducing just public investment rather than current expenditure due to greater political pass-through and the presence of a political cycle.

The results are, however, ambiguous in the sense that, although at the European Union level this relationship is visible, in individual countries the effect may be negative or positive. In general, we can confirm that the negative character prevails and that fiscal rules reduce the share of public investment in total public expenditure. Therefore, these results are generally in line with previous results of authors dealing with this issue (Wijsman & Crombez, 2021; Kell, 2001; Basdevant et. al., 2020; Tkachevs, 2020).

In the case where we split the countries according to Eurozone membership, the negative relationship was again confirmed and showed a higher degree of dependence between the two variables. Conversely, if we split the EU countries into older and newer members, we can no longer speak of a clearly significant negative correlation, as the relationship is not statistically significant in the case of the newer EU member states. This may be due to the different level of public finance management in the case of the newer member countries and their history of centrally planned economies. Another factor may be that these post-communist countries implemented national fiscal rules much later than the older EU Member States.

Based on the results of the correlation analysis, we can to some extent conclude that fiscal rules can harm public investment and thus reduce the level of economic growth. For this reason, it is necessary to reform the fiscal rules and introduce a golden rule at national level to protect public investment.

Conclusion

Fiscal rules are one of the tools of public financial management to achieve the sustainability of public finances in the long term. However, in addition to this effect, they bring with them several spill-over effects, one of which is the impact on the level of public investment. The present paper deals with the correlation in question. Our main hypothesis was that fiscal rules reduce the share of government capital spending in total spending. We were able to confirm this hypothesis through correlation analysis for the European Union member countries over the period 1995-2021. This negative correlation is also prevalent in disaggregated data, i.e., at the level of individual member countries, although it is not always clear-cut and for some countries there is even an inverse (positive/proportional) correlation. In the case of focusing on sub-groups of countries, we obtained similar results as when using panel data at the EU level, although for the newer Member States this relationship appeared statistically insignificant. Thus, it is important to get the fiscal rules right so that the first move of policymakers is not to reduce public investment in the event of a period of fiscal consolidation, as reducing public investment in the long run can also have a negative impact on the level of economic growth. Future research needs to focus not only on correlation analysis but also on regression analysis using more sophisticated econometric methods.

Abstract

Research background: Financial distress prediction is one of the key tasks of risk management and is still a widely discussed topic by many authors. Identification of the financial distress situation at least one year in advance is necessary for the company's management to implement measures that could alleviate or eliminate this situation.

Purpose of the article: The paper aims at predictive modelling of the financial distress of companies operating in the conditions of the Slovak economy, regardless of the economic segment. The models are created using real data from real Slovak companies and can potentially be effective and universal tools for ex-ante analysis in Slovakia.

Methods: Models are created using several machine learning techniques, namely Support Vector Machines, k-Nearest Neighbours, Bayesian Networks, and Genetic Algorithms. These algorithms provide a very good predictive ability of the models. A precisely prepared dataset of tens of thousands of Slovak companies is used to create models. The quality of the models is analysed and compared based on several evaluation metrics calculated from the confusion matrix and the value of AUC.

Findings & Value added: The achieved results point to the potential of the tools used in modelling financial distress. The model created by the Support Vector Machines technique best identifies the financial distress of Slovak companies because it correctly classifies almost 87% of companies.

Keywords: prediction model, financial distress, machine learning, prediction ability, confusion matrix

JEL classification: C38, G33

1. Introduction

In recent years, the economic environment has developed very turbulently, resulting in financial problems for many companies. Therefore, it is necessary to evaluate the company's financial health and predict its future development. That also reflected a significantly higher interest in creating predictive tools capable of predicting financial problems with relatively high reliability. These forecasts are necessary not only for the companies themselves but also for cooperating entities.

Traditional approaches to creating prediction models are multivariate discriminant analysis and logistic regression. However, various data mining approaches based on machine learning are being used more often. These tools are often better able to identify hidden connections in historical data and are therefore able to achieve higher predictive power. In addition to the widely used artificial neural networks and decision trees, various alternatives are also used, such as the technique of Support Vector Machines, k-Nearest Neighbors, etc.

However, the use of these tools in predicting the financial distress of Slovak companies is still not very widespread. Therefore, the article aims to point out the effective use of these tools in the Slovak economy's conditions. Specifically, the goal is to create the most accurate financial distress prediction models using four selected machine learning techniques – Support Vector Machines (SVM), Genetic Algorithms (GA), Bayesian Networks (BN), and k-Nearest Neighbors (kNN). Data from real Slovak

* Corresponding author: marek.durica@uniza.sk

companies will be used for modelling, while the quality of the models will be quantified on a randomly created test set using several evaluation metrics derived from the confusion matrix and the AUC metric, i.e. the Area Under the Curve ROC.

The remainder of the paper is structured as follows. In the Literature Review section, we present some interesting studies in the field of predicting financial distress that uses various machine learning algorithms. The Methodology section describes selected techniques, the source database used in modelling, and characteristics used for model evaluation. We present the created models and their evaluation metrics in the Results section. Subsequently, in the Discussion, we analyse the results of the models and compare them with some models of other authors. Finally, the Conclusion section summarises the main findings.

1.1 Literature review

Predictive modelling of financial distress using various machine learning techniques is a frequently discussed topic by many authors worldwide. The use of these techniques has expanded not only in the area under consideration, especially in connection with the development of computer technology. The authors mostly deal with creating new national models, which, compared to global models, usually provide a higher predictive ability because it considers the specifics of the national economy, which are hidden in the real data used.

In the past, prediction models were created using mathematical-statistical methods, and later the use of neural networks and decision trees prevailed. However, those used by us are also used. For example, Akman et al. (2020), Gutierrez et al. (2022), Shetty et al. (2022), Shrivastav and Ramudu (2020), and Teles et al. (2021) used the SVM technique to model and predict corporate bankruptcy. Shrivastav and Ramudu (2020) analysed Indian banks. Based on the collected data, they created several prediction models, and the best of them achieved a prediction ability of almost 93%. On the other hand, Teles et al. (2021) compared many machine learning algorithms and pointed out that SVM outperformed all other models, including the random forest model.

Bayesian networks are also used in credit scoring, but often in combination with other approaches. For example, a fuzzy-Bayesian approach was used by Aydin and Kamal (2022) to analyse the financial situation of shipping companies. A probabilistic Bayesian network and other approaches were used by Wang and Chen (2021) to identify the financial status of SMEs from different countries. Comprehensive surveys comparing different approaches (including Bayesian networks) in credit risk modelling are published by Tripathi et al. (2022).

The most critical factors influencing the classification of companies based on credit risk were identified by Jandaghi et al. (2021). They used the ant colony algorithm and the k-nearest neighbours technique for this. Wang and Liu (2021) also used this technique for undersampling bankruptcy prediction on a sample of Taiwan bankruptcy data. From the point of view of the financial failure of the companies, Aljawazneh et al. (2021) compared this technique with other techniques, using unbalanced data from Spanish, Taiwanese and Polish companies.

2. Methodology

We take creating a prediction model as a classic data mining task and use one of the common data mining methodologies, namely CRISP-DM. Its first phase is Business Understanding, within which we focused on the study of the current state of the problem, the partial result of which is the presented literature review. As the main task, we have identified the creation of models that will predict the financial status of Slovak companies with a success rate of around 90% in a one-year time horizon. This status is the prosperity or non-prosperity of the company.

In the subsequent Data Understanding phase, we identified 25 financial ratios, company size and SK NACE identifier as potential predictors. The source for us was the Amadeus database. To create a one-year model, we need data from two consecutive years. Since we wanted to avoid using data affected by the COVID-19 pandemic and the consequences of the conflict in Ukraine, we decided to use data from 2018 and 2019. We cleaned the original data set of more than 660 thousand companies and prepared it to model financial distress. That was the content of the Data Preparation phase. From the data set, we removed those companies' data for which data were unavailable in both monitored years. We also removed variables with more than half of the missing data and, based on the Variance Inflation Factor analysis, variables that caused an undesirably high degree of multicollinearity. Thus, we created a final set of financial ratios as potential predictors for the models being created. As can be seen in Table 1, the final set

contains ratios from each of the four basic areas of financial analysis. Subsequently, we focused on defining the target variable, i.e. the identifier of financial distress or prosperity of companies. As non-prosperous, we consider companies that meet the conditions of a "company in crisis" defined by current Slovak legislation. However, only 12.6% (9,497) of companies met these conditions. Therefore, we proceeded to balance the subsets, and from the remaining prosperous companies, we randomly selected only 9,497 of them into the final dataset. Finally, we split the final dataset in a ratio of 80:20 into training and testing subsets.

Table 1. List of financial ratios as potential predictors

Ratio	Type	Symbol	VIF
Asset Turnover Ratio	Activity	SAL/TA	1,614
Current Ratio	Liquidity	CA/CL	1,741
Return on Equity	Profitability	ROE	1,014
Return on Assets	Profitability	ROA	2,484
Debt Ratio	Leverage	TL/TA	1,840
Cash to Assets Ratio	Liquidity	CASH/TA	1,239
Return on Sales	Profitability	ROS	2,323
Non-Current Debt Ratio	Leverage	NCL/TA	1,025
Liability Turnover Time	Activity	TL/SAL	1,776

Source: authors (2023)

Next comes the Modeling phase, in which we created the models themselves. We wanted to point out the potential for effective use of machine learning tools, which are relatively less used in modelling financial distress, at least in the conditions of the Slovak economy. At first, we use the SVM technique, which can be used not only for solving classification problems. This technique uses a convex quadratic programming algorithm to find a solution. The technique was created in 1995 by Vladimir Vapnik, and in the following decades, it surpassed some techniques in many applications (Suykens et al., 2002). Assuming linear data separability, the SVM technique can also be used as a linear classifier in the case of binary as well as multiple classifications. In this case, the principle is to find the optimal separation function, which is a linear function of the input data vector. This procedure was designed for non-overlapping data but has also been shown to apply to overlapping data. Geometrically, this technique is analogous to multivariate discriminant analysis. The general SVM technique is used in more realistic cases where the data is not linearly separable. (Thomas et al., 2017)

Furthermore, we used the technique of genetic algorithms (GA) in modelling. Genetic algorithms belong to the so-called evolutionary algorithms, while the idea is to find the most suitable individual and transfer its properties and qualities (genetic material) to the next generations. The algorithm starts working with the initial generation, or population, which is gradually improved by repeating the cycle of this algorithm consisting of five steps. Most applications need 50 to 500 cycles (generations) to reach the end condition, which is usually the maximum of the objective function. That is related to the relatively high computational complexity of these algorithms.

In modelling, we also use Bayesian networks, which describe the dependence of a discrete independent variable on dependent variables using the values of conditional probabilities calculated using Bayes' theorem. The advantage of Bayesian networks is that they are relatively easy to implement and can be used to conclude even if the values of some dependent variables are unknown and thus predict even on incomplete data.

The last technique used is the k-Nearest Neighbors (kNN) technique, which is one of the simplest machine learning classification algorithms. Its principle is learning by analogy. The entire training set essentially forms the model itself, and we classify the new case based on the majority vote of the k-nearest neighbours from the training set, which are closest to the new case. Various metrics are used to determine the distance, but the Euclidean or Manhattan (city-block) metric is the most common.

Evaluation is the last phase, in which we quantify the predictive ability of the created models based on the classification of cases from the training set, which was not used in the modelling phase. We start from the confusion matrix, in which there is the number of correctly and incorrectly classified positive and negative cases. In our case, positive cases are non-prosperous, and positive cases are prosperous

companies. We quantify the overall quality of the models based on several characteristics. Overall Accuracy (ACC) expresses the proportion of correctly classified cases out of all cases in the test set, and Precise (PR) expresses the proportion of correctly classified positive cases. In addition to these characteristics, we use the Matthews correlation coefficient (MCC) as equivalent to the classic Pearson correlation coefficient and the F1-score, the harmonic mean of PR and the model's sensitivity (True Positive Rate, TPR). Sensitivity (TPR) is a metric expressing the proportion of true positive cases correctly identified as positive. In addition, we also used specificity (True Negative Rate, TNR), which quantifies the proportion of negative cases correctly identified as negative by the model. The maximum value of all characteristics is 100%, with higher values identifying a better model. The last evaluation characteristic used is the Area Under the Curve (AUC), i.e. the area under the ROC curve. The maximum AUC value is one, and a value of 0.5 belongs to a random classifier, so in this case, a value close to one identifies a better model.

We used IBM SPSS Modeler software in all phases.

3. Results

First, we describe the results obtained in the modelling phase. We model the financial distress of Slovak companies in a one-year time horizon. We applied the selected machine learning tools to the training sample created in the previous phases. Potential predictors are the values of nine financial ratio indicators (see Table 1) and two indicators (size and SK NACE indicator) of 15,235 companies obtained from the financial statements for 2018. The target variable is a binary identifier of the prosperity of Slovak companies in 2019, while there are 7,629 prosperous and 7,606 non-prosperous companies in the training set.

We failed to create a model using a genetic algorithm, so we only present the results of these models – LinearSVM (SVM model as a linear classifier), SVM (general SVM model), Bayes (Bayesian network), and kNN (k-nearest neighbours model). Almost all created models work with all eleven predictors, i.e., nine financial ratios and indicators of company size and its SK NACE classification. However, the TL/TA ratio is the most significant predictor.

Now the results of the evaluation phase follow, in which we quantified the predictive ability of the created models on a test set of 3,759 (approximately 20% of all) companies. From the point of view of the target variable, the test set is balanced, as it contains 1,868 (49.7%) prosperous and 1,891 (50.3%) non-prosperous companies. We constructed a confusion matrix for each model and calculated its ACC, TPR, TNR, PR, F1 and MCC metrics. Analogously, we also constructed the ROC curve of all models and, in particular, calculated the size of the area under that curve, i.e. the AUC value. The values of these metrics are summarised in Table 2 and illustrated in Figure 1.

Figure 1. Comparison of evaluation metrics
Source: own processing (2023)

Table 2. Evaluation metrics of created models

Model	ACC	TPR	TNR	PR	F1	MCC	AUC
LinearSVM	86,03%	87,15%	84,90%	85,39%	86,26%	0,721	0,931
SVM	86,96%	85,72%	88,22%	88,05%	86,87%	0,740	0,936
Bayes	82,95%	81,49%	84,42%	84,12%	82,78%	0,659	0,915
kNN	86,14%	81,76%	90,58%	89,78%	85,58%	0,726	0,933

4. Discussion

We created prediction models using several machine learning techniques that achieved relatively high predictive ability. Due to software issues, we could not build a model using a genetic algorithm. All other methods used can be considered suitable for modelling the financial distress of Slovak companies in a one-year time horizon.

Based on the comparison of the values of the evaluation metrics, we can conclude that the Bayesian network model achieved the worst results of all models we created. This model lagged in all metrics but most significantly in those that characterise the overall quality of the models (ACC, F1, and MCC). On the contrary, the best overall quality (based on ACC, PR, F1, MCC, and AUC) was achieved by the SVM model, that is, the model created by the general Support Vector Machines technique. The SVM model lagged only in sensitivity (TPR) and specificity (TNR). In terms of sensitivity, the LinearSVM model is the best, which therefore best identifies truly non-prosperous companies, as it correctly identified the impending financial crisis for $TPR_{\text{LinearSVM}} = 87.15\%$ of non-prosperous companies.

An interesting finding is that from the point of view of specificity, the best is the kNN model, a very simple model created by the k-nearest neighbours technique. This model correctly identified prosperity (financial health) for $TNR_{\text{kNN}} = 90.58\%$ of really prosperous companies. As a result, this model is also the best in terms of precision (PR). The AUC metric also confirms the above findings. The Bayesian network achieved the lowest value, and the other three models achieved similar results.

Several authors deal with the issue of predicting the financial distress of Slovak companies. Gavurova et al. (2022) have studied non-financial companies, Mazanec et al. (2022) non-profit companies, while data from the post-pandemic period were examined by Valaskova et al. (2023). The quality of our models is comparable to the results of these authors. In addition, our models are created using a large and precisely prepared data set and are designed for use in all economic segments and in all size categories of companies. Therefore, they are capable of competition compared to the mentioned models and the models of other authors (Jencová et al., 2020; Stefko et al., 2019, 2020, 2021).

Conclusion

In recent years, the use of various machine learning tools in predicting the financial problems of companies has greatly expanded. Artificial neural networks and decision trees are probably used the most. Our goal is to point out the possibility of using other tools to identify the financial distress of Slovak companies. We used real data for modelling, which we first prepared precisely. The values of nine financial ratios of almost 20,000 companies remained in the final set, together with the identifier of their size and the SK NACE category of their economic activity. These variables served as potential predictors of models trained on the training sample (about 80% of the whole sample) using Support Vector Machines, Bayesian Networks and k-nearest neighbours techniques. On the test set (the remaining 20% of the entire sample), the models achieved a high predictive ability of almost 90%. The Bayesian network model achieved worse results, and the other models achieved comparable results. Despite such good results, we recommend combining our models with other models, especially with a financial-economic analysis of the company for practical use. That is one of the main limitations of our research.

Of course, our research also has several other limitations. We used older data that had not yet been affected by the COVID-19 pandemic. However, this may result in a lower quality of the created models when assessing the company's current financial situation. Another limitation is the need for relatively complex data when using the created models.

These limitations also result in possibilities for the direction of our future research, which is the creation of models based on newer data. It would also be possible to combine the used approaches with other machine learning techniques and thus create robust ensemble models capable of revealing complicated data patterns and providing even more accurate predictions.

Abstract

Research background: One of the important decision-making processes in the prediction of businesses' bankruptcy is the selection of an appropriate prediction method and creation of an early warning model. Several methods and approaches can be applied when predicting the bankruptcy of companies. The aim of academics is to find a prediction model with the best possible classification accuracy.

Purpose of the article: The aim of the paper was to select an appropriate bankruptcy prediction method and to predict bankruptcy of analysed sample of companies.

Methods: The research was carried out on a sample of companies from the construction industry. Most important financial bankruptcy features were selected applying Least Absolute Shrinkage and Selection Operator (Lasso). Within prediction methods, Logit model, decision tree learning algorithm and feed-forward neural network were applied. Overall performance of created models was measured with the use of accuracy, F1-score and AUC.

Findings & Value added: The result of the research is finding that the best performance was achieved by decision tree learning algorithm. This model is also very beneficial in terms of managerial implications since it is able to identify most important financial features for bankruptcy prediction. These features can be very helpful for managerial decision-making in construction companies not only in Slovakia but also in V4 countries. We consider it as the most important value added of the given research.

Keywords: bankruptcy prediction, decision tree, Logit model, neural network

1. Introduction

Predicting financial difficulties is absolutely essential for traders, creditors and suppliers. To avoid any financial loss, they have to assess the financial risk of the firm before taking any decisions (Rafatnia et al., 2020). An early warning system for business failure events (e, g, bankruptcy or financial distress) has such economic benefits for the mentioned stakeholders that many models have been proposed to predict these events in several areas of research (Mousavi et al., 2022). Techniques for predicting business bankruptcy can be divided into parametric and nonparametric ones (Mousavi et al., 2022). Among parametric techniques can be mentioned univariate and multivariate discriminant analysis, linear probability models, Logit and Probit analysis and others. Regarding non-parametric techniques there are two main groups - machine learning and artificial intelligence methods, which include case-based reasoning, neural networks, decision trees, genetic algorithms and other methods and Operation research methods comprising of Data Envelopment Analysis and other multi-criteria decision making methods.

Academic research on business bankruptcy began to rise in Western countries in the 1960s. It was driven by huge demand from practice (Bae, 2012). Pioneer of business financial distress prediction models based on financial ratios was Fitzpatrick, who published his study in 1931. Beaver (1966) was the first who applied univariate discriminant analysis. When choosing specific ratios entering the model, he applied a dichotomous classification test to identify financial ratios that best describe the difference between prosperous and non-prosperous enterprises. His research was important to developed threshold value for individual indicators to classify them into two groups.

* Corresponding author: martina.mokrisova@unipo.sk

In 1968 Altman applied the method of multivariate discriminant analysis in predicting financial distress and formulated Altman Z-score model. This model used five financial ratios and has become the most popular method since then in the accounting and finance research fields (Cindik & Armutlulu, 2021). Altman's work was followed by Taffler and Tisshaw, who published the first model in 1977 and many other authors.

When using multivariate discriminant analysis, it is necessary to fulfill several assumptions. They include independence of observations, multivariate normality and homogeneity of covariance matrices (Brown & Wicker, 2000). According to Mihalovič (2015) the problem with multivariate discriminant analysis is that although it is able to identify businesses that are likely to be non-prosperous, it cannot estimate the probability with which this situation may occur. Objections to discriminant analysis as a technique for predicting business financial distress have led several authors to search for new ways of predicting. As one of the possible solutions, conditional probability models came to the fore.

The first author who applied logistic regression to predict the financial situation of companies was Ohlson (1980). His model was based on data from 1970-1976 and it considered 9 financial indicators. Ohlson examined 2,163 American industrial enterprises, 105 of which were insolvent and 2,058 were solvent. The study concluded that logistic regression is a suitable method for predicting business failure. Compared to discriminant analysis, logistic regression has several advantages. It does not require multivariate normality of the values of independent variables or homogeneity of covariance matrices. The main weaknesses of Logit models include their extreme sensitivity to multicollinearity, outliers, and missing values (Hassan, 2017). Another conditional probability model is the Probit model. The main difference compared to Logit model is that it assumes normal distribution of random variables (Kováčová & Klieštk, 2017). The Probit model was used for the first time by Zmijewski in 1984.

In the next years the achieved improvements in other fields of science like mathematics and computer science enabled the creation of prediction models based on more computationally demanding methods. In the next part we focus on neural networks and decision trees applied in this paper.

The first theoretical work dealing with neural network was the work of McCulloch and Pitts published in 1943. These authors pointed out the possibility of the existence of an artificial neural network that could work with arithmetic or logical formulas. The first experiments with a simple single-layer neural network dates back to 1950s and 1960s. This network was created by a single neuron called the "perceptron" and consisted of several inputs and one output. However, it was found that the linear neural network algorithm was not suitable for solving tasks that are more complex. This limitation could be removed by constructing a multilayer network. One of the most popular network types is multilayer perceptron (MLP), which represents a feed-forward network trained with backpropagation learning algorithm and consists of one input layer, one or more hidden layers and one output layer (Bianchesi et al., 2022). MLP was used to predict bankruptcy of businesses by various authors. We can mention Brenes et al. (2022) who examined the discriminatory power of a MLP on a sample of Taiwanese firms. They considered different setups of optimization algorithms, activation functions, number of neurons and number of layers. They conclude that the proposed MLPs show superior performance compared to other methods.

First authors who used decision trees to predict business failure were Frydman et. al. in 1985. They found out that decision tree created in their study is a better predictor of business failure compared to MDA (Durica et al., 2019). Many other authors applied decision trees in bankruptcy prediction, while the most frequently used types of decision trees include ID3, C4.5, C5, CART (Classification and Regression Trees), Best First Decision Tree and AD Decision Tree (Olson et al., 2012). One of the most successful ones is CART learning algorithm. This algorithm was used in the study of Karas & Reznakova (2017), who created two CART models for a sample of 630 active and 24 bankrupt companies operating in the construction industry (data were obtained from AMADEUS database). While the first CART model contained 3 variables, the second one used 5 variables. They came to a surprising finding that the model with a lower number of variables is more accurate than the model with a larger number of variables.

Many authors dealing with bankruptcy prediction compared classification accuracy of several approaches. Olson et al. (2012) used neural networks, support vector machines, decision trees and logistic regression to predict bankruptcy of US firms. For the analyzed data, decision trees were found to be more accurate than neural networks. Logistic regression was less accurate than decision trees, while support

vector machines worked less well on the analyzed data than any of the other models. Chen (2011) created financial distress prediction models applying decision tree classification methods (C5.0, CART, and CHAID) and logistic regression. They used sample of Taiwanese firms for the period amounting to 7 years and 5 months. They found out that decision trees approach is suitable for financial distress prediction in short run, while logistic regression approach gets better prediction accuracy in long run. Altman et al. (2020) applied different methods to predict bankruptcy up to 10 years before it in an open European economy. They found out that logistic regression and neural networks are superior to other approaches.

Based on the information presented above, the research objective was established, focusing on selecting an appropriate bankruptcy prediction method and predicting bankruptcy of analysed sample of companies. Appropriate prediction method was selected with regard to its classification accuracy. From the managerial point of view, the most easily interpretable model with sufficient classification accuracy was chosen.

The structure of the paper is as follows: In the "Methods" section, the research sample and financial features are introduced, and the methodologies of features selection method and bankruptcy prediction methods are explained. The "Results" section presents the most important performance features selected by Lasso regression and provides results of bankruptcy prediction using Logit model, decision tree learning algorithm and feed-forward neural network. The "Discussion" section provides discussion to the obtained results. The "Conclusion" section offers conclusions, limitations and future research.

2. Methods

The input database for the prediction of financial bankruptcy of companies operating under SK NACE 41 - Construction of buildings consisted of data from the financial statements of 1,349 companies. The database of the financial statements of these companies was provided by CRIF – Slovak Credit Bureau, s.r.o. (CRIF, 2022).

The construction industry was chosen because it is one of the few industries that can have a stabilizing effect on the economy, this segment is an indicator of economic development and affects the development of other industries and segments of the economy (PS Stavby, 2021). Therefore, it is necessary to pay attention to the prediction of financial difficulties of companies operating in this industry and to identify possible risks these companies have to face.

In this study, the following financial ratios were considered: Cash ratio, Quick ratio, Current ratio, Net working capital to current assets, Net working capital to total assets, Netto cash flow to total assets, Netto cash flow to debt, Netto cash flow to short-term debt, Assets turnover, Receivables turnover, Short-term debt turnover. Return on assets, Return on equity, Return on sales, Return on costs. Return on assets with EAT (Earnings after taxes), Return on sales with EBITDA (Earnings Before Interest, Taxes, Depreciation and Amortization), Total debt to total assets, Financial leverage, Debt to equity ratio, Equity to fixed assets ratio, Long-term capital to fixed assets ratio, Short-term debt to total assets, Cost ratio.

2.1 Method used for features selection

In this paper most appropriate features for bankruptcy prediction were selected with the use of Lasso regression introduced by Robert Tibshurani in 1996. When performing Lasso regression in software Statistica, logistic regression was selected. The penalized logarithmic likelihood function of Lasso logistic regression that needs to be maximized can be written as (1) (Pereira et al., 2016):

$$l_{\lambda}^L(\beta) = \sum_{i=1}^n [y_i x_i \beta - \log(1 + e^{x_i \beta})] - \lambda \sum_{j=1}^k |\beta_j|, \quad (1)$$

where $\lambda \geq 0$ is the penalty parameter, β is the column vector of the regression coefficients, x_i are the independent variables, y_i is the binomial dependent variable, n is the number of observations, and k is the number of variables.

The penalty parameter λ was determined based on the minimum prediction error in cross-validation (λ_{\min}).

2.2 Methods used for bankruptcy prediction

Logit model uses the dependent variable in nominal form (binary logistic regression) (Sperandei, 2014). The variable y_i can take only two values, i.e $y_i = 1$ if the enterprise is not doing well and $y_i = 0$ if the enterprise is doing well. We can further assume that the probability $y_i = 1$ is given by P_i and the probability that $y_i = 0$, is given by $1 - P_i$. Using the logistic transformation, we specify the probability of P_i as follows: $P_i = f(\alpha + \beta x_i)$, where x_i are selected financial indicators, α and β are estimated parameters. We then calculate P_i using the logistic function (2):

$$P_i = \frac{\exp(\alpha + \beta x_i)}{1 + \exp(\alpha + \beta x_i)} = \frac{1}{1 + \exp(-\alpha - \beta x_i)} \quad (2)$$

The Logit model is defined as follows (3) (Kováčová & Klieštík, 2017):

$$\text{Logit} = \ln\left(\frac{P_i}{1 - P_i}\right) = f(\alpha + \beta x_i) \quad (3)$$

The above represents the logarithm of the odds ratio of both possible alternatives ($P_i, 1 - P_i$). A likelihood ratio test (LR test) was used to verify the statistical significance of the model. Statistical significance of individual explanatory variables in the Logit model and their regression coefficients (β) was tested with the use of Wald test. The Hosmer-Lemeshow goodness-of-fit test was applied to assess the strength of the resulting model.

A decision tree is a non-linear discrimination method which uses a set of independent variables to divide the sample into smaller subsets. The procedure is iterative, in each branch of the tree the goal is to select the independent variable that has the strongest association with the dependent variable according to a specific criterion (Chen, 2011). In the mathematical formulation of decision tree we consider training vectors $x_i \in R^n, i = 1, \dots, l$ and a label vector $y \in R^l$, a decision tree recursively partitions the feature space in such a way that the samples with the same labels or similar target values are grouped together. Let the data at node m be presented by Q_m with n_m samples. For each candidate split $\theta = (j, t_m)$ consisting of a feature j and thresholds t_m , partition the data into $Q_m^{\text{left}}(\theta)$ and $Q_m^{\text{right}}(\theta)$ subsets as follows (4) (Scikit-learn, 2023)

$$\begin{aligned} Q_m^{\text{left}}(\theta) &= \{(x, y) | x_j \leq t_m\} \\ Q_m^{\text{right}}(\theta) &= Q_m / Q_m^{\text{left}}(\theta) \end{aligned} \quad (4)$$

In this paper the optimized version of CART algorithm implemented in Python module Scikit-learn was used. Quality of a candidate split of node m was calculated with the use of Gini coefficient.

Artificial neural networks (ANN) are a group of learning statistical models inspired by biological neural networks. They are used for estimating functions that may depend on a large number of inputs and are generally unknown (Zhu et al., 2021). The error backpropagation method for feed-forward ANN with hidden layers was introduced by Rumelhart et al. in 1986. The feed-forward neural network is a feed-forward connection w_{ij}^m (i is a neuron of m -layer and j is a neuron of $(m - 1)$ - layer) between neurons, with each neuron of one layer transmitting signals to each neuron of the next layer. A neuron works with two types of inputs, namely inputs from other neurons and inputs from the environment. Input from the external environment is a threshold value - bias (θ). The outputs of each neurons are y_i^m while i is a number of neurons ($i = 1, 2, \dots, n$) in m -layer. The total number of layers is M , while the input layer is marked 0 . The activation values of a neuron are marked as V_i^m , where $y_i^m = V_i^m$ ($m = 1, 2, \dots, M$). The activation values of the input neurons are V_i^0 . The total outputs of the network are V_i^M , where $y_i^M = V_i^M$ and M is the last layer of the network. The general formula for calculating the activation value of any neuron and any layer can be written as follows (5) (Pfeifer et al., 2010):

$$V_i^m = y_i^m = f(\text{int}_i^m) = f\left(\sum_{j=1}^{n+1} w_{ij}^m \times V_j^{m-1}\right) = f\left(\sum_{j=1}^n w_{ij}^m \times V_j^{m-1} - \theta_j\right), \quad (5)$$

where int_i^m is the total input to the i -neuron of m -layer, which is calculated as the sum of the product of the weight going from j -neuron to i -neuron and the activation value of the neuron from which the signal originates. N represents the number of neurons in the input layer, f is an activating function.

Individual models were built in software Statistica and Python module Scikit-learn. The assumption about whether the company is prosperous or not was made based on the approach of Bakeš

& Valášková (2018). According to these authors, non-prosperous businesses included those with an equity-to-liability ratio less than 0.08, current ratio less than 1 and negative EAT (Earnings after taxes). These criteria take into account the currently valid legislation and the practice of Slovak businesses in this area. Based on these criteria, there were 1,282 prosperous and 67 non-prosperous enterprises in the research sample.

Research sample was divided into two sets: 80% training data and 20% test data. K-fold cross-validation was applied to ensure that observations in each set are equally distributed between prosperous and non-prosperous businesses. Models were trained and tested five times, while the dataset was divided into five subsets of equal size and each time, the model was trained on four subsets leaving one subset for testing. Performance of bankruptcy prediction models was measured by accuracy, F1-score and AUC. F1-score is calculated as harmonic mean of the precision and recall, while AUC represents area under the ROC curve. Overall performance metrics are an average of the five individual performance metrics obtained for each individual experiment.

3. Results

As part of the analysis of financial ratios, averages and medians of individual indicators of businesses from the analyzed sample were evaluated and compared (see Table 1).

Table 1. Comparison of averages and medians of financial ratios

Indicator	Abb.	Average	Median	Indicator	Abb.	Average	Median
Cash ratio	CaR	1.50	0.32	Return on equity	ROE	0.11	0.09
Quick ratio	QR	2.45	1.11	Return on sales	ROS	0.03	0.02
Current ratio	CuR	2.75	1.26	Return on costs	ROC	0.06	0.02
Net working capital to current assets	NWCCA	0.07	0.21	Return on assets with EAT	ROA _{EAT}	0.05	0.03
Net working capital to total assets	NWCTA	0.18	0.15	Return on sales with EBITDA	ROSEBITDA	0.10	0.06
Netto cash flow to total assets	NCFTA	0.10	0.07	Total debt to total assets	TDTA	0.64	0.68
Netto cash flow to debt	NCFD	0.33	0.11	Financial leverage	FL	5.78	2.69
Netto cash flow to short-term debt	NCFSD	0.41	0.14	Debt to equity ratio	DER	4.78	1.69
Assets turnover	AT	1.81	1.43	Equity to fixed assets ratio	EFAR	3.25	1.01
Receivables turnover	RT	12.35	4.71	Long-term capital to fixed assets ratio	LCFAR	3.82	1.34
Short-term debt turnover	SDT	5.34	2.99	Short-term debt to total assets	SDTA	0.56	0.57
Return on assets	ROA	0.08	0.04	Cost ratio	CoR	0.96	0.98

Source: authors (2023)

Results of initial analysis show that there are no significant deficiencies in the liquidity of analyzed businesses. However, the safety of businesses shows considerable reserves - the median of NWCCA is 0.21, the average is even lower. From the point of view of assets management, AT achieves adequate results while on the other hand Creditors payment period is very high (its median is 120.29 days). In terms of profitability, ROA and ROE show better results, while results of ROS and ROC are lower. Debt dominates the capital structure of analysed businesses. In terms of operating indicators, CoR achieves positive results.

3.1 Results of Lasso regression

The most important bankruptcy prediction features were selected with the use of Lasso regression, while Lasso Logit model was used. The optimal value of λ was determined based on the minimum prediction error of the model using 10-fold cross-validation (λ_{min}). The optimal value of λ (λ_{min}) was chosen at the lowest point of the curve (Figure 1). From 24 financial features Lasso regression identified 10 features with non-zero coefficients at $\lambda_{min} = 0.003$. Coefficients of other indicators were shrunk to 0.

Figure 1. Graph of error against Log Lambda
Source: authors (2023)

Figure 2 shows, that the most important bankruptcy features for the analysed sample of businesses are TDTA, ROC, ROE, SDTA, NWCTA, NCFTA and AT. Coefficients of FL, LCFAR and DER were close to zero, therefore we did not use them in further analysis.

Figure 2. Results of Lasso regression for λ_{\min}
Source: authors (2023)

Features selected by Lasso regression were used as inputs for Logit model, decision tree learning algorithm and feed-forward neural network.

3.2 Results of Logit model

Logit model allows us to identify statistically significant explanatory variables. For this purpose we used the Wald test (table 2). Based on its results for the selected training data we can say that explanatory variables ROC, TDTA, NWCTA and ROE significantly contribute to the predictive ability of the model. Regarding NWCTA, ROE and ROC we talk about negative dependence. It means that the higher the value of these indicators, the lower the probability of business bankruptcy. Regarding TDTA, it is a positive dependence - the higher the value of TDTA, the higher the probability of business bankruptcy.

Table 2. Logit function coefficients

Parameter	Estimate	Standard error	Wald stat.	Lower and Upper Confidence Limit 95.0%		p-value
Intercept	-10.37	1.39	55.62	-13.09	-7.64	0.00
NWCTA	-1.90	0.85	5.07	-3.56	-0.25	0.02
ROE	-1.54	0.38	16.04	-2.29	-0.79	0.00
ROC	-7.08	2.38	8.82	-11.75	-2.41	0.00
NCFTA	-2.19	2.27	0.93	-6.65	2.27	0.34
AT	-0.19	0.19	1.03	-0.55	0.18	0.31
TDTA	4.92	1.57	9.80	1.84	8,00	0.00
SDTA	2.81	1.45	3.74	-0.04	5.67	0.05

Source: authors (2023)

The explanatory variables NCFTA, AT and SDTA are not statistically significant (see Table 2). However, their omission from the model did not bring a significant improvement in the model's characteristics, so we decided to keep these variables in the resulting model.

The statistical significance of the Logit model as a whole was tested using a likelihood ratio test. P-value is lower than the significance level $\alpha = 0.05$ (see Table 3). Therefore we can conclude that Logit model is statistically significant.

Table 3. Statistical significance of the Logit model

	Chi-Square	Df	p-value
Likelihood ratio	274.41	7	0.00

Source: authors (2023)

Table 4 shows the results of the Hosmer-Lemeshow goodness-of-fit test, which can be used to evaluate the quality of the logistic regression model. The p-value of the test is higher than the significance level $\alpha = 0.05$. Therefore, the null hypothesis is not rejected and we conclude that the model is statistically significant and suitable, because there is no big difference between the actual and predicted values of the dependent variable.

Table 4. Quality of the Logit model

	Chi-Square	Df	p-value
Hosmer-Lemeshow test	3.72	6	0.88

Source: authors (2023)

3.3 Results of decision tree algorithm

Decision tree algorithm allows us to rank features according to their importance for preventing the possible bankruptcy. Based on table 5 we can say that the most important feature is profitability indicator ROC, followed by indebtedness indicators TDTA and SLTA.

Table 5. Features importance based on the decision tree algorithm

Feature	ROC	TDTA	SLTA	NWCTA	ROE	NCFTA	AT
Coefficient	0.42	0.25	0.16	0,10	0,04	0,03	0.01

Source: authors (2023)

Graphical representation of the results of decision tree algorithm for the selected training data is shown in Figure 3.

Figure 3. Decision tree diagram
Source: authors (2023)

3.4 Results of neural network

A feed-forward network with 5 layers, one input layer, one output layer and three hidden layers was chosen to predict the financial bankruptcy of businesses. The model worked with 7 financial features at the input layer. These features were selected by Lasso regression. As the additional input, the unit bias (θ) was added, which acts as a constant in the regression analysis. Neural network worked with three hidden layers of 16, 32 and 16 units respectively. The output layer represents one dependent variable - bankruptcy, while the total number of units is equal to 2. The network parameters can be seen in the figure 4.

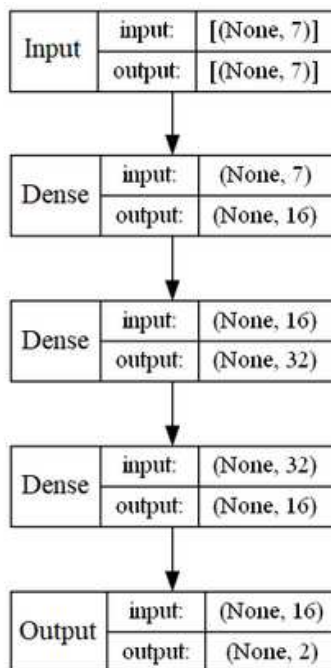

Figure 4. Neural network's parameters
Source: authors (2023)

4. Discussion

Overall performance of bankruptcy prediction models created in this paper was assessed with the use of accuracy, F1-score and AUC. Figure 5 shows results of these measures for the test data. As stated in section “Methods”, overall performance metrics were calculated as an averages of the five individual performance metrics obtained for each individual experiment.

Figure 5. Overall performance of bankruptcy prediction models for test data
Source: authors (2023)

Applied models achieved the most balanced results in terms of accuracy. Decision tree learning algorithm achieved accuracy 0.99, feed-forward neural network 0.98 and logistic regression 0.96. Accuracy is a very often used performance characteristic of bankruptcy prediction models in other studies. For example accuracy of neural network created by Olson et al. (2012) in software SPSS was 0.798, while logistic regression achieved the same accuracy 0.798 and CART learning algorithm achieved the best result with the accuracy 0.898.

There are larger fluctuations in the results of AUC and F1-score for individual bankruptcy prediction models. The best results of AUC achieved decision tree learning algorithm (0.92) followed by feed-forward neural network (0.88) and logistic regression (0.74). We can see that decision tree learning algorithm achieved the best results also in this characteristic. Its results can be compared with AUC of CART learning models of Karas and Reznakova (2017), who created two CART models for construction industry. The difference between them was in the number of indicators. While the CART model with 5 indicators achieved AUC of 0.785, the CART model with 3 indicators achieved better AUC (0.859).

Decision tree learning algorithm achieved also the best results of F1-score (0.88). We consider this characteristic as the most appropriate one for the given sample of businesses since it is suitable for unbalanced datasets.

Two of the methods applied for bankruptcy prediction are able to assess the importance of the features entering the model. Therefore, we consider these models significant in terms of their interpretability. Logistic regression is able to identify statistically significant indicators in terms of businesses` bankruptcy. For the research sample of construction companies were identified as statistically significant two indicators of profitability ROA and ROE, indicator of indebtedness TDTA and safety indicator NWCTA. Decision tree classifier is able to rank indicators according to their importance in relation to businesses bankruptcy. Based on this method indicator of profitability ROC ranked first, followed by two indebtedness indicators TDTA and SLTA. Indicator of safety NWCTA ranked fourth. Based on these results we can say that construction companies should focus on managing their profitability, indebtedness and safety to avoid bankruptcy.

Conclusion

The best performing model in terms of all applied characteristics was CART learning algorithm. Therefore we consider this model as the most appropriate one for the given sample of construction

companies. This model is also early-warning model which is able to identify most important features which should be monitored in order to avoid bankruptcy. Based on its results we can conclude that analysed construction companies should focus on managing their profitability, indebtedness and safety. Due to the similar economic conditions in the V4 countries compared to Slovakia, the results of this model can also be applied in the construction companies of the V4 countries. Limitation of the given research is lack of available data to create a sufficiently large balanced sample of prosperous and non-prosperous companies doing a business within the construction industry. Due to the limited length of the article, the results of individual bankruptcy prediction models are presented briefly. They will be analyzed in more detail in the future research. To improve the performance of decision tree learning algorithm, boosted decision tree created with the use of AdaBoost methodology will be applied.

Prediction of Corporate Bankruptcy - Malmquist Index Approach

Jarmila Horváthová^{1,*}, and *Martina Mokrišová*¹

¹ University of Presov, Department of Finance, Accounting and Mathematical Methods,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The issue of bankruptcy is still relevant. Academics, as well as practitioners in the business environment, deal with it. In their studies, they apply different features selection methods, different features as well as various bankruptcy prediction models. When constructing bankruptcy prediction models, an often-solved question is whether to apply characteristics according to the knowledge of experts or apply any of the available scientific methods, or combine them.

Purpose of the article: The paper deals with the analysis of the financial failure of companies. The aim was to select bankruptcy prediction features applying selected methods and to compare the results of the dynamic bankruptcy prediction model constructed for these selections.

Methods: The research was carried out on a sample of businesses from the construction industry. The selection of bankruptcy features was carried out using domain knowledge (DK) and the LASSO method. For the dynamic prediction of bankruptcy, the Malmquist index based on Data envelopment analysis (MIDEA) was applied. When evaluating the results of bankruptcy prediction, attention was paid to the change in technical efficiency and frontier shift.

Findings & Value added: The contribution of the paper is a dynamic approach to predicting bankruptcy of businesses, which is based on the comparison of results over the years and on efficiency evaluation, which is divided into two categories, namely the change in the technical efficiency and frontier shift of businesses. The selection of features using the DK technique indicates that significant results can be achieved when applying suitable prediction method.

Keywords: bankruptcy, domain knowledge, features, LASSO, Malmquist index

JEL classification: C52, C53, M2

1. Introduction

The discussion surrounding the prediction of the company's financial decline and the potential risk of bankruptcy is prevalent in the current period. Various global issues, including the pandemic, as well as internal problems within the country and businesses form the assumption of their possible failure, and thus they have to face many challenges. There has been an increase in bankrupt companies in Slovakia, particularly from 2021 onwards. According to the information provided by the European Statistical Office Eurostat (2022), however, the number of new businesses grew faster than the number of businesses that went bankrupt, especially in the third quarter of 2022, while the most registrations were recorded in the field of construction (+8.1%), information and communication technologies (+2.3%) and transport and storage (+1.8%). Businesses analyzed in the given research are active in the construction industry. According to data from the Statistical Office of the Slovak Republic (2022), the growth in civil engineering construction exceeded 20%. The amount of works implemented abroad, which helped boost the industry's performance throughout 2021, has currently experienced a year-on-year decline. However, there has been an increase in domestic construction activities, including new construction, renovations, modernizations, as well as repairs and maintenance. When examining the construction industry's major subfields, there was a notable decrease of 3.7% in the construction of buildings, whereas engineering constructions, which mainly include highway construction, experienced a remarkable year-on-year increase of up to 23.7%. Currently, works on domestic civil engineering constructions make up almost 30.1% of the total construction production. Construction production in aggregate for the first quarter of

* Corresponding author: jarmila.horvathova@unipo.sk

2022 reached 1.1 billion EUR and increased by 4.9% year-on-year. Construction business is very important for the economy because it creates a strong multiplier effect. The construction industry's growth is bringing about positive outcomes in the supply sectors and services, fostering employment and supporting public finances. Nevertheless, it is worth noting that in the last two years, the construction industry in Slovakia has experienced a detachment from the business cycle's development. This unfortunate situation has resulted in the industry being unable to consistently and efficiently utilize the generous opportunities provided by EU financial frameworks for investments in essential engineering and civil infrastructure.

While the automotive industry was considered the main pillar of the Slovak economy before the crisis, experts currently agree that the construction industry will help the economic recovery in the recession the most. The construction industry actively contributes to the gross fixed capital in the economy by undertaking the construction of durable infrastructure and serving as a reliable gauge of the economic cycle's development. With its contribution to the gross domestic product ranging from 7-8%, the construction sector holds substantial importance. It is crucial to recognize that the proper functioning of this economic pillar is paramount, as it encompasses the construction of buildings and structures that form a significant component of investments and the overall formation of gross fixed capital.

1.1 Bankruptcy prediction models

The first to deal with bankruptcy prediction was Fitzpatrick (1932) (In: Klieštík et al., 2019), who in his study compared the financial indicators of financially sound business entities and those facing financial problems. In the following years, research into bankruptcy prediction was carried out by Merwin (1942), Chudson (1945), Jackendoff (1962) and Beaver (1966) (In: Delina & Packová, 2013). Beaver (1966), who used one-dimensional discriminant analysis to predict bankruptcy, pointed out that financial indicators can be useful in predicting the financial failure of individual business entities (Šarlija & Jeger, 2011). At the same time, he confirmed that not all financial indicators are suitable for this prediction. Multivariate discriminant analysis (MDA) models, such as Altman's Z-score model devised in 1968, were employed for bankruptcy prediction subsequent to univariate discriminant analysis. Since Altman's seminal study, there has been a significant increase in both the number and complexity of these models. Discriminant analysis was especially popular in the early days of predicting corporate bankruptcy. This method was used in the study by Taffler (1983) and other well-known studies. Following multivariate discriminant analysis (MDA), the subsequent approach in predicting corporate bankruptcy favoured the logistic regression method. Ohlson (1980) was the pioneer in utilizing this method in the prediction of businesses' bankruptcy. Ohlson's model demonstrated superior classification capability compared to discriminant analysis models (Aziz & Dar, 2006). Another conditional probability model employed in the prediction of corporate bankruptcy is the Probit model. Zmijewski (1984) introduced the Probit model for the first time. Mathematical programming and operational research have also become increasingly prominent in the field of corporate bankruptcy prediction. Markowski and Markowski (1987) also employed these methods to predict the financial health of business entities.

Data Envelopment Analysis (DEA) models are a special mathematical programming method applicable in bankruptcy prediction. Authors who devoted themselves to bankruptcy prediction using DEA included Cielen et al. (2004), Premachandra et al. (2009),

Conventional (static) DEA models were constructed to research only one time period. However, many researchers have also been interested in the change in efficiency over time, as such information can provide particularly important insights into financial difficulties prediction (Li et al., 2017). Shahwan and Habib's (2020) study using MIDEA was one of the first attempts to assess the relative effectiveness of corporate governance and intellectual capital practices and their impact on financial distress. In their work, Wang et al. (2021) focused on the calculation of MIDEA and used this index to predict and evaluate the performance of businesses in two periods: 2015–2018 and 2019–2022.

1.2 Methods for selecting features

Apart from selecting an appropriate model for predicting company bankruptcy, the selection of suitable features for bankruptcy prediction holds significant importance. Various methods exist for feature selection in this regard. Two main approaches can be identified in this domain, one of which involves the use of domain knowledge (DK) derived from financial and accounting information. The authors who favoured this approach include for example Tsai and Hsu (2013). Another approach involves the selection of features through more scientific methods. In this regard, two common methods are the 'filter' method

and the 'wrapper' method (Kirkos, 2015). The filter method assesses attributes based on measures that are independent of the learning algorithm to be employed. On the other hand, the wrapper approach evaluates a subset of indicators based on the specific learning method to be utilized. This approach is referred to as 'wrapper variables' (Kirkos, 2015). The LASSO method is one of the techniques employed in feature selection, as demonstrated by Tian et al. (2015) in their selection of relevant characteristics for the bankruptcy prediction model.

Considering the aforementioned research motivation, the MIDEA method was employed due to its underutilization in this research domain. The MIDEA method offers an advantage as a non-parametric approach that does not necessitate the fulfillment of prerequisites typically required in other methods, like DA. By employing the DEA method, it becomes feasible to identify companies experiencing financial distress as they lie on financial distress frontier. In contrast, the DA method rarely produces such outcomes. The application of MIDEA in predicting corporate bankruptcy is considered innovative due to its infrequent usage. One of its notable advantages is its dynamic approach to evaluating financial issues within companies, enabling the quantification of changes in technical efficiency and technological advancements. Employing MIDEA can be seen as bridging a gap in addressing the given problem, as prevailing methods such as discriminant analysis, logistic regression, and various genetic algorithms dominate the current research. One drawback of these methods is their inability to compare two years at the same time and uncover changes in both technical efficiency and technological advancements over the observed period. Moreover, an innovative aspect of this research lies in comparing the results of models that employ different features selection methods, namely domain knowledge (DK) and LASSO. This pioneering approach represents a new and innovative solution for predicting bankruptcy among companies in the Slovak construction industry. The main objective was to utilize the dynamic MIDEA approach for bankruptcy prediction. One of the sub-objectives was to compare the bankruptcy outcomes of companies using DK and LASSO features. Features were selected from financial indicators utilized in previous bankruptcy prediction studies or through the implementation of the LASSO method.

The structure of the paper is as follows: In the "Methods" section, the research sample is defined, two sets of features are introduced based on DK and LASSO approaches, and the methodologies of LASSO and MIDEA are explained. The "Results" section presents the performance results of MIDEA models constructed using DK and LASSO features. The "Discussion" section provides discussion to the obtained results. The "Conclusion" section offers conclusions, limitations and future research.

2. Methods

The Malmquist index (MI) was applied to predict corporate bankruptcy. Färe et al. (1984) presented a decomposition of MI into a catch-up effect and a frontier shift effect. These components correspond to two "movements in time", towards or away from the efficiency frontier, i.e. efficiency change (ECH) and movement of the frontier itself (frontier shift - FS), i.e. change in technology and introducing innovation. When interpreting, ECH, FS or $MI > 1$ mean an improvement over time.

Suppose that each decision making unit $DMU_j (j = 1, 2, \dots, n)$ uses a vector of inputs $x_j^t = (x_{1j}^t, \dots, x_{mj}^t)$ to produce vector of outputs $y_j^t = (y_{1j}^t, \dots, y_{mj}^t)$ at each period of time $t, t = 1, \dots, T$. Efficiency of DMU_0 can change or the frontier can shift or both changes may occur in the same time. The MI based on the DEA approach can be written as follows (1) (Zhu, 2014):

$$MI_o = \left[\frac{\theta_o^t(x_o^t, y_o^t)}{\theta_o^t(x_o^{t+1}, y_o^{t+1})} \cdot \frac{\theta_o^{t+1}(x_o^t, y_o^t)}{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})} \right]^{\frac{1}{2}} \quad (1)$$

where MI_o measures the productivity change between the periods t and $t + 1$. $\theta_o^t(x_o^t, y_o^t)$ is calculated by comparing x_o^t to the EPF (Empirical Production Frontier) at time t with the use of input oriented CRS DEA model, while $x_o^t = (x_{1o}^t, \dots, \dots, \dots, x_{mo}^t)$ and $y_o^t = (y_{1o}^t, \dots, \dots, \dots, y_{so}^t)$ are the input and output vectors of DMU_0 among others. Similarly $\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})$ is calculated by comparing x_o^{t+1} to the EPF at time $t+1$, $\theta_o^{t+1}(x_o^t, y_o^t)$ by comparing x_o^t to the EPF at time $t + 1$; and $\theta_o^t(x_o^{t+1}, y_o^{t+1})$ is calculated by comparing x_o^{t+1} to the EPF at time t applying input-oriented CRS DEA model.

Research sample consisted of 231 companies doing a business in the construction industry within SK NACE 42. Data from financial statements of individual businesses for the years 2019 and 2020 were obtained from Slovak Analytical Agency CRIF - Slovak Credit Bureau, s.r.o. Despite the various economic impacts in the field of private and public investments in recent years, the construction industry is still considered one of the most important sectors of the Slovak economy (MTSR, 2019).

Two groups of bankruptcy prediction features were chosen for the research. The first group was created from features, the selection of which is based on the results of previous studies (DK approach) aimed at predicting bankruptcy. The second group of features was chosen based on the LASSO regression introduced by Robert Tibshirani in 1996. In this paper LASSO Logit model was used. The penalized logarithmic likelihood function of LASSO logistic regression that needs to be maximized can be written as (2) (Pereira et al., 2016):

$$l_{\lambda}^L(\beta) = \sum_{i=1}^n [y_i x_i \beta - \log(1 + e^{x_i \beta})] - \lambda \sum_{j=1}^k |\beta_j|, \quad (2)$$

where $\lambda \geq 0$ is the penalty parameter, β is the column vector of the regression coefficients, x_i are the independent variables, y_i is the binomial dependent variable, n is the number of observations, and k is the number of variables.

The penalty parameter λ was determined based on the minimum prediction error in cross-validation (λ_{\min}). When performing LASSO regression, assumption about whether businesses are prosperous or not needs to be taken into account. In this paper assumption about the prosperity was made based on the criteria proposed by Bakeš and Valášková (2018). According to these authors non-prosperous businesses achieve Earnings after taxes lower than 0, Current ratio lower than 1 and equity to debt ratio lower than 0.08.

Features that are different when selecting them based on DK and LASSO method are listed in table 1.

Table 1. Different indicators when comparing DK and LASSO indicators` selection

	DK	LASSO
Different indicators	Cash flow/ Assets, Cash flow/ Liabilities, Collection period ratio, Credit period ratio, Current ratio, EBIT/ Assets, EAT/ Sales	EAT/ Costs, Current liabilities/ Total assets, EAT/ Total assets

Business bankruptcy prediction models with input selection using DK and LASSO approaches have provided interesting results in the field. They can also be the basis for further research. The results using DK indicators` selection for the analyzed sample of businesses are presented in table 4. These results are the averages of MIDEADK (Malmquist index DEA domain knowledge) outputs.

Table 4. Results of MIDEADK

Variable	Descriptive Statistics DK					
	Valid N	Mean	Median	Minimum	Maximum	Std. Dev.
MIDK	231	2.70	1.74	0.04	61.63	5.42
ECHDK	231	1.69	1.01	0.07	39.03	3.36
FSDK	231	1.56	1.65	0.12	3.08	0.37

Source: authors (2023)

Results of MIDEADK using selected DK data shows that the productivity of businesses (MIDK) is high. as the average value of this indicator reaches 2.7. This result is due to the value of ECHDK as an improvement in efficiency (average value 1.69). as well as the technology change coefficient (FSDK). which reached 1.56.

Results of MIDEALASSO listed in Table 5 shows that the analyzed sample of businesses is doing well in terms of its financial health. The average value of ECHLASSO is 1.77. This value indicates an improvement in the financial health of companies. However, FSLASSO shows that the shift of the efficiency frontier is below 1, so the innovation adoption process stagnates compared to DK indicators selection (FSDK).

Table 5. Results of MIDEALASSO

Variable	Descriptive Statistics LASSO					
	Valid N	Mean	Median	Minimum	Maximum	Std.Dev
MILASSO	231	1.77	1.15	0.03	47.39	3.68
ECHLASSO	231	2.02	1.25	0.06	52.21	4.16
FSLASSO	231	0.89	0.89	0.05	1.64	0.67

Source: authors (2023)

A graphic comparison of the average values of efficiency indicators is shown in figure 1.

Figure 1. Comparison of average values of efficiency indicators
Source: authors (2023)

It is clear from the figure that in the case of selecting inputs using LASSO, there are problems with the introduction of new technologies and innovations.

4. Discussion

When we look at the specific results of MI, they are different. When applying the DK indicators, there are 36 inefficient businesses in the analyzed sample that are at risk of bankruptcy. In the case of the MILASSO calculation, there are 77 such businesses. This is mainly due to what was mentioned above, namely the stagnation in the introduction of new technologies, but also the selection of input parameters to MI using LASSO,

A comparison of the number of businesses, according to the Total factor productivity (TFP) scale calculated using MI is presented in figure 2.

Figure 2. Results of MI using DK and LASSO indicators selection
Source: authors (2023)

Figure 3 shows that more businesses identified as inefficient and bankrupt were confirmed in the case of the selection of indicators by the LASSO method. On the contrary, a larger number of efficient and non-bankrupt businesses was confirmed when selecting indicators using DK. The number of inefficient and bankrupt enterprises when selecting indicators using the LASSO method was 77, while in the case of DK it was 36.

Since MI is composed of two indices, it is possible to analyze the results in more detail. The change in technical efficiency can be seen in Figure 3.

Figure 3. Results of ECH using DK and LASSO indicators selection
Source: authors (2023)

Figure 4 shows that when applying DK indicators, more enterprises were identified compared to the LASSO selection, in which there was no increase in efficiency and the effect of catching up the efficiency frontier did not occur. On the contrary, when applying indicators selected by the LASSO method, 115 businesses were confirmed, which lie on the efficiency frontier or exceed it, and also 46 businesses, which are high above the efficiency frontier.

Figure 4. Results of FS using DK and LASSO indicators selection
Source: authors (2023)

A completely different situation occurred in the case of FS, i.e. shift in the efficiency frontier, namely through the introduction of new technology or innovations. In this case, when selecting indicators according to LASSO, 186 businesses were identified for which no shift in the efficiency frontier was recorded, i.e. no technological change was implemented. While when applying the indicators selected by DK, only 25 such businesses were identified. In the case of DK application, 200 businesses experienced a significant technological change in the given time period.

Figure 5 shows the distribution of businesses in 3D space with the application of DK indicators. It is clear from the graph that MIDK achieves significantly higher values compared to MILASSO, which can also be seen in figure 6. It means that more businesses were identified as efficient and well-performing applying this selection of indicators.

Figure 5. Scatterplot of FS against MI and ECH - DK selection of features
Source: authors (2023)

When selecting features according to LASSO, the share of efficient businesses in the total number of businesses is lower than in the case of the application of DK features. When applying features selected by DK, the increase in technical efficiency was significantly confirmed. The increase in technological change was more significant when applying features selected by LASSO.

Figure 6. Scatterplot of FS against MI and ECH - LASSO selection of features
Source: authors (2023)

MIDEA index was used in the study by Li et al. (2017). These authors analyzed data of 742 Chinese business units over a ten-year period. The results of their investigation revealed that MIDEA offers valuable insights into a company's competitive position and facilitates accurate predictions of financial distress based on the DEA efficiency measures.

Conclusion

In this paper, the dynamic approach to businesses' bankruptcy prediction was applied using Malmquist index based on the DEA approach. The use of this method enabled to assess the change in

efficiency of businesses over time. It also made it possible to monitor not only the efficiency results measured by the Malmquist index, but also more deeply analyze its two components, the change in the technical efficiency and frontier shift. When selecting features, two approaches were used - approach based on experts opinion (DK) and one of the data mining techniques (LASSO regression). Important finding is that when selecting features according to LASSO, the share of efficient businesses in the total number of businesses is lower than when selecting features with the use of DK. The main contribution of the paper is finding that increase in technical efficiency was significantly confirmed in the case of DK features selection, while increase in technological change was more significant in case of LASSO features selection. Limitations of the research were connected with the fluctuation of businesses within the construction industry. Therefore it was not possible to obtain a larger sample of businesses for two years. Future research will be aimed at the comparison of the results of other innovative methods which can be used for features selection, for example decision trees or genetic programming. Managerial implications of the research lies in the fact that selected features can help managers of construction businesses to better identify the impending bankruptcy, However, they have to be selected for a larger sample of companies from the given industry.

Financial Auditors' Perspective on Environmental, Social and Governance Non-financial Data Dissemination by Bulgarian Companies Participating in Global Value Chains

Daniela Ventsislavova Georgieva^{1,*}, and *Diyana Bankova*²

¹ International Business School, Bulgaria, Department of Economics,
7 Vincent van Gogh Str., Sofia, Bulgaria

² Higher School of Insurance and Finance, Department of Accounting and Audit,
St. Gusla 1,1618, Sofia, Bulgaria

Abstract

Research background: Sustainable public and private sector development is constantly changing. One of the possibilities for enterprises to reduce their costs and gain innovativeness through technology diffusion is to participate in a Global value chain (GVC). However, recent studies are indicating that Bulgarian enterprises refrain from such participation. The adaptation of business processes to unforeseen circumstances such as COVID-19, international wars, and others has an additional negative impact on the entity's financial situation. Due to these circumstances, compliance with the rules and policies of corporate social responsibility is not entirely sufficient. Textual disclosures, such as ESG, in the financial statements of entities are factors for the sustainability of micro- and macro-level throughout the industry, especially globalized ones. However, due to the wide variety of disclosures, there is a lack of textual homogeneity in published data related to non-financial textual disclosures. The financial auditor has an essential role in the disclosure of data's reliability.

Purpose of the article: The purpose of the paper is to present the importance of auditors' involvement in auditing non-financial information (with a main focus on ESG) to companies participating in a Global Value Chain in Bulgaria.

Methods: The adopted research methods are logical, deductive, and comparative methods, methods of analysis and synthesis, as well as the method of desk research. To collect primary data individual interviews with independent financial auditors, who are auditing Bulgarian companies in GVC, are presented.

Findings & Value added: The paper presents data related to the requirements for carrying out auditing procedures by financial auditors related to the check of the ESG disclosure data. Emphasis is set on the importance of risk assessment and to what extent this method has been implemented in Bulgaria. The answer to such questions could improve the level of reliable disclosure and hence the overall financial situation of the companies. This, on hand, can improve the participation of enterprises in GVC.

Keywords: management, audit, global value chain, environmental and social perspective, governance perspective

1. Introduction

European law requires large and public interest listed companies (with certain exceptions) to publish information on social and environmental (ESG) issues and their risks and impacts on people and the environment. The disclosure of ESG data is believed to improve the financial performance of enterprises (Kumar & Firoz, 2022; Mario et al., 2021), increase stock market returns (Weber, 2014), reduce credit risk (Barth et al., 2022) and has an impact on investor decisions. Among the main purposes of the disclosures is to present true and fair information for economically justified and objective decisions by the data users from the financial statements of the enterprises. However, as a result of the wide variety of

* Corresponding author: dgeorgieva@ibsedu.bg

disclosures, there is no narrative consistency of published data, which creates international disharmony (Stolowy & Cazavan-Jeny, 2001). There is also a risk of information asymmetry and even publication of false, misleading data or information that can be characterized as an enterprise secret. The existence of such risks depends on the managerial attitudes towards ESG, the person preparing such kind of information for the financial statements and the appropriate control over the published data. Such control is provided to the fullest extent by the independent financial auditor. According to IFAC data (Corporate decision-making, 2023, p.3), CPAs account for a majority of all assurance reports on ESG. 70% of the ESG assurance reports provided by audit firms were done by the same firm as the statutory auditor for the same reporting entity. In addition, it is emphasized that the auditor knows the business processes and financial risks and can provide assurance regarding ESG. In this respect, independent financial auditors have an essential role in ESG disclosure.

Even though the topic of social and environmental policies of enterprises is not new for science and business, seeing to what extent the independent financial auditor should be perceived as a tool for the control and management of ESG risk has not been sufficiently analyzed in Bulgaria. The purpose of the paper is to present the vision of the independent financial auditors in Bulgaria regarding their participation in the review of published non-financial information (with a main focus on ESG) to companies, participating in Global Value Chains (GVCs). The adopted research methods are logical, deductive, and comparative methods, methods of analysis and synthesis, as well as the method of desk research. To collect primary data individual interviews with independent financial auditors, who are auditing Bulgarian companies in GVC, are conducted. The results of the research support the literature in the field by presenting information about the attitude of the Bulgarian financial auditors towards their commitments regarding the ESG policies of the enterprises.

2. Literature review

The audit helps to reduce information asymmetry and improve the effectiveness of ESG policies of enterprises (Agyei-Mensah, 2018). It is believed that voluntary disclosure of more reliable non-financial information, including ESG data, can be ensured through qualitative audits (Ammar Zahid et al., 2022, p. S203). This requires auditors to put more effort into reducing the risk of a bad ESG reputation for companies with poor ESG performance (Asante-Appiah, 2020). Wang et al. (2023, p. 14) argue that when the quality of financial reporting of companies with good ESG performance improves, it influences the financial auditor's opinion. D. Georgieva, in a study on the factors that have an impact on the disclosure of non-financial information in Bulgaria, calculated an average statistical relationship between external audit control and staff-related disclosures (Georgieva & Georgieva, 2020). In addition, the author considers that the degree of disclosure of non-financial information is influenced by the presence of foreign participation in the capital of enterprises and whether the entity can be perceived as a global enterprise.

World trade and production are increasingly dependent on global value chains, representing "the full range of activities by firms and workers to bring a product from the conception of its creation to its consumption and subsequent disposition" (Gereffi & Fernandez-Stark, 2011). GVC is characterized by related activities of companies in different countries. Some of them are characterized by the participation of a large number of small firms, each of which carries out specific activities coordinated through horizontal transactions. Others involve many activities that are internationalized through large multinational companies (Strange, 2020). The participation of enterprises in such chains leads to an increase in the demands of investors for more reliable financial and non-financial reporting, as well as to the strengthening of control as a result of the different reporting requirements in the different countries in which the individual activities of the enterprise are positioned. In this context, the requirements for financial audit engagements are also increasing.

Without generalizing, the auditing profession in Bulgaria is over-regulated. This is because auditors must comply with every change of regulations against the specifics of the business and public pressure, such as the General Data Protection Regulation (GDPR), counteracting money laundering risk assessment, publication of non-financial information and others. For an audit to be of added value, a well-developed strategy is needed. The transition to ESG starts with the writing of relevant non-financial information. In 2011, the Organization for Economic Co-operation and Development (OECD) issued guidelines emphasizing the auditor's role and choice regarding non-financial information. Enterprises are required to apply high-quality standards related to accounting practices, and financial and non-financial disclosure, including environmental and social reporting. An annual audit should be

conducted by an independent, competent and qualified auditor. It is so to provide an external and objective assurance that the financial statements fairly represent the financial position and performance of the enterprise (OECD, 2011, p. 28).

Auditing the non-financial information in the financial statements was also a challenge for the auditors. The reason is the innovative standards that have been developed for auditors to carry out their procedures and risk assessments. Since July 2012 the International Federation of Accountants has developed: International standards for quality control, auditing, review, other assurance engagements and related services of the International Auditing and Assurance Standards Board. According to Peycheva and etc. (Peycheva et al., 2016, p. 393), the Institute of Certified Public Accountants in Bulgaria (ICPA) has an essential role in the correct implementation of audit procedures, as it translates the standards from English into Bulgarian language. Currently, there are legislative reforms worldwide, which have also been introduced in Bulgaria regarding non-financial information and are included in:

- Handbook of International Quality Control, Auditing, Review, Other Assurance, and Related Services Pronouncements Version 2021;
- International Quality Control, Auditing, Review, Other Assurance, and Related Services Pronouncements Version 2021, Part II;
- International Quality Control, Auditing, Review, Other Assurance, and Related Services Pronouncements Version 2021, Part III;
- Handbook of the International Code of Ethics for Professional Accountants) – Version 2022.

The global ESG standards are expected to officially come into force at the start of the fiscal 2024 year and to be published by enterprises in 2025 (Global ESG Reporting Rules Could Be Imposed From Fiscal 2024). This requires auditors and accountants in Bulgaria to comply with the formation of an International Sustainability Standards Board and the SEC's work to prepare a climate risk disclosure rule. At the European level, this process has already started with the introduction of the Corporate Sustainability Reporting Directive (CSRD) at the beginning of 2023. CSRD includes new challenges regarding climate change and other sustainability issues. At that moment an advisory group is in the process of developing European Sustainability Reporting Standards (ESRS). Large public-interest companies (like listed companies, banks, insurance companies and others) will be required to comply with these regulations. The ESG disclosure requirement also applies to small and medium-sized enterprises, for which a grace period of 1 year is provided and under reduced requirements. In the member states of the European Union, there will be a period of adaptation for each country, as well as the development of guidelines and rules regarding the refinement of emerging ESG risks. At the moment, the Republic of Bulgaria and ICPA have not created such a methodology. However, its development and implementation may take considerable time, taking into account the current situation of political uncertainty in the country. This can lead to delays and even a lack of basic training and experience related to ESG for the auditors.

3. Methodology

To collect primary information about the opinion of certified public accountants (CPAs), an author's questionnaire of 7 open questions was prepared. Data from the ICPA's Public Register was used to identify potential respondents. From a total of 731– CPAs, members of the Institute of Certified Public Accountants in Bulgaria, were sent invitations to 100 potential respondents. The selected are financial auditors of enterprises involved in the global value chains. Hence, it is considered that they will have better knowledge and experience related to ESG. Based on the respondent method, 7 CPAs were finally interviewed. The low response rate is considered by the authors as a limitation of the study. However, it provides some signs regarding the view of the auditors towards the subject under analysis.

Interviews were conducted over the telephone during the period April-May 2023 with an average duration of 25 minutes. The purpose of the interviews was to outline the attitudes and views of the interviewed experts regarding:

- the measures and procedures they carry out about the verification of non-financial information, subject to publication in the financial statements of the enterprises;
- the influence of the measures and procedures carried out by the auditors about the verification of non-financial information on the financial condition and reputation of the enterprises;
- the understanding of the importance of the ESG data and the measures the auditors have taken to be prepared for the new regulations in the field.

3.1 Survey results and discussions

From a socio-demographic point of view, the interviewees were from big cities, mostly female (86%) with experience in the field over 10 years (71.43%). All the interviewees claim that they are familiar with the national and European requirements regarding the disclosure of non-financial information. The verification procedures carried out by them are aimed at verifying if the disclosure follows the obligatory standards data and if the deadlines for their submission to the national authorities are complied with. „To the extent that non-financial information disclosed can be measured and verified, we apply customary procedures. Concerning additional asset impairment risks due to green technologies and/or requirements, we make investigative inquiries about management's plans to implement new technologies, decommission existing assets, analysis of management assumptions and other“. When asked if the auditors are preparing for the expected regulatory requirements and changes in ESG policies and disclosures, only about 40% say they have started looking for training in the field.

However, the interviewees indicate that, to a large extent, non-financial information incl. ESG data is written by the accountants of the companies, with managers very little involved in this process. However, accountants are not fully competent in matters concerning the environment and social environment of the enterprise, which makes the disclosed data irrelevant and even useless. The main reason for such a negative trend in Bulgaria is the fact that the management perceives the disclosed non-financial data as part of the financial statements of the enterprises, for which accountants are primarily responsible. As a result, it is important for managers that the deadlines are met and that the enterprise comes to "expected" accounting and tax results, and not so much what is disclosed as non-financial information, as long as it does not negatively affect the reputation of the enterprise.

According to the majority of interviewees (nearly 60%), auditors are gradually beginning to gain knowledge about the multiple aspects of reporting and the impact of sustainable development on business. „Discussing with the client the individual manifestations both at the level of financial statement and at the level of reporting of non-financial information helps speed up the process of forming an understanding and applying the requirements“. Nevertheless, "the developing, compliance and disclosure of such policies and measures by enterprises are rather only on paper“. In this respect, none of the respondents considers that the applied audit measures and procedures about non-financial information have an impact on the reputation, profitability and economic condition of the enterprises.

To a large extent, the consideration of the questioned auditors is in the direction of inefficiency and the lack of understanding of the disclosed policies and measures, which can be traced from the managers and accountants and by the auditors themselves. A specific example was given of an entity publishing non-financial data only to have published it to comply with legal requirements. At the same time, however, some of the information can even be interpreted as "risky" for the enterprise. However, the need for the accountant to "satisfy" the management's requests to publish information to increase the prestige of the enterprise can have a negative result, especially due to the lack of competencies in the field of ESG. At the same time, the performance of "atypical" functions for accountants is a "usual" practice in Bulgaria, especially for accountants of micro and small enterprises. Although accountants realize that this can lead to asymmetric information, they often feel "squeezed by the managers“. In this case, however, the auditor is only obliged to ascertain the existence of such information, and not to give an opinion on its usefulness.

The data collected and analyzed by the auditors that were interviewed gives us reason to argue that the review of ESG disclosures is perceived as a "presence finding" rather than an essential part of reporting. In this case, a question can be raised whether and to what extent the nature of such disclosures was understood by the auditors? Although auditors primarily have a control function, they indirectly have a significant impact on the strategic decisions of management. The lack of understanding of the importance of ESG reporting along the manager-accountant-auditor chain can lead to an incorrect introduction of a methodology for specifying emerging ESG risks, and from there to its incorrect application. To support ESG-related activities, the management of companies must initiate the writing of such a report before it is audited by financial auditors.

4. Good practices in the audit field for sustainable business

Development and implementation of a suitable methodology for the disclosure of ESG information in Bulgaria should not be done in isolation, without prior analysis of best practices. One of the notable best practice examples is given by the globally recognized auditing company from the Big 4, Ernst & Young (E&Y) (EY sustainability and ESG leaders share insights on how organizations can

embed sustainable business practices into their operations). Its representatives share the view that although the last letter in the "ESG" acronym is related to governance, which is fundamental, effective governance is not possible if there is weak oversight from government authorities. Therefore, businesses must engage in dialogue with the government. Another representative from the auditor's company, Kristen Gray, also presents an important benefit for businesses from the implementation of ESG. He gives the example of the US law which has implemented the Inflation Reduction Act. This Act is designed to support investment in energy transition and renewable technologies. Hence, new tax provisions can help enterprises. In this respect, it is appropriate and beneficial to propose tax incentives for enterprises that implement and disclose ESG policies. Of course, such incentives should be tied to specific measurable indicators that allow an assessment of the effectiveness of the measures undertaken by the enterprises and their sustainability over time. When taking into consideration such a statement we should take into account that companies expect state involvement in ESG and require legislative changes, especially in taxation (Skýpalová & Kučerová, 2014, p. 1413). Even though companies don't sufficiently know and understand the basic principles of the CSR and ESG concept they could become more demanding in the process of developing governmental policies which could lead to inappropriate practices.

If we conduct a more in-depth analysis of best practices regarding ESG audits, it is appropriate to consider Thomson Reuters' research titled „Understanding ESG audits: Checklist and best practices“. According to this research, auditors should pay attention to 5 main components - Assess the ESG landscape, Choose an ESG reporting format (standards), Prepare for ESG engagements, Integrate ESG into an annual audit plan, and Implement audit software and guidance. These components fully outline the main processes within the scope of ESG data audits and could be implemented in Bulgarian audit practices.

Factors that may influence ESG audits are also important. On one hand, according to A. Dennis (2021) factors that would affect the financial reporting of the company depend on the business sector, location, key transactions of the company, forecasted risks, and others. On the other hand, these factors are divided into physical risks – how meteorological conditions would affect the business and the useful life of assets that align with ESG requirements. Such factors also require specific knowledge on the part of the auditor, which cannot always be acquired through general training in the field. In this regard, it is necessary to also pay attention to the specific competencies of the auditor by introducing certain non-discriminatory requirements. Additionally, the information from the ESG report is of great interest to stakeholders, requiring auditors to ensure the appropriateness of the information to be harmonised with the financial statements.

Conclusion

Within the conducted study, it was found that independent financial auditors in Bulgaria, analyzed in the paper, are not fully prepared for the implementation of ESG reporting requirements and disclosure. There is a lack of understanding in the manager-accountant-auditor chain regarding the benefits and risks of such publishing.

Bulgaria has not yet taken specific legislative measures, which is why the current implementation of the new ESG requirements is limited to general training and acquiring basic knowledge by the auditors. However, this will not be sufficient in the context of the increasing importance of ESG data.

ESG leads to a fundamental change in terms of business sustainability and every stakeholder involved in it. The financial sector has undergone a complete transformation related to ESG practices. The legislation imposes regulatory requirements that accountants and auditors will need to adapt to. To have a smoother transition to ESG, it is reasonable to improve our knowledge in this area and adapt it to our professional activities. Every participant in the global supply chain has a role to play in this adaptation, including financial experts.

Abstract

Research background: Financial anxiety is a prevalent and enduring type of stress experienced globally. It can be described as a condition of concern, unease, or emotional strain arising from financial matters, including money-related issues, debt, and upcoming or ongoing expenses.

Purpose of the article: This study explores the prevalence of financial anxiety among males and females in Slovak republic and investigates its possible relationship with monthly net income, age groups and educational level.

Methods: Data for this study was collected through a survey where respondents were asked about their feelings of anxiety regarding their finances in the current socio-economic and political situation. The survey encompassed various demographic factors, including gender, age group, education level, monthly net income etc. Correspondence analysis was used to explore the relationships between educational level, monthly net income and inclination to financial anxiety.

Findings & Value added: We find that financial anxiety is more prevalent among females, with 70.4% reporting feeling anxious about their finances compared to 46.3% of males. Both genders experience financial anxiety, and the percentages vary mainly based on monthly net income. As monthly net income increases, the percentage of individuals feeling anxious decreases for both genders. Financial anxiety is more likely to be present in cases of individuals with secondary education with matriculation exam and monthly income between €1001 - €1500, second university degree-educated individuals earning between €500 - €1000 and individuals with a 1st university level education and monthly income between €1500 - €2000.

Keywords: financial anxiety, financial literacy, net income, gender differences

JEL classification: G50, G53, G59

1. Introduction

According to Huston (2010), literacy refers to a person's ability to read and write (Zarcadoolas, Pleasant and Greer 2006). The standard definition of literacy developed the use of printed and written information to function in society, to achieve one's goals, and to develop one's knowledge and potential" (Kirsch, 2001). In its widest sense, literacy consists of the use, ability to write, read and count of materials and comprehension of information and documents. The idea of literacy has been over time extended to the study of specific skill sets, such health literacy, computer literacy, statistical literacy, financial literacy, environmental literacy, legal literacy, digital literacy media literacy and so forth. Financial literacy is a knowledge, skills, and understanding of financial concepts that enable individuals to make informed and effective decisions about their personal finances. It involves having the ability to manage money wisely, budget effectively, and make informed choices about saving, investing, and spending.

In this paper we will focus on one of the financial literacy components, financial stress/anxiety. Firstly, financial literacy is the ability and knowledge of proper management of money and financial

* Corresponding author: matus.kubak@unipo.sk

resources, thus ability to understand financial concepts, manage money effectively, plan a budget, invest, understand risks and debts, and understand the basics of economics. These competences allow individuals to make more informed decisions about their finances, helping them achieve financial stability and better long-term outcomes. Financial stress, or anxiety is a condition when an individual, or household increased pressure in connection with financial matters. This condition can be caused by various factors (financial factors, emotional stress, increase of debts, impoverishment, health problems) and can have different levels of intensity.

According to OECD/INFE 2020 International Survey of Adult Financial Literacy which surveyed 26 countries and economies financial stress is a common phenomenon. According to findings, 42% of individuals worry about everyday living expenses and 37% of the sample reported that they are just getting by financially. Given numbers suggest significant part of the individuals experience financial anxiety and came across financial worries in everyday life (OECD/INFE 2020). As far as overall financial literacy is concerned, survey revealed that financial literacy was relatively low in all 26 countries. Individuals scored an average of 12.7 points, what is 61% of the maximum possible financial literacy score. The average value of the OECD countries in the survey was only slightly higher, 13.0 points. The highest score in financial literacy was achieved by Hong Kong (China) - 14.8 points, while Italy was the worst with 11.1 (OECD/INFE 2020).

Huston (Huston, 2010) outline the thought that establishment of financial education programs designed specifically to increase financial literacy is seen as a solution to alleviate the financial problems faced by individuals and families. On the other hand, research brings mismatched evidence about the measurable benefits of education on financial literacy provides measurable benefits (Huston, 2010; Fox, Bartholomae, and Lee 2005; Lusardi 2003; Mandell 2005; Willis 2008). Willis (2008) argues that the costs of financial education programs may outweigh the benefits. Some literature suggests that financial education does not have a significant effect on the improvement of the financial knowledge of high school students in the United States (Mandell 2005).

Nowadays is characterized by growing anxieties due to socio-economic, political, or interpersonal relations. We can also perceive anxiety in relation to finances and financial worries in everyday life. According to the American Psychological Association's 2022 Stress in America Survey (American Psychological Association, 2022), 87 % of people who responded listed inflation as a source of significant stress, followed by the economy (69%) and money (66%) as a significant source of stress. Financial anxiety can have a negative effect on mental health but also for financial decisions. Financial literacy and knowledge in this area could also help.

Jung et al. (2022) investigated the link between the financial impact of COVID-19 and the psychological well-being of South Korean adolescents. The results indicate that the economic hardships resulting from COVID-19 are strongly connected to increased financial anxiety among adolescents, particularly among females and those with lower incomes. To address this issue, the researchers suggest implementing a combination of psychiatric support and relevant financial education. Shih and Ke (2014) found that money anxiety is particularly prevalent among low-risk investors. Financial literacy affects consumer financial behaviour and demographic variables play a segmentation role. Financial anxiety is not experienced by investors who take higher risks. Adamus and Ballová Mikušková (2022) concluded that people experiencing financial anxiety and considering their economic status to be lower are more pessimistic in several ways, whether it concerns the development of the economy as a whole or their private development. Such people are more often subject to conspiracy theories and more often support them. They are less prone to adapt to changes and make adaptive economic decisions that could alleviate their uncertainty and anxiety. Financial anxiety and related low financial literacy contribute negatively to the financial system.

The aim of the paper is to reveal possible socio demographic characteristics that have influence on the financial anxiety of Slovakian inhabitants. To do so, we run questionnaire query which is described in more details in methods section. Paper is organised as following. In second part methods and data are described, followed by results part. Discussion and concluding remarks are presented in the final part of the paper.

2. Methods

The data presented in this paper is derived from a study conducted on financial literacy in Slovakia. The study involved collecting data through a questionnaire survey from a sample of 400 respondents across Slovakia. The data was collected online, following the methodology of the Organization for Economic Cooperation and Development - International Network on Financial Education (OECD/INFE) and its Toolkit for measuring financial literacy and financial inclusion. Additionally, the survey included

some additional questions, one of which focused on financial anxiety. The question asked was: "Do you feel anxious about your finances due to the current socio-economic and political situation?" The respondents could answer either "yes" or "no" to this question. Along with this, information about the survey respondents' demographic, social, and economic status was also gathered. In the following section, the article presents the results regarding the respondents' financial anxiety in relation to their demographic, social, and economic status.

3. Results

First, we note that that financial anxiety is more prevalent among females than among males. 70.4% of females and only 46.3% of males answered that they feel anxious about their finances due to the current socio-economic and political situation? In table 1 we present the gender differences in financial anxiety related to the respondent's monthly income. The data indicates that both males and females experience financial anxiety, but there are some differences in the percentages. First, we note that there is a clear trend in the relationship between monthly net income and feelings of anxiety about finances. As the monthly net income increases, the percentage of people feeling anxious decreases. This trend can be observed for both genders. Interestingly, among respondents with a monthly net income over €2000, the majority (63.3%) of females still feel anxious about their finances, while the majority (78.9%) of males in the same income bracket do not feel anxious. In the low-income interval of "Less than €500" a higher percentage of females (20.0%) do not feel anxious compared to males (30.0%). In the middle-income intervals ("Between €500 and €1000" and "Between €1001 and €1500"), there is a relatively even distribution between males and females as far as financial anxiety is concerned, but males seem to be more resistant to financial anxiety as compared to females.

Table 1. Financial anxiety and monthly income

Gender	Monthly net income	Do you feel anxious about your finances due to the current socio-economic and political situation?	
		No	Yes
Female	Less than €500	20.0%	80.0%
	Between €500 and €1000	16.7%	83.3%
	Between €1001 and €1500	29.0%	71.0%
	Between €1500 and €2000	41.7%	58.3%
	Over €2000	36.7%	63.3%
Male	Less than €500	30.0%	70.0%
	Between €500 and €1000	50.0%	50.0%
	Between €1001 and €1500	48.6%	51.4%
	Between €1500 and €2000	44.9%	55.1%
	Over €2000	78.9%	21.1%

Source: own processing (2023)

Secondly, we are interested in the matter of age on the financial anxiety. Table 2 presents data on gender, age groups, and feelings of anxiety about finances due to the current socio-economic and political situation. There is a noticeable variation in the levels of financial anxiety among different age groups for both genders, especially in case of females.

Among females, the age group that experiences the highest level of financial anxiety is the "50-59" group, with 88.9% responding "Yes" to feeling anxious. The "40-49" and "60+" age groups also show significant percentages of respondents feeling anxious about their finances (82.0% and 80.0%, respectively). Among males, the "20-29" and "30-39" and "40-49" age groups have the highest percentages of respondents answering "No" to feeling anxious about their finance. In contrast, the "50-59" age group shows the highest percentage of males feeling anxious about their finances (45.5%). The data suggests that in almost all age groups, a higher proportion of females feel anxious about their finances compared to males. In case of females, the financial anxiety increases with aging.

Table 2. Financial anxiety and age

Gender	Age	Do you feel anxious about your finances due to the current socio-economic and political situation?	
		No	Yes
Female	20-29	33.9%	66.1%
	30-39	34.7%	65.3%
	40-49	18.0%	82.0%
	50-59	11.1%	88.9%
	60+	20.0%	80.0%
Male	20-29	52.9%	47.1%
	30-39	54.3%	45.7%
	40-49	55.2%	44.8%
	50-59	54.5%	45.5%
	60+	50.0%	50.0%

Source: own processing (2023)

To reveal possible relationship between education level and monthly net income in context of financial anxiety we run correspondence analysis. Correspondence analysis (Benzécri, 1973) is a visual technique that allows the graphic presentation of rows and columns of a pivot table (Heijden& Leeuw, 1989). Correspondence analysis brings similar results to factor analysis and measures the possible relationship between categorical variables. Figure 1 displays results of correspondence analysis where only individuals that revealed financial anxiety enter. We observe some insights from the correspondence analysis. Financial anxiety occurs habitually in cases where following combination of education and monthly income meet. Firstly, financial anxiety occurs in cases of individuals with secondary education with matriculation exam and monthly income 1001 € -1500 €. Secondly, we observe presence of financial anxiety when second university degree educated individuals which earns 500 € - 1000 € are considered. Financial anxiety also occurs in cases when individuals with 1st university level education and earnings between 1500 € - 2000 € are considered. Presented results are more precise for females, as in case of males we detect much lower degree of collinearity between rows and columns.

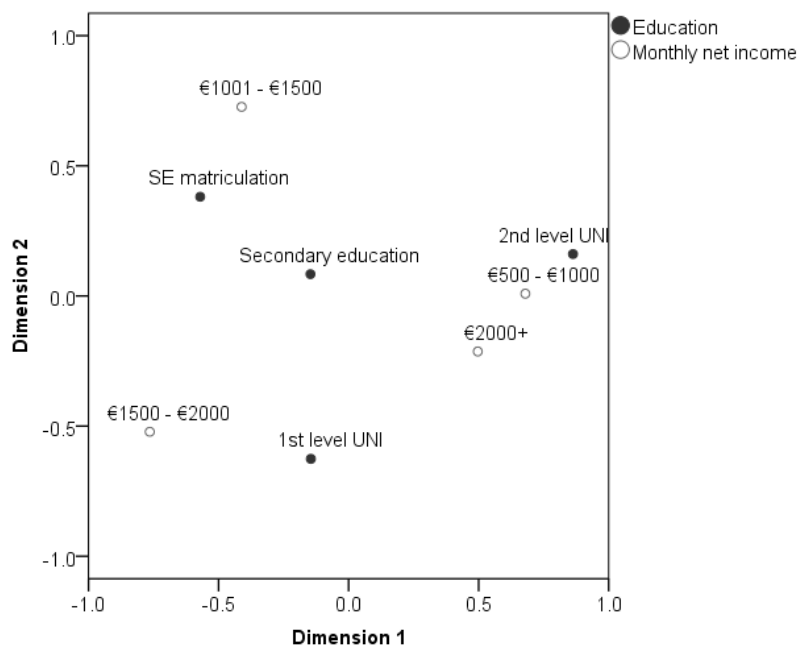

Figure 1. Correspondence analysis - Education and Monthly net income
Source: own processing (2023)

4. Discussion and Concluding remarks

Financial anxiety is a prevalent concern in today's socio-economic and political context. It affects individuals' psychological well-being and decision-making as well. This study aims to examine the gender differences and age group influence on financial anxiety, exploring the relationship between monthly net income, education level, and the likelihood of experiencing financial anxiety. The results revealed that financial anxiety is more prevalent among females, with 70.4% reporting feeling anxious about their finances compared to 46.3% of males. Both genders experience financial anxiety, and the percentages vary based on monthly net income. As monthly net income increases, the percentage of individuals feeling anxious decreases for both genders. However, among respondents with a monthly net income over €2000, a significant proportion (63.3%) of females still reported feeling anxious about their finances, whereas most males (78.9%) in the same income bracket did not. As for the age, females aged "50-59" years exhibits the highest percentage of feeling anxious about their finances, followed by the "40-49" and "60+" age groups (82.0% and 80.0%, respectively). In contrast, among males, the "20-29" and "30-39" and "40-49" age groups show the highest percentages of individuals reporting no financial anxiety. The "50-59" age group stands out with 45.5% of males experiencing financial anxiety. Correspondence analysis revealed that financial anxiety tends to occur among individuals with specific combinations of education and monthly net income. Specifically, financial anxiety is more likely to be present in cases of individuals with secondary education with matriculation exam and monthly income between €1001 and €1500. Additionally, second university degree-educated individuals earning between €500 and €1000 and individuals with a 1st university level education and monthly income between €1500 and €2000 also exhibit a higher likelihood of experiencing financial anxiety. The results were more precise for females, indicating a stronger association between education level, income, and financial anxiety in this gender.

5. Regional Development Management

Selected Sustainable Development Goals of Agenda 2030 in V4 countries

Milena Švedová^{1,*}, and Tünde Dzurov Vargová¹

¹ University of Presov, Department of Tourism and Hotel Management,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The goals of sustainable development are firmly embedded in European treaties and important projects and policies. Inclusive economic growth is necessary for the benefit of the entire population and future generations. Education is a key tool for achieving sustainable development and supporting the economic growth of society.

Purpose of the article: The article specifies the goals of sustainable development in terms of quality education, work, and economic growth in the V4 countries, which represent a new universal standard for the development of the world's inhabitants and their significance for Slovakia from the perspective of globalization.

Methods: We analyzed data primarily from the European Union's Statistical Office databases, focusing on sustainable development goals in the 2030 Agenda. Specifically, we concentrated on two key indicators: education, employment, and economic growth progress in the V4 countries. Our analysis employed Pearson's correlation coefficient, and our goal selection was deliberate.

Findings & Value added: The results of our research show that each country has its weaknesses, but also strong points. The Czech Republic received the best rating from us, as it achieves the best results in most cases in terms of these goals. Slovakia also had better and worse results compared to other countries. Among the better results are: Population by level of education, gender and age (less than primary, primary and lower secondary education) From this we can see that in Slovakia it is in the interest of people not to settle for less than secondary education and to complete more than compulsory school attendance. However, there are cases when our country ranks among the selected states. The worst results are seen in the unemployment rate in the 15-74 age group, which is related to the overall state policy.

Keywords: goals of sustainable development, United Nations Organisation, Agenda 2030, globalization, Slovakia

JEL classification: R11, Q56

1. Introduction

Today, humanity faces major environmental, social and economic challenges globally. In order to address these global challenges at an international level and create a more sustainable and better future for all, the United Nations adopted 17 Sustainable Development Goals (SDGs) in 2015. (Weiland et al., 2021) Each of the goals has indicators that are used to measure progress towards the goals. (Poliak et al., 2021) The goals do not stand alone, rather they interact with each other and are closely interlinked. Each goal addresses environmental, social and economic issues. (Hickmann, 2021) Peace, diplomacy, and international cooperation are essential conditions for the world to make progress towards the SDGs by 2030 and beyond. (Galvão & Zeferino de Menezes, 2021). Global cooperation and commitment to the core principles of sustainable development - social inclusion, clean energy, responsible consumption and universal access to public services - are needed more than ever to respond to the major challenges of our time, including security crises, pandemics and climate change. (Zeigermann, 2021) Despite these difficult times, the SDGs should remain the roadmap for achieving sustainable development to 2030 and beyond. It

* Corresponding author: milena.svedova@unipo.sk
822

is particularly important how the SDGs are perceived, accepted and valued by people around the world. A top priority of recovery plans and reforms of the international development finance system should be to restore and accelerate progress on sustainable development in all countries, including the poorest and most vulnerable. (Štrba et al., 2020)

1.1 Sustainable development objectives and concept

We live in a society that is progressing and changing every day. There are those among people who do not care about relationships with people or with the environment and destroy everything around them recklessly. But there are also those who are the opposite and strive for a good quality of life in the environment in which we live. It is these people who are leading our society forward in a good way, and we hope there will be more and more of them. It is a worldwide trend that we need to preserve. The Sustainable Development Goals (SDGs) set out in the 2030 Agenda (Figure 1), otherwise known as the Global Goals, are a set of targets within the universal agreement to end poverty, protect everything that makes the planet habitable, and ensure that all people enjoy peace and prosperity, now and in the future. (Matusik et al., 2021) There is still much debate about the concept and practicalities of sustainable development. The Sustainable Development Goals are the most focused attempt to date by the international community to set out what sustainable development means in practice for all nations, rich and poor alike. The Goals were adopted by all United Nations member states formally to address the overwhelming empirical and scientific evidence that the world needs a radically more sustainable approach. (Hickel, 2019) The Goals provide a well-consulted framework, are sufficiently scientifically robust, politically acceptable and publicly intuitive. The goals provide the best chance to ensure the necessary collaboration and alignment to implement global approaches to ensure a just, healthy and prosperous future for all. (Huang et al., 2022)

The definition of "sustainability" is the study of how natural systems function, remain diverse, and produce all that the ecology needs to remain in balance. It also recognizes that human civilization requires resources to sustain our modern way of life. (Offertaler, 2017) There are countless examples in human history in which civilization has damaged its own environment and severely affected its chances of survival. Sustainability considers how we might live in harmony with the natural world around us and protect it from damage and destruction. (Mason, 2020) The concept of sustainable development can be interpreted in many different ways, but at its core is an approach to development that seeks to balance different and often competing needs in light of the environmental, social, and economic constraints we face as a society. Through sustainable development, we can recognise that what we do today to improve our lives should not have a negative impact on our children or their children. (Blanc & Cotella, 2022) An example of this is how we rely on fossil fuels with providing heat and light in our homes and offices causing climate change. Climate change will limit lifestyle options for future generations and can have devastating consequences worldwide. (Sustainable Development Commission, 2020)

Figure 1. UN Graphical Illustration of the 17 SDGsA

Source: www.sd-commission.org.uk (2020)

1.2 The education system and sustainable development

The education system has an important role to play in raising awareness of the SDGs and in teaching skills and values that lead to more sustainable behaviour. The United Nations Educational, Scientific and Cultural Organization has therefore developed educational goals for the SDGs to support teachers and students. (UNESCO, 2020) Achieving inclusive and quality education for all reaffirms the belief that education is one of the most powerful and proven means of sustainable development. It also aims to ensure equal access to affordable vocational training, eliminate gender and wealth disparities, and achieve universal access to quality higher education. (Juuti et al., 2021) Tertiary education institutions are particularly important in this regard, as they are educating the next generation of decision-makers who will have a decisive influence on the future. Through their education and influence, universities directly contribute to the achievement of a range of Sustainable Development Goals In recent years, there has been a significant increase in sustainability programmes at universities, with a particular focus on student attitudes (Rodríguez-García et al., 2019); however, there is a great deal of variation between programmes. Despite the recent increase in sustainability in higher education, students generally have limited knowledge of the SDGs. (Zamora-Polo et al., 2019) Higher education institutions, such as universities, have a special responsibility worldwide as they shape future leaders, decision-makers, professionals (Kioupi & Voulvoulis, 2020), and intellectuals across various academic fields. In addition to the growing number of sustainability-focused courses, there should be a greater emphasis on the interconnectedness of different layers of the SDGs. Each SDG should pay attention to highlighting the social, environmental, and economic components and emphasizing the close relationship among these pillars (Hanspach et al., 2020). This approach enables the acknowledgment of the importance of all three components within each SDG when addressing current issues. These interconnections should be addressed and emphasized in environmental education courses. Particularly, political or educational activities, such as highlighting the global significance of economic goals within the context of education, should be given special importance. The fact that sustainable development goals are rated lower on average in wealthier countries with higher education indices indicates the need to improve related knowledge in these countries. It also highlights the importance of institutions of higher education focusing specifically on content related to sustainable development goals. In this context, it is not sufficient to teach only basic scientific knowledge; rather, education should primarily focus on other factors such as attitudes and values. The importance of sustainable development goals should be considered not only at the country level but also in an international and global context. These topics could be incorporated into the curricula of universities and schools to enable students, as future decision-makers in society, to act as multipliers and convey the significance and importance of sustainable development goals in society. The importance of sustainable development goals, regardless of the sustainability pillar (social, economic, environmental), is considered important by students in environmental and sustainability science courses in various countries (Rodríguez-García et al., 2019).

1.3 Economic growth of the society and sustainable development goals

Promoting inclusive and sustainable economic growth, employment, and decent work for all is one of the goals of sustainable development (Poliak et al., 2021). The COVID-19 pandemic has triggered the worst economic crisis in decades and has reversed progress towards decent work for all. Although the global economy started recovering in 2021, bringing some improvements in unemployment, the recovery remains transient and fragile (Lu et al., 2021). By the end of 2021, the recovery of the global economy was hindered by new waves of COVID-19 infections, rising inflationary pressures, significant disruptions in the supply chain, political uncertainty, and persistent labor market challenges. As the global economy continues to recover, we see slower growth, deepening inequalities, and a lack of job creation to keep pace with the growing workforce (Blanc & Cotella, 2022).

The tourism industry is one of the economic sectors affected by the COVID-19 pandemic due to border closures, travel bans, and lockdown measures (Vašaničová et al., 2021). Due to travel restrictions, international travel arrivals in 2020 decreased by 60 to 80 percent compared to 2019 (Vargas-Sanchez et al., 2019). One possible solution to address the issue could be providing youth with the best opportunity for transitioning into decent work, which requires investment in high-quality education and vocational training that equips young people with skills aligned with the demands of the labor market, granting them access to social protection and basic services regardless of their employment contract type, so that everyone can attain productive employment regardless of their gender, income level, or socio-economic background (Streimikiene et al., 2021). Governments can function by building a dynamic, sustainable, and

innovative people-centered economy, supporting youth employment, as well as the economic status of women and decent work for all (Wang et al., 2020). Implementing adequate measures to promote health and safety, supportive work environments, and quality living conditions is the foundation for protecting the safety of workers and those providing essential services for further economic development (Rigelsky et al., 2022).

2. Methods

Currently, the development of international cooperation and understanding in the fields of social and natural sciences, education, culture, information, computer science, communication, and the environment represents an important aspect that led to the establishment of the 17 Sustainable Development Goals (SDGs). The objective of this contribution is to specify the goals of sustainable development in terms of quality education, decent work, and economic growth in the V4 countries, which represent a new universal standard for the development of the world's population and their significance for Slovakia from the perspective of globalization.

The Visegrád Group (V4) is an alliance of Central European countries, including the Czech Republic, Poland, Hungary, and Slovakia, reflecting the efforts of these countries to cooperate in various areas of common interest within the framework of European integration.

We obtained data for analysis from the Statistical Office database and focused on the period from 2008 to 2018. For the application of higher statistics, we selected two indicators - the fourth and eighth goals - and formulated hypotheses. We calculated the selected indicators using the Pearson correlation coefficient in the Gretl program. The results were processed and presented clearly using tables and graphs.

Quality education

The goal of this indicator is to ensure lifelong education for everyone, as well as fair and quality education. One of the partial goals of this indicator is to ensure that children complete free and quality primary and secondary education, which is equal for girls and boys (Wailand, 2021). In this section, we compared "population by level of education, gender, and age in selected countries."

Data from Eurostat provide us with an insight into the highest level of education successfully completed by individuals in the population. The classification of educational activities is based on the International Standard Classification of Education (ISCED). In general, the online database includes three aggregates, which are:

- Less than primary, primary, and lower secondary education
- Upper secondary and post-secondary education
- Tertiary education.

We have selected the first level, which includes less than primary, primary, and lower secondary education for the age group of 15 to 64 years. As can be seen from Graph 1, the highest number of people who completed less than primary, primary, or lower secondary education was in Hungary, while the lowest was in the Czech Republic throughout the observed period. The highest number of people was in 2008 (25.8% - Hungary), and the lowest was in 2017 and 2018 (12.1% - Czech Republic). As we can see, the data from Slovakia, the Czech Republic, and Poland are relatively close to each other, especially in the last three years.

Slovakia shows the second-lowest percentage in the years 2008-2016, but in the last two years, Poland has achieved better results in terms of completion of education. Slovakia shows a yearly decline in the data, except for the year 2014.

Figure 1. Population by educational attainment (below primary, primary, and lower secondary education) in V4 countries from 2008 to 2018.

Source: own processing (2022)

Labor and Economic Growth

The main objective of the mentioned indicator is to ensure an adequate number of job positions and support sustainable economic growth (Wailand, 2021). To secure employment for everyone, including individuals with disabilities and young people, as well as promote equal pay for equal work, we have chosen the „unemployment rate for the age group 15-74“ as our indicator.

The unemployment rate, obtained from Eurostat, represents the percentage of unemployed individuals as a proportion of the labor force. The labor force comprises the total number of employed and unemployed persons. Unemployed persons include individuals between the ages of 15 and 74 who were:

- Without work during the reference week,
- Currently available for work, i.e., available for paid employment or self-employment within the next two weeks following the reference week,
- Actively seeking employment, i.e., taking specific steps in the four weeks preceding the reference week to seek paid employment or self-employment, or those who have found a job to start within the next three months.

According to Graph 2, it can be observed that the highest unemployment rate throughout the entire period was in Slovakia. The highest percentage is seen in 2010 (14.4%), while the lowest was in the Czech Republic in 2018 (2.2%). The Czech Republic consistently exhibited the lowest unemployment rate among the countries examined. The lowest unemployment rate can be observed for each country in 2018.

Figure 2. The unemployment rate for the age group 15-74 in V4 countries from 2008 to 2018
Source: own processing (2022)

3. Results

We have established the following hypothesis within the Quality Education indicator for the facts being explored before us:

H1: We assume that there are statistically significant correlations in the development of completion rates of education below primary, primary, and lower secondary levels during the observed period among the selected V4 countries.

Table 1. Results of hypothesis testing regarding completion of education below primary, primary, and lower secondary levels in V4 countries

A pair of variables	p-value	Pearson's correlation coefficient	Association between variables	The magnitude of the strength of the relationship
Slovakia and the Czech Republic	0,0008	0,8778	it exists	big
Slovakia and Poland	0,0020	0,8474	it exists	big
Slovakia and Hungary	0,0041	0,8141	it exists	big
Czech Republic and Poland	0,0001	0,9404	it exists	big
Czech Republic and Hungary	0,0001	0,9305	it exists	big
Poland and Hungary	0,0000	0,9892	it exists	big

Source: own processing (2022)

During the testing of the given hypothesis, the p-value for all variable pairs is less than the specified significance level $\alpha = 0.05$. Therefore, we can conclude that there is a statistically significant correlation in the development of completion rates of education below primary, primary, and lower secondary levels across the observed period between each pair of countries. The highest correlation coefficient value ($r = 0.9892$) was observed between Poland and Hungary, while the lowest but still high value ($r = 0.8141$) was found between Slovakia and Hungary.

Based on our results, we confirm Hypothesis 1. The positive values of the correlation coefficient indicate a direct relationship, suggesting that when there were high values of the completion rate indicator below primary, primary, or lower secondary levels in one country, there were also high values of the indicator in the other country, and vice versa. The direction of the indicator's development over time is the same in this case. Based on these values, we can observe low percentages, with each year staying below

30%. In several countries in Europe, the values range around 30% or higher, with the highest values reaching above 70%.

Within the indicator of Labor and Economic Growth, we have tested the following hypothesis:

H2: We assume that there are statistically significant correlations in the development of unemployment rates among individuals aged 15-74 years during the observed period among the selected V4 countries.

Table 2. The results of hypothesis testing regarding the unemployment rate among individuals aged 15 to 74 in the V4 countries

A pair of variables	p-value	Pearson's correlation coefficient	Association between variables	The magnitude of the strength of the relationship
Slovakia and the Czech Republic	0,0000	0,9770	it exists	big
Slovakia and Poland	0,0000	0,9852	it exists	big
Slovakia and Hungary	0,0001	0,9084	it exists	big
Czech Republic and Poland	0,0000	0,9740	it exists	big
Czech Republic and Hungary	0,0000	0,9582	it exists	big
Poland and Hungary	0,0000	0,9374	it exists	big

Source: Source: own processing (2022)

In all pairs of variables, the p-value is lower than the specified level $\alpha = 0.05$, indicating a statistically significant relationship in the development of unemployment rates among individuals aged 15 to 74 in the observed period between each pair of countries. The highest correlation coefficient value ($r = 0.9852$) was recorded between Slovakia and Poland, while the lowest, but still high value ($r = 0.9084$), was observed between Slovakia and Hungary.

Based on our results, we confirm hypothesis 2. Positive values of the correlation coefficient indicate a direct relationship, meaning that when the unemployment rate was high among individuals aged 15 to 74 in one country, it was also high in the other country, and vice versa. The direction of the indicator's development over time is the same in this case.

The unemployment rate is higher in the observed period than it could be, with each of our monitored countries having a value above 5% on average. However, compared to other countries in Europe, these values can be considered normal. The highest values in Europe reach even above 30% in some years.

4. Discussion

In our contribution, we addressed the 2030 Agenda for Sustainable Development, specifically two goals, and analyzed and compared selected indicators within the Visegrád Group countries using higher-level statistics.

For each of the indicators, we stated hypotheses and processed the data using the Pearson correlation coefficient, utilizing the Gretl program. We found that there is a statistically significant relationship in the development of values among the following indicator pairs:

- Population by level of education (less than primary, primary, and lower secondary education),
- Unemployment rate among individuals aged 15-74.

We conclude that the mentioned indicators are interconnected, and it is necessary to monitor their development. This is because education is linked to job opportunities in the labor market, and ultimately, the unemployment rate in the Central European region of the V4 countries. It is crucial for these countries to remain competitive and ensure a standard of living and environment that their citizens deserve.

Based on our results, we have found that each country has its strengths and weaknesses. According to our analysis, the Czech Republic has achieved the best results among the V4 countries. However, our focus was on the development in Slovakia, which showed comparatively poorer results, particularly in the area of the unemployment rate among individuals aged 15-74. Regarding the goal of Population by level of education, gender, and age (less than primary, primary, and lower secondary education), we observe stagnation. Our results indicate that it is in the best interest of people in Slovakia not to settle for less than secondary education and to complete more than compulsory schooling. However, there are instances where our country is ranked among selected states. The worst results are observed in the unemployment rate among individuals aged 15-74, which is related to the overall state policy.

We conclude that it is in the best interest of people in Slovakia not to settle for less than secondary education and to complete more than compulsory schooling.

Conclusion

Agenda 2030 inspires us to think creatively and utilize innovative approaches to critically reconsider the way we approach the challenges of today's development. Advocacy and raising awareness are crucial for mobilizing support for the achievable and attainable goals of the Agenda. However, to create lasting change, raising awareness and advocacy alone are not enough. In-depth knowledge about the breadth and depth of the Agenda will be key to realizing the Sustainable Development Goals. By adopting the Agenda, UN member states committed to ambitious action plans that require alignment of efforts from all segments of society, including civil society, development experts, the private sector, and academia. Each of us, according to our individual capacities, must also take concrete steps towards sustainability. A commitment to lifelong learning is necessary to drive the transformative agenda that lies ahead of us.

Countries around the world must strive for continuous improvement in their performance to remain competitive and ensure their citizens a standard of living and environment they deserve. In a country where people live well, citizens themselves will take action to improve their situation. While this may not be possible in every case, it is undeniable that the involvement of citizens is crucial, and likewise, the state cannot overlook the importance of its citizens.

Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: In today's era of rapidly growing competition and customer demands, it is necessary to increase the efficiency and competitiveness of ongoing business processes. This is also the main goal of the digital transformation of businesses. As part of this process, it is necessary not only to introduce new elements of businesses' digitalization, but also to effectively use those that have been already introduced into businesses.

Purpose of the article: The aim of the paper is to assess the efficiency of the introduction and use of digitalization elements of businesses over time.

Methods: To evaluate the efficiency, the elements of digitalization listed in the Digital Intensity Index (DII) were used. The Malmquist index – Data Envelopment analysis approach (MIDEA) was applied to assess the efficiency of the digitalization process of businesses. This approach makes it possible to evaluate the change in the technical efficiency and frontier shift of the introduction and use of the digitalization elements of businesses.

Findings & Value added: The finding is that the position of individual countries in the digital transformation ranking using the MIDEA method is different compared to the results of the DESI index. This finding is particularly true for the introduction of digitalization elements into businesses in individual EU countries. From the point of view of the MIDEA index, Slovakia occupied the 12th position. Based on it, it can be assumed that Slovakia achieves a significantly better position in introducing businesses' digitalization elements than in the DESI index.

Keywords: businesses, digitalization, efficiency, Malmquist index, dynamic approach

JEL classification: O11, O33, C44

1. Introduction

Digitalization stands as one of the primary objectives for the European Union (EU) countries. The term "digitalization" emerged in the mid-20th century (Shpak et al., 2020). It has been recognized as one of the primary trends shaping both present and future society and business (Kääriäinen et al., 2017). Digitalization and innovation have become instrumental in propelling organizations forward while transforming their operations (Kraus et al., 2021). The interest in researching these areas, particularly the digitalization industry, has seen an upsurge, as evidenced by Matt et al. (2023) study, which offers a comprehensive literature overview and contributions in this domain. There are two fundamental approaches to defining digitalization. The first refers to digitization as the process of converting analog data into a digital format, also known as digital enablement (Gartner, 2023). The second aspect of importance pertains to digitalization, representing the integration or increased usage of digital technology by organizations, industries and countries (Gorenšek, Kohont, 2019). Legner et al. (2017) share a similar outlook on the concept of digitalization, which encompasses describing diverse sociotechnical phenomena and the widespread adoption and usage of these technologies. In the same vein, Vial (2019) views digitalization as encompassing efforts towards organizational transformations through the acceptance of digital technologies.

Digitalization, however, extends beyond mere technology implementation; it involves fundamental changes that can reshape "organizational strategy, business processes, organizational knowledge, and the

* Corresponding author: jarmila.horvathova@unipo.sk

entire socio-technical organizational system" (Alsufyani and Gill, 2022, p. 1). Authors Brennen and Kreis (2016), along with Unruh and Kiron (2017), define digitalization as a process that drives the restructuring of the economy, institutions, and society at a systemic level.

The objective of digitalization is not solely to increase the number of introduced digital elements but also to enhance the efficiency of utilizing those already in place. This highlights the need to focus on measuring the efficiency of using digitalization elements and their impact on the performance and efficiency of countries and companies. Measuring the level of the digital economy poses challenges, but several studies exist that assess the efficiency and advantages of digitalization for businesses in EU countries.

In the context of the current research, it is relevant to reference the study conducted by Inel (2019). In this study, the author utilized the Data Envelopment Analysis (DEA) method to assess the efficiency of the digital transformation in EU countries. The findings suggest that certain countries such as Denmark, Italy, and the United Kingdom demonstrate relatively high efficiency, while the Netherlands and Germany exhibit lower efficiency levels (Inel, 2019). Georgescu et al. (2022) also performed the Data Envelopment Analysis non-parametric test to measure the digitalization efficiency or inefficiency of EU Member States. They found out that only 8 out of 27 countries can be considered efficient in the digitalization process during COVID-19 pandemic. Efficient countries were Belgium, Denmark, Estonia, Finland, Italy, Latvia, Lithuania and Malta. These countries could be considered benchmarks for the inefficient ones.

Thanh's (2022) study is groundbreaking as it empirically investigates the relationship between digital transformation and financial development. The research underscores the relevance of digital transformations in both business and the public sector. The authors emphasize the need to measure the short-term and long-term impacts of digitalization, revealing that e-commerce and e-government exert positive long-term influences on financial markets and the performance of financial institutions.

In his research, Yalcin (2021) examined the efficiency of digitalization of EU countries. The aim of the research was to identify countries that transformed digitalization into their growth and employment rates (ER) in the period 2015-2019. The results of the study show that "in countries such as Bulgaria, Cyprus, Hungary and Romania, the effective use of DESI indicators, which are considered a measure of digitalization, has a one-on-one effect on the GDP and ER values. DESI indicators are not used effectively in the GDP and ER values of countries like Denmark, Finland, and Spain. In general, in terms of digitalization, it has been revealed that developing countries use digitalization more effectively in terms of economic growth and job creation" (Yalcin, 2021, pp. 323).

Given its role as a novel business driver, digitization should be incorporated into performance measures and indicators (Fernández-Portillo et al., 2017). Similarly, Zhai et al. (2022) substantiated the influence of the digital transformation process on business performance. Jardak and Ben Hamad (2022) examined the effect of digital transformation on firm financial performance. They found out that "in the short term firms undertaking digital transformation will face some financial difficulties which affect negatively their ROA and ROE, but in the long term they can maximize their performance (captured by Tobin's Q) and improve their market value" (Jardak and Ben Hamad, 2022, p. 329).

Rejman Petrovic et al. (2022) measured the efficiency of the use of information and communication technologies in businesses in order to assess the intensity and success of their digitalization process. To analyze the efficiency of digital business transformation the DEA was applied, while for the robustness analysis of values of average efficiency they used bootstrapping method. They revealed that the process of digital business transformation in the Republic of Serbia is relatively efficient. The efficiency of e-commerce in businesses in most years was over 80%, on the other hand the use of software packages was insufficient. Kao et al. (2022) also applied DEA to investigate efficiency in implementing digital transformation in Taiwanese firms. According to Zhang et al. (2021), digital technology has been verified to bolster corporate production efficiency through cost reduction and increased innovation. Correspondingly, Lin and Xie (2023) confirmed the comparable influence of incorporating and utilizing digitalization elements on power enterprises' efficiency.

Based on the information presented earlier, the research objective was established, focusing on evaluating the efficiency of implementing specific digital elements in businesses across EU countries.

The paper is organized as follows: The "Methods" section outlines the data and their sources, providing a comprehensive description of the Malmquist index measurement method using Data Envelopment Analysis (MIDEA). In the "Results" section, the study presents its findings and analyses

of the efficiency of implementing digitalization elements in the EU business landscape. "Discussion" section provides a more detailed discussion of the achieved results. Lastly, the "Conclusion" section encapsulates research conclusions, contributions, limitations, and recommendations for future research endeavors.

2. Methods

For the research in the given area, the Malmquist index was applied. This index is based on the application of DEA models over time. It measures the change in the Total Factor Productivity (TFP) between two periods based on the principle of calculating the ratio of the distances of each data point relative to a common technology. The index is based on the use of distance functions, which allow to describe production technology with multiple inputs and outputs without the need to specify the objectives of the company's behavior. It is possible to define both input and output distance functions (Fandel, 2002).

Several methods can be used to estimate distance functions, which are the starting point for calculating TFP. Linear programming is most often used, especially the Data Envelopment Analysis (DEA) method proposed by Färe, Grosskopf, Norris and Zhang in 1994 (Fandel, 2002). The use of DEA models to calculate TFP is related to the assumption that homogeneous data are available over several periods. Calculating the change in efficiency requires solving four linear programming problems, assuming the use of technology with constant returns to scale (Fandel, 2002).

Suppose that each $DMU_j (j = 1, 2, \dots, n)$ uses a vector of inputs $x_j^t = (x_{1j}^t, \dots, x_{mj}^t)$ to produce vector of outputs $y_j^t = (y_{1j}^t, \dots, y_{mj}^t)$ at each period of time $t, t = 1, \dots, T$. Efficiency of DMU_0 can change or the frontier can shift or both changes may occur in the same time. The Malmquist Productivity Index is then defined as follows (1) (Zhu, 2014):

$$MI_o = \left[\frac{\theta_o^t(x_o^t, y_o^t)}{\theta_o^t(x_o^{t+1}, y_o^{t+1})} \frac{\theta_o^{t+1}(x_o^t, y_o^t)}{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})} \right]^{\frac{1}{2}}, \quad (1)$$

where MI_o measures the change in productivity between the periods t and $t + 1$. $\theta_o^t(x_o^t, y_o^t)$ is calculated by comparing x_o^t to the EPF (Empirical Production Frontier) at time t with the use of input oriented CRS DEA model, while $x_o^t = (x_{1o}^t, \dots, \dots, x_{mo}^t)$ and $y_o^t = (y_{1o}^t, \dots, \dots, y_{so}^t)$ are the input and output vectors of DMU_0 among others. Similarly $\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})$ is calculated by comparing x_o^{t+1} to the EPF at time $t+1$, $\theta_o^{t+1}(x_o^t, y_o^t)$ by comparing x_o^t to the EPF at time $t + 1$; and $\theta_o^t(x_o^{t+1}, y_o^{t+1})$ is calculated by comparing x_o^{t+1} to the EPF at time t applying input-oriented CRS DEA model.

This model is also available in its modified form (2) (Zhu 2014):

$$MI_o = \frac{\theta_o^t(x_o^t, y_o^t)}{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})} \times \left[\frac{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1}) \theta_o^{t+1}(x_o^t, y_o^t)}{\theta_o^t(x_o^{t+1}, y_o^{t+1}) \theta_o^t(x_o^t, y_o^t)} \right]^{\frac{1}{2}} \quad (2)$$

According to Fandel (2002) the term (3) represents the change in technical efficiency, it is the efficiency known according to Farrell (1957). The change in efficiency is equivalent to the ratio of Farrell's efficiency at time t and at time $t + 1$ (technical efficiency change between periods t and $t + 1$). Usually, this term expresses the improvement, deterioration or stability of technical efficiency.

$$\frac{\theta_o^t(x_o^t, y_o^t)}{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1})} \quad (3)$$

The term (4) represents the frontier shift (FS) in the EPF between periods t and $t + 1$ (Zhu, 2014).

$$\left[\frac{\theta_o^{t+1}(x_o^{t+1}, y_o^{t+1}) \theta_o^{t+1}(x_o^t, y_o^t)}{\theta_o^t(x_o^{t+1}, y_o^{t+1}) \theta_o^t(x_o^t, y_o^t)} \right]^{\frac{1}{2}} \quad (4)$$

The research data were obtained from a database focused on the collection of the data on the digitalization process taking place in EU countries (Eurostat, 2022). As inputs were used indicators for which data for the years 2019, 2020, 2021 and 2022 were available. Inputs were as follows: E-commerce sales, Use of computers and the internet by employees, Type of connections to the internet - Enterprises use DSL or other fixed broadband connection, Enterprises having received orders online, Use

of mobile connections to the internet and Security policy: measures, risks and staff awareness. GDP per capita and unemployment rate were used as outputs. EU member states data for the period 2019-2022 were used.

3. Results

Table 1 shows descriptive statistics results of digital transformation indicators of businesses operating in EU-27 Member states. Businesses achieve the best results in the indicator Type of connections to the internet - Enterprises use DSL or other fixed broadband connection, in this area it is up to 94% coverage. The area with the lowest share of digitalization elements is Security policy - 15.5% coverage.

Table 1. Descriptive statistics of EU-27 Member States` indicators in the period 2019-2022

Variable	Descriptive Statistics					
	Valid N	Mean	Median	Min.	Max.	Std.Dev
E-commerce sales	108	19.37	18.00	5.4	38.0	7.65
Use of computers and the internet by employees	108	55.25	53.25	29.0	86.5	12.53
Type of connections to the internet	108	92.22	94.0	77.1	100.0	5.41
Enterprises having received orders online	108	20.55	19.25	7.4	38.4	7.94
Use of mobile connections to the internet	108	76.77	78.65	46.0	97.7	11.31
Security policy: measures, risks and staff awareness by size class of enterprise	108	20.04	15.50	2.8	70.6	14.55

Source: authors based on data from Eurostat (2022)

Figure 1 illustrates digital intensity of businesses in EU countries for the year 2022. Results show that Denmark is the leader in the given area, while Romania is a significantly lagging country. Slovakia reaches digital intensity 2.9, which is approximately at the level of Italy, France and Luxembourg. Based on the comparison with other EU countries, Slovakia achieves a low value of the given index.

Figure 1. Digital intensity in EU countries

Source: authors (2023)

The E-commerce indicator is also included in the DII evaluation criteria. Since this indicator significantly affects the results of the DII index, it is necessary to state its results achieved by individual countries. The results of E-commerce sales are shown on figure 2. In this area, the best results are achieved by Ireland (33.2%) and the worst by Cyprus (5.4%). Slovakia reaches 22.7%, which means that it can be included among the countries that use e-commerce more significantly.

Figure 2. E – commerce sales in the EU countries
Source: authors (2023)

The Malmquist index (MIDEA) was applied to assess the efficiency of digitalization of business environment in EU countries. The results are presented in Table 2. The column MI 19-20 expresses the efficiency of the digital transformation in EU companies for the years 2019-2020. Similarly the column MI 20-21 shows mentioned results for the year 2020-2021 and the column MI 21-22 shows the results for the year 2021-2022.

Table 2. Results of measuring the efficiency of digitalization process in businesses

DMU	MI 19-20	MI 20-21	MI 21 - 22	19-20	20 - 21	21 - 22

Explanatory notes	decline	stability	growth
--------------------------	----------------	------------------	---------------

When comparing the efficiency of the use of digitalization elements in 2019 and 2020, an increase in efficiency was recorded in almost every analyzed country, which could be caused by the Covid-19 pandemic. When comparing the years 2020 and 2021, stable development was recorded in 16 companies, i.e. efficiency neither decreased nor increased. 8 countries achieved an increase in efficiency, while 3 countries recorded a decrease. Slovakia was among the countries in which a decrease was recorded. In 2022, 14 countries achieved higher digitalization efficiency and the remaining 13 achieved lower digitalization efficiency, which could also be due to the slowdown after the Covid-19 pandemic. An increase in efficiency in all monitored periods was recorded only in Bulgaria and Slovenia.

Table 3 shows the change in the technical efficiency of EU countries with regard to enterprises' digitalization elements. Most countries achieved the technical efficiency of introducing digitalization elements in enterprises in the period 2020-2021, except for Estonia, Latvia and Poland. The value of technical efficiency is the result of the efficiency of the application of already established digitalization elements in enterprises in EU countries.

Table 3. Technical efficiency of introducing digitalization elements

<i>DMU</i>	<i>19-20</i>	<i>20-21</i>	<i>21-22</i>
Belgium	0.98	1.00	0.96
Bulgaria	1.00	1.00	1.00
Czechia	0.98	1.00	0.89
Denmark	0.98	1.00	0.97
Germany	0.99	1.00	1.03
Estonia	0.96	0.99	0.94
Ireland	0.99	1.00	0.98
Greece	1.02	1.00	0.86
Spain	0.97	1.00	0.99
France	0.97	1.00	0.89
Croatia	0.93	1.00	0.91
Italy	0.96	1.00	0.91
Cyprus	0.97	1.00	0.91
Latvia	1.03	0.99	0.95
Lithuania	1.00	1.00	1.00
Luxembourg	1.00	1.00	1.00
Hungary	1.00	1.00	1.00
Malta	0.97	1.00	0.94

Poland	0.93	0.99	1.00
Portugal	0.95	1.00	0.97
Romania	0.97	1.00	1.00
Slovenia	1.00	1.11	0.90
Slovakia	0.98	1.00	0.96
Finland	0.99	1.00	0.99
Sweden	0.98	1.00	1.04

Source: authors (2023)

Technical efficiency decreased in the period 2021-2022. This decrease is noticeable in almost all analyzed countries. The increase occurred only in Germany and Sweden. Slovakia achieved stable results in the period 2020-2021, while in the periods 2019-2020 and 2021-2022 there was a decline in the technical efficiency of introducing selected digitalization elements in Slovak businesses. Bulgaria, Lithuania, Luxembourg and Hungary achieved the same technical efficiency throughout the analyzed period. Comparing the years 2021 and 2022, Germany and Sweden achieved the best technical efficiency. Figure 3 shows the frontier shift caused by technological changes. The largest shift (1.47) is recorded in Luxembourg when comparing the years 2021 and 2022.

Frontier Shift

Figure 3. Level of technological change in businesses in EU countries
Source: authors (2023)

In the field of technological change, most countries reached a value above 1, i.e. there was a frontier shift thanks to the introduction of new technological solutions. In particular, the comparison of the years 2019 and 2020 indicates a shift, which may again be a consequence of the Covid-19 pandemic. In this period, only Poland and Croatia do not show the value of FS equal to 1 or above 1. When comparing the years 2020 and 2021, Slovakia also did not reach the value of FS equal to 1. However, when comparing the years 2021 and 2022, FS, i.e. technological changes in the business environment of Slovakia, occurred again.

4. Discussion

In order to detect changes in MI, it was necessary to look in more detail at the development of selected digitalization factors. This analysis recorded growth especially in the Use of computers and the internet by employees and the Use of mobile connections to the internet, in almost all EU countries. The Use of computers and the internet by employees is one of the significant digitalization factors. Development of its introduction is shown on figure 4, while the best results achieved Finland and Denmark.

Figure 4. Development of the introduction of the Use of computers and the internet by employees
Source: authors (2023)

The results of Use of mobile connection to the internet achieved in individual EU countries are balanced. However, the leader in this area is Sweden. The results can be seen on figure 5.

Figure 5. Development of the introduction of the Use of mobile connection to the internet
Source: authors (2023)

It can be clearly confirmed that the best results in the field of introducing new technological solutions were achieved when comparing the years 2019 and 2020. The change in technical efficiency increased especially in 2021 compared to 2020, which is the result of better use of already introduced technological changes in 2020. The results indicate that less developed countries do not lag behind more developed countries in the efficiency of the digitalization process. The MI result indicates that Bulgaria, Lithuania, Hungary and Slovenia belong to the more efficient countries during the years 2019-2022. In these countries, the MI was higher than 1 in all monitored periods. In Germany, Spain, France, Italy, Netherland and Portugal, a stable development, without growth, was recorded when comparing the years 2020-2021. In other countries, a decrease in efficiency was recorded in some of the periods, such as in the case of Slovakia in 2020-2021. In the comparison of the years 2021-2022, there is a decrease in Finland and Sweden. The best MI value in the last analyzed year was achieved by Luxembourg. These results correspond with the study of Inel (2019) and Yalcin (2021). The results of the change in technical efficiency indicate that stable development is mainly in Bulgaria, Hungary, Luxembourg, Lithuania. Slovakia achieved the best results in 2020-2021. The leader in the recent period is Germany, despite the fact that the overall result of MI efficiency was not the best. Frontier shift increased in the last period in almost all countries except for Sweden and Finland, which also caused their decline in overall efficiency. Similarly, Cyprus, Ireland, Austria and Latvia do not reach the required value 1. The rating of countries using these results confirmed Luxembourg as the leader in the given area. Surprisingly, Bulgaria is in 3rd place, Slovakia in 12th place. These are favorable results, as Slovakia's position in the DESI index is 23rd.

It is difficult to compare the results of this research with the results of other studies, since the Malmquist index has not been applied in the studies published in this field so far. It represents a gap in this research.

Perhaps it is possible to mention the study by Inel (2019), which investigated the efficiency of the digital transformation of EU countries using the DEA method. In his study, he surprisingly found that Germany and the Netherlands do not achieve the required efficiency of digital transformation.

Conclusion

In this research, the Malmquist index based on the DEA method was applied. The results of MI, ECH and FS were different in individual years and individual countries. The benefit of the research is the application of MIDEA and the dynamic assessment of the efficiency of digital transformation. The main contribution of the paper is finding that by applying this method, it is possible to find out how the efficiency of digital transformation has developed over several years in individual countries. This approach does not evaluate the % share of companies that have introduced individual digitalization elements, but it evaluates the above mentioned efficiency of their use and development of efficiency over time. In addition, it allows to evaluate the technical efficiency itself and the development of technological changes. With the use of this method surprising results were achieved in the positions of some countries.

The limitation of the given research was the missing data on individual digitalization elements of the business environment of EU countries. Another limitation was the fact that only 9 digitalization elements could enter the DEA model, and therefore the analysis was focused on the business environment. It would be appropriate to calculate MIDEA for other areas of digitalization as well, based on the DESI index, and to compare the results. Accordingly, future research will be focused on the calculation of MIDEA with different input variables and their comparison and creation of country ratings. The research will also focus on more detailed data collection. Managerial implications of the research point out the importance of applying individual elements of digitalization by businesses' managers, as it is clearly confirmed that digitalization affects the performance of companies and thus also the performance of EU countries. MIDEA method of measuring the efficiency of digital transformation can be a suitable tool supplementing the evaluation of companies in individual countries by the DII index.

Abstract

Research background: The digital competitiveness and sustainability of countries is an important concept that is constantly evolving and is often considered a driving force for economies. Competitive national economies are able to catch and promptly respond to new strategic opportunities and threats, constantly adapting to the rapidly changing conditions of the dynamic market. The level of competitiveness and sustainability reflects the country's success in international operations in relation to other market participants.

Purpose of the article: The aim of the paper is to evaluate the development of digital competitiveness and sustainability of the EU-27 countries using selected indices of the global assessment of digital competitiveness (DESI) and sustainability of economic development (GSCI) for the period 2016-2020 and to reveal the influences among the analyzed indices and their dimensions or pillars.

Methods: We used quantile regression to reveal the mutual influences of the individual pillars of the GSCI index on the change in the value of the global DESI index in the group of EU-27 countries.

Findings & Value added: We can state that the Nordic countries (Finland, Sweden and Denmark) are among the leaders in the assessment of digital and sustainable competitiveness. The worst ranking was achieved by Romania for the DESI and Cyprus for the GSCI. The results of the quantile regression confirmed that Social Capital has the most significant influence on the change in the value of the DESI index, followed by Resource Efficiency, Intellectual Capital and Natural Capital, but no influence was confirmed for Governance alone.

Keywords: digital performance, sustainability of economic development, Digital Economy and Society Index (DESI), Global Sustainable Competitiveness Index (GSCI), quantile regression

JEL classification: O30, O57

1. Introduction

Competitive national economies are able to quickly respond to emerging strategic challenges and opportunities by quickly adapting to constantly changing market conditions. Compared to other market players, a country's performance is reflected in its level of sustainability and competitiveness.

The constant impact of scientific and technological development, or the introduction of modern ways of doing business, forces national economies that enter international markets to adapt their activities to these changes in order to ensure sustainability and improve the country's competitive position (Jednak & Kragulj 2015). Ensuring economic development, well-being and a higher standard of living is the priority of every country. Nowadays, in addition to achieving favorable and stable values of these key areas, it is also important to achieve their long-term sustainability, which is generally associated with the efficient use of resources (Širá et al. 2020).

Currently, concepts such as sustainability and sustainable development as well as competitiveness are becoming topics of fundamental importance for academics, business work as well as for governments

* Corresponding author: beata.sofrankova@unipo.sk

of economies (Secundo et al. 2020). Sustainable development is increasingly seen as a driving force behind many economic policies, as it encompasses the achievement of social, environmental and economic sustainability goals. Researchers have emphasized the importance of achieving sustainability to guarantee a country's long-term competitiveness, as competitiveness is considered the basis of national social and economic development (Balkyte & Tvaronaviciene, 2010). The concept of sustainable competitiveness, which encourages countries to meet the needs of the current generation of citizens while maintaining and increasing future national wealth without draining and degrading social and natural capital, is attracting increased attention as reported by Solability (2021). Measurement, evaluation and subsequent implementation of steps to improve the competitiveness and sustainability of countries is extremely important in the conditions of globalization. The analysis of these properties is carried out using globally recognized tools and indexes, which approach the given issue from different points of view.

There are currently studies comparing EU countries in terms of the transformation of economies into a digital environment (Huňady et. al., 2022, Andrei et al., 2022, Malkovska et. al., 2021). The data show (Aluculesei et al., 2020, Skare et al., 2023) that the level of digitization in the EU member states is far below their potential, with visible differences between individual states, which requires sustained efforts to eliminate the differences between states and making progress across the European Union.

The inspiration for processing our paper was the results of a research study by the authors Šofranková et al. (2022), which examined the interrelationships between digital and innovation performance of EU-27 countries using selected global indices (DESI, GII and SII). The results of the analyzes confirmed that a higher statistically significant positive relationship was identified between the digital performance of the EU-27 countries and their innovation performance assessed using the SII compared to the innovation performance using the GII. We focused our next research direction on the analysis of the mutual influence between the assessment of digital performance and the sustainability of economic development within the EU-27 countries, which we address in more detail in this paper.

1.1 Digital Economy and Society Index and its description

The Digital Economy and Society Index (DESI) according to the European Commission (2021) summarizes European indicators of digital performance and tracks the progress of the countries of the European Union. The European Commission (2021) has been monitoring the digital progress of Member States through DESI index reports since 2014. Each year DESI contains country profiles that support Member States in identifying areas requiring priority action, as well as thematic chapters offering analysis of key digital areas at European level, which it is essential to support political decisions.

The European Commission annually monitors the progress and level of development of Europe's digital competitiveness in individual member countries using the DESI index, which uses a combination of 33 indicators in the main measurement dimensions. Compared to previous years, the European Commission made changes to the indicators in the index and at the same time reduced the number of areas for monitored indicators, which are now structured around the 4 main areas of the Digital Compass: human capital, connectivity, integration of digital technologies, digital public services.

Figure 1. Structure of DESI

Source: processed according to European Commission (2021)

1.2 Global Sustainable Competitiveness Index and its description

The Global Sustainable Competitiveness Index (GSCI) measures the true competitiveness of nations. The GSCI is based on 120 purely quantitative indicators, derived from reliable sources (World Bank, UN agencies, the IMF), grouped in the 5 pillars of national competitiveness : natural capital, resource efficiency, social capital, intellectual capital and governance. The GSCI is the most comprehensive measurement of the competitiveness of nation-states and their future potential (Solability 2021).

GSCI is based on a pyramid system, i.e. each level of the index (pillar) affects the immediately following one and is necessary to support the higher level.

Figure 2. Structure of GSCI
Source: processed according to Solability (2021)

2. Methodology

The aim of the paper is to evaluate the development of digital competitiveness and sustainability of the EU-27 countries using selected indices of the global assessment of digital competitiveness (DESI) and sustainability of economic development (GSCI) for the period 2016-2020 and to reveal the interrelationships between the analyzed indices and their dimensions or pillars.

We have chosen countries of the European Union for our analyses. These countries currently form a group of 27 countries, and the length of the time period (5 years) was influenced by the availability of secondary data. We obtained secondary data from the annual reports published by the European Commission (2017, 2018, 2019, 2020, 2021) – DESI index and Solability (2017, 2018, 2019, 2020, 2021) - GSCI index for the years 2017 to 2021. Considering, that the data entered for the evaluation of the analyzed indices are often from the previous year than the year of publication annual report, we decided to mark the analyzed period as 2016 to 2020.

The results of the descriptive statistics of the analysed indices of the EU-27 countries for the period 2016 to 2020 are presented in Table 1.

Table 1. Descriptive statistics of analyzed indices and their dimensions or pillars

Variable	DESI	DESI_D1	DESI_D2	DESI_D3	DESI_D4	GSCI	GSCI_P1	GSCI_P2	GSCI_P3	GSCI_P4	GSCI_P5
Mean	40,513	11,2714	8,4616	7,0005	13,7804	53,0586	46,824	49,3444	52,8333	54,3869	59,5958

Source: authors' own processing

The main goal was fulfilled with the help of the following partial goals:

- *partial objective 1* → to evaluate the development of digital competitiveness and sustainability of the EU-27 countries using the DESI and GSCI global indexes for the period 2016-2020,
- *partial objective 2* → to identify the existence of mutual influences between the analyzed indices and their dimensions or pillars.

To estimate the determinants of the global DESI index, we apply linear and quantile regressions, which are commonly used in the literature for the analysis of economic phenomena. On the one hand, the main shortcoming of classical linear regression is the estimation of the average relationship between the dependent variable and a set of explanatory variables based on the conditional expected function, and thus such parameter estimation is only one value. On the other hand, quantile regression (Koenker & Hallok, 2001) examines the relationship between the dependent variable and the explanatory variables at different quantiles of the conditional distribution of the explanatory variable. The application of quantile regression is appropriate, as it is likely that the effects of independent variables are different in individual quantiles compared to the average estimates from linear regression. In addition, quantile regression is a more robust method, as it is not sensitive to the normality of the distribution of random errors, nor to extreme values occurring in the data.

We can write the quantile regression model in the following form:

$$y_i = x_i \beta_{\theta} + \varepsilon_{\theta i} \quad (1)$$

where y_i represents the investigated response, x_i is a set of explanatory variables, β_{θ} represents a parameter in the θ -th quantile of the distribution of the dependent variable, and $\varepsilon_{\theta i}$ is a random error. A specific feature of quantile regression is that the estimated coefficients of the independent variables, β_{θ} ,

may differ significantly in different quantiles, which may indicate a non-homogeneous conditional distribution of the dependent variable.

The conditional quantile regression function can be written in the following form:

$$Q_Y = (\theta | X = x) = x_i \beta_\theta \quad (2)$$

Subsequently, the parameters of the conditional quantile regression can be estimated by solving the following optimization problem:

$$\hat{\beta}_\theta = \arg \min \sum_{i=1}^n \rho_\theta (y_i - x_i \beta) \quad (3)$$

Since equation (3) does not have an explicit form, the estimation from the quantile regression is performed by minimizing the objective function using the simplex method in the form:

$$Q(\beta_\theta) = \sum_{i: y_i \geq x_i \beta_\theta} \theta |y_i - x_i \beta_\theta| + \sum_{i: y_i < x_i \beta_\theta} (1 - \theta) |y_i - x_i \beta_\theta| \quad (4)$$

Since this is a primary linear programming task and its description is quite extensive, we do not elaborate on the method further in this text.

The basic questions that the authors of the present study asked in connection with partial objective 2 are:

RQ1: *In what way do the pillars of the global index GSCI influence the change in the value of the global index DESI?*

The second research question, which is complementary to the first, is:

RQ2: *Does the influence of the pillars of the global GSCI index on the change in the value of the DESI index depend on its value itself?*

To answer these basic research questions, we used quantile regression analysis as the most appropriate method. In the first step, it is necessary to analyze the basic researched relationship (1) in a general form, using linear regression analysis using the method of least squares. This will give us a fundamental insight into the investigated dependence, which will allow us to understand how the individual pillars of the global GSCI index influence to change the value of the DESI index:

$$DESI = f(GSCI_P1, GSCI_P2, GSCI_P3, GSCI_P4, GSCI_P5) \quad (5)$$

3. Results

In the following part of the paper, we present the results of our analyzes resulting from partial objective 1, in which we focused on the evaluation and mutual comparison of the development of digital competitiveness and sustainability of the EU-27 countries using the average total score of the DESI and GSCI indices for the individual years 2016 to 2020. Average total the DESI score of the EU-27 countries had an increasing trend, reaching a high of 35.07 in 2016, but its score increased by 34.97% to 47.64 in 2020. The annual growth of the mentioned index gradually increased and ranged from 6.2% to 10.13%. We noted a fluctuating development for the development of the overall average score of the GSCI index of the EU-27 countries, which reached 51.71 in 2016 and reached its maximum in 2019, when it grew by 5.34% year-on-year and its score was 55.01. In 2020, it decreased by 1.68%, while the value of the average total score was only 54.08%.

As part of further analyses, we focused our attention on a mutual comparison of the average total score of the analyzed indices among the 27 selected countries of the European Union for the years 2016 to 2020 compared to the average European score (AVG EU-27), which we present in the following Figure 3.

The leader in the digital competitiveness of the EU-27 countries, evaluated using the average total score of the DESI index, is Finland (54.79), followed by Denmark (53.69) and Sweden, which reached an average score of 52.53. Also in the rankings using the GSCI index, the leaders are the same countries as in DESI, but in a different order. The leader is Sweden with an average GSCI score of 61.15. The second place in the ranking belongs to Finland (59.33), followed by Denmark with a score of 58.50. We recorded the lowest average DESI score for Romania, which was only 22.93. Cyprus ranked last with an average GSCI score of 45.47. It is also interesting that Greece ranks second to last in the assessment of digital competitiveness and sustainability. (AVG_DESI_{CY}=26.30, AVG_GSCI_{CY}=48.27).

Figure 3. Comparison of the average total score for the years 2016 to 2020 of the analyzed indices of the EU-27

Source: authors' own processing

At the end of our comparative analyzes focused on 27 European countries, we provide an overview of the average total score of the analyzed indices, as well as their average score of the dimensions of the DESI index and the average score of the pillars of the GSCI index. In the table, it is also possible to find the minimum and maximum values for the analyzed indicators together with the country that achieved this result.

Table 2. Overview of min, max and average score of analyzed indices and their dimensions or pillars

	DESI	DESI_D1	DESI_D2	DESI_D3	DESI_D4	GSCI	GSCI_P1	GSCI_P2	GSCI_P3	GSCI_P4	GSCI_P5

Source: authors' own processing

In this part of our contribution, we present the results of our analyzes with a link to partial objective 2, which is aimed at identifying the existence of mutual influences between the analyzed indices and their dimensions or pillars.

The basic analysis of model (5) is given in Table 3. It is clear from the above table that model (5) is significant at the selected significance level $\alpha = 0.05$, that is, within the model there is at least one estimate of the regression coefficient that is statistically different from zero.

Table 3 further shows that the modified index of determination, as a measure of the ability to test selected predictors (pillars of the GSCI index), the variability of the investigated DESI response has a

value of 53.1100%. Another conclusion is that when using a linear regression analysis, the change in the value of the studied variable DESI does not have a significant impact on the chosen significance level of the *GSCI_P1 (Natural Capital)* pillar ($p=0.1380$), while its share in the change in the value of the DESI index is 6.558%, as is the *GSCI_P5 (Governance)* pillar ($p=0.4430$) with a share in the change in the value of the investigated response at the level of 3.389%. The greatest influence on the change in the value of the investigated DESI index has the values of the predictor *GSCI_P3 (Social Capital)* ($p=0.0000$) with 31.514% influence, followed by pillar *GSCI_P2 (Resource Efficiency)* ($p=0.0000$) with 17.121% influence and pillar *GSCI_P4 (Intellectual capital)* ($p=0.0000$) influence for a change of 15.405%. Within the framework of model (5), there is also an absolute member of the model (*_const*) to change the value of the investigated response, the DESI index. Its share in the change in the value of the DESI index is 26.012%. The interpretation of the meaning of the absolute member is on two basic levels. From a mathematical point of view, the absolute member of the model represents the average value of the DESI index if all regressors (pillars of the GSCI index) are zero. However, from a practical point of view, this situation will never occur, because the individual pillars of the GSCI index always have a non-zero value, and their value is given by the very nature of the GSCI index. Therefore, it is correct to interpret the absolute member of the model (*_const*) as the influence of factors, predictors that we did not consider in the analysis, but have an impact on the change in the value of the investigated response. The basic model of linear regression analysis using the method of least squares is that the estimate of the regression coefficients is constant throughout the studied response interval (DESI). This fact and at the same time the second research question that

Before the analysis itself, it is necessary to define the limit values of the quantiles of the amount of the tax gap, for which the analysis will be carried out. For the purposes of the study, the following quantiles and corresponding values of the DESI global index were chosen as the investigated response: quantile $Q 0.1 = 28.0446$, where it is possible to include the countries BG (28.0417), EL (26.2984) and RO (22.9296); quantile $Q 0.2 = 32.1693$, where we can include PL (30.3124); quantile $Q 0.3 = 35.4790$ with countries like CY (33.5207), HU (33.0223), IT (34.1269) and SK (34.1714); quantile $Q 0.4 = 37.8573$ with the countries CZ (37.2253) and HR (35.5322); quantile $Q 0.5 = 40.5181$ with countries DE (39.2448), FR (39.5402); quantile $Q 0.6 = 43.3570$ with countries AT (42.0332), BE (40.9427), LT (41.9859), LV (41.5941), PT (40.5702) and SI (41.0666); quantile $Q 0.7 = 45.8587$; quantile $Q 0.8 = 48.0124$ with countries EE (46.8202), ES (47.0895), MT (47.7928) and quantile $Q 0.9 = 53.1537$ with countries DK (53.6888), FI (54.7909), IE (48.0133), NL (52.2450) and SE (52.5301). The basic results of the quantile regression analysis for the selected values of the quantiles $Q 0.1$, $Q 0.3$, $Q 0.5$, $Q 0.7$ and $Q 0.9$ are shown in summary Table 4.

Source: authors' own processing

It is clear from Table 4 that the very height of the value of the investigated response, the DESI index, affects the effect of the predictors (pillars of the GSCI index). First of all, the absolute member of the model (*_const*). If we understand the absolute term of the model as influences that we did not consider

in the analysis, then its contribution to the change in the DESI value is significant in the entire interval of the used DESI values. Its influence gradually decreases, from a value of 28.5647% for countries that achieved a DESI index of Q 0.1 (DESI = 28.0446) to a value of 22.1374% for countries with a DESI index of Q 0.9 (53.1537). The change in the value of the individual estimates of the regression coefficients of the pillars of the GSCI index as predictors that influence the change in the value of the examined response, the DESI index, depending on the individual quantiles of the DESI index are shown in Figure 4. In this figure, the estimate of the regression coefficients obtained by linear regression analysis using the method of least squares is shown by a dashed line.

Figure 4. Change in the values of regression coefficient estimates for individual quantiles of the DESI index

Source: authors' own processing

The first conclusion of the performed quantile regression analysis is the fact that the regressor *GSCI_P5 (Governance)* does not have a significant influence on the change of the DESI value in the entire range of values of the DESI index at the chosen level of significance $\alpha = 0.05$. The impact of the *GSCI_P5 (Governance)* pillar on the change in the value of the DESI index varies from a value of 2.2118% for countries with a DESI index of Q 0.1 to a value of 3.6664% for a DESI index of Q 0.7 (45.8587). A more pronounced change in the influence of the *GSCI_P5 (Governance)* pillar occurs at the value of the DESI index at the level of Q 0.8 (48.0124%), where its share is 7.3663% with an increase to the value of 14.3766% for the countries with the highest value of the DESI index (Q 0.9; 53.1537), as documented in Figure 5.

The most important predictor that significantly affects the change in the value of the DESI index in the entire interval of its values is the *GSCI_P3 (Social Capital)* pillar. As can be seen in Figure 5, its influence on the change in the value of the DESI index for countries at the level of Q 0.1 (28.0446) represents 22.5412% ($p=0.0000$). According to Figure 5, increasing the influence of the *GSCI_P3 (Social Capital)* pillar on the change in the value of the DESI index is up to the level of Q 0.4 (37.8573), when its influence represents 35.3837% ($p=0.0000$). For countries with a value of the DESI index at the level of Q 0.5 (40.5181), the share of influence of the *GSCI_P3 (Social Capital)* pillar decreases to the level of 30.9942% ($p=0.0000$) with a subsequent increase in the influence on the change in the value of the DESI index up to Q 0.8 (48.0124), where it reaches its maximum value at at the level of 47.4268% ($p=0.0000$). For the countries with the highest value of the DESI index at the level of Q 0.9 (53.1537), the contribution of the *GSCI_P3 (Social capital)* pillar to the change in the DESI value is at the level of 40.4580% ($p=0.0020$).

Figure 5. The influence of the individual pillars of the GSCI and the constant on the change in the value of the DESI

Source: authors' own processing

The second most important predictor that affects the change in the value of the DESI index is the *GSCI_P2 (Resource Efficiency)* pillar. Its influence on the change in the value of the DESI index oscillates (Figure 5) from a value of 15.2941% ($p=0.0010$) for countries with a value of the DESI index at the level of Q 0.1 (28.0446) to a value of 15.6772% ($p=0.0310$) for countries with an index value of DESI at the level of Q 0.7 (45.8587) with its maximum value at the level of 16.4274% ($p=0.0020$) at the value of the DESI index at the level of Q 0.5 (40.5181). The influence of the *GSCI_P2 (Resource Efficiency)* pillar for countries with a DESI index value higher than 48.0124 (Q 0.8) is no longer significant ($p=0.1070$). The influence of the *GSCI_P4 (Intellectual Capital)* pillar is significantly manifested only in countries that have a DESI index value at the level of Q 0.1 (28.0446) to Q 0.3 (35.8573), while the influence of the *GSCI_P4 (Intellectual Capital)* pillar is at the level of 22.1118% ($p=0.0000$) at Q 0.1 to 11.9082% ($p=0.0140$) at Q 0.3. The *GSCI_P1 (Natural Capital)* pillar, on the other hand, is significant only for countries with a DESI index value in the interval from Q 0.3 (35.4790) to Q 0.6 (43.3570). The influence of the *GSCI_P1 (Natural Capital)* pillar in this interval ranges from 11.0952% ($p=0.0220$) to 16.1064% ($p=0.0230$). Thus, for countries with a DESI index value in the interval 28.0446 (Q 0.1) to 32.1693 (Q 0.2) and in the interval 45.8587 (Q 0.7) to 53.1537 and higher (Q 0.9), the *GSCI_P1* pillar no longer has a significant impact on the change in the DESI index value.

4. Discussion

In this part of our contribution, we present several research studies in which the authors devoted themselves to a mutual comparison of the assessment of digital competitiveness in connection with other instruments for the assessment of the sustainability of economies. Jovanović et al. (2018) examined the relationship between digitalisation (DESI) and sustainable development (economic, social, and environmental components). The study explored the correlations of DESI and other composite indices (Global Competitiveness Index, Global Innovation Index, Gross Domestic Products, Global Entrepreneurship Index, The Good Country Index, Sustainable Development Goal Index, Sustainable Society Index) and examined the relationships between Hofstede's cultural dimensions and digital performance. Jenčová et al. (2023) concluded that the assessment of digital performance using DESI achieved a statistically significant correlation in the rankings of EU countries between the analyzed years 2016-2020. Among the countries of the European Union, there are internally homogeneous and externally heterogeneous groups of countries in terms of ranking within the DESI dimensions. Quantifying and comparing the position of the 28 countries of the European Union in the

international space using DESI can help to identify and improve the digital competitiveness of the countries of the European Union. Knowing the five dimensions of DESI, its specific sub-dimensions and indicators can help to identify controversial areas to which the state should pay attention. Esses et al. (2021) examined interconnections between the dimensions of the DESI and the indicators of the Sustainable Development Goal (SDG) targets together in the V4 countries. The results show the extent of digital performance in individual countries and the relationship between their digital performance and sustainability indicators.

At the end of our paper, we present the following summary of the achieved results of quantile regression. The influences that influence the change in the value of the DESI index, which we did not consider in the study and are represented by the absolute member of the model (*_const*), are significant in the entire range of values of the DESI index and their influence gradually decreases from the value of 28.5647% to 22.1374%. The most significant predictor that affects the change in the value of the DESI index is the GSCI_P3 pillar – *Social capital*, while this pillar significantly affects the change in the value of the investigated response. Its influence is maximum for countries with a DESI index value of 48.0124 with a value of 47.4268%. The second most significant predictor that affects the change in the value of the DESI index is the GSCI_P2 pillar – *Resource Efficiency*, while the influence of this index is statistically significant only for countries with a DESI index value of up to 45.8587. The third most significant predictor is the GSCI_P4 pillar – *Intellectual Capital*, which, however, significantly affects the change in the DESI value only for countries with a DESI index value in the interval 28.0446 to 35.4790. The fourth most significant regressor, which significantly affects the change in the value of the DESI index, is the GSCI_P1 pillar – *Natural Capital*, while a statistically significant effect is manifested only in countries with a value of the DESI index in the range of 35.4790 to 43.3570. The GSCI_P5 pillar – *Governance* does not have a significant impact on the change in the value of the DESI index.

Conclusion

The competitiveness and sustainability of countries is an important concept that is constantly being reassessed and developed, and is often considered the driving force of economies. Competitive national economies are able to catch and promptly respond to new strategic opportunities and threats, constantly adapting to the rapidly changing conditions of the dynamic market. The level of competitiveness reflects the country's success in international operations in relation to other market participants.

At the end of our contribution, we can state that the Nordic countries (Finland, Sweden and Denmark) are among the leaders in the assessment of digital and sustainable competitiveness. The worst ranking was achieved by Romania for the DESI index and Cyprus for the GSCI index. From the results of the quantile regression, we conclude that 4 pillars of the GSCI index (*Social Capital, Resource Efficiency, Intellectual Capital and Natural Capital*) have a significant impact on the change in the value of the DESI index, but only one pillar of the GSCI (*Governance*) does not have a significant impact on the change in the value of the index DESI. The most significant predictor that affects the change in the value of the DESI index is the *Social Capital pillar*, which focuses on the assessment of health, safety, freedom, equality and life satisfaction and the facilitation of development.

During the realization of our analyses, we also noted several limitations, such as the different number of evaluated countries (DESI – only EU countries, GSCI – 180 countries of the world) and also differences in the number of input indicators included in the individual dimensions and pillars of the analyzed indices (DESI – 33 indicators, GSCI – 120 indicators). The mentioned limitations have a significant impact on the achievement of relevant results for individual countries and also affect the further direction of our research analyses. We can see the further direction of the research in a more detailed analysis of the individual indicators entering the dimensions or pillars of the analyzed indices, as well as revealing the mutual relations between them and their influence on other areas of the evaluation of the competitiveness and sustainability of the selected countries.

Support of Investors Located in the Banská Bystrica Region through Regional Investment Aid

Lenka Hvolková^{1,*}, Vladimíra Klementová¹, and Ladislav Klement¹

¹ Matej Bel University in Banská Bystrica, Department of Corporate Economics and Management, Faculty of Economics, Tajovského 10, 975 90 Banská Bystrica, Slovakia

Abstract

Research background: Slovak regions can be characterized through different level of their economic development. These disparities can be eliminated through a set of various tools, one of them is regional investment aid as a specific type of state support. It is designed for domestic and foreign companies that are already located in Slovakia or those that only will become a part of Slovak economy. The aim to align regional disparities is emphasized mostly in last few years and it means that nowadays applicants for this type of support will be entitled to obtain more financial resources in case that they will be situated in less developed Slovak regions.

Purpose of the article: The aim of this paper is to prove that the Banská Bystrica Region belongs among less developed Slovak regions through the analysis of economic indicators from this region and their comparison with the average values in Slovakia. Secondly, the aim of this paper is to monitor and identify the development of provision of (regional) investment aid to this region and its comparison with the other regions of Slovakia.

Methods: The paper is using secondary data obtained from the Statistical Office of the Slovak Republic and the Ministry of Economy of the Slovak Republic with the help of mathematical and statistical methods used for the verification of the settled assumptions.

Findings & Value added: The findings indicate that in last few years the inflow of regional investment aid to the Banská Bystrica Region is not so strong compared with more developed regions of Slovakia.

Keywords: investors, regions, economic development, regional investment aid

1. Introduction

It is generally accepted that foreign direct investments (FDI) represent an important driver of economic development of emerging as well as developed countries. One of the main positive effects of FDI is the increase in labour productivity and its contribution to the national income of the host country. Foreign investors add value to inputs and generate profits, from which they pay taxes, thereby contributing to the GDP. Higher productivity is a result of more focused specialization, better capital equipment, and improved management and marketing practices by foreign companies. (Tsinaridze & Makharadze, 2023).

Foreign direct investments also facilitate technology transfer between partner countries, especially between developed and transitioning economies. Domestic firms enhance their efficiency by adopting more effective technologies from foreign companies operating in the local market. These technologies encompass various aspects, such as product design, production processes, management techniques (e.g., supplier management, production management, marketing, and sales skills), and research and development. While the mentioned factors positively influence growth and productivity, it is the influx of new modern technologies that serves as the fundamental driving force behind economic growth, significantly contributing to increased productivity. As a result, technological development is perceived as the most critical factor determining the pace and character of the economy. This leads to an increase in the technical level of production, product quality, and the qualifications of the workforce. Due to

* Corresponding author: lenka.hvolkova@umb.sk

these advantages, associated business entities of multinational companies generally report higher levels of productivity compared to their domestic competitors. (Gelitashvili & Dzhvarsheishvili, 2021)

Further positive effects, as described by Milovanovic & Markovic (2022), include increasing and maintaining employment, boosting exports, improving the institutional environment, investing in education, and enhancing access to foreign capital. The effect of increasing and maintaining employment is accompanied by modernization within companies, the creation of new jobs, expanding production, improving product quality, and achieving better sales performance. Increased productivity also positively impacts the average monthly wage, which tends to increase with productivity growth. Although the influx of FDI may initially result in the import of foreign goods, machinery, intermediate products, and greater utilization of foreign services, in the long term, it is expected to have a positive effect on export growth. This is attributed to the improved access of subsidiary companies to foreign markets, which is secured by international corporations. The presence of multinational companies also leads to an improvement in the institutional environment, offering better protection and enforcement of property rights.

The main goal of home countries' measures is to support the flow of Foreign Direct Investment (FDI) into developing countries, assisting them in attracting FDI and maximizing its beneficial impact. Home countries adopt various approaches to influence the volume and quality of FDI flows, including the liberalization of outward FDI, removing barriers to foreign direct investments, collaborating with agencies that provide technical advice, organizing seminars, and similar initiatives. (Michalek, 2023) They also support technology exports and incentivize companies investing abroad through financial and fiscal benefits. Additionally, home countries minimize risks by offering investment insurance against political or other non-economic risks. Furthermore, home countries exercise control over multinational enterprises by implementing regulatory and sanction measures to ensure their compliance with legal and ethical obligations while conducting business. Failure to meet these obligations may involve practices such as corruption, fraud, improper accounting, or environmental pollution (Tsinaridze & Makharadze, 2023).

Effective state support for foreign direct investment leads, on one hand, to stabilization in public functions by increasing tax revenues and reducing the amount of resources allocated to unemployment benefits, assuming that FDI creates new job opportunities. On the other hand, if the inflow of FDI is driven by state support in the form of investment aid, the economy incurs costs in providing this assistance, as well as costs associated with supporting measures and administrative expenses. When considering the provision of a certain type of investment aid, it is essential to keep in mind that granting significant advantages to foreign investors may have adverse effects on the national economy. On one hand, there is a risk of corruption and clientelism, and on the other hand, significant disadvantages for domestic entrepreneurs do not contribute to the development of the domestic economy. (Narteh-Yoe, Djokoto, & Pomeyie, 2023) According to Ferencz et al. (2019), state aid consists of measures that meet cumulative criteria, which are the advantage granted or implemented from public funds and attributable to the state, an economic benefit for the recipient of the support, impact on economic competition, and effect on the internal market of the European Union. A similar view is held by Wislade (2003), who states that state aid is provided from state resources and can take any form. However, for the aid to be applicable, it must distort economic competition by favouring certain companies. Regional aid promotes the economic, social, and territorial cohesion of Member States and the European Union as a whole and aims to assist the development of disadvantaged areas by supporting investments and job creation in the context of sustainable development. Thus, the objective of regional aid is to reduce the disparities in socio-economic development between the various regions of the European Union by supporting the least economically developed regions. (Ambroziak, 2022) By reducing disparities in the level of development of individual EU regions, EU economic and social cohesion is achieved. (Podsiadlo, 2016) By targeting regional aid toward the least developed (most disadvantaged) regions in the EU, the impact on trade and competition is minimized. The main objective of regional aid is to promote the investments in regions where the level of economic development is below a certain EU average. (Wróblewska, 2022; Ramboer, & Reynaerts, 2020)

Currently, the provision of investment aid in the Slovak Republic is regulated by Act No. 57/2018 Coll. on regional investment aid, which repealed the previous Act No. 561/2007 on investment aid. The Act on regional investment aid governs the provision of investment aid from both accounting and tax perspectives. It establishes the rules for granting regional investment aid, the rights and obligations of the aid recipients, and the responsibilities of state administration bodies concerning its provision and

monitoring of its use. (Novackova & Saxunova, 2020) Regional investment aid can be granted under precisely defined conditions to support the implementation of investment intentions in industrial production, technological centres, and enterprise service centres. Based on the regulations of Act No. 57/2018 Coll. on regional investment aid, investment aid is provided in the form of subsidies for tangible and intangible fixed assets, income tax relief, contributions to created new jobs, or transfer of immovable property and rental of immovable property for a value lower than the appraised value determined by an expert. According to this act, subsidies for tangible and intangible assets, as well as contributions for creating new job positions, belong to the direct forms of regional investment aid, on the other hand, income tax relief and the transfer of immovable property or rental of immovable property for a value lower than the appraised value determined by an expert represent indirect forms of regional investment aid.

Regional investment aid is a form of investment assistance aimed at supporting competitiveness and reducing regional disparities. The Ministry of Economy of the Slovak Republic supports investments that utilize smart industry technologies and contribute to research and development within the country. Additionally, a priority is given to supporting job creation in the least developed districts. Any registered business entity in Slovakia whose investment plan meets the criteria for receiving investment aid according to the Act on regional investment aid can apply for regional investment aid. (Fabus & Csabay, 2018) The providers of investment aid can include various entities in the Slovak Republic, such as Ministry of Economy of the Slovak Republic, Ministry of Finance of the Slovak Republic, Ministry of Labor, Social Affairs, and Family of the Slovak Republic, owners, or administrators of real estate within the functional scope of public administration bodies, and Slovak Land Fund. Additionally, this form of investment aid can also be provided by municipalities, higher territorial units, or organizations under their supervisory authority. The main goal of regional investment aid is to reduce regional disparities. The maximum amount of investment aid in all types of projects is determined by the maximum percentage of eligible costs that can be approved for the investor in the form of investment aid. However, it is worth noting that the Bratislava Region is excluded from receiving investment aid. The following image shows the maximum intensity for the year 2023. (Ministry of Economy of the Slovak Republic, 2023)

Figure 1. Maximum intensity for regional investment aid in Slovakia
 Source: Ministry of Economy of the Slovak Republic (2023)

As seen in the image, the percentage values of regional aid intensity are divided according to the individual regions of Slovakia. It is evident that the Bratislava region is excluded from receiving this aid, while the intensity increases towards the eastern parts of the country. Compared to the previous year, the overall intensity of aid has increased, particularly in the eastern regions of Slovakia. In comparison to the year 2021, the aid intensity in the central and western parts of Slovakia has increased by 5%. However, in the eastern region, there has been a significant increase of up to 15% in aid intensity.

2. Methods

The aim of the paper is to prove that the Banská Bystrica Region belongs among less developed Slovak regions and to monitor and identify the development of provision of (regional) investment aid to this region and its comparison with the other regions of Slovakia. For this purpose, two types of secondary data were utilized: information about selected economic parameters available from the DATAcube database of the Statistical Office of the Slovak Republic, and the database of the Ministry of Economy of the Slovak Republic, containing data on provided (regional) investment aid. Regarding the DATAcube database, the most recent available data for the year 2021 was used for the analysis of the position of the Banská Bystrica Region in the Slovak economy, specifically the characteristics of the economy, the GDP per capita, the amount of added value, labour productivity per hour worked and per employed person, average gross wage, and unemployment rate.

The Ministry of Economy's database includes information about individual investment projects, providing detailed identification of the country of origin of the investor, eligible investment costs, the planned number of created jobs, and the forms of (regional) investment aid approved for the companies. In terms of time, the analysis covered the investment aid granted to investors from 2002 (when investment aid was launched as a form of state aid) until May 2023. As the aim of the paper is also to examine the development of (regional) investment aid over time, the analysed period is subsequently divided into two periods – 2002-2017 (support provision regulated by the Act on Investment Aid) and 2018-May 2023. During the latter period, the provision of aid is regulated by the Act on Regional Investment Aid, with a stronger emphasis on supporting less developed regions of Slovakia. The analysed data is current as of May 2023.

3. Results

According to reports from the Slovak Investment and Trade Development Agency (2022) and the Statistical Office of the Slovak Republic (2023), the Banská Bystrica Region is characterized by several dominant sectors, namely industry, wholesale and retail trade, public administration, and healthcare. In terms of the industrial sector, the most prevalent sub-sectors in the Banská Bystrica Region are the production of metal products, food and beverages, and instruments and equipment. However, despite these circumstances, the region's industrial sector only generated revenues of 5.7 billion euros from its own goods in 2021, making it the lowest among all regions. Additionally, the number of individuals employed in the industrial sector stood at 50.7 thousand, also the lowest compared to other regions. Notable foreign investors in the region include companies such as Continental Automotive, Kronospan, and Nematik. Agricultural land occupies 43.1% of the Banská Bystrica Region's total area. The southern part of the region is predominantly dedicated to agriculture, focusing on the cultivation of grains, corn, and vines. The northern part, characterized by meadows and pastures, plays a vital role in livestock farming, particularly cattle and sheep. The region stands out at a national level due to its extensive forested area, covering almost half of its territory. Its timber production significantly surpasses that of other regions. Despite Banská Bystrica's historical candidacy as the official centre of Slovakia, the region currently focuses on trade and services.

Strong aspects of the region include a substantial workforce, a well-educated population, abundant reserves of key materials suitable for various industries, a favourable location for exporting metals, wood processing, clay, and chemicals, favourable conditions for establishing industrial parks, a positive climate, and a rich cultural environment that supports the growth of tourism. According to Economic and Social Development Program of the Banská Bystrica Self-Governing Region for the years 2022 – 2030, the Banská Bystrica Region is characterized by many small villages, which hinders their ability to meet all original and transferred responsibilities and achieve sustainable growth due to limited financial and human resources. The region faces challenges related to a crisis in human potential caused by the departure of productive-age citizens, low natural population growth, and a high number of unemployed individuals. The main reason for the outflow of residents from the region is the low productivity and performance of the economy, which limits the creation of attractive professional opportunities. This, in turn, accelerates the overall aging of the population and places increased pressure on the allocation of healthcare and social services.

3.1 Regional economy of the Banská Bystrica Region

In 2021, the economically active population accounted for 51% of the total population. The employment rate reached 71.3%, while the unemployment rate stood at 10.2%. However, despite these

positive indicators, the average monthly nominal wage was 1,250 euros, which was the second lowest among all regions. In comparison to the national average in Slovakia, the nominal monthly wage was lower by 11%. In the Banská Bystrica Region, individuals were most employed in the industrial sector, accounting for 26% of the workforce in 2019 (newest data). Other sectors with a significant number of employed residents in the Banská Bystrica Region included wholesale and retail trade (13%), public administration and social security (13%), education (12%), and healthcare and social work (9%). Approximately 11% of the population worked in various other activities such as art, entertainment, recreation, administrative services, professional and technical activities, real estate, financial and insurance services, information and communication, and accommodation and food services. However, individually, these activities did not exceed a 2% share.

In 2021, the Banská Bystrica Region created a regional GDP of 8,694 million euros at current prices, representing 8.8% of the national GDP. As there are eight NUTS 3 regions in Slovakia, the even share would be 12.5% per region, so the Banská Bystrica Region was lagging behind the average by 3.7 percentage points. Other selected indicators of regional economy of NUTS3 region in Slovakia presents table 1.

Table 1. Selected indicators of regional economy of NUTS 3 regions in Slovakia in 2021

	GDP per capita (€)	Gross value added (€)	Labour productivity per employed person (€)	Labour productivity per hour worked (€)	Average gross wage (€)	Unemployment rate (%)
Bratislava Region	38,761	24,907	45,598	28.4	1,767	4.38
Trnava Region	19,415	9,777	35,773	22.3	1,331	4.16
Trenčín Region	15,313	7,848	27,049	17.3	1,317	4.28
Nitra Region	14,893	8,953	28,376	17.6	1,266	4.80
Žilina Region	15,922	9,796	26,832	17.4	1,308	5.32
Banská Bystrica Region	13,949	7,744	26,192	16.9	1,246	9.01
Prešov Region	11,114	8,003	24,920	16.1	1,153	10.75
Košice Region	15,418	10,726	30,952	20.2	1,333	9.98
Slovak Republic	18,098	10,969	30,711	19.53	1,340	6.76

Source: own processing based on data from the Statistical Office of the Slovak Republic (2023)

Per capita, the regional GDP lagged behind the national average by 23%, amounting to 13,949 euros at current prices. The Banská Bystrica Region had the second lowest GDP per capita among all regions. Considering the regional gross value added (GVA), the position of the Banská Bystrica Region was even worse. The GVA in 2021 was the lowest in Slovakia lagging over 30% behind the national average. The primary contributors to the regional gross value added were the industrial sector, public administration, defence, healthcare, and social assistance, accounting for 18.1%. Trade, transport, accommodation, and food services accounted for 16.9%. Effectivity of using the labour force in particular regions in 2021 showed, that average labour productivity indicator per employed person in the Banská Bystrica Region was only 26,192 €, the average labour productivity per one hour worked was 16.9 €. There was only one region (Prešov) which had even lower values of both indicators. The national average of labour productivity per employed person was in 14.5% higher. Consequently, the average regional gross wage in 2021 was only 1,246 €. It was only 8% below the national average, but still the second lowest among all NUTS 3 regions. The Banská Bystrica Region had the third highest unemployment rate among NUTS 3 regions in Slovakia, which was over 33% higher than the national average. According to the values of the analysed indicators we can confirm, that the Banská Bystrica Region belongs among less developed regions in Slovakia. This is also confirmed by the identification of the Slovak Investment and Trade Development Agency (2022) that has identified the least developed districts – most of them are situated in the Banská Bystrica Region, the Prešov Region, and the Košice Region. (Beresova, 2018)

3.2 Regional investment aid in Slovakia

Since the establishment of investment aid in 2002, a total of 256 companies from different countries have chosen to avail themselves of this form of state aid. However, not all of them met the prescribed criteria, leading to the cancellation of investment aid for 27 companies. Therefore, the total amount of investment aid granted was €1,993,427,985 distributed over 229 instances. The average value of the granted investment aid was €9,140,555. As was mentioned above, investment aid is provided in four forms – tax relief, contribution for creating new job positions, subsidy for tangible and intangible assets, and transfer of assets at a price below market value – that can be also combined. The most common form of assistance was tax relief, it was granted 196 times, with an average value of €5,154,643. The next form of assistance was the subsidy for tangible and intangible assets (granted 87 times), which accounted for a total expenditure of €843,616,063. Following that, there was the contribution for creating new job positions, amounting to €140,053,230. This form of assistance was granted 71 times, with an average value of €1,972,580. The lowest amount of assistance was provided through the transfer of assets at a price below market value, which was given to two business entities, totalling €46,695,530.

The majority of investors who applied for investment aid in Slovakia come from European countries, specifically Germany, Austria, the Netherlands, Switzerland, and Italy. Germany had the highest number of companies, with a total of 56, followed by 25 companies from Austria and 22 companies from South Korea. Additionally, 17 companies originated from the Netherlands and the United States. Luxembourg and France had the fewest investors. It is worth noting that the analysis reveals investment aid was also granted to Slovak companies, with a total of 37 benefiting from it. This confirms that while foreign investors may seem to dominate, local businesses have also received support.

The following table provides an overview of the volume of (regional) investment aid granted, categorized by individual regions of the Slovak Republic, with the aim of creating a certain number of job positions and subsequent calculation of average costs per job position created.

Table 2. (Regional) investment aid according to Slovak regions (2002 - May 2023)

	Value of investment aid (€)	Number of jobs created	Average cost per job (€)
Bratislava Region	52,906,417	3,007	17 594.42
Trnava Region	408,970,373	9,430	43 369.07
Trenčín Region	209,641,133	11,357	18 459.20
Nitra Region	365,794,418	10,767	33 973.66
Žilina Region	421,410,316	7,640	55 158.42
Banská Bystrica Region	126,028,997	6,245	20 180.78
Prešov Region	96,451,645	3,073	31 386.80
Košice Region	312,224,686	11,809	26 439.55
Slovak Republic	1,993,427,985	63,328	31 477.83

Source: own processing based on data from the Ministry of Economy of the Slovak Republic (2023)

The data from the table 1 indicates that the highest amount of investment aid flowed into the Žilina and Trnava regions since 2002, accounting for approximately 21% of the total financial resources. The Nitra Region followed closely with 18% of the investment aid, while the Košice Region received 16% of the investment aid. Among the regions receiving the smallest amount of this state support, we can include the Banská Bystrica Region with 6%, the Prešov Region with 5%, and the Bratislava Region with 3%. The reason why the Bratislava region received the least amount of (regional) investment aid is that it is one of the most developed regions in Slovakia, therefore, foreign investors likely prioritize less developed regions due to the availability of greater investment aid. In terms of the number of jobs created (a significant criterion in providing investment aid as it contributes to reducing unemployment rates), the leading regions are primarily the Košice and Trenčín regions, accounting for 18% share of the total number of jobs created. On the other hand, the Bratislava and Prešov Regions have the smallest share in this indicator (5%). The Banská Bystrica Region ranks sixth in terms of the share of jobs created since it saw the creation of more than 6,200 job positions during the observed period. Since 2002, the Slovak Republic has created over 63,000 jobs through the provision of investment aid. When providing state support, it is crucial to consider

not only the number of created jobs but also their relation to the financial resources allocated to individual enterprises. In this regard, significant variations can be observed among different regions. The average cost of creating one job ranged from approximately €17,594 in the Bratislava region to €55,158 in the Žilina Region. Evaluating the situation in the Banská Bystrica Region, it can be confirmed that it ranked third in terms of the cost of creating one job, with an investment aid value of approximately €20,180.

3.3 Regional investment aid in the Banská Bystrica Region

When analysing the situation in the Banská Bystrica Region in more detail, the total sum of the (regional) investment aid was €126,028,997 provided for 32 investors. When comparing this region with other Slovak regions according to the total amount of provided investment aid we can confirm that the Banská Bystrica Region is on the 6th place from total 8 regions. This region witnessed the highest number of Slovak companies (11) applying for (regional) investment aid. Among the foreign investors in the Banská Bystrica Region who sought investment support, four originated from Austria and Germany, while two each came from the USA, Italy, and Spain. Other countries, such as Poland, Ukraine, Belgium, Sweden, and South Korea, had only one investor each. This indicates that there has been a relatively low number of foreign companies seeking investment aid in the Banská Bystrica Region since 2002.

For a better representation of regional investment assistance in the Banská Bystrica Region, we have decided to provide a graphical visualization showing the specific districts to which the regional investment support was directed (figure 2).

Figure 2. Regional investment aid in the Banská Bystrica Region – districts

Source: own processing based on data from the Ministry of Economy of the Slovak Republic (2023)

The figure illustrates that a significant share of (regional) investment aid was directed towards the southern part of the Banská Bystrica Region. This was mainly due to the presence of one of the least developed districts, Lučenec, which accounted for 22.08% of the investment share within the Banská Bystrica Region. Following Lučenec, the district of Žiar nad Hronom received 17.37% of the investment assistance. The Zvolen district ranked third in terms of investment volume, with 14.46% directed towards it. On the other hand, the districts of Veľký Krtíš, Tornaľa, and Revúca received the smallest share of regional investment assistance, with allocations of 0.24%, 0.69%, and 2.73% respectively.

The following figure characterizes the development of investment aid provision in the Banská Bystrica Region from 2002 to May 2023, based on data from the Ministry of Economy, together with values of average costs per created job.

Figure 3. Regional investment aid and average cost per job in the Banská Bystrica Region during 2002 – May 2023

Source: own processing based on data from the Ministry of Economy of the Slovak Republic (2023)

Based on the analysis of the provided data, we can confirm that investment aid did not flow into the examined region every year during the observed period, and its amount varied significantly. The highest value was recorded in 2006 when €51,076,600 was provided for 6 investment projects, while the lowest value occurred in 2021, with almost €270,000 granted to a single investor. Furthermore, when considering the average costs per created job, we observed considerable differences. The "most expensive" investment aid was provided in 2023 to an investor creating 10 job positions, amounting to an average of €86,800 per job. In contrast, the "cheapest" investment aid was granted in 2007 to an investor who committed to create 1,200 jobs in connection with the project, resulting in an average cost of approximately €5,924 per job.

4. Discussion

The main objective of the legislative change in providing investment aid in 2018 was to place stronger emphasis on supporting less developed regions and encouraging investors to invest in those specific areas. As a result, this contribution also focuses on analysing the development of the situation during the observed period, which is further divided into two distinct periods: before and after 2018. The table below presents information about the total amount of investment aid allocated to individual regions over the entire period. This data is then categorized into the two aforementioned periods for a more detailed examination. Since the second period was considerably shorter, we have decided to use not only absolute but also relative values and the percentage share of each region in the overall value of state support acquired through this instrument.

Table 3. Development of (regional) investment aid according to Slovak regions

	total sum of (regional) investment aid	% share	investment aid in 2002-2017	% share	regional investment aid in 2018-2023	% share
Bratislava Region	52,906,417	2.65	52,906,417	3.15	0	0.00
Trnava Region	408,970,373	20.52	365,671,197	21.75	43,299,176	13.88
Trenčín Region	209,641,133	10.52	191,682,228	11.40	17 958,905	5.76
Nitra Region	365,794,418	18.35	224,634,668	13.36	141,159,750	45.26
Žilina Region	421,410,316	21.14	408,998,261	24.32	12,412,055	3.98
Banská Bystrica Region	126,028,997	6.32	110,125,094	6.55	15,903,904	5.10
Prešov Region	96,451,645	4.84	52,164,637	3.10	44,287,008	14.20
Košice Region	312,224,686	15.66	275,336,909	16.37	36,887,777	11.83
Slovak Republic	1,993,427,985	100.0	1,681,519,411	100.00	311,908,575	100.00

Source: own processing based on data from the Ministry of Economy of the Slovak Republic (2023)

During the period from 2002 to 2023, a total of 229 investment incentives were approved, with 175 of them approved before 2018. In terms of the number of supported projects in this period, the Košice Region stood out with a dominant share of 24% of the total projects. It was followed by the Trenčín, Nitra, and Žilina regions, each with a relatively balanced share of approximately 14-15%. In this case, we can positively evaluate the high proportion of projects in the Košice Region since, as mentioned earlier, it belongs to the less developed regions. However, the situation changed significantly in the period from 2018 onwards. Out of a total of 54 projects, the Prešov Region accounted for the largest share, with 13 projects representing approximately 24%. The Košice Region ranked second, receiving 12 projects with a share of approximately 22%, and the Banská Bystrica Region received 10 projects (the third largest number with a percentage share of approximately 18.5%). Evaluating this period confirms that the policy of regional investment aid successfully supported less developed regions. Nevertheless, it is important to note that not only the number of supported projects matters but also the amount of financial resources provided through investment aid. In this case, we can refer to the data presented in Table 3, which indicates that during the period from 2002 to 2017, the largest amount of financial resources flowed to the Žilina Region (approximately 24% of the total amount of supported projects), followed by the Trnava Region (almost 22%) and the Košice Region (approximately 16%). However, the situation changed in the period from 2018 onwards, as the largest amount of funding was allocated to investors who invested in the Nitra region (over 45%), with significantly lower shares going to the Prešov Region (approximately 14%) and the Trnava region (almost 14%) in subsequent positions. In the case of the Banská Bystrica Region, the situation can be evaluated as follows: concerning the number of supported projects, its situation improved in percentage terms from 2018 onwards. However, when analysing the volume of provided funds and the region's share of these funds, the situation worsened.

Our findings can be supported by the results of other conducted research studies, e. g. Košdy (2023) has confirmed that based on a spatial distribution analysis focused on the least developed regions, it can be concluded that the level of support in most of these areas is insufficient. Other authors suggest on the base of their research that state aid should primarily be provided for small and medium-sized enterprises as the beneficiaries of the aid achieve good economic results and their competitiveness on the market is enhanced. (Paskrtova, Novackova, & Stachova, 2019) The research of this topic can be extended by further analysis on macro and micro level in area of effectiveness of (regional) investment aid, some findings of other authors suggest that investment aid and the creation of new jobs supported by it cannot be considered as an effective tool for reducing unemployment or stimulating wage growth. The results of the research carried out at the micro level show that investment aid in terms of the creation of new jobs is in most cases ineffective for the state. On the other hand, there are indicated certain positive effects of new jobs for the state, but these are achieved only under the restrictive assumption that these new jobs are occupied by unemployed persons, which, however, often does not correspond to reality. (Hintosova, Bruothova, & Barlasova, 2021)

Conclusion

Reducing regional disparities is one of the primary tasks of the state, aiming to achieve economic balance among its regions. Currently, the Slovak Republic exhibits significant economic differences between its various regions, resulting in several issues such as higher unemployment rates and lower levels of gross domestic product and value-added. To address this, one potential tool that can be employed is providing investment incentives through the Act on Regional Investment Aid. However, the analysis conducted suggests that the existing rules favouring investments in less developed regions of Slovakia do not strongly motivate both domestic and foreign investors to consider locating their investments in these areas. Therefore, it becomes essential for the state to reassess the current regulations governing the provision of regional investment aid. The goal should be to modify these rules in a way that better aligns with their primary objective of fostering economic development in the less-developed regions.

66 Ivan Mihaylov str., 2700 Blagoevgrad, Bulgaria

Abstract

Research background: Urban traffic congestion is a nuisance for both city dwellers and car drivers. The city's residents suffer from traffic congestion, car noise, and air pollution. Furthermore, city captains and planners choose different methods to manage urban transportation to create as spacious an environment as possible for residents. In this research, we will explore the multifaceted challenges posed by pollution's long-range transport, focusing on the necessity for regional cooperation and its ecological repercussions. It aims to contribute valuable insights for crafting effective policies and strategies to combat the far-reaching impacts of pollution in an increasingly interconnected world by conducting a historical analysis of dealing with traffic congestion in large cities.

Purpose of the article: Managing traffic jams in urban areas is a difficult and complex task in urban areas worldwide. The current study aims to obtain tools to deal with traffic congestion in the city by examining the urban history dealing with traffic congestion around the world.

Methods: The research is based on a comprehensive literature review of the history of traffic jams and dealing with them.

Findings & Value added: This research enriches the understanding of how cycling infrastructure, subway systems, and freeway networks intersect with urban sprawl. By offering tangible findings and value-added insights, the research contributes to the advancement of sustainable urban planning strategies that prioritize efficient transportation and mitigate the adverse impacts of urban sprawl.

Keywords: cycling, urban sprawl, subway, freeway

JEL classification: R1, R2, R3, R4, R5

1. Introduction

This article examines the historical context of commuting problems and the importance of well-designed and properly maintained infrastructure in managing urban traffic. By examining the experiences of several cities, including Amsterdam, Copenhagen, and Utrecht, valuable insights emerge into the positive impact of investments in bicycle infrastructure. Examples show that cities with extensive bicycle infrastructure have less congestion, better air quality, and a higher proportion of active road users. In addition, the case studies emphasize the importance of continued infrastructure development and maintenance to ensure its effectiveness in promoting sustainable urban mobility. The findings underscore the need for policymakers and urban planners to prioritize investments in bicycle infrastructure and integrate multimodal transportation systems that promote a shift away from car dependence. Overall, the commute story underscores the critical role that well-designed and properly maintained infrastructure plays in managing urban traffic and creating a more livable and sustainable urban environment.

1.1. The late 19th

Amsterdam's cycling infrastructure has a long history, with significant developments over several decades. Although it is difficult to pinpoint an exact date for each aspect, Amsterdam began building dedicated bicycle lanes, called "cycle tracks" or "bike lanes," in the late 19th century to separate bicycle

* Corresponding author: eyalwhabby@gmail.com

traffic from other roads. These paths were initially separated from the main roads and were often made of asphalt or cobblestones (Feddes, de Lange & te Brömmelstroet, 2020).

1.2. The beginning of the 20th

In the 20th century, Copenhagen, Denmark, faced the problem of traffic congestion and urban sprawl. In response, the city implemented the "Finger Plan" in the mid-20th century. This urban development strategy focused on creating a series of radial corridors extending from the city center. The plan included efficient transportation infrastructure, including highways and rail lines, to provide residents with a sustainable commute to work (Knowles, 2012). Copenhagen also has a long history of bicycle culture. As early as 1900, bicycles were a popular means of transportation. During that time, the city began developing basic bicycle infrastructure, including segregated bike lanes (Carstensen et al., 2015).

The Paris Métro, inaugurated in 1900, was an early example of a well-designed public transportation system tailored to commuter problems efficient, comprehensive, and well-connected Métro network provided an alternative to crowded streets. The Métro system played an important role in shaping urban development and reducing traffic congestion (Vuchic, 2002). New York City's subway system, established in 1904, revolutionized commuting in one of the busiest cities in the world. With an extensive underground rail network, the subway provided a reliable and efficient transportation option that reduced congestion on city streets. Today, the subway still plays an important role in New York City's transportation infrastructure (Wang & Ross, 2019).

In 1939 the Arroyo Seco Parkway, also known as the Pasadena Freeway, opens as the first freeway in the Los Angeles metropolitan area. It connects downtown Los Angeles with Pasadena and serves as a major transportation corridor. In the 1940s a major air pollutant of smog, known as photochemical smog, was first described in Los Angeles. In the 40s and 50s construction begins on several major freeways around Los Angeles, including the Hollywood Freeway (US 101), the Santa Monica Freeway (Interstate 10), the San Bernardino Freeway (Interstate 10), and the San Diego Freeway (Interstate 405) (Goodwin, 1965).

1.3. The mid 20th

In the 50s and 60s, London was famous for its thick smog and its winter 'pea soupers' which culminated into lethal acidic smogs in 1952, 1956, 1957 and 1962. The first severe smog episode of lethal acidic of 1952 made London experience thousands of deaths and widespread health problems. One of the contributing factors was the high concentration of commuter traffic that relied on coal-burning vehicles and poorly designed road infrastructure. This event prompted the city to invest in greener transportation such as electric buses and improved road layouts to reduce pollution and congestion in the future (Antipova, 2018).

In 1965, in United States, the Century Freeway (Interstate 105) project begins to connect Los Angeles International Airport (LAX) with the Norwalk area and was completed in the 1990s (Hestermann et al., 1993).

In Europe, the 60s and 70s, Copenhagen experienced a surge in car use, leading to increased traffic congestion and concerns about air pollution. In response, the city government prioritized investment in bicycle infrastructure to provide alternative transportation options. Dedicated bike lanes were upgraded to increase safety for cyclists (Gössling, 2013).

In Asia, Tokyo experienced a sharp increase in commuter traffic in the 60s as the population grew rapidly. The city responded by building the Shuto Expressway, a network of elevated roads around central Tokyo. This well-designed infrastructure project provided alternative routes for commuters, reduced congestion on the roads and improved traffic flow in the urban area (Shibata, 2007).

1.4. The late 20th

In the 70s, Amsterdam's bicycle infrastructure experienced a major boom. The city introduced a comprehensive plan known as "Stop de Kindermoord". This initiative aimed to improve road safety and give priority to non-motorized modes of transportation, especially bicycles. The city began installing a network of bike lanes to increase safety and comfort for cyclists. At the same time, Utrecht, like many other Dutch cities, began to prioritize bicycle infrastructure in response to increasing car use and traffic congestion. This was the beginning of a dedicated effort to develop a comprehensive network of bicycle lanes in the city (Feddes, de Lange, & te Brömmelstroet, 2020).

In South America, Curitiba, Brazil, struggled with increasing traffic congestion and air pollution in the 70s due to its growing population and reliance on cars. In response, the city implemented a well-designed integrated transportation system. This system combines dedicated bus lanes, well-organized bus stops, and efficient scheduling to provide fast and reliable public transportation. This approach has significantly reduced traffic congestion, improved air quality, and influenced urban planning strategies in other cities (Newman, 2021).

In the 80s, in Europe, Copenhagen introduced the concept of a "green wave" for cyclists. This system synchronized traffic lights along popular bicycle routes so that cyclists could maintain a steady pace and no longer had to stop at red lights. The introduction of the "green wave" improved the efficiency and comfort of cycling in the city. The 90s marked an important turning point in Copenhagen's commitment to becoming a bicycle-friendly city. The city introduced the Bicycle Account, a comprehensive survey and analysis of bicycle conditions and infrastructure. The Bicycle Account enabled the city to assess the needs of cyclists and make informed decisions about infrastructure improvements. In the mid-90s, Amsterdam introduced innovative bicycle infrastructure, such as color-coded bike lanes, red asphalt surfaces, and clear signage. These improvements further separated bike lanes from car lanes and increased cyclist visibility and safety (Feddes, de Lange, & te Brömmelstroet, 2020).

1.5. The beginning of the 21st

In the early 2000s, Copenhagen further expanded its cycling infrastructure. The city invested in creating more dedicated cycling lanes, separated bike paths, and cyclist-friendly intersections. These improvements aimed to increase safety and convenience for cyclists and encourage more people to choose cycling as their preferred mode of transportation. Amsterdam continued to expand its bicycle infrastructure, especially in the city center and suburbs. More bicycle-specific measures were introduced, including traffic lights synchronized with cyclists' speed, bicycle-friendly traffic circles, and improved intersection designs that prioritize cyclists' safety. And Utrecht increased its focus on bicycle infrastructure. The city introduced innovative concepts such as the "fietsstraat" concept or bike lanes that gave cyclists priority over motor vehicles. These bike lanes were installed at various locations and provide a safer and more pleasant cycling experience (Feddes, de Lange, & te Brömmelstroet, 2020).

In the United State, in 2004, construction began on the Metro Gold Line Eastside Extension. This light rail line, which opened in 2009, extends the Gold Line from downtown Los Angeles to East Los Angeles and provides an alternative to the freeway system (Murthy & Mori, 2010).

In Asia, China's 21st-century investment in high-speed rail has fundamentally changed commuting problems in China. The extensive network of high-speed rail lines connects major cities and reduces reliance on air travel and private vehicles for long-distance trips. These investments in infrastructure have not only improved connections between cities but also resulted in less congestion and shorter travel times for commuters (Dong, 2018).

At the same time, Tokyo has consistently expanded its rail network to accommodate the city's growing population and handle commuter traffic. Projects such as the construction of new subway lines and the expansion of existing rail lines, such as the Yamanote Line, have increased capacity and improved connectivity. These investments in rail infrastructure have helped reduce congestion and improve mobility in the city (Cao, 2022).

1.6. Recent years

In 2013 the world's largest bicycle parking garage is inaugurated in Utrecht, known as "Bicycle Parking Utrecht" or "Stations Plein West" - The parking garage under Utrecht Central Station has space for around 12,500 bicycles and provides safe and convenient parking for cyclists (Daris, 2020).

In Copenhagen the investment in bicycle-friendly infrastructure continued. The city has expanded its network of bike lanes, improved bike parking facilities, and introduced innovative designs for bicycle infrastructure. For example, in 2014 Copenhagen opened the Cykelslangen – the Bicycle Snake, an elevated bicycle bridge that provides cyclists with a direct and safe route across the harbor (Galal, 2023).

In 2015, Utrecht hosted the start of the Tour de France, demonstrating the city's commitment to cycling and its investment in cycling infrastructure. The event highlighted Utrecht's efforts to promote cycling on an international level (Hull & O'holleran, 2014).

In 2017, IRIS Smart Cities launched the "Horizon 2020" project to improve urban life and ensure sustainable and affordable energy. The "lighthouse cities" chosen for the project were - Gothenburg in Sweden, Nice Cote d'Azur in France, and Utrecht in the Netherlands. "These cities have been acting as

living laboratories for demonstrations, integrations, and implementations of innovative energy-efficient areas, flexible smart energy solutions and applications, and incrementing the utilization of renewable energy sources and smart energy storage solutions (Paalosmaa & Shafie-khah, 2021).

In the recent years, Seville, Spain, has experienced a cycling revolution by investing in an extensive bicycle infrastructure network. The city introduced a bike-sharing system, built dedicated bike lanes, and implemented traffic-calming measures to promote cycling. Seville's efforts have led to a significant increase in cycling and a reduction in traffic congestion (Wałdykowski, Adamczyk, & Dorotkiewicz, 2021). And in Portland, Oregon, United States, has made significant efforts to prioritize bicycling and develop comprehensive bicycle infrastructure. The city has an extensive network of bike lanes, dedicated bike lanes, and bike boulevards. Portland's commitment to bicycling has resulted in a strong bicycle culture, reduced traffic congestion, and improved air quality (Geller & Marqués, 2021).

Nevertheless, while efforts to reduce smog and pollution in major cities have shown some success, pollution's long-range transport can lead to its appearance in previously unaffected areas like the pollution growth in formerly pristine areas like Cape Cod and the Great Smoky Mountains, in United States, that suffer from acid rain (Lu et al., 2011) highlights, in our opinion, the complexity of environmental challenges and that regional solutions and global cooperation are essential to address pollution's far-reaching effects, protect ecosystems, and secure a sustainable future for the planet.

1.7. Plans for the future

The development of the Los Angeles freeway system, for example, is an ongoing process, with expansions, improvements, and additions being made over time to meet the region's growing transportation needs. It is also important to note that the transformation of Copenhagen into a bicycle-friendly city has been a gradual and ongoing process, with continuous investments and improvements over many decades. The city's commitment to cycling infrastructure has resulted in high cycling rates, less traffic congestion, and a more sustainable urban environment. Moreover, while some of these dates mark important milestones on the road to becoming bicycle-friendly cities it is important to note that the development of bicycle infrastructure is an ongoing process. Utrecht, for example, continues to invest in improving bicycle infrastructure, with plans and initiatives evolving over time to support sustainable transportation and prioritize the needs of cyclists.

The history of commuting problems shows the importance of a well-designed and well-maintained infrastructure. Cities must invest in robust transportation networks, including streets, highways, bridges, and mass transit systems. Sufficient capacity, efficient connections, and strategic expansion plans can help avoid congestion. And efficient and reliable public transportation systems play an important role in managing urban traffic. Historical examples show that cities with well-developed public transportation networks, such as subways, light rail, and buses, can significantly reduce congestion by providing commuters with alternative modes of transportation. Investments in public transportation infrastructure and services can help reduce the number of private vehicles on the road.

2. Method

The research methodology for this study focuses on gaining insights into the intricate relationship between urban sprawl, urban traffic congestion, and the strategies historically employed to alleviate congestion. The primary aim of this research is to investigate the historical dynamics of urban sprawl, its contribution to urban traffic congestion, and the historical strategies that have been utilized to mitigate congestion challenges. A rigorous and comprehensive literature review method was chosen as the cornerstone of this research. The literature review encompassed three main areas of focus:

Urban Sprawl: Extensive research was conducted to identify historical literature addressing the phenomenon of urban sprawl. This included scholarly articles, books, urban planning reports, and relevant government publications. The review encompassed a wide temporal scope, tracking the evolution of urban sprawl theories, definitions, and historical context. This historical analysis allowed for a nuanced understanding of the origins and manifestations of urban sprawl.

Urban Traffic Congestion: A dedicated examination of historical literature concerning urban traffic congestion was undertaken. This review phase included a comprehensive survey of academic studies, transportation reports, and policy documents.

Historical Congestion Mitigation Strategies: Historical strategies spanning transportation infrastructure development, policy initiatives, and technological advancements were meticulously analyzed. Both successful and unsuccessful strategies were scrutinized to draw meaningful insights. The

literature review covered a broad temporal spectrum to trace the historical evolution of urban sprawl, traffic congestion, and mitigation strategies. Geographical diversity was also considered to capture regional variations and trends.

Urban Traffic Congestion Literature Review: A focused examination of historical literature related to urban traffic congestion was undertaken. This involved a comprehensive survey of academic studies, transportation reports, and policy documents. The review aimed to elucidate the development of urban traffic congestion as a byproduct of urban sprawl, tracking its historical evolution, contributing factors, and associated challenges.

Historical Strategies for Congestion Mitigation: A critical component of the research involved identifying and analyzing historical strategies employed over the years to address urban traffic congestion. This encompassed various interventions, including transportation infrastructure development, policy initiatives, and technological advancements. Case studies and historical analyses of successful and unsuccessful congestion mitigation strategies were examined to extract valuable insights into their effectiveness and impact.

Comparative Analysis: A rigorous comparative analysis was conducted to discern patterns, trends, and shifts in urban sprawl, traffic congestion, and mitigation strategies across different periods and geographical regions. The goal was to identify commonalities and differences in the historical development of urban areas, the emergence of congestion challenges, and the adaptation of strategies to address these challenges.

Synthesis and Framework Development: The findings from the historical literature review were synthesized to develop a conceptual framework that elucidates the complex interactions between urban sprawl, traffic congestion, and mitigation strategies. This framework serves as the basis for the research's conclusions and recommendations, providing a structured understanding of the historical context and implications of congestion in urban areas.

3. Results

The comprehensive review of historical literature on urban sprawl, urban traffic congestion, and congestion mitigation strategies has yielded valuable insights into the intricate relationship between these factors. The results of this research highlight the multifaceted nature of urban sprawl, traffic congestion, and congestion mitigation. They underscore the potential of strategies such as cycling infrastructure, subway systems, lifestyle changes, and multimodal transportation in managing these challenges. Furthermore, the importance of technology and global cooperation in addressing contemporary urban issues becomes evident through historical analysis. These findings provide a solid foundation for informed urban planning and transportation policies in the modern era. We will present here key findings that shed light on historical trends, challenges, and strategies employed over the years.

Cycling Infrastructure and Urban Sprawl: The research revealed a compelling correlation between well-designed cycling infrastructure and the reduction of urban sprawl. Cities that strategically invested in cycling infrastructure, including dedicated lanes and bike-sharing programs, witnessed a substantial decrease in short-distance car commuting. This finding underscores the potential of cycling to promote localized living and counteract the outward expansion of urban areas.

Subway Systems as Urban Sprawl Mitigators: Robust subway systems emerged as effective tools in curbing the negative impacts of urban sprawl. Areas adequately served by subway networks exhibited lower vehicle ownership rates and reduced traffic congestion. Commuters' preference for subway travel was pivotal in fostering higher population density around transit hubs, encouraging denser and more sustainable urban development.

Freeway Networks' Dual Role: When strategically designed and seamlessly integrated with efficient public transportation systems, freeway networks demonstrated the capacity to counterbalance the adverse effects of urban sprawl. The research highlighted the importance of well-planned freeway systems in reducing the need for long-distance car commuting. Proper integration of freeways with mass transit options encouraged commuters to opt for public transportation, thereby mitigating urban sprawl's impact.

Lifestyle Changes and Congestion Mitigation: The historical literature review emphasized the role of lifestyle changes in congestion mitigation. Notably, a small reduction in legal speed limits was found to conserve fuel and significantly reduce NOx emissions with minimal increases in hydrocarbon emissions. Furthermore, increased utilization of public transportation emerged as an effective strategy for reducing photochemical smog.

Multimodal Transportation Approach: The research underscored the value of adopting a multimodal transportation approach that combines various modes of transportation, such as buses, trains, bike lanes, and pedestrian paths. This approach enhances mobility, reduces traffic congestion, and promotes a more balanced and sustainable transportation system. It aligns with the evolving psychological flexibility of contemporary urban populations.

Leveraging Technological Solutions: Historical analysis indicated that technological advances are crucial in effective traffic management. Intelligent traffic management systems, real-time navigation applications, and vehicle-to-vehicle and vehicle-to-infrastructure communications offer opportunities for optimizing traffic flow and enabling dynamic traffic management.

The Importance of Global Cooperation: The research findings stress the significance of global cooperation in addressing environmental challenges like pollution and urban sprawl. Cross-border collaboration through international agreements and partnerships can be instrumental in mitigating the global impacts of these challenges.

4. Discussion

The results of this research illuminate the complex interplay between urban sprawl, urban traffic congestion, and historical strategies for congestion mitigation. These findings offer valuable insights into the challenges posed by urbanization and the potential avenues for addressing them. The findings from this research emphasize the multifaceted nature of urban development and the diverse strategies employed to address its associated challenges. To build more sustainable and livable cities, it is essential to consider a holistic approach that integrates cycling infrastructure, public transportation, lifestyle changes, and technology. Moreover, the significance of global cooperation in addressing urban and environmental issues calls for concerted efforts on an international scale. These insights provide a foundation for informed decision-making in contemporary urban planning and transportation policies.

In this discussion, we delve deeper into the implications of these results and their relevance for contemporary urban planning and transportation:

Lifestyle Changes for Pollution Control: The historical emphasis on lifestyle changes as a means of congestion mitigation is noteworthy. Small adjustments, such as reducing speed limits, can substantially impact emissions and air quality. Additionally, the increased use of public transportation can significantly contribute to reducing environmental pollution. These findings suggest that individual choices and government policies play a pivotal role in shaping the environmental impact of urban areas. Lu and colleagues (2019) advocate a range of strategies to control the formation of photochemical smog. Notably, "Lifestyle Changes" is a viable influence. Santos and colleagues (2020) claim that even small reductions in "Legal Speed" can lead to fuel conservation and a significant reduction in NO_x emissions, with only a negligible increase in hydrocarbon emissions. Additionally, increased utilization of public transportation has been shown to reduce photochemical smog effectively.

Leveraging Technology for Traffic Management: The historical analysis underscores the transformative potential of technology in traffic management. Intelligent traffic systems, real-time navigation apps, and vehicle-to-vehicle communication efficiently optimize traffic flow and address congestion. Embracing these technological advancements is crucial for modern cities seeking to alleviate traffic-related challenges. Technological advancements offer new opportunities for efficient traffic management. Innovations like intelligent traffic management systems, real-time navigation apps, and vehicle-to-vehicle and vehicle-to-infrastructure communications provide real-time data and the ability to optimize traffic flow. These technologies enable dynamic traffic management, enhancing urban mobility and reducing congestion (Whabby, 2023).

The Role of Cycling Infrastructure in Sustainable Urban Development: The correlation between well-designed cycling infrastructure and reduced urban sprawl underscores the significance of promoting non-motorized transportation options. Investments in cycling lanes and bike-sharing programs have the dual benefit of reducing traffic congestion and promoting localized living. This finding underscores the importance of integrating cycling infrastructure into urban planning to encourage active and sustainable modes of commuting.

Subway Systems as Catalysts for Denser, Sustainable Cities: The effectiveness of robust subway systems in mitigating urban sprawl is a compelling argument for investment in mass transit. Lower vehicle ownership rates and reduced traffic congestion in subway-served areas demonstrate that public transportation can foster higher population density around transit hubs. This encourages more sustainable and environmentally friendly urban development patterns.

Freeway Networks and Public Transportation Integration: The research highlights the potential of well-planned freeway networks combined with efficient public transportation systems. This integration reduces the need for long-distance car commuting, promoting a balanced urban development approach. However, it also underscores the importance of careful urban planning to ensure freeway systems do not exacerbate sprawl.

Multimodal Transportation for Urban Mobility: The concept of multimodal transportation, combining various modes like buses, trains, cycling, and walking, emerges as a key solution for addressing congestion and promoting sustainable urban mobility. This approach provides commuters flexibility, time and cost savings, and improved health while reducing traffic congestion. It aligns with the evolving preferences of urban populations for diverse transportation options.

Global Cooperation for Global Challenges: The importance of global cooperation in addressing environmental challenges like pollution and urban sprawl cannot be overstated. Pollution and congestion are not confined by geographic borders, necessitating international collaboration through agreements and partnerships. This global perspective is essential for mitigating the far-reaching impacts of these challenges.

Conclusions

The research presented here has delved into the intricate relationship between urban sprawl, urban traffic congestion, and the historical strategies employed to address congestion challenges. The research findings underscore the complexity of urban development and the interrelated challenges of sprawl and congestion. By embracing sustainable transportation options, encouraging lifestyle changes, leveraging technology, and fostering global cooperation, cities can pave the way for more livable, efficient, and environmentally conscious urban environments. The historical context serves as a guide, reminding us that thoughtful, holistic urban planning is essential for shaping the cities of the future. In conclusion, the synergy of lifestyle changes, multimodal transportation, technology, adaptive traffic management, and global cooperation holds the potential to create more livable, efficient, and sustainable urban environments. These findings offer valuable insights relevant to contemporary urban planning, transportation, and environmental management. By embracing these conclusions, cities can pave the way for a brighter and more environmentally conscious urban future.

As we draw this research to a close, several key conclusions emerge:

1. **Embracing Sustainable Modes of Transportation:** Investing in sustainable modes of transportation, such as cycling infrastructure and robust subway systems, is paramount for managing urban sprawl and congestion. These options reduce traffic congestion and promote healthier, more environmentally friendly urban environments.

2. **Leveraging Technology for Traffic Management:** Technology is pivotal in effective traffic management. Adopting intelligent traffic systems, real-time navigation apps, and vehicle-to-vehicle communication can optimize traffic flow, reduce congestion, and enhance urban mobility.

3. **The Importance of Lifestyle Changes:** Lifestyle changes, even modest ones such as reducing speed limits and promoting public transportation usage, can significantly impact congestion and environmental pollution. Encouraging these changes can contribute to healthier and more sustainable urban living.

4. **Global Cooperation for Global Challenges:** The global nature of environmental issues, including pollution and urban sprawl, necessitates international collaboration. Pollution and environmental issues transcend geographic boundaries, making global collaboration vital in combatting climate change and preserving the planet's health. Global cooperation through agreements and partnerships is essential to address these challenges effectively and plays a crucial role in mitigating pollution's global impacts.

5. **The Need for Holistic Urban Planning:** Holistic urban planning that considers cycling infrastructure, public transportation, technology, and lifestyle changes is crucial for addressing the multifaceted challenges of urban sprawl and congestion. Such planning should prioritize sustainability, environmental conservation, and the well-being of urban residents.

6. **The Historical Context as a Guide:** Understanding the historical context of urban development and congestion provides valuable lessons for contemporary urban planning. Both successful and unsuccessful historical strategies offer insights that can inform modern approaches to urban challenges.

7. **Adaptive Traffic Management for Changing Urban Landscapes:** Recognizing that traffic patterns and commuter flows evolve is crucial. City agencies must continuously review and adapt their traffic management strategies to address changing needs, accommodate population growth, and harness new

technologies. Regular monitoring, data analysis, and stakeholder engagement are essential for effective decision-making.

8. Promoting Multimodal Transportation for Urban Sustainability:

The concept of multimodal transportation, which combines various modes, stands out as a solution for improving urban mobility, and combining bicycles and public transportation has gained prominence in recent years (Liu & Lin, 2019). This approach aligns with the evolving psychological flexibility of the current generation (Fuchs & Fuchs, 2023). Cities can create more balanced and sustainable transportation systems by providing commuters with flexibility and reducing traffic congestion.

This approach offers several benefits:

Flexibility: Commuters can tailor their journeys according to their specific needs and preferences, choosing when and where to cycle and when to rely on public transportation.

Time and Cost Savings: Cycling to a public transportation station eliminates the need to find parking, reduces travel time, and can lead to cost savings. It also is a cost-effective alternative to driving a private vehicle for the entire journey.

Health and Sustainability: Incorporating cycling into commutes promotes physical activity, leading to health benefits. Moreover, increased use of public transportation reduces individual car usage, contributing to environmental sustainability and reducing traffic congestion.

Abstract

Research background: Research has consistently highlighted the negative impacts of sedentary lifestyles linked to increased screen time on health and social interactions. Concurrently, studies have emphasized the positive effects of nature exposure on well-being and the importance of integrating cultural heritage with tourism experiences. These findings serve as a foundation for Ein Qiniyya's approach to promoting sports tourism to address these challenges while embracing the village's unique cultural and natural attributes..

Purpose of the article: The purpose of this article is to explore the potential of promoting sports tourism in Ein Qiniyya to revitalize well-being and social bonds amidst the Age of Screens.

Methods: This article is grounded in a comprehensive literature review that encompasses research on sedentary lifestyles, the impact of screen-based interactions, nature's influence on well-being, cultural heritage in tourism, and sustainable practices. Through this review, a nuanced understanding of the challenges posed by the Age of Screens and the potential of sports tourism in Ein Qiniyya has been developed.

Findings & Value added: Findings suggest that by leveraging Ein Qiniyya's unspoiled nature and vibrant cultural heritage, sports tourism can counter sedentary lifestyles, foster face-to-face interactions, and offer authentic experiences that resonate with visitors. In conclusion, the development of internal and external sports tourism in Ein Qiniyya presents significant economic growth and recognition potential. However, addressing challenges such as infrastructure development, funding, stakeholder engagement, and marketing strategies is imperative for success. Overcoming these obstacles will position Ein Qiniyya as a thriving sports tourism destination, yielding economic growth and a heightened reputation. Embracing sports education and tourism can strategically transform Ein Qiniyya into a vibrant city that values active lifestyles, community cohesion, and its unique identity.

1. Introduction

As mayor of Ein Qiniyya, a Druze village at the foot of Mount Hermon in the Golan Heights of Israel, I find myself running a city in a very unique era - the age of screens (Tooth et al., 2021). Our world is increasingly connected through technology, and digital platforms have transformed the way we communicate, access information and make even our most personal decisions (Fuchs, 2000). In the midst of this digital revolution, however, we can also recognize some worrisome trends emerging – First of all, people are not physically moving like they used to, leading to sedentary lifestyles and health problems and the prevalence of screen-based human interactions has led to a decline in face-to-face interpersonal communication (Tooth et al., 2021). In this regard, I believe that it is crucial for me as mayor to address these challenges and revitalize the welfare and social fabric of our municipality. Ein Qiniyya, with its

* Corresponding author: rosh@einknia.com

unspoiled nature and vibrant cultural heritage, offers the perfect opportunity to promote sports tourism to revitalize the body and promote direct communication between people.

Sports tourism is an effective antidote to the sedentary habits that are prevalent in the age of screens. By encouraging our residents and visitors to be physically active, we can offset the negative effects of a technology-driven lifestyle. Physical activity not only improves physical health, but also mental well-being and overall quality of life (Fuchs, 2023; Marquez et al., 2020). In addition, sports activities provide people with a platform for face-to-face communication. In a world where virtual interactions have become the norm, it is important to create opportunities for real human contact. Sports tourism brings people together and allows them to bond over shared experiences, teamwork, and friendly competition. Sports activities facilitate interpersonal communication and allow people to interact beyond the confines of the screen, sharing ideas and building lasting relationships (Theodorakis et al., 2019).

Therefore, in this paper I try to show that promoting internal and external sports tourism in our village is not only a way to showcase our cultural heritage and natural beauty, but also a means to create a vibrant and cohesive community that values physical activity, human relationships, and the incomparable beauty of Ein Qiniyya.

1.1 Sports & Holistic Tourism

In 1982, the World Tourism Society (WTS) established two basic elements to define tourism activities. First, tourism includes transient, short-term travel to destinations that are not close to home or work. Second, it includes the activities that people engage in at a destination, whether for leisure, business, or other purposes (WTS, 1982 in Robinson, 2012, p. 45). In recent years, a new form of leisure and entertainment has emerged, sports tourism, which combines the thrill of sports with the excitement of travel (Su, 2012). Sports tourism has quickly become a significant segment within the broader tourism industry. It includes travel to attend or observe sporting events, as well as sports-related activities at various destinations (Radicchi, 2013; Schumacher, 2015). Sports tourism has proven to be a catalyst for destination improvement, employment growth, and tourism infrastructure development (Mashiach, 2021). In 2011 alone, for example, the sports tourism industry generated an incredible \$7.68 billion in revenue worldwide (Schumacher, 2015). This surge in popularity can be attributed to a variety of motivations, including the desire for physical challenge, cultural discovery, and the opportunity to meet like-minded people (Nordin, 2005; Šimková & Holzner, 2014; Dolinting, Yusof, & Soon, 2015).

Leisure, recreation, sports, and tourism play an important role in modern societies. They contribute to economic development, improving quality of life, promoting social cohesion, preserving cultural heritage, and promoting environmental sustainability (Roberts, 2006; Kelly, 2012; Butler, 1999) and psychological flexibility (Fuchs, 2023).

In recent years, tourism behavior has changed. Sports tourism and active vacation tourism are no longer limited to the younger generation. Activities such as hiking, mountain biking, car navigation, off-roading, safaris, and winter sports have gained popularity among people of all ages (Mashiach, 2021). This trend has created new opportunities for destinations to attract visitors and compete for hosting sporting events (Schumacher, 2015; Donner, 2011).

In the field of tourism, the concept of holistic tourism has gained importance. Holistic tourism involves the construction and operation of a destination, be it a city or a small town, with emphasis on the organic integration of regional resources, industrial development, social cooperation, and coordinated economic and social growth (Li, 2016). The focus is on utilizing local resources, offering comprehensive products and services, and meeting the diverse needs of tourists (Li, 2016).

1.2 The Location

The Golan Heights, covering an area of 1,250 square kilometers, offers a rich variety of attractions and activities for a wide range of interests. The region's unique geography is a playground for outdoor enthusiasts and adventure seekers. Mount Hermon, located in the northern part of the Golan, is the highest mountain in Israel. Its snow-covered slopes and well-developed ski resorts make it an enticing destination for winter sports tourism. Skiing, snowboarding and other exciting winter activities attract enthusiasts from near and far. The combination of challenging slopes and breathtaking views offers an unforgettable experience for thrill seekers and nature lovers alike.

To the west of the Golan lies the famous Sea of Galilee, a paradise for water sports enthusiasts. The huge lake attracts with its calm waters and offers an ideal environment for swimming, sailing, kayaking and fishing. The Sea of Galilee has become a well-known center for water sports activities and attracts

tourists seeking both relaxation and adventure. In the southern part of the Golan, the Route 98 trails are a paradise for cycling enthusiasts. This extensive network of roads and trails winds through the region's picturesque landscapes, offering an exciting experience for cyclists of all levels. The hilly terrain and breathtaking views along the route make Golan Heights an ideal destination for cyclists seeking both physical challenges and natural beauty.

The abundance of natural treasures located near each other has cemented the Golan's reputation. And can become a paradise for sports tourists. From winter sports on Mount Hermon to water sports on the Sea of Galilee to exciting cycling adventures along Route 98, the region offers a wide range of interests and preferences.

Ein Qiniyya is a small Druze village in the southern foothills of Mount Hermon in Israel. The village was granted local council status in 1982, signifying its administrative autonomy within the Israeli governmental system. Ein Qiniyya population in 2019 was 2,098 according to Israel Central Bureau of Statistics (ICBS, 2019). The population of Ein Qiniyya is growing steadily with an annual increase of 1.6%. Although the village is relatively small, it occupies an important place in the ranking of municipalities and is ranked 249th in Israel. Education plays an important role in the village, as evidenced by the high percentage of 12th grade students who successfully obtain the national Bagrut High School diploma. In the 2019-2020 academic year, the rate of students earning this diploma reached an impressive 95.5%, reflecting the commitment to academic excellence and the high value placed on education in the community.

In terms of economic indicators, the average monthly salary of an employee in Ein Qiniyya in 2022 is approximately 1,644 EURO. It is important to note that this figure is slightly lower than the national average income for an individual in Israel, which is approximately 2,618 EURO (ICBS, 2022). These statistics shed light on the economic landscape of the village and provide insight into the income levels and economic opportunities of the residents.

Ein Qiniyya has immense potential for the development and management of sports tourism. The topography of Ein Qiniyya is built on a steep slope. The upper houses of the village are 850 meters above sea level and the lower houses of the village are 600 meters above sea level. A difference in altitude of 150 meters, which corresponds to the horizontal distance between them about 750 square meters. By taking advantage of the natural beauty of the region, the cultural heritage of the village, and the increasing popularity of sports tourism, Ein Qiniyya can position itself as a unique and attractive destination for sports enthusiasts and travelers. By examining the challenges, opportunities, and strategies for success, we can unlock the full potential of sports tourism for the village, its residents, and the region.

1.3. Reasons for Promoting Internal and External Sports Tourism

Promoting internal and external sports tourism in Ein Qiniyya can be considered the best way to fulfill the role of a mayor in the age of screens for several reasons:

Promoting sports tourism can provide opportunities for residents to connect with each other, socialize, and strengthen the community (Struthers, 2011; Gibson, Kaplanidou, & Kang, 2012). It has the potential to bring Ein Qiniyya local community together, encourage participation, and foster a sense of belonging.

The city can promote its identity and create a positive image that resonates with both residents and potential visitors by using sports tourism showcases offerings, share success stories, generate interest, leveraging natural landscapes, cultural heritage, and sports facilities (Hargrove, 2017). Sports tourism can serve Ein Qiniyya as a platform to highlight Ein unique features and attractions.

In the age of screens, physical inactivity and screen addiction have become major problems (Kardefelt-Winther, 2017). By promoting sports tourism, the city can promote physical activity, health, and wellness among residents and visitors. By using digital platforms, Ein Qiniyya can disseminate information about sports activities, provide training resources, and facilitate virtual engagement in sports-related initiatives, motivating people to lead more active and balanced lifestyles.

1.4. Obstacles Promoting Internal and External Sports Tourism

The development of internal and external sports tourism in Ein Qiniyya has great potential, but there are some obstacles that we must address.

It is critical to the success of sports tourism initiatives that the city has the necessary resources to meet the facilities needs of participants and visitors (Gibson, 1998; Weed & Bull, 2012; Higham & Hinch, 2018). One of the main obstacles that Ein Qiniyya is facing is the need for adequate infrastructure and

facilities to support sports tourism. This includes the construction or renovation of sports facilities, accommodations, internet and transportation systems.

Securing sufficient funding and investment for sports tourism development can be a significant barrier. The costs associated with infrastructure development, marketing campaigns, event organization, and ongoing maintenance can be significant (Heydari et al., 2022). There is a need to develop various sources of funding, such as government grants, private sponsorship, and partnerships, to ensure the financial sustainability of sports tourism efforts.

Engaging and mobilizing diverse stakeholders, including residents, community organizations, sports associations, and government agencies, is essential to the success of sports tourism initiatives. Effective communication, collaboration, and negotiation are necessary to build consensus, address concerns, and ensure that all stakeholders are aligned in their vision and commitment to Ein Qiniyya sports tourism (Gjertsen, 2022).

Effective marketing and promotion strategies are needed to promote sports tourism destinations. The challenge of establishing a recognized and desirable location for sporting events and activities can include targeted advertising campaigns, participation in industry trade shows and exhibitions, use of digital marketing channels, and building partnerships with tourism agencies and sports organizations (Yamashita & Takata, 2020). The seasonality of sports tourism and the potential impact of weather conditions can be challenging. The location of Ein Qiniyya near Mount Hermon means that certain sports and activities may be limited to certain seasons or weather conditions. Developing a diverse range of sports that can be enjoyed throughout the year and contingency plans for bad weather will be critical to attracting visitors and ensuring economic stability (Mesci et al., 2021).

2. Methodology

The combined methodology of a comprehensive literature review and assumptions development provides a robust foundation for the research, enabling a deeper understanding of the challenges of the Age of Screens and the potential of sports tourism as a comprehensive urban development strategy in Ein Qiniyya.

2.1. Methodology: Literature Review

The research methodology is founded on a rigorous literature review approach. This methodology aims to establish a robust theoretical framework and gather essential insights into several key domains, including sedentary lifestyles, screen-based interactions, well-being influenced by nature exposure, cultural heritage in tourism, and sustainable tourism practices. The comprehensive literature review involves the following steps:

The literature review begins with formulating a structured search strategy. This strategy defines the scope of the research and specifies the key terms and phrases related to the study's focus areas. Boolean operators, such as AND, OR, and NOT, are employed to refine search queries and maximize the relevance of sources.

Inclusion and exclusion criteria are established to ensure the relevance and quality of sources. Only peer-reviewed articles, academic papers, books, and reports published in reputable journals and publications are considered. Primary sources with empirical data and secondary sources with theoretical contributions are included.

Each source is critically evaluated for its relevance, credibility, and quality. Relevant information is extracted from the sources, including key concepts, methodologies, findings, and recommendations. A structured framework categorizes the information according to the study's focus areas.

The information extracted from the selected sources is synthesized to develop a comprehensive understanding of the subject matter. Common themes, trends, and key findings are identified through qualitative analysis. Connections between sedentary lifestyles, screen-based interactions, well-being, cultural heritage, and sustainable tourism are explored.

2.2. Methodology: Assumptions Development

Based on the insights and findings gathered during the literature review, a set of assumptions is systematically formulated. These assumptions serve as guiding principles for the research and contribute

to developing the study's objectives and strategies. The process of assumption development involves the following steps:

Identification of Key Insights: The key insights and findings extracted from the literature review are carefully reviewed and analyzed. Concepts related to sedentary lifestyles, screen-based interactions, nature's influence on well-being, cultural heritage in tourism, and sustainable tourism practices are considered.

Formulation of Assumptions: Assumptions are developed based on the identified insights. These assumptions encompass the potential of sports tourism to address sedentary lifestyles, enhance social bonds, promote cultural heritage, and contribute to well-being. They are formulated in clear, concise statements aligning with the research objectives.

Validation: The formulated assumptions are critically evaluated to ensure they accurately represent the insights gained from the literature review. They are validated through logical reasoning and supported by evidence from the reviewed sources.

Integration into Research Framework: The validated assumptions serve as foundational elements for the research framework. They guide the development of research objectives, strategies, and the overall research design.

3. Results

The comprehensive literature review conducted for this study has yielded valuable insights into the multifaceted dynamics of sedentary lifestyles, screen-based interactions, well-being influenced by nature exposure, cultural heritage in tourism, and sustainable tourism practices. The reviewed literature has emerged as a transformative approach for this municipality underscored the detrimental effects of sedentary behaviors and excessive screen time on physical health and social interactions, echoing concerns raised in contemporary research (Tooth et al., 2021). Conversely, the positive impact of nature exposure on overall well-being has been consistently documented, emphasizing the therapeutic value of natural environments (Marquez et al., 2020). Moreover, the significance of integrating cultural heritage with tourism experiences has emerged as a pivotal driver of destination attractiveness and visitor engagement (Hargrove, 2017). Sustainable tourism practices are vital for long-term destination development, fostering economic growth, and preserving cultural and natural assets (Carneiro et al., 2016).

These findings collectively lay the groundwork for understanding the unique challenges of the Age of Screens and the potential of sports tourism as a holistic urban development strategy in Ein Qiniyya. The literature review highlights the critical need to counter sedentary lifestyles and the erosion of face-to-face interactions and underscores the role of sports tourism in achieving these objectives. In the following sections, these insights will be translated into concrete strategies and recommendations to leverage Ein Qiniyya's natural beauty and cultural heritage as catalysts for revitalization, community cohesion, and enhanced well-being in an age marked by digital screens.

4. Discussion

The findings derived from the comprehensive literature review underscore the urgency of addressing the challenges posed by the Age of Screens in contemporary society. Sedentary lifestyles and screen-based interactions have become prevalent, leading to adverse effects on physical health and a decline in face-to-face interpersonal communication (Tooth et al., 2021). In this context, the role of Ein Qiniyya as a Druze village nestled amid the unspoiled nature of the Golan Heights takes on new significance. The village's unique combination of natural beauty and vibrant cultural heritage provides a promising foundation for promoting sports tourism as a multifaceted solution.

One central discussion that emerges from the literature is the potential of sports tourism to counteract sedentary habits and encourage physical activity. Physical activity, as highlighted in previous research, is crucial for improving physical health and plays a pivotal role in enhancing mental well-being and overall quality of life (Marquez et al., 2020). Sports tourism can be a powerful tool to inspire residents and visitors to engage in active lifestyles, offsetting the negative consequences of excessive screen time.

Furthermore, the literature emphasizes that sports activities inherently facilitate face-to-face communication and the building meaningful relationships. In a digital age where virtual interactions have become the norm, the value of creating opportunities for genuine human contact cannot be overstated. Sports tourism has the potential to bring people together, fostering community engagement, shared experiences, teamwork, and friendly competition (Theodorakis et al., 2019). It transcends the

confines of screens, allowing individuals to interact authentically, exchange ideas, and build lasting connections.

Conclusion

The discussion on sports tourism in Ein Qiniyya extends beyond its immense potential for economic growth and recognition. It becomes a strategic pathway for promoting physical activity, strengthening community bonds, showcasing cultural identity, driving economic development, and prioritizing the health and well-being of residents and visitors alike. This holistic approach to urban development aligns Ein Qiniyya with the changing needs of a digitally connected society, ensuring that it thrives as a vibrant, active, and culturally rich destination in the age of screens.

Embracing sports education and tourism is a strategic move for the Mayor of Ein Qiniyya and a transformative one. By promoting physical activity, fostering community engagement, showcasing the city's identity, driving economic development, and prioritizing health and well-being, the Mayor can lead Ein Qiniyya toward a brighter and more prosperous future. With careful attention to addressing the obstacles and leveraging the immense potential of sports education and sports tourism, the Mayor can create a dynamic and thriving city that values active lifestyles, strong community bonds, and the unique charm of Ein Qiniyya.

However, several obstacles need to be addressed to exploit this potential fully. Adequate infrastructure and facilities must be developed or improved, including sports facilities, accommodations, internet connectivity, and transportation systems. Securing sufficient funding and investment through various sources will be crucial for the financial sustainability of sports tourism initiatives. Engaging and mobilizing diverse stakeholders is essential for building consensus and ensuring a shared commitment to Ein Qiniyya sports tourism. Effective marketing and promotion strategies are needed to establish Ein Qiniyya as a recognized sports tourism destination. Addressing the challenges of seasonality and weather conditions through developing a diverse range of sports and contingency plans will attract visitors and ensure economic stability.

By overcoming these obstacles, Ein Qiniyya can position itself as a thriving sports tourism destination, reaping the benefits of increased tourism, economic growth, and enhanced reputation. Incorporating these principles will enable leading the village towards a prosperous future. By harnessing the power of sports and tourism, the city can flourish by promoting physical activity, community engagement, economic development, and well-being, all while maintaining its cultural authenticity. Together, Ein Qiniyya can stand as a shining example of a city thriving in the age of screens.

Abstract

Research background: The direction of the tourism industry towards digital change is a particularly hot topic of many discussions. Especially during the pandemic, the initiatives started to be strengthened for the accelerated development of digital elements that will be able to support the tourism industry, especially in the post-pandemic period. Destination try to refresh their action by using several digital marketing tool to attract tourist after so difficult period.

Purpose of the article: The purpose of the contribution is to bring closer the perception and use of digital information as a means of digital marketing as well as the digital offer itself as a way of sustainability of the chosen tourism destination, using the example of the town of Prešov in the Slovak Republic. The conducted research investigates the behaviour of the modern digital tourist with regard to the digital offer provided to him through modern technologies.

Methods: Digitally oriented research was based on author's questionnaire research, the results of which were evaluated using several methods. As the main methods of evaluating the research result were Kruskal-Wallis and Chi-square test.

Findings & Value added: The results of the conducted research showed that digital information plays a dominant role in information in the tourism industry. Its participants are moving towards transformations and to a profile of distinctly digital tourist. It relies on modern technologies and therefore it is essential that individual tourist destinations also adapt to this digital trend and develop digital services for the benefit of future sustainability.

Keywords: digital marketing, digital tourism, smart cities, digital tourist, sustainable tourism

JEL classification: M31, L83

1. Introduction to the digitalization of tourism sphere

The world of digital media is constantly changing and shifting. Evolving technologies and the way people use them is transformed not only to access information but also a way of processing information in a variety of interactive channels (Slivka, 2015; Rajnoha et al., 2019). Rapid emergence and evolution of digital technology have created an enormous opportunity also for the tourism industry to transform itself due to the increasing number of travellers and the changing requirements of travellers' organizations (Puri et al., 2023; Stefko, Bacik et al., 2022).

Tourism is one of the most dynamic sectors and a way to connect these two worlds, entails a new form of communication with travellers - the tourists (Slivka, 2015). Over the last decade, advances in digital technologies are creating new opportunities for services by proposing not only new platforms to increase value delivery and creation but also new ways of providing offerings to customers (Sklyar et al., 2019; Stefko et al., 2020). Digitalization accelerates the need of tourism and hospitality ecosystems to reframe business models in line with a data-driven orientation that can foster value creation and innovation (Troisi et al., 2023).

Digitalization of tourism sector is closely related to digital marketing (Heckova, Kubak, Marková et al., 2021). Migration movements and tourism in general, together with the improvement of new technologies, have meant an increase in the availability and ease of information related to tourism. At the same time, the use of artificial intelligence has opened up new horizons in which digital marketing strategies associated with tourism can improve this industry and thus offer more possibilities in the short

* Corresponding author: kristina.sambronska@unipo.sk

term (Lacarcel 2022). In similar context Perinotto and de Siqueira state, the dynamics and changes that constantly occur in this market lead the tourist activity to constant renewal. The development of the tourism market brings a new challenge to the tourism sector, which points out that the tourist is increasingly informed and independent. A consumer who has immediate access to information via digital platforms, he feels able to offer himself services that companies do not offer as part of destination products. With this challenge to overcome, it is necessary to know the potential consumer in order to create marketing strategies that will either attract or convince them to travel. Closest communication with this public and understanding of its needs a desire is possible through digital marketing (Perinotto, de Siqueira, 2021). Many destinations are fiercely fighting for their visitors precisely by using digital marketing tools that increase awareness of their existence and bring the potential to motivate future travelers to visit them. In the modern sense, these tools are also defined as smart elements that bring new ways of participating in tourism. Valeri & Baggio mentions that smart technologies are composed of a cohesive system of several digital tools. These are mainly cloud computing technologies, social networks, IoT and mobile applications. These tools can enhance the interactions between actors. On the other hand, they support the human-technology interaction and information exchange by providing the possibility to establish real-time communication, personalized interactions and to increase engagement which is extremely important in the tourism industry (Valeri & Baggio, 2021).

In connection with tourism, the digital development of destinations is also closely connected. It involves the application of new elements and trends, hand in hand with modernization in digitalization (Dzurov Vargová, et. Al., 2020). As claimed by Huang et al. (2023), smart tourism destinations are another emerging topic that needs to be explored more deeply. Also, the authors Bastidas-Manzano et al. (2021), mention that the concept of smart tourism destinations has emerged in tourism research, few studies have delved deeply into the topic, and the little research focused on the topic has not offered an overview of its development, current scope and potential areas of interest. However, they point to the fact that the topic of digitization of tourism destinations is dominated by studies based mainly on technologies. Up to their results, smart tourism destinations can shape tourist behaviour through technology, culminating in sustainable destination development and the formation of smart cities (Šenková et al., 2020). The authors Schönherr et al. (2023) also agree in their opinion, when argue that digital transformation also provides opportunities for sustainable tourism development. Due to the fact that the tourism sector is a sector of the tertiary sector based on the provision of services, additional specifics have arisen for this sector in connection with digitalization. The combination of services and digitization also gave rise to the concept of servitization. It was also described, for example, by the author collective Kowalkowski et al. (2017), who define the term digital servitization as that which refers to the utilization of digital tools for the transformational processes whereby a company shifts from a product-centric to a service-centric business model and logic. The servitization literature has evidenced that the development and provision of Smart Product-Service Systems usually happen through collaborative ecosystems, but little is known about the different arrangements that ecosystem's actors can follow to provide digital solutions (Dalenogare et al., 2023).

The use of digital marketing by tourism has an increasing importance, since most of the time, it is through digital marketing that it is possible to obtain information about tourists or make them reach information (Arantes, Sousa 2021). While technology has been advancing significantly and becoming increasingly widely adopted amongst visitors over the decades (Vasanicova et al., 2021), the application of digital technologies by Destination Management Organisations to fulfil their management role has been generally limited (Estêvão et al. 2020). The tourism industry in current status should adopt new strategies and innovations to keep up with post pandemic recovery and maintain healthy competition in its ecosystem (Aitken 2016 in Puri et al., 2023).

2. Methods

The theoretical background of the study (scientific abstraction method) formed the fundamental basis for obtaining new knowledge, resulting in the author's questionnaire research, which was necessary for the fulfilment of the established research goal. The aim of the study *was to bring closer the perception and use of digital information as a means of digital marketing as well as the digital offer itself as a way of sustainability of the chosen tourism destination, using the example of the town of Prešov in the Slovak Republic*. The conducted research investigates the behaviour of the modern digital tourist with regard to the digital offer provided to him through modern technologies.

In order to fulfil the goal, an author's questionnaire was compiled, which was focused on the digital tourist and the offer of digital tourist products in the town of Prešov that can be a proper fundamental of

future sustainable development of tourism in the town. Questionnaire questions were open, where respondents could express their opinion in closed questions (choice type) and scaled questions set on a Likert scale (from 1 = absolute agreement to 5 = absolute disagreement). 178 respondents participated in the questionnaire, while the inquiry took place exclusively in the town of Prešov - through personal contact. The places of contact were cultural monuments (museums, galleries, selected historical and modern sights), tourist information centres and selected restaurants and cafes. The study presents the evaluation of the questionnaire by cumulative frequency, selected methods of descriptive statistics, while selected results are also presented using graphs and tables made in the MS Excel program. The period of data collection through the questionnaire survey in the tourism destination of the town of Prešov was spring months of year 2023, in concrete March to May 2023 (i.e. the post-covid research period).

As part of the "age" variable, the initial investigation was carried out with an open question to enable the evaluation of the variable with descriptive statistics. Subsequently, age intervals were chosen and the respondents were classified into seven intervals 19-25; 26-35; 36-45; 46-55; 56-65; 66-75 and 76-86 years old.

As part of the research, hypotheses were established, which were subsequently verified or falsified using appropriate mathematical and statistical methods at the level of significance (alpha) $\alpha = 0.05$, i.e. j. at 95% probability.

Hypothesis 1: There is a relationship between the attractiveness of the product for the digital tourist and the location of the search for digital information about the tourism destination.

Hypothesis 2: There is a difference between the preferred way of searching for digital information about a tourism destination and the age of the digital tourist.

If the p-value of the selected mathematical-statistical test was less than the set level of significance (α), the null hypothesis ($H_1 : \mu = \mu_0$) was rejected and an alternative hypothesis was accepted, i.e. original hypothesis ($H_1 : \mu \neq \mu_0$).

3. Results

From the basic description of the respondents, resulting from the questionnaire research, it can be stated that 178 respondents participated, while 49% of the research sample were women and 51% were men. The average age of the respondents was 38.5 years. Based on the standard deviation, which is 14.57, it can be seen how widely the values of the variable "age" are distributed in the research sample. The youngest research participant, (the minimum age) was 19 years old. The oldest research participant (the maximum age value) was 86 years old.

The largest group of respondents consisted of respondents with a secondary education, 51%, followed by respondents with a completed second-level university education, 31%. Respondents also selected first (bachelor) and third level university education (doctoral- PhD), each group 9%.

The current respondents' status was most often stated as an employee by up to 60%, entrepreneur was stated by 13% of the respondents, 10% of the respondents were pensioners. There were only 8% of students, 5% of respondents were not currently working and 4% indicated another possibility, being a parent on maternity leave or a disabled person.

Respondents stated that 59% currently visit the town of Prešov with their family, 22% with their partner, 13% with friends, and 6% of respondents stated that they usually travel alone.

For 34% of the respondents, the main activity during their stay in the town of Prešov was getting to know the culture, 24% nature or sports activities, 15% of the respondents indicated participation in events held in the town and 11% of the respondents come for clerical tourism. Entertainment was mentioned as the main motive by 9% of respondents and 7% of respondents come for the purpose of shopping tourism.

From the results of the questionnaire, which was focused on digital means used in tourism and the evaluation of the digital product of the town of Prešov by tourists, it is possible to state the following findings:

- evaluation of the respondents' answers regarding obtaining information about the destination with regard to the age categories into which they were additionally classified, it can be stated, which also follows from Table 1, that the respondents tend to search for information mainly in the form of recommendations and information from acquaintances and friends and in digital form. The category Tourist Information Centre (TIC) was presented rather as an additional choice/ option (the most preferred answers are marked in dark font).

Table 1. Contingency table of the mean of the variables "age category" and "obtaining information about the destination“

Age category	Digital information	Tourist information board	Family, relatives	Printed materials
19-25	2.12	4.78	2.26	4.27
26-35	1.55	4.23	1.27	3.55
36-45	1.67	3.74	2.16	2.61
46-55	2.45	2.91	2.34	2.71
56-65	2.71	2.12	2.15	2.11
66-75	2.89	1.79	2.58	2.56
76-86	3.56	3.09	2.48	1.92

Source: own processing 2023

- Obtaining the information in a digital form is the key to obtaining information about the destination (the answer is "absolutely prefer") for respondents aged 26 to 35 (64%) and from 26 to 45 (58%), while the given method of searching for information was also strongly preferred by respondents from 19 to 25 years old (47%), while the mentioned age category minimally uses tourist information services (81% - cumulative answers I rather do not prefer, I absolutely do not prefer). Respondents in the second half of the productive age (the answer "rather prefer") expressed a positive opinion about the obtaining the information. In concrete it was 43% of respondents in the age range of 46 to 55 years and 37% of respondents in the age range of 56 to 65 years. Respondents in the age category of 76 to 86 years most often stated the option "rather I don't prefer" (61%). Within the last category, respondents preferred information about the destination obtained through print materials (79%) and subsequently based on recommendations from their family and relatives (42%), who usually had previous personal experience with the destination and its services.
- The most frequently preferred elements of digital tourism marketing (either when obtaining information or tourist products) were social networks by 34% of women and 41% of men. Within the age category, it is preferred by 36 to 45-year-old respondents (39%), the digital tool web was popular among respondents, even though it reached an average value. It is most preferred by women (28%) with secondary education (24%), within the age category 46 to 55 (31%). Mobile applications are preferred by men 47%, which is +12% more than in the case of women. The digital guide is preferred by respondents aged 26 to 35 (47%), who always access it and 23% who almost always download it and draw information from it. In terms of gender, it can be stated that there was a percentage agreement between the respondents in the answer. Influencers as a source of evaluated information in tourism were accepted by respondents from 19 to 25 years old (75%), while as the age of respondents increases, the influence of influencers decreases slightly up to the age limit of 45 years, and in the case of older respondents, the percentage of influence is minimal or zero (76-86 years).
- The respondents indicated as a source of digital information regarding the destination subcastes, which dominate in the age categories 35 to 45 years (39%) and 46 to 55 years (35%), while these were mainly respondents with higher education (I, II., and III degree). Digital animations dominated the youngest age group of 19 to 25 years (41%), while respondents with secondary education (38%) and students (31%) prevailed.
- Visitors to the town of Prešov, who more often used digital technologies to search for information about the destination, i.e. respondents from 26 to 45 years old (answer "always") were more critical of this type of tourism product (65%), indicating that this type of product is few (45%), poorly advertised (78%). Respondents expressed dissatisfaction with the quality of the product (cumulatively 61% rather dissatisfied and dissatisfied). Satisfaction with the quality of digital products of the city of Prešov was expressed by 45% of respondents in the age category of 56-65 years. Respondents in the age category 19-25 years (34%) and 56-65 years (31%) single out digital tourism products as attractive.
- Respondents perceive a connection between sustainability and digital elements of marketing that are applied in tourism, while the dominant "smart elements of tourism" were the digital guide

(82%), mobile applications (e.g. Booking, TripAdvisor, Trivago, etc.) (63%), it is possible to assume that they often prefer them to printed materials.

As part of the first hypothesis, the connection between the attractiveness of the product for the digital tourist and the place of obtaining the digital information about the destination from the point of view of visitors to the town of Prešov was determined.

To verify the hypothesis, a statistical method was chosen for non-parametric data of several groups (unpaired variables), Kruskal-Wallis test (Table 2).

Table 2. Kruskal – Wallis test H_1

K	4.99
[K]	9.49
DF	4
p-value	0.29
α	0.05

Source: own processing 2023

The results shown in Table 2 show that the calculated K value (4.99) was less than the critical value of IV. degree (DF) of the test (9.49) and the calculated p-value (0.29) was greater than the established alpha significance level (0.05). In view of the above mentioned, it was possible to accept the null hypothesis, which discussed statistically insignificant differences, and in which the assumption was made that "there is no statistically demonstrable connection between the opinion on the attractiveness of the product for the digital tourist and the place of obtaining the digital information about the tourism destination" at the example of the town of Prešov.

Hypothesis 2: There is a difference between the preferred way of searching for digital information about a tourism destination and the age of the digital tourist.

As part of the verification of the second hypothesis, it was determined whether there is a connection between the preferred method of obtaining the information and the age category of the visitor to the town of Prešov.

To test the hypothesis two, respondents' responses were evaluated in relation to the demographic variable "age". Respondents' answers to the opened age question were additionally divided into seven age categories.

For a closer specification, a table 3 explaining average values of responses to the method of searching for digital information about the destination town of Prešov was compiled within individual digital options (social networks, mobile applications, web sites, audio guides).

Table 3. Average values of the answers "digital information search" depending on the "age category"

Age category	Social networks	Mobile app	Web	Audio guide
19-25	2.02	3.18	2.44	3.18
26-35	1.94	2.95	2.32	3.26
36-45	1.94	2.64	2.57	2.93
46-55	2.30	2.75	2.44	2.71
56-65	2.28	2.94	2.50	2.45
66-75	2.57	2.43	2.43	2.87
76-86	3.00	4.00	3.00	2.00

Source: own processing 2023

The question focused on the preferred method of searching for digital information about the tourism destination was formulated on a scale of options: always; often; sometimes; rarely; never. It was the basis for the verification of the hypothesis, through the χ^2 test method (chi-square test- Table 4).

Table 4. Chi-square test of destination information obtaining depending on age category

χ^2	63.16
$ \chi $	38.64
df	24
p-value	0.00
α	0.05

Source: own processing 2023

The results shown in Table 4 showed that the calculated chi-square value ($\chi^2 = 63.16$) was greater than the critical chi-square value of the 24th degree of freedom $\chi^2 (0.05) (24) = 38.64$ and at the same time the calculated p - the value (0.00) was less than the established level of significance ($\alpha = 0.05$). Based on the results, it is possible to accept an alternative hypothesis and confirm a statistically significant difference that "there is a difference between the preferred method of obtaining the digital information and the age of the digital tourist".

From the given results and the performed chi-square test, it follows that the differences in the obtaining the information about the destination in relation to the age categories of the visitors were confirmed.

4. Discussion

Based on the presented results, it can be stated within the studied sample that respondents from 19 to 55 years of age, regardless of gender, with university and secondary education, within the economic status of employment, had a high potential to be addressed by digital marketing. The stated findings show a positive correlation with the study of Tajtáková 2020.

From the results of the mentioned research, it can be observed that visitors to the town of Prešov, who often used digital technologies and preferred digital obtaining of information about the tourism destination (while answering "always" on the Likert scale) were more critical of this type of tourism product. There are several explanations for this dependency:

- higher expectations – visitors who rely heavily on digital technologies tend to have higher expectations of digital products. The higher level of use of digital tools can also be related to their higher expected quality and functionality of digital tourism products. If these expectations are not met, it can lead to more criticism,
- more experience – more frequent use of digital technologies can mean that visitors have more experience with different digital products. In case of negative experiences with some products of the mentioned type, it may lead to greater criticism of new digital products, including digital tourism products.
- more informed - visitors who prefer digital search for destination information are likely to be better informed about the destination's leisure options and services. Growing awareness can increase visitors' perception of digital tourism products as they have a better idea of what to expect.

As part of testing hypothesis H1, the product for the digital visitor was assessed separately, as it is possible to agree with the above-mentioned authors that digitization will be a significant part of tourism services. Hypothesis H1 was not confirmed. In the basic evaluation of the respondents' answers from the questionnaire, it was found that visitors to the town of Prešov, who more often used digital technologies and preferred digital search for information about the destination (answer "always"), were more critical of this type of tourism product. Considering the above result for frequent users of modern technology, it would be advisable to improve the quality of the given product and make the product offer more attractive in relation to the "digital tourist" segment.

Hypothesis H2, examining the connection between the preferred way of searching for information and the age of the respondent, was confirmed. As important findings, it can be stated that digital information about the destination is most often acquired by the generation aged 26-45 (1.94). The 66-75 age group most often visits the tourist information centre (2.43). The 26-35 age group (2.32) gets advice from family and friends most often, and the 76-86 age group (2.0) uses print material most often.

Conclusion

Since the time of improvement and promotion of digitization, as well as competition, i.e. the offer of digital products in the tourism industry, is increasing, it is necessary to vary and expand the offer for the digital tourist. Author Troisi also mentions that digital transformation forces companies to increase agility and proactivity, implement constant changes and constantly adapt strategies to market demand (Troisi et al., 2023). It is therefore necessary that not only destination management workers (i.e. workers of the regional tourism organization) collaborate on the preparation of the digital product of a modern tourism destination, but that part of the creation is entrusted to experts in digital technologies and digital marketing.

It is necessary to start investing in modern digital products to achieve higher goals of tourism development. There is need to set logical and modern structure of it and identify the key key entities of future management. The importance of investing in digital innovations in tourism in destinations is also confirmed by a British study that points to, „demonstrable need for increased investment in digital technologies as a way to collaborate and work more efficiently in the future” (Llewellyn, 2021, p. 5).

In the context of digital marketing, the connection with the sustainable growth of a tourist destination can be supported by a well-known personality promoting a dominantly ecological way of travel. The thematic alignment between the area in which the influencer operates and the digital tourism product presented by him is an important element in building credibility and the success of a marketing campaign. At the same time, if an influencer talked about an environmental and sustainable topic related to nature conservation, responsible travel or other topics related to sustainable tourism before being approached in a marketing campaign related to the promotion of digital tourism products, this can have a positive impact on perception of its connection with a digital tourism product that emphasizes these values.

Department of Tourism, Dražovská 4, 949 01 Nitra, Slovakia

Abstract

Research background: Creativity is now the driving force behind the development of modern society and an integral part of the strategies to increase economic growth and promote innovation within it. Destinations across the world are beginning to replace or supplement culture-led development tourism strategies with creative tourism. The starting platform for developing creative tourism is cultural tourism, which is dominant globally and within tourism in Slovakia.

Purpose of the article: The paper discusses the specific potential that Slovakia disposes of from the point of view of culture in the example of pottery. Our paper aims to present pottery as a potential tool in the development of tourism in the Gemer region.

Methods: We apply an interdisciplinary approach in the preparation of the paper. We collect and analyze the necessary information from primary and secondary sources. Data was collected from visitors to Gemer using a questionnaire survey.

Findings & Value added: Based on the questionnaire survey, we formulate the characteristics of a creative tourist in Gemer. Tourism stakeholders can work with the results achieved. They are important for their activities, targeted offers and the development of an attractive creative tourism offer for visitors to the region.

Keywords: creative tourism, cultural tourism, Gemer, pottery, sustainable development

JEL classification: Z32

1. Introduction

Creative tourism is a new form of tourism which has the potential to change the existing models. If we diversify and innovate we can expand the tourist experience. By doing so, creative tourism can help to stimulate local economic, social and cultural development (Richard, 2009).

Destinations across Slovakia are constantly looking for new ideas that will help attract tourists by being both competitive and sustainable at the same time. Especially in the last two decades, creativity has also found its place in tourism, with experiential learning, fun, self-realisation, interaction, active participation, authentic experiences and the development of the cultural tourist's manual skills being its characteristic features.

This content of creative activity is cross-sectionally present in different types of tourism such as cultural tourism, gastronomic tourism, rural tourism, thematic tourism and recreational tourism. Creativity is on offer in various tourism enterprises. Using a programme of cultural activities at their facilities to eliminate the holiday stereotype in addition to the traditional cultural facilities (e.g. community centres, outreach centres, observatories, galleries, libraries, etc.) and cultural-historical objects (e.g. open-air museums, castles, chateaux, traditional architecture objects, etc.). Visiting these institutions is a frequent motive for culturally oriented tourists. In general, these attractions are faced with the challenges of diversifying from the norm. Updating educational services and making them more attractive to the general public.

Cultural tourism is very important for tourism in Slovakia. It includes and develops from passive observation and cognition of culture to a more active and intensive experience, by promoting active involvement of the visitor in traditional activities. The need for self-fulfilment is a strong motive for

* Corresponding author: vbizikova@ukf.sk

participation in cultural tourism (Richard, 2011). The starting point for creative tourism is cultural tourism, developed in locations rich in cultural heritage, with cultural and historical links to traditional crafts.

In Slovakia, pottery has a rich tradition and excellent conditions thanks to the presence of multicoloured clay deposits and sufficient wood for firing products in kilns. Pottery was one of the most widespread crafts in Slovakia from the Middle Ages until about the middle of the 20th century. There are known areas of production in Western Slovakia (e.g. Veľké Leváre, Stupava, Modra, Senica), Central Slovakia (e.g. Pukanec and surroundings, Banská Bystrica and surroundings, Horná Nitra and Turiec, Orava, Liptov, Novohrad and Hont, Gemer) and Eastern Slovakia (e.g. Pozdišovce, Bardejov, Prešov, Snina) etc. (The Centre for Folk Art Production, 2023).

The rich cultural heritage of the Gemer region and its strong creative tradition reflect not only the past but also shape the future. On this unique basis and by developing the strengths of the Gemer destination, this less developed region can meet the challenges of today's demand for creative tourism.

In line with the trend of creative tourism product development, this paper focuses on the potential of pottery as part of the creative tourism offer in Gemer. The creative base of this destination includes handicraft production like pottery, which has the potential to attract artistic visitors. It will meet the specific needs within the framework of creative tourism as a modern sustainable tourism development path in the selected destination Gemer.

1.1 Literature review

The starting platform for the development of creative tourism is cultural tourism, which is dominant both globally and within Slovakia. The major difference between cultural and creative tourism lies in the resource base of both variations and in the tourists' motivation to participate in the activities on offer. Cultural tourism mostly focuses on exploring cultural and historical heritage, tangible and intangible cultural heritage, historic and biographical artefacts, descriptions, legends, as well as different art forms. However, the consumption of cultural products passively takes place. In contrast, the main goal of creative tourism is to experience things first-hand. Experiencing new emotions, and acquiring new knowledge and skills through creative activities shared with fellow tourists, and through interaction with the locals. (Pine and Gilmore, 2019; Richards and Wilson, 2007).

The roots of the creative tourism concept go back to the mid-1990s when a group of researchers and practitioners were looking at ways to enhance the sales of craft products to tourists. The first craft experiences were related to the production of textiles within the project Eurotex. Many visitors were interested in seeing how craft products were made, and many wanted to learn craft skills for themselves (Richard, 2009). We started to gain knowledge on the use of creativity in tourism when studying the research papers of Richard and Raymond (2000), which focus on creativity as a factor in destination development.

Creative people, who according to Florida (2012) represent the creative class, are naturally attracted to diverse and vital places that have become popular and prosperous thanks to the presence of the creative sector. Creative tourism means tourism that offers visitors the opportunity to develop their creative potential through active participation in courses and learning activities that are specific to the destination in which they take place (Richards, 2011). Creative development strategies linked with tourism can provide a „creative atmosphere" in specific areas making them attractive to the creative class, as well as to others (Richards, 2020).

Destinations specialising in creative activities and experiences are attractive to the mobile creative class, both for creative entrepreneurs and visitors. In this context, Duxbury (2019) points to the importance of deeply embedding place specificity in creative tourism activities and experiences and the importance of networks as a means to generate creative experiences. A highly networked environment in tourism destinations enables tourists to create peer-to-peer relations with the local creative people (artists, craftsmen etc.) and to gain the co-creation of their experiences. This is the characteristic feature of Creative Tourism 4.0 by Duxbury and Richards (2019). According to the study by Remoaldo et al. (2020), cultural tourists increasingly seek to experience cultural events actively and to directly engage in creative activities. Empirical knowledge about the creative tourist extends with the characteristics of the profile of creative tourists: Novelty-Seekers, Knowledge and Skills Learners, and Leisure Creative-Seekers.

The role of creativity in generating social and economic development of regions worldwide has caught the attention of many experts in a wide range of fields of study. The strong relationship between

tourism and creative industries has been recognized not only by many researchers but also by policy-makers (Csapó, 2012).

The political, legal and programmatic basis for the promotion of creativity at the European level is currently provided by the European Commission's Creative Europe programme 2021 to 2027 and its sub-programme Creative Europe Culture strand. The Culture strand encourages cooperation and exchanges among cultural organisations and artists within Europe and beyond (European Commission, 2023).

The interest in the perspective field of creative industries and their socioeconomic spillovers can be traced in Slovakia as well. Support for creativity, culture and cultural heritage is also declared in the Creative industries development strategy in the Slovak Republic (Ministry of Culture of the Slovak Republic, 2023).

In Slovakia, research on creative tourism was conducted by Csapó, Palenčíková and Csóka (2022), who provide a comprehensive view of the current conditions for the development of creative tourism. They point out the key importance of cooperation and networking between different stakeholders in Slovak tourism. The activities of creative artists in Slovakian tourism are examined by Hudáková and Korenková (2020), who conclude that the number of creative artists and craftspeople has been increasing in recent years. They are very important as they transmit the cultural expression of the nation in the form of traditional crafts and contribute to the dissemination of cultural heritage.

The Centre for Folk Art Production (ÚĽUV) has a mission to safeguard and develop traditional crafts and homemade production in Slovakia. It focuses mainly on looking for, mapping out and protecting crafts that are dying out. It then develops them using various activities, connecting the information and skills of the best producers with the knowledge of ethnologists and the vision of designers. The result is an original artist's work which respects traditional craft processes, patterns and materials.

The ÚĽUV's database provides a detailed overview of the most important traditional crafts and home-made products. Pottery is the production of ceramics (vessels and objects) from fired clay, originally by modelling in the hand, later using a potter's wheel or by modelling with moulds (The Centre for Folk Art Production, 2023).

The topic of pottery in Gemer and Malohont is dealt with by the author Bodorová (1952, 2019) in the work *Hrnčiarstvo v Šiveticiach: východný Gemer-Malohont* and also in the publication *Hrnčiarstvo v Suchánskej doline*. She describes the technological process, and artistic expression, and lists the craftsmen in each locality, manufactories, sales and sales methods up to the disappearance of the craft due to industrialisation. It lists the last artisan potters who are preserving this cultural heritage.

Regional activities, events and activities with the theme of pottery are also presented by cultural tourism organisations in Gemer, especially the Gemer-Malohont Museum in Rimavská Sobota, The Gemer's Culture Outreach Centre in Rožňava, House of Traditional Culture of Gemer in the East Slovak Museum in Košice, the DMO Gemer, DMO Banská Bystrica Region Tourism and DMO Košice Region Tourism.

1.2 Pottery as a part of the tourism offer for visitors to the tourism destination Gemer

The Gemer region is located in the south of central Slovakia and borders the Republic of Hungary. As a tourist region according to the Regionalisation of Tourism in Slovakia (2005), it consists of the districts of Rimavská Sobota, Revúca and Rožňava. It coincides with the cultural region of Gemer and Malohont. Malohont is a territory that has been connected to Gemer since 1803. It represents the western part of the region with its centre in Rimavská Sobota.

Gemer and Malohont was a region rich in pottery production. Thanks to the quality of the material, potters worked in almost 40 important localities. There were urban (Jelšava, Revúca, Rimavská Sobota, Rožňava, etc.) and village workshops (Držkovce, Meliata, Šivetice, Licince, Hrnčiarska Ves, Hrnčiarske Zalužany, etc.). Potters made plates, bowls, crocks or 50-litre containers from high-quality clay. It was also used by tile makers and manufacturers of tiles and bricks. Sometimes it was even used to make clay whistles, various figurines and, for a time after the Second World War, even souvenirs for visitors to the Domica cave and the Číž spa. The clay from the Gemer fields itself was also an export commodity (The Centre for Folk Art Production, 2023).

The peak period of classical pottery in Gemer and Malohont was the 19th century. Potters sold their products by wagonload from village to village, at fairs and later by rail. At the beginning of the 20th century there was a decline in production due to mechanisation, the development of new products

made of glass or enamelware, changes in the way of life, and the kilns were gradually replaced by stoves.

Pottery production gradually disappeared. Today, only the last two potters, Danka Bakšová and Paulína Kortišová, are active in the region, preserving the tradition of this craft in Hrnčiarské Zalužany. Danka Bakšová has also been a holder of the Regional Product of Gemer-Malohont regional label since 2015 (Region Gemer, 2023).

The theme of pottery as a creative activity is addressed in its diverse activities by institutions in the Gemer region, aimed at documenting the development of this craft from the earliest times to the present day. In addition to permanent exhibitions, various events, guided tours, lectures, courses, workshops and excursions related to pottery are prepared for the public. Other strategies being used by these institutions to obtain repeat visitors from the general public include mainly cultural and educational events for kindergartens and primary and secondary schools in the region. The programme for schools is called „Crafts in a Cube“.

Table 1. Tourist attractions related to pottery and a calendar of events and exhibitions in the destination

Name of the attraction, event, exhibitions		Date
Pottery Memorial Room Cultural House Sušany	Permanent exhibition and guided tour	Monday – Friday or by agreement 7.00 – 12.00, 13.00 – 15.30,
House of Traditional Culture Pottery Workshop Cultural Outreach Centre Rožňava	guided excursion creative workshops, max.10-12 pers. Courses (8 lessons)	Monday – Friday 8.00 – 15.00
Gemer – Malohont Museum Rimavská Sobota	Courses Teaching Lessons Permanent Exhibition	Tuesday – Friday by agreement 9.00 – 17.00
Jelšava Town Museum	Permanent Exhibition	
House of Crafts Kránohorská Dlhá lúka	Creative workshops Artisan market, Antiques Exchange	Weekends in autumn April - October

Source: author’s elaboration (2023)

To attract visitors and build relationships with the public, these cultural institutions now use a standard way of promoting their activities - websites. It is also possible to obtain interesting information about pottery from radio or television in the form of various documentary programmes and interviews (e.g. Slovakia in Pictures, RTVS, Košice online) and as part of news reporting from regional print media. An exceptional activity is the issuance of a banknote as a sovereign with a value of EUR 0 on the occasion of the 140th anniversary of the foundation of the Gemer-Malohont Museum. The main motive of the banknote is the building of the museum itself and a typical clay pot of the Gemer-Malohont pottery called "posed'an" with one ear decorated with a specific large-area wave, it comes from Sušany in Suchánská Valley and dates from 1920 (Gemer-Malohont Museum, 2023). The programme for visitors is also diversified by the event Night of Museums, during the XVIII. year, the Geme-Malohont Museum prepared a programme with the dominant theme of pottery as a traditional craft, as well as blacksmithing and the production of wooden toys in cooperation with traditional craftsmen (Rimava.sk, 2023).

To support the development of craftsmen, the Handicraft Incubator Gemer operates, which is a specialized form of support for folk craftsmen and folk-art producers. It is a unique tool for creating favourable conditions for the development of traditional craftsmanship in the territory of the Košice Region.

It helps beginners as well as experienced craftsmen who want to improve the marketing and presentation of their work. Also, they get assistance in areas of current legislation, production, sales and business. They can also learn more about the historical development of the craft and supplement their knowledge and skills with traditional techniques, technologies and production procedures about the aesthetics and functionality of the products (Rink, 2023).

Table 2. Web pages with Tourist information about the Pottery in the destination Gemer

Further information about pottery in Gemer can be obtained through the social network Facebook DMO Gemer, a mobile application of the local government "Virtualne", which involves the town of Rimavská Sobota.

1.3 Visitation to the Destination Gemer

We found the number of visitors to the region from available secondary sources provided in the database of the Statistical Office of the Slovak Republic. The table shows the number of tourists accommodated in the Gemer region for the period from 2018 to 2022, the number of overnight stays, and the average length of overnight stays.

Table 3. Number of tourists accommodated in the Gemer region

Year	2018	2019	2020	2021	2022
Indicator					
Number of tourists	65 004	76 673	33 514*	29 053*	50 973
Number of overnight stays	176 092	212 112	112 404*	92 229*	141 306
The average number of overnight stays	2,63	2,66	3,25*	3,05*	2,70
Share of guests in Slovakia in %	1,16	1,19	1,04*	1,07*	1,05

Source: author's elaboration (Statistical Office of the Slovak Republic, 2023)

*data for the districts of Rimavská Sobota and Rožňava

The number of overnight stays and the number of guests decreased in the Gemer region for the years 2018 - 2022. The decrease was particularly noticeable in 2020 when the global pandemic COVID-19 broke out. The average length of an overnight stay in the region is more than 2.5 days. The year-on-year decrease between 2018 and 2022 in the number of guests is -27.53% and in the number of overnight stays is -24.62%. Revúca district did not publish statistical data on the number of visitors for the years 2020 and 2021. The number of foreign visitors could not be registered due to the lack of statistical data on foreign visitors, which were given as D "dôverný" (confidential), for the years 2018 - 2022, in all districts.

2. Methods

We apply an interdisciplinary approach in the preparation of the paper. Our paper aims to present pottery as a potential tool in the development of tourism in the Gemer region. To achieve the main objective of this article, we worked with the collected primary and secondary data. We studied the theoretical background from the available literature. We used sources of domestic and foreign authors devoted to creativity, creative tourism and cultural tourism, mentioned in the literature resources. We draw information from publications on the historical context of pottery as a traditional craft in Gemer. We used available statistical data from the Statistical Office of the Slovak Republic as a central body of state administration of the Slovak Republic for the field of statistics. From secondary sources, we found out what is the current offer of creative activity in tourism products in Gemer, who are the local traditional artists who are engaged in pottery.

The primary research was carried out in March and April 2023. Data was collected from visitors to Gemer using a questionnaire survey processed by Google Forms. It investigated the current state of awareness, interest, needs, expectations and ideas of the visitors about the creative product using pottery. Through the survey we want to get answers to these research questions: What is the demand for tourism in Gemer? What is the visitor's attitude towards creative tourism? What is the profile of the target group of

creative tourism relating to pottery in Gemer? The questionnaire was distributed to respondents through a social network. In total 120 answers were collected. The data obtained were processed using quantitative statistical methods, mainly descriptive ones.

3. Results

A Creative tourist is the key element of the demand for creative tourism. They decide where, when and how to spend their leisure time and what activities to undertake to gain an engaging creative experience. Creative tourists have their own perceptions of creativity and creative experiences (Tan, Kung, & Luh, 2013), they will not be satisfied with common cultural spectacles and are looking for active participation. A “presumption”, not a consumption, means tourists become producers of the products and experiences they consume (Tan & Tan, 2019). Understanding the needs, motives and preferences of creative tourists is a prerequisite for the development of creative tourism in destination Gemer.

Before getting into details, the general data of the respondents should be introduced. During the survey, the research group received 120 responses, out of which 29 % were male and 71 % female. Gender representation is rather disproportionate. The age composition of the research group is represented by age categories as follows: 18 years and under (3 %), between 19 – 30 of age (43 %), between 31 – 50 of age (30 %), between 51 – 65 of age (14 %), 66 years and more (10 %). The active working age generation has the highest representation by age in this survey. According to the achieved education level, most of the respondents had upper secondary education ending with a school leaving examination (43 %), followed by having a Master’s degree university diploma (54 %). Only 3% of respondents declare primary education, these are the youngest age group in the survey. The distribution of the achieved sample according to regions covers the whole of Slovakia, with the largest representation of the Banská Bystrica Region (34 %), followed by the Bratislava Region (14 %) and Košice Region (16 %). Ratios of the other regions were significantly smaller and are represented as follows: Žilina Region (10 %), Trnava Region (10 %), Prešov Region (9 %), Nitra Region (5 %) and the fewest responses were collected in the Trenčín Region (2 %). The distribution of the respondents is well balanced according to the economic activity since the largest group of the respondents were employees (40 %), followed by students (37 %) and retired persons (11 %), but self-employed entrepreneurs (8 %), unemployed (1 %) and homemakers (currently on maternity or paternity leave 3 %) were also targeted. By marital status, the sample is characterized by the distribution of single (54 %), married (30 %), divorced (12 %) and widowed (4 %).

We also focus our attention on the interpretation of the results of the primary analyses in connection with the consumer habits of creative tourists in the destination. The following part of the content contains the interpretation of the results of the primary analyses. This is based on the results of the previously introduced questionnaire survey on the demand side of the visitors in Gemer. It intends to survey consumer habits and trends related to travel and the use of services in the destination in the Gemer Region.

Hotel-type accommodation enterprises are preferred by 73% of respondents, the rest (27 %) spend their holidays in so-called para-hotel accommodation enterprises. Catering services are preferred by visitors directly in accommodation enterprises (51 %), a part of respondents (37%) are in various catering enterprises and the rest (12 %) consume their prepared food. When asked which mode of transport they use, their transport dominates (72 %), followed by the option of public transport (22 %) and the rest transport arranged through travel agents and agencies (6 %). Visitors in the research sample visit the destination continuously throughout the year, but most in summer (40 %), in autumn (21,88 %) and in spring (21,25 %), least in winter (16,87 %). All seasons are balanced. The most represented length of stay in the survey in Gemer is 1 to 3 days (69 %), followed one day trip visitors (15 %), 4 to 6 days (12 %), and at least long-term visitors for more than 4 days (4 %). When asked with whom tourists visit Gemer, they answered that with a partner (34 %), with friends (20 %), as a family (33 %), alone (10 %) and as a business trip (3 %). In the survey, we were curious about the average amount a visitor spends in Euros during a short-term holiday. According to the answers, visitors spend an amount of money on their stay from 150 to 300 € (56 %), up to 150 € (21 %), from 300 to 500 € (16 %), from 500 to 700 € (5 %), and the rest (2 %) more than 700 €. Respondents report that their highest expenses are for accommodation, catering, cultural attractions and events, transportation, sports activities, and the purchase of souvenirs and local products.

The question of what activities visitors look for when travelling gave the following findings with the following percentages of responses: rest and recreation (26,27 %), visiting cultural and historical sites (20,37%), entertainment activities (11,26 %), sporting activities (10,18 %), learning about local culture (9,65 %) and attending events (9,65 %), and visiting relatives (6,70 %). Creative activities specifically

sought during the stay occur in 1,16 % of the responses, educational activities in 2,41 % of the responses and nature in 2,35 %. The popularity of the attractions visited is fairly balanced; 51 % of visitors consider the cultural heritage (e.g. Betliar, Muráň castle, Gothic sacral road) and 49 % of visitor natural heritage listed in brackets to be the most popular (Muráň National Park, Slovak Karst National Park, caves, gopher meadow). Visitors get information through websites (28,13 %), social networks (22,92 %), friends based on recommendations (19,09 %), travel agents and agencies (3,12 %), by email (2,08 %) and telephone (2,44 %), online booking portals (22,22 %). Respondents also indicated more than one possible answer. In the open-ended questions for suggestions and tips for improving the destination, respondents state that there is a need to improve the quality of the tourism superstructure in the destination and the awareness of tourism services in general.

The following part of the paper contains the interpretation of the results from the primary analyses. These are based on the results from the previously introduced questionnaire survey on the demand side of the visitors. The attention is to survey the consumer habits and trends related to creative tourism and in particular pottery in Gemer. Our first question intended to reveal the respondent's relation to folk crafts. A positive relationship is declared by the majority of respondents (52 %), a negative relationship by a minority (7 %) and a neutral relationship by the rest (41 %). In the next question, we asked how many times they engaged in a creative activity during their holiday. They actively engaged in creative activity 1-2 times (43 %), 3-5 times (4 %), not once yet (41 %), 6 times or more (2 %), and only passively as an observer (10 %). We were curious to understand the reason why some respondents did not participate in creative activities at all. They cited either a lack of supply or even a perception of disinterest. Visitors in our survey are most interested in the following activities related to the traditional craft of pottery: guided tour (24,42 %), visit to an event with active participation (23,50 %), creative workshops (22,12 %), interactive exhibition (18,43 %), stay with a course (11,53 %). Up to 71 % of respondents are interested in buying local products, the rest gave a negative answer. When asked how much money they are willing to spend on a creative activity, they responded as follows: the majority of respondents up to 49 % from 21 to 50 €, up to 20 € (32 %), from 51 to 80 € (11 %), the rest of the respondents report different amounts. The next question of the survey is intended to reveal what the creative activity should be. Respondents could indicate more than one answer. A creative activity should be interesting and inspiring (21,39 %), fun (20,59 %), relaxing (17,91 %), authentic (15,24 %), educational (14,97 %), eco-friendly and sustainable (8,29 %), challenging (1,61 %). We also wanted to know who would like to practice or with whom the (possible) tourists would like to practice certain activities. That is, we intend to reveal in the next question, how the respondents would like to take part in creative activities during their holiday. Participation with a partner (34 %), with family and children (32 %), or with friends is preferred (20 %), which stems from the very nature of the creative activity, which is characterised by collectivity and sociability. Only 10% of respondents can imagine participating in a creative activity individually and 4 % with colleagues. Respondents have a clear preference for summer as the season during which they like to participate in a creative activity (63 %), followed by spring/autumn (26 %) and the holiday season (10 %). Winter was identified by only 1 % of all respondents. In the survey, we were interested in how much time they would spend on a creative activity. Respondents would most like to spend half a day (49 %) or less than half a day (28%) on a creative activity. A full day would be the preference of 18% of respondents. The remainder would prefer more than 1 day (5 %). The last question gauged respondents' interest in receiving targeted information about a creative activity related to pottery. More than half of the respondents agreed (56%) and the remainder disagreed.

4. Discussion

Based on our survey, we can characterize visitors to Gemer as individual travellers searching for this destination mainly because of its rich natural and cultural heritage with a preference for rest, recreation, visiting cultural and historical monuments, attending events and staying in nature. In terms of age composition, we can say that all generations are represented, which we refer to as the so-called "baby boomers", X, Y, Z. Also represented is the Alpha generation, which is presumably not travelling alone, thus representing the segment of families with children. Baby boomers, as active seniors, although less technologically savvy, are highly skilled with a positive attitude toward manual labour. Generation X and Y have good purchasing power because they are of active working age. Millennials and Zoomers are technologically savvy, have high expectations, and are open to new ideas. This characteristic of the age group needs to be worked with when developing a creative product.

According to the information from the survey, visitors do not purposely search for creative activities as they do not have enough information about them in advance. The source of information is the internet, especially websites, social networks and WOM. Tourists reach their travel destinations by car mainly during the summer season, preferring to stay in hotel-type accommodations with catering services. The average length of stay at the destination is 1-3 days and the average cost is €300. Visitors have a strong interest in buying local products. Visitors consider the weaknesses of the destination to be the lack of information about the region and a lacklustre marketing campaign, as well as the insufficient offer of tourism services of lower quality compared to other tourism regions.

The Gemer region has a wonderful landscape for active and meaningful leisure time. Due to its exceptional natural beauty and this region's relationship with pottery Visitors declare a positive attitude towards the craft. Pottery as a traditional craft of Gemer represents a competitive advantage and an opportunity to create creative tourism products with added value. The attractiveness of the market with a strong cultural and historical reference to pottery predisposes the region to creative tourism. This is provided that there is synergy between marketing, information technology and sufficient support for distribution. This will result in The creation and implementation of a thematic product with the quality of the tourism services provided at all stages.

In the process of creating the offer, it is important to identify and approach key tourism stakeholders in Gemera for cooperation. The Gemer region is applying elements of creativity in the development of its programmes at its cultural facilities. Examples of this are thematic exhibitions, workshops, creative workshops or programmes for primary and secondary schools. Despite this Gemer is not able to attract a significant number of visitors.

At the same time, visitors are highly interested in visiting cultural and historical monuments, various events, etc. Changing the passive participation of tourists into an interactive one through creative activities such as traditional pottery crafts can bring an authentic experience. As the results of our survey show, the current visitor to the Gemer region expects entertainment and an authentic, interesting, inspiring original and unconventional experience with a connection to cultural heritage and history. According to the results of the survey, this is a visitor with an interest in exploration, meaningful use of leisure time and time spent with their partner, family and friends. Women are more highly represented and motivated to forget about their daily routines and stereotypes through creative activities related to pottery. There is therefore a high expectation that they will be motivated to actively participate in various creative and educational activities. They show an interest in creative courses, guided tours, visiting events with active participation and workshops that are based on learning about the local culture. The creative activity should be timed to retain its element of fun and authenticity. The optimal time is half a day. Such a solution would suitably break up the daily holiday routine and remove stereotypes. When developing a creative offer, it is necessary to think about visitors who are satisfied with passively watching a traditional craft such as pottery.

To better exploit the potential for the creation of a creative tourism offer with the application of the traditional craft of pottery, measures need to be taken in the following key areas of tourism management:

- *Close and effective cooperation and partnership between the private sector, public sector and public-private sector (DMOs).* It is about the communication of typical tourism actors such as destination management organisations, tourism and related services entrepreneurs, development agencies, local self-government and state government, operators of monuments, cultural and natural heritage sites, event organisers, tourist information offices, tour operators and travel agencies, media, marketing companies, operators of reservation systems etc., while the product must have added value for all actors. Stakeholder cooperation and partnerships are a tool for aligning interests in a destination to ensure its success, competitiveness and sustainability, while at the same time ensuring optimal use of primary and secondary tourism market supply. Local and regional development strategies that use traditional folk crafts and skills as the potential for economic development.
- *The use of regional development grants in 2023.* As already mentioned, the tourist region of Gemer represents the districts of Rožňava, Rimavská Sobota, and Revúca, which since 31.12.2015 are on the list of the least developed districts (Office of Labour, Social Affairs and Family, 2023) within the meaning of Act 336/2015 Coll. on support for the least developed districts and amendments and supplements to certain acts as amended, eligible applicants may apply for a regional contribution in tourism within the framework of the activities of the development plan. Activities related to the creation of cultural tourism, sightseeing tourism, sustainable tourism, and rural tourism, as well as the implementation of destination marketing, improving the accessibility of districts, the creation of

sustainable facilities for the stay of visitors are defined (Office of Deputy Prime Minister of the Slovak Republic for Investment and Informatisation, 2023).

- *Support for the family business in region Gemer.* In many countries around the world, family businesses are the pillars of the economy and the dynamics of their development are astonishing. They pay close attention to regional and local conditions. They are a source of employment and economic growth, contributing significantly to GDP. They give a chance to the people who live in the region by paying taxes, building value and creating new jobs. They offer opportunities for young people at home, support regional development and thereby demonstrably increase the purchasing power of the population. The money saved is used for social programmes; to ensure sustainable development, stability of the business environment and the loyalty of business operators to their region. (Peráček, Vilčeková, Strážovská, 2020).
- *Use of information technology, and digitalization.* The current development of information technology is the driving force behind the development of destinations. This is due to the changes in consumer behaviour. The visitors are more sophisticated, often connected to the internet and also prefer to interact dynamically with their environment. It is essential to develop and implement the following digital tools: a single website, a mobile app, work on social networks, use of audio guides, QR codes, etc. Digital engagement of the creative tourism offer will help to attract the younger generation, who take for granted the instant use and consumption, as well as sharing the experience.
- *Interactive communication with visitors.* With the creation of one central information resource, e.g. a website with a comprehensive list of creative activities in the region. The possibility of online course booking or participation in workshops. Of course, there is information about the programme, a price list, a calendar of events and other activities.
- *Close cooperation with the community of local potters.* Designing a creative programme dedicated to pottery requires the creation of a functioning network of potters, craftspeople, enthusiasts, artists and lecturers. Using the skills of these experts to organise various traditional exhibitions will apply the creative and cultural potential of the destination and provide authentic experiences for enthusiastic visitors to fill their leisure time.

Conclusion

We are convinced that cultural heritage and the cultural and creative industries are an important part of the "social" dimension of sustainability. Gemer's wealth of monuments and sites and its creative diversity of traditions, crafts and arts is a unique asset. It enriches our lives and fosters social and cultural cohesion. It also underpins an economy generating more employment, regional development and business opportunities in a less developed region, such as Gemer. Many World and European destinations build their international success on their cultural heritage and creativity. As stated in the theoretical background of the paper and aforementioned scientific works, which we present in the literature review. At the same time, the sector of creative tourism is nurturing large numbers of dynamic small and micro enterprises, creating employment not just for young people and women, but also for people from disadvantaged backgrounds and less developed regions. At the same time, they are deploying their creativity not only to generate income but also to contribute to social and cultural sustainability. Community well-being and the projection of unique cultural values stemming from the traditional craft of pottery.

In cultural tourism, the new destination culture-based tourism products should add value to local communities, protect the environment, and create local benefits, providing visitors with an authentic travel experience (UNWTO, 2018).

As Richards and Marques (2012) enumerated, creative tourism can be a means of involving tourists in the creative life of the destination. A creative means of using existing resources. A means of strengthening identity and distinctiveness. A form of self-expression and discovery. A form of edutainment—education as self-realisation and entertainment. Source of "atmosphere" for places and a source for re-creating and reviving various locations.

Although creative tourism in Slovakia is looking for its fans, so to speak, the consumer demands of visitors are constantly changing. From the point of view of tourism management, they must make provision in their area for creative tourist destinations. They should offer the opportunity to satisfy the visitor's needs through the demonstration of traditional crafts in Gemer like pottery. The creation of a creative tourism product using pottery draws on the cultural value of the region's history. It is both an opportunity and a way of building a recognisable brand for the region. This would be based on presenting the uniqueness of their craftsmanship and highlighting home production, traditional architecture,

traditional dress, gastronomy, folklore and customs. It is traditional culture, together with the primary tourism offer, that represents the strengths of the tourism development of Slovakia's regions.

¹ University of Presov, Department of Tourism and Hotel Management, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The article focuses on current trends in travel and spending vacations from the perspective of Slovak residents with an emphasis to principles of sustainability and digital marketing in the post-pandemic period. At the research level, we therefore focused on examining the development of trends in travel and spending vacations from the perspective of Slovak residents.

Purpose of the article: The aim of the paper is to identify trends in travel and vacation spending of Slovak residents over the past 10 years and current trends in travel and vacation spending on a sample of 580 Slovak residents.

Methods: Primary data collection was carried out using the CAWI (Computer-Assisted Web Interview) method on a sample of 580 respondents. From a methodological point of view, it was a matter of selecting respondents based on availability and voluntariness. As part of the analysis, we investigated the connections between trends in travel and vacation spending in terms of the age and gender of the respondents through correlation analysis.

Findings & Value added: The main finding from the research is, for example, that Slovak residents generally prefer a vacation at home to a vacation abroad. We also observe some gender tendencies in vacation spending, as Slovak women prefer vacations by the sea and Slovak men prefer vacations in the mountains. The added value of this contribution is the possibility to follow changes in the development of trends in travel and holiday spending by Slovak residents over a relatively wide period of time and the opportunity to observe current trends in travel and holiday spending by Slovak residents. At the same time, the results of the research can serve as a basis for tourism companies to create new tourist products for the Slovak resident with an emphasis on current trends.

Keywords: trends, tourism, residents, sustainability, digital marketing

JEL classification: Z32, M21

1. Introduction

The trend represents the direction of development, future expectations. Businesses operating in the tourism industry need to follow trendy developments. Some trends have a long-term effect, other trends we currently cannot predict and their occurrence is conditioned by the overall economic and social development (Slovak Business Agency 2020).

Currently, a number of authors are devoted to the development of trends in travel and spending vacations, e.g. Cakar and Aykol, 2022; Pricope and Baltsecu, 2022; Pabel and Cassidy, 2022; Ozdemir and Goktas, 2021; Stefko et al., 2020. For example, in their research, Matušíková, Šambronská & Košíková (2021) focused on changes in the consumer behavior of Slovak youth under the influence of the COVID-19 pandemic. They found that the pandemic has significantly affected youth interest, purchasing and overall travel behavior.

According to a study of the available literature on trends in travel and spending vacations in the post-pandemic period, these trends have two features in common, namely digitalization and sustainability.

* Corresponding author: anna.senkova@unipo.sk

In the following table 1, we present a brief overview of the trends in tourism in the post-pandemic period with their subsequent detailed characteristics and the area to which they relate. The results in the table were processed according to the website Travel Trends 2023 and according to the authors Lebrun, Corbllel and Bouchet 2022; Bali Shrivastava and Sinha 2022; Gonzalez-Padilla 2022; Dudek, Jaremen and Michalska-Dudek 2020.

Table 1. Trends for tourism

P.č.	Trend in tourism	The area which the trend relates	Characteristic
1.	Bleisure travel	Digitization and digital marketing	Combining travel for work or business with leisure activities. The extreme in this type of travel is the travel of "digital nomads" who travel and work online.
2.	Technology of recognition	Digitization	Use of biometrics at airports, voice commands in hotels, fingerprints.
3.	Robots	Digitization	Using robots as staff.
4.	The local experience	Sustainability	The effort to find the specifics of the destination, the difference from globalization, the search for local specialties, customs and traditions, cultural experiences from the location.
5.	Artificial intelligence	Digitization	Use of chatbots, GTP chat.
6.	The internet of things	Digitization	Connecting people/devices/processes to the Internet. For example the use of various global distribution and reservation systems in hotels, gastronomy, etc.
7.	Ecological travel	Sustainability	Reduction of the carbon footprint, electric cars, eco friendly hotels, restaurants.
8.	Virtual reality	Digitization	Used for tours of historic buildings, but also for booking hotels, fitness centers, etc.
9.	Augmented reality	Digitization	Augmented reality.
10.	Healthy foods and organic foods	Sustainability	Focused on homemade food and regional dishes, specializing in diets - lactose, protein, gluten, but also reducing, vegetarian and vegan dishes.
11.	Demographic development	Digital marketing	Tourism needs to adapt not only to the young generation, which expects experiences, adrenaline, unconventional vacations that need to be addressed on social networks, but also to the aging generation, which uses a completely different tourism offer. Spa and medical stays with a rich offer of high-quality services are becoming more and more interesting for seniors.
12.	Security	Sustainability	Tourism is sensitive to events that threaten the safety of passengers. Currently, it is not only terrorist attacks, but also the migration crisis and various types of diseases. Destinations (it can even be an entire country) where terrorist attacks have taken place have seen significant numbers of tourists drop off, depending on the duration of the ongoing threat.

Source: own processing (2023)

Common features of the current trends in travel and spending vacations are the two key areas already mentioned, which, however, in a narrower sense mean the following:

- **Preparing tourism businesses for the digital future and digital marketing.** Creating a website and communicating through social media is standard for businesses in the travel industry. In this way, companies are adapting not only to the current generation, but especially to the upcoming Generation Z and Millennials, who by 2040 will form a decisive component of the participants in the tourism industry. The task of businesses in the field of tourism that want to succeed in the market in the coming years is to use digital technologies to the greatest extent possible in order to adapt to the emerging clientele. The government plays an important role in the preparation of the offer of tourism products, which mainly fulfills a supporting function. Its task should be to secure the territory with high-speed internet, support innovation, develop smart destination tourism, create and support travel-tech incubators (OECD 2023).
- **Reevaluate tourism from the point of view of sustainability.** The availability of individual travel made it possible on a mass scale. Some localities have thus become overcrowded, which can have negative consequences for nature, cultural and historical monuments, monuments, but also for the local population. In tourism, it is not only the number of visitors and the number of tourists who visit the location that is important, but also the contribution of tourists to the destination itself. Therefore, the ability to maintain a balance between the three pillars of tourism - economic, social and environmental - is becoming even more important nowadays. An important element is the cooperation of all those involved. In addition to businesses in the field of tourism, there are also voluntary, non-profit organizations, strategic visions of the city, the region and the entire state. The task of the government is to develop a future vision, based on which tourism entities know where and how to direct their activities (OECD 2023).
- **The mutual connection of these two key areas.** According to the OECD (2023), it is about creating a synergistic effect in the interaction of these two key areas. We can see this fact in the following picture.

Figure 1. Interconnection of key areas influencing current trends in travel
Source: own processing (2023)

2. Methods

The aim of the presented paper is to identify the development of trends in travel and spending vacations of Slovak residents with an emphasis on the principles of sustainability and digital marketing in the post-pandemic period.

The research level of the paper is divided into two parts in terms of content. The first part of the research is focused on the analysis of trends in travel and spending vacations of Slovak residents over the last 10 years from the point of view of statistical indicators. The period 2013-2023 was taken into account. The second part of the research is devoted to the analysis of trends in travel and vacation spending of Slovak residents within the author's questionnaire survey. In the overall conclusion of the research, we compare individual findings from both research levels with the aim of detecting significant changes in the development of trends in travel and vacation spending by Slovak residents from the point of view of time, as well as from the point of view of the diversity of the research sample.

From the above, it is clear that for data collection we used a questionnaire survey aimed at obtaining the opinions of Slovak residents about trends in travel and vacation spending, constructed by the authors,

based on existing surveys with a similar theme. The survey sample of respondents was selected by random selection of Slovak residents to ensure the representativeness of the sample.

Since we combine quantitative and qualitative research in the contribution, the nature of the data we work with in the contribution also changes. In the first part of the research, we mainly work with secondary data from official institutions dealing with data collection. On the contrary, in the second part of the research, we mainly work with primary data obtained through a questionnaire survey.

As part of the research, we focused on the following two research questions:

- *Research question no. 1:* Is there a statistically significant relationship between the type of vacation that the respondents prefer with regard to the gender of the respondents?
- *Research question no. 2:* Is there a statistically significant relationship between the respondent's travel frequency and the age of the respondents?

We process individual data using appropriate mathematical and statistical methods. In addition to the basic forms of descriptive statistics used mainly in the first part of the research, we use correlation analysis through the Cramer coefficient to determine the connections between variables in the second part of the research.

3. Results

As the research level of this paper consists of two parts, we will present the results individually for each of them. First of all, we will point out the development of trends in the travel of Slovak residents over the last 10 years, which we evaluate on the basis of secondary data from various official sources dealing with the collection of statistical data and indicators in the tourism industry in Slovakia. In the second part of the research, we will point out the development of travel trends of Slovak residents based on their answers from the author's questionnaire survey and subsequent data analysis using mathematical and statistical methods.

3.1. Results from a survey of the development of trends in travel and spending holidays from the point of view of Slovak residents over the last 10 years

The development of participation in tourism for personal purposes between 2013 and 2018 has had an upward trend since 2014. The average annual increase for the years 2013 to 2018 is 5.7%. In 2018, the majority of residents were those who made only domestic trips (47.8%). 16.4% of the residents took a trip abroad, and the remaining 35.8% went on both domestic and foreign vacation trips. Correspondents preferred long-term trips to short-term ones. The total number of Slovak residents who did not participate in tourism in 2018 was 1,228,778, of which 32.6% were residents aged 65 and over. The most common reason for non-participation in tourism was insufficient financial resources. The second most common reason for non-participation in tourism was health problems. The year-on-year increase in the number of long-term trips with an overnight stay for personal purposes in 2018 is equal to 18.4%, and for short-term trips it is 13.0%. Domestic trips with overnight stays increased in 2018 compared to 2017. The main motive for these trips was a vacation trip, spending free time and recreation. The second most common purpose of trips was to visit relatives and friends. The other purpose of the trips is 14.2% for long-term trips and 2.8% for short-term trips. During long-term domestic trips with an overnight stay for personal purposes, the choice of paid rented accommodation prevailed (62.9%). During domestic short-term trips with an overnight stay for personal purposes, accommodation with relatives and friends prevailed (53.3%). More than three quarters of domestic journeys were made by car. The most common purposes of domestic trips were getting to know new cities and visiting mountainous and rural areas (Naňáková 2019).

The survey in 2020, which was carried out by the agency Median SK for the Košice self-governing region and the Košice Tourism Region, investigated the vacation plans of Slovaks based on a representative sample of 502 adult respondents. The Median SK agency found out through a survey that before the outbreak of the pandemic, 51% of respondents had already planned a vacation, of which only 29% were going to vacation in Slovakia. The results of the survey also confirmed a radical change in behavior in response to the pandemic. In the pre-coronavirus era, the strongest decision-making factor was what places we want to see and visit (68%), followed by the quality of accommodation (30%), accommodation facilities services (26%) or recommendations from acquaintances (22%). Post-pandemic decision-making factors among respondents are dominated by hygiene and health recommendations (71%), information about the country (58%) and the ability to get home in case of emergency (32%). For 23% of respondents, the availability of medical care is also important (Košický self-governing region 2023). The comparison of these facts can be found on the following graphs.

Figure 2. Comparison of factors influencing vacation choice before and after the COVID-19 pandemic
Source: own processing (2023)

The latest UNWTO expert panel survey shows a mixed outlook for 2021-2023. Almost half of the respondents (45%) predicted a better outlook for the period 2021-2023, while 25% expect a similar performance and 30% foresee a deterioration in the results in 2023 due to rising inflation rates worldwide, the military conflict in Ukraine and the energy crisis. However, the UNWTO expert group also foresees a growing demand for outdoor and nature-based tourism activities, with increasing interest in domestic tourism and "slow travel" experiences (UNWTO 2023).

3.2. Results from the author's questionnaire survey on the development of trends in travel and spending holidays from the perspective of Slovak residents and their mathematical and statistical processing

As for the results of the questionnaire survey, we present the most important findings. The survey sample consisted of a total of 580 respondents (n=580). In terms of gender differentiation, 291 women (50.17%) and 289 men (49.83%) participated in the survey.

From the point of view of age differentiation, the lowest recorded age of the respondent was 16 years and the highest age of the respondent was 78 years. The most frequent age category was respondents from 26-35 years old. The least frequent age category was respondents aged 16-20 years.

As for educational level, the largest group of respondents was made up of respondents with secondary education completed with a high school diploma (up to 46.60% of the survey sample). Within the framework of economic activity, the largest part of the survey sample consisted of employed respondents, of whom there were 300 respondents out of the total number of respondents.

The majority of respondents were residents of the Prešov region (28.60%), followed by respondents from the Trnava region (13.90%), Nitra region (12.90%), Bratislava region (11.90%), Banskobystrické region (10.70%), Košice Region (8.10%), Žilina Region (7.60%) and finally from Trenčín Region (6.40%). We note that as part of the survey, we had representation from each of the Slovak regions.

It follows from the above that the research sample is relevant, therefore it is appropriate to compare individual answers from respondents and look for connections between them through mathematical and statistical methods, specifically using the Cramer coefficient.

Since we are working with two research questions (see chapter no. 2), for each of the stated research questions we are working with a null hypothesis (H0), which assumes the absence of a connection between the variables, and an alternative hypothesis (H1), which assumes the existence of a connection between the variables. We use the Cramer coefficient to verify our assumptions. We performed the statistical analysis in the statistical program Gretl. The results of the verification of the research questions are presented in the following Table 2 and Table 3.

Table 2. Verification of research question no. 1.

Variable 1	Type of vacation
Variable 2	gender of the respondents
Absence of a statistically significant relationship	$H_0: f_i = 0$
The existence of a statistically significant relationship	$H_1: f_i \neq 0$
Significance level α	0,05
Chi-square test	1,60614
df	3
p – value	0,657999

Source: own processing (2023)

From the results presented in Table 2, it is clear that due to the p-value, which is more than the significance level α , we reject the alternative hypothesis H_1 , which says about the connection between the variables. Therefore, it follows from the above that the choice of the type of vacation is not related to the gender of the respondent.

Table 3. Verification of research question no. 2.

Variable 1	frequency of travel
Variable 2	Age of respondents
Absence of a statistically significant relationship	$H_0: f_i = 0$
The existence of a statistically significant relationship	$H_1: f_i \neq 0$
Significance level α	0,05
Chi-square test	188,77
df	180
p – value	0,312098

Source: own processing (2023)

Even in the case of verification of research question no. 2 we are dealing with a similar conclusion as in the previous question. Here, too, the p-value is higher than the level of significance, and therefore we conclude that there is no statistically significant connection between the frequency of travel and the age of the respondents.

In both cases, the assumptions about the existence of connections between the established variables were not confirmed, and therefore the frequency of travel and the type of vacation are not related to the age and gender differentiation of Slovak residents.

4. Discussion

The results of the analysis show that Slovak residents prefer vacations at home to vacations abroad in the last 10 years. At the same time, a long-term vacation is typical for a Slovak resident. The most common motive of a Slovak resident for traveling and spending a vacation is recreation and relaxation. From the first part of the survey, we found that more than 32% of Slovak residents did not take part in a vacation in the last 10 years, and this was partly related to their age, as it was the age category of 65 and over. For that reason, we decided in the second part of the research to find out the connections between the frequency of travel of Slovak residents and their age. However, assumptions about the existence of a connection between the age of the resident and the frequency of travel were not confirmed, which means that the frequency of travel of Slovak residents is not influenced by their age. Since the research sample was representative in terms of gender, we also decided to investigate the connections between the selected type of vacation and the resident's gender. Even in this case, our assumption was not confirmed and the selected type of leave is not related to the gender of the Slovak resident.

However, what needs to be included in the discussion is the fact that the research as well as the survey was focused on the development of trends mainly in the post-pandemic market environment. At the time when the data was collected, the impact of other crises (apart from the COVID-19 pandemic) that had a significant impact on the tourism industry as such had not yet been recorded. This is primarily a price increase that occurred immediately after the end of the pandemic. According to Dzvóniková (2023), there was, for example, a significant demand for short-term travel insurance in 2022, because Slovaks lost "faith" that they would be able to afford to travel several times a year due to inflation and sharp price increases. Slovaks are increasingly approaching the creation of financial reserves.

Following the above, the interest of Slovak residents in online travel insurance has increased (Wüstenrot, 2023). It is also surprising that more and more Slovak residents in the age category over 45 arrange travel insurance online, as opposed to physically obtaining insurance at a branch. Interesting findings are also related to the period of travel insurance. Up to 90% of Slovaks take out travel insurance no more than 9 days before the start of their holiday, 78% of Slovaks take out travel insurance within four days before the start of their holiday, 13% of Slovaks take out insurance within 9 days and 5% of Slovaks take out insurance within 2 weeks.

At the same time, it is necessary to take into account the impact of the ongoing military conflict in Ukraine. The fact that we are a state immediately neighboring Ukraine has significantly changed the perception of foreign visitors about the safety of their vacation in Slovakia. As for how Slovakian residents spend their vacations, the military conflict in Ukraine caused another wave of price increases, which is why Slovak residents have reassessed the frequency and duration of their vacations. In this direction, the length of vacation is significantly shortened. While before the pandemic, the average vacation time of a Slovak resident was about 14 days, currently this number of days has been halved. In 2023, the average vacation of a Slovak resident lasted only 7 days, which is a significant decrease (Dzvoníková, 2023).

Another factor that changed in the post-pandemic period was also the tourist season. Before the pandemic period, the holiday season was strongest in the months of June to September, after the cancellation of pandemic measures in 2022, the season started already in May and its peak was in August - which means that the tourist season, from the point of view of Slovak residents, started a month earlier.

Last but not least, the energy crisis affects the vacation and travel of Slovak residents. The resident is mainly affected by the price of accommodation services, which have increased due to the energy crisis. In the same way, household energy payments also increased, which is why Slovak residents began to build up financial reserves to a large extent, also for the purpose of managing this crisis.

Conclusion

The presented contribution provides a brief overview of trends in travel and spending vacations of Slovak residents with an emphasis on the principles of adaptability and digital marketing in the post-pandemic period. From the point of view of travel, sustainability is the most effective concept of tourist behavior, due to the fact that it reflects the needs of the local community, but also the current needs of the destination, in terms of the environment and the environmental impact of tourism. Today's tourist already takes into account the impact of his travel behavior on the environment.

Equally crucial is the preparation of tourism businesses and all interested parties for the digitization of processes and digital marketing, which is coming to the fore, due to the fact that a significant part of participants in the tourism industry in the coming years will be generation Y and Z, as outlined by the OECD. These generations perceive tourism products differently than Generation X. They also perceive travel trends differently. For this reason, it is important that destination management and its organizations adapt the tourism product to these two key areas. It should be a long-term priority and effort of destination management organizations to create tourism products that will have elements of sustainability on the one hand and elements of digital marketing on the other (Vašaničová et. al. 2022). Ultimately, such tourist products will be both trendy and competitive and at the same time meet the needs and requirements of the customer.

At the same time, it is important to take into account the fact that the travel behavior of Slovak residents, and thus the trends, have changed significantly as a result of the currently ongoing crises - the ongoing military conflict in Ukraine, the worldwide increasing rate of inflation and the energy crisis. Each of the crises had a significant impact on the tourism industry, and the forecasts for the further development of the tourism industry are constantly changing.

The current political situation also affects the travel of Slovaks. However, all these facts are exogenous influences that the Slovak resident cannot significantly influence. For this reason, the contribution expands knowledge in the field of analysis of trends in travel and spending vacations, while it can also serve as a basis or starting point for further research on similar trends, but only from the perspective of Slovak residents, which we also consider to be the biggest limitation of the research. The analysis of trends in travel and spending vacations from the perspective of residents of several countries (at least V4) could, with appropriately chosen methods, also bring interesting results leading to the generalization of conclusions about current travel trends, which largely depend on the consequences of ongoing crises.

Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The sustainable development of tourism is particularly emphasized that its activities should be carried out with as little impact on the environment as possible. Nowadays, the attitudes of residents to tourism are very important to receive the sustainable development.

Purpose of the article: The aim of the contribution is to assess the resident's perception of sustainable development of tourism in the Horehron region.

Methods: The primary data was carried out using the CAWI method on a sample of 219 residents of the studied region. When analyzing the data, we focused on the search for statistically significant differences between the perception of a high number of tourists in the region in terms of the respondent's permanent residence and at the same time in terms of their economic activity using inductive statistics.

Findings & Value added: Survey findings were that the respondents coming from the rural environment of the region perceive the negative impact of tourism activities on the quality of the environment in the region as the number of visitors to the region increases. We also found the tendency of employed respondents not to perceive a high number of tourists only in a negative sense, but as an opportunity for the economic growth of the region. The added value of the research is reflected in its importance in the implementation of the global goals of sustainable development at the level of the region and the application of the results for further research in the field of sustainable development of tourism.

Keywords: sustainable development, Horehron region, residents

JEL classification: M21, Q01, Z32

1. Introduction

Sustainable development is about meeting the needs of present generations without compromising the satisfaction of future generations (Bedrunka, 2020). It presents a comprehensive approach that combines economic, social and environmental aspects in a way that is mutually reinforcing (Švedová, Dzurov Vargová and Gallo, 2019).

The beginnings of scientific research of tourism from the point of view of sustainable development date back to the 80s of the 20th century. At that time, the international organization UNESCO in the program "Man and the Biosphere" evaluated how over 100 years the development of tourism affected the territory of the Alps. Even then, the need to move away from mass to sustainable tourism development was being asserted. Since 1999, tourism as a factor of sustainable development has been enshrined in the third and fourth articles of the Global Code of Ethics for Tourism (UNWTO, 2023).

The 2030 Agenda for Sustainable Development, adopted by the United Nations General Assembly in 2015 in all member countries, forms a jointly developed blueprint for our future as human beings and the future of our home, planet Earth. It presents a comprehensive and universal plan of actions aimed at achieving sustainable development through a balanced process. The main intention is to leave no one behind and ensure that people of all ages and in all areas of society reach their potential so that they can lead a dignified way of life while meeting their human needs (WHO, 2023; Ocler and Ekiz, 2016).

* Corresponding author: erika.kormanikova@smail.unipo.sk

The Sustainable Development Goals set out in the 2030 Agenda, regardless of their level of economic and social development, apply to all countries in the world. The 2030 Agenda requires action not only from Member States, but also from individuals. All objectives are not only quality-oriented, but also quantity-oriented. It will take the next fifteen years to transform the world through seventeen headline goals and one hundred and sixty-nine sub-goals. The aforementioned SDGs must be considered comprehensive and also interrelated. The concept of sustainable development is based on the thesis that the Earth is connected to each other and this relationship is not always uniform. In the following Figure 1, we present 17 comprehensively defined SDGs internationally abbreviated as SDGs (Zajac, 2016; Lagodiienko et.al., 2022).

Figure 1. 17 Sustainable Development Goals
Source: UNWTO (2023)

Sustainable development is built on three pillars – economic, social and environmental. The environmental pillar includes 12 indicators expressing biodiversity and intensity of human stress on ecosystems, e.g. proportions of protected areas, air contamination by toxic substances, number of industrial plants exceeding pollution limit values and logging difficulty (Szabo, Csete and Palvogyi, 2008). The economic pillar is focused mainly on the transparency of the company, on good relations with stakeholders, participating in the economic principles of the company. It provides companies with new business opportunities. An essential principle in it is the effort to change the focus of companies from their short-term goals to long-term goals and from maximizing to optimizing profits. The Social Pillar calls for support in creating fair and equal conditions for societies that strive for a favorable direction of human

development and allow people to develop (Rajnoha and Lesnikova, 2022, Guzhavina and Mekhova, 2018; Uskova and Babich, 2021).

These three main pillars have an impact on each other. More favourable or unfavourable developments under one of these pillars have immediate effects on all the others. Sustainable tourism development is subsequently guaranteed while achieving a balance and the best results of all three pillars (Gajdošíková, 2019; Huttmanová and Chovancová, 2015).

In addition to initiatives by international organizations, sustainable tourism development is also addressed in theory, and its nature and significance are explored from different points of view by several authors (Butler, 1991; Ko, 2005; Choi and Murray, 2010; Gajdošík et. al., 2021; Bushra et al. 2022). In their research on sustainable development, these authors point out differences between the perception of a high number of tourists in a destination in terms of age and economic activity of the resident. Lee and Jan (2019) focused on residents' perception of community tourism sustainability based on the life cycle theory of six tourism areas in Taiwan. Martinez-García et al. (2017) found a certain development of the reactions and attitudes of residents towards tourists over time. Their research showed that in the first phases residents and tourists are in a harmonious relationship, but later with the increasing number of tourists, the attitudes of residents towards tourists become more and more negative and finally there is irritation between residents and tourists. All these results showed that residents' perceptions of economic, sociocultural and environmental sustainability varied significantly in the phases of consolidation, development and involvement in tourism development in the community and that there are differing attitudes among residents towards the development of sustainable tourism.

2. Methods

The aim of the contribution is to assess the resident's perception of sustainable development of tourism in the Horehronie region. The Horehronie region was chosen by random selection for the purpose of the survey because it is located in the middle of the Slovak Republic, specifically near the Zvolen basin, which is bordered from the west side by the Kremnické vrchy mountains. The northern horizon is dominated by the spectacular majestic scenery of the Low Tatras.

In the eastern part, it borders with the Muránska planina National Park. Thanks to its unusual natural heritage and favorable geographically advantageous location in the middle of Slovakia (see Figure 2, where the Horehronie region is marked in red), this area is one of the most visited in Slovakia. In a relatively small area there is a great diversity of natural elements - alpine landscapes, fields, forests, springs, ponds, lakes, thermal and mineral resources, caves, plants, animals - all these elements make up a number of fascinating elements of this spectacular mountain area (Slovak region, 2023).

Figure 2. Map with location of selected region
Source: Slovak region (2023)

In addition to the above, more than 40 regional products with the Horehronie region label are produced in the region (Horehronie, 2023). Due to its potential, this region has high prerequisites for sustainable development compared to other Slovak regions. We also took this into account when conducting a survey aimed at ascertaining residents' views on the sustainable development of this region. Based on the theoretical definition of the studied issue, we determined two research questions:

Research Question 1: Are there statistically significant differences between the perception of the high number of tourists in the region as a factor for environmental degradation in terms of residents' residency?

Research question 2: Are there statistically significant differences in the perception of a high number of tourists as a factor for improving the economic situation in the region in terms of current economic activity of residents?

The primary data collection was carried out using the CAWI (Computer-Assisted Web Interview) method on a sample of 219 residents of the studied region. As 300 respondents were contacted by an e-mail, the return on the questionnaire was at the level of 73%. The high return on the questionnaire was also due to its distribution using the QR code. From a methodological point of view, it was a selection of respondents based on outreach from the database of residents in Horehronie region. The primary data collection took place from 04.03.2023 to 03.05.2023 and consisted of 15 items. The questionnaire survey was constructed based on a study of the literature.

When analyzing the survey data, we focused on searching for statistically significant differences between the perception of a high number of tourists in the region in terms of respondents' permanent residence and at the same time differences in the perception of a high number of tourists in the region in terms of respondents' economic activity using inductive statistics tests.

3. Results

Through questionnaire survey we found that from total number of respondents, 219 were women (68%) and 70 men (32%). We divided the current economic activity of our respondents into five groups. The largest part were employed people, of whom there were 134 (61%), followed by students of high schools or universities in the number of 52 (24%). The survey also included 14 entrepreneurs (6 %), 10 (5 %) of respondents of retirement age and 9 (4 %) respondents who indicated the status of unemployed, which shows Figure 3.

Figure 3. Actual economic activity of residents
Source: own processing (2023)

The respondents come from a total of 22 municipalities of the Horehronie region. The largest number of respondents currently resides in the village of Pohorelá, which represents up to 133 inhabitants. The second place was taken by the city of Brezno. As many as 17 respondents came from this town, followed by 15 respondents from the village of Polomka. There were 13 respondents from the village of Heľpa, 6 people from Závadka nad Hronom, 5 respondents from more eastern villages such as Šumiac and 5 people from Telgárt. The village of Bacúch was reported by 3 persons.

Currently, only 3 respondents live in the regional capital of Banská Bystrica. A total of 8 respondents live in the territory of the four mentioned municipalities Valaská, Pohronská Polhora, Čierny Balog and Zlatno, which means that there are 2 respondents per municipality. Sihla, Beňuš, Červená Skala, Horná Lehota, Nemecká, Valkovňa, Beňuš part Gašparovo and Michalová. In these municipalities, 1 respondent lives in each of them. For this reason, it can be argued that the vast majority of the residents addressed

reside in a rural municipality. The representation of residents who live in the cities of the surveyed region is in the minority.

In the survey, 172 respondents showed knowledge about sustainable development, 47 respondents had not yet encountered this term. The last part of the survey focused on expressing respondents' attitudes towards sustainable development claims using a 5-degree liquor scale. An overwhelming majority of respondents agreed with these statements. 128 respondents identify with economic development in relation to sustainable development, 80 respondents agree with the need to reduce water consumption, 91 respondents identify with nature protection, 129 respondents agree with the reduction of all types of waste, 111 respondents agree that businesses should treat their employees and customers fairly, and 141 respondents share the need to protect natural sites. Most respondents identified with the statement about the protection of natural monuments and vice versa the least with reducing the amount of water consumed.

We have recorded all the claims made by residents in the following Table 1. The figures in the table reflect the number of residents who agreed or disagreed with the statements in the survey.

Table 1. Residents' attitudes to statements about sustainable development

Statement	Totally agree	Agree	Without an opinion	Disagree	Totally disagree
Economic development is essential for sustainable development	128	78	13	0	0
Reducing the amount of water consumed is essential for sustainable development	80	78	39	16	6
Nature protection is necessary for sustainable development	91	63	9	24	32
The reduction of all types of waste is essential for sustainable development	129	69	19	6	4
Fair treatment of their employees and customers by companies is essential for sustainable development	111	83	22	3	0
The preservation of numerous natural monuments is essential for sustainable development	141	73	4	1	0

Source: own processing (2023)

From the above Table 1 we can see that most respondents care about sustainable development in the Horehronie region. This fact is expressed by agreeing attitudes to several statements about sustainable development and it means that residents are aware of the uniqueness of the territory of the Horehronie region and its wise use for future generations. These results are similar as results from study of Martínez-García et al. (2017) were resident's attitudes varied with respect to the number of tourist in destination.

Because we found in the survey that the vast majority of survey respondents resided in a rural village, we determined the first research question based on the assumption that residents who reside in rural areas feel a higher need for environmental protection than urban respondents. At the same time, therefore, this research question focuses on finding differences between the perception of high tourist numbers among urban and rural residents (Guzhavina and Mekhova, 2018; Uskova and Babich, 2021).

The same applies to the second research question, as most respondents expressed "employed" as an economic activity in the survey. The question works on the assumption that the employed are more aware that the influx of new tourists will increase incomes in the region than students who do not yet have their own income and do not perceive the need to increase the number of tourists in the region. We tried to verify these assumptions using inductive statistics tests and present the findings in the following Tables 2 and 3.

Table 2. Verification of Research Question 1.

Variable 1	perception of the high number of tourists in the region
Variable 2	permanent residence of the resident (village or city)
No statistically significant differences	$H_0: F(x) = F(y)$
Statistically significant differences	$H_1: F(x) \neq F(y)$
Significant level α	0,05
Mann-Whitney U-test	---
p – value	0,14064

Source: own processing (2023)

Due to the distribution of variables, which showed that the variables were not normal, we used a nonparametric Mann-Whitney U-test to verify the first research question.

The decision rule was as follows:

- If p -value is $\leq \alpha$, we reject the H_0 hypothesis. There are statistically significant differences between the variables.
- If the p -value is $> \alpha$, we cannot reject/reject the H_0 hypothesis. There are no statistically significant differences between the variables.

Based on a p -value that is higher than the significance level, we conclude that there are no statistically significant differences between the perceived high number of tourists in a region and the residency of a resident of that region. Thus, residents of the Horehronie region, regardless of whether their permanent residence is in the city or in a rural village, perceive the high number of tourists in the region as a factor for disturbing the typical environmental character of the Horehronie region.

Table 3. Verification of Research Question 2.

Variable 1	perception of the high number of tourists in the region
Variable 2	economic activity of the resident
No statistically significant differences	$H_0: F(x) = F(y)$
Statistically significant differences	$H_1: F(x) \neq F(y)$
Significant level α	0,05
Mann-Whitney U-test	---
p – value	0,16949

Source: own processing (2023)

Again, even in this case, the variables did not have a normal distribution, and therefore a nonparametric Mann-Whitney U-test was used to verify the differences between the variables, which confirmed the absence of statistically significant differences between the perception of the high number of tourists in the region as a factor for improving the economic situation in the region. Thus, regardless of whether the resident is a student or employed, he perceives the high number of tourists as a space for improving the economic situation in the Horehronie region. At the same time, we can argue that in both cases, on the basis of mathematical-statistical methods, we have refuted our assumptions about the existence of statistically significant differences.

4. Discussion

From the results of the survey we can conclude that the largest part of the survey sample consisted of employed residents of the Horehronie region who have permanent residence in the countryside. It was also found that the vast majority of residents were knowledgeable about sustainable development. This is positive news for all stakeholders striving for sustainable development, as the residents themselves will support this development. It was also found that the inhabitants of the Horehronie region largely express their concurring attitudes to the basic claims of sustainable development and thus are aware of the need for such development in the territory of their region, which recalls in her study Gajdošíková (2019).

Through selected mathematical-statistical methods, it was found that regardless of the resident's permanent residence, this respondent is aware that a high number of tourists can have a major impact on the environment in the region. Although it is important for this region to have a high number of tourists, it is not appropriate, taking into account sustainable development, for the situation with tourists to change into overtourism.

At the same time, we found that regardless of the economic activity of residents, these residents realize that with a high number of tourists, income also comes to the region and the economic situation in the region improves. From the above, you can observe that sustainable development encounters 2 problems in practice. On the one hand, the high number of tourists brings funds to the region, but on the other hand, it can also mean that environmental conditions are damaged or production factors are wasted (Szabo, Csete and Palvogyi, 2008).

Therefore, current concepts focus on moving from a specific problem to a solution. Currently, the concept of slow travel is coming to the fore. It is a concept that includes a whole range of activities whose aim is to prioritize quality over quantity (Reháková, 2022). At the same time, it is also necessary to realize that traveling without leaving negative traces is simply impossible. However, we can minimize these negative footprints, e.g. by choosing transport, choosing services, choosing the destination itself, etc. Even the concept of slow travel itself is built on the idea of maximizing the experience and minimizing traces.

Slow travel is not only a good concept for humans, but also for the environment itself, as tourism affects ecosystems. A person on vacation "for which he has time" can rest better and more efficiently than during a cheap vacation for which he has only a few days. The benefit of the slow travel concept is also the reduction of the carbon footprint, as this concept assumes the use of more environmentally friendly forms of transport.

Since the Horehronie region has sufficient natural potential, its territory would also be suitable for such a concept of travel. Practically, it is suitable for the application of the slow travel concept to any other region or destination, as this concept should be primarily an initiative of the tourist (Slovak region, 2023).

Conclusion

Sustainable development is a key topic in today's world and has a profound impact on society, the environment and the economy. It is a long-term process that includes measures to ensure a balance between social, environmental and economic aspects.

Efficient resource management and environmental protection are key elements of sustainable development. It is essential to implement measures to reduce greenhouse gas emissions, protect biodiversity, sustainably manage water and waste management, and use renewable energy sources.

Sustainable development requires cooperation and involvement of different actors, including government, business, civil society and individuals. It is important to promote participatory processes where all stakeholders can participate in decision-making and implementation of measures (Gajdošíková, 2019; Rajnoha and Lesnikova, 2022).

Education and public awareness are key to sustainable development. There is a need to raise awareness and awareness of the environmental, social and economic problems we face and to promote responsible behaviour. Since the survey found that the inhabitants of the Horehronie region had sufficient knowledge about sustainable development, sustainable development should also be integrated into political and economic strategies at all levels - from global to local. It is essential to create legal and regulatory framework conditions that promote sustainability and encourage innovation and sustainable development.

However, sustainable development is a long-term goal that requires sustained efforts and continuous progress. It is necessary to monitor and evaluate the results achieved and to adapt strategies according to changing conditions and knowledge. Overall, sustainable development is a key factor for the future of our planet. This is a challenge that we must accept and act on individually and collectively in order to ensure better and sustainable living conditions for present and future generations (WHO, 2023).

Sustainable development and slow travel are two concepts that are interlinked and can contribute to environmental protection and social justice. Slow travel is an approach to travel that focuses on exploring and understanding local culture, minimizing negative impacts on the environment, and supporting local economies.

Slow travel is different from traditional tourism, which is often associated with mass travel, resource consumption and mass tourism. It focuses on slow pace, active involvement in the local environment and respect for local traditions and values. Sustainable development and slow travel have the potential to change the way we travel and perceive the world. They help us connect with local culture, protect nature and support local economies. Bringing them together can lead to sustainable and meaningful forms of travel that contribute to global well-being and the preservation of our planet for future generations, which is an important fact we took into account in this survey.

We consider the survey to be limited to its focus on only one region. Analysis focused on the perception of sustainable development in other regions of Slovakia could serve as a basis for their mutual comparison within the framework of progress in sustainable development.

Sustainability in the Corporate Strategy of European Wellness Hotels as a Generic Approach Based on the UN SDGs and the Experience of the COVID-19 Pandemic an SLR Analysis

Maximilian Maas^{1,*}

¹ University of Economics in Bratislava, Faculty of Business Management,
Dolnozemska cesta 1/b, 852 35 Bratislava, Slovakia

Abstract

Research background: The unprecedented disruptive changes in the tourism market, caused by a demand and supply shock, have also triggered the discussion about a sustainable form of the hotel industry. How can the 2015 UN SDGs be achieved and strategically implemented in the particularly energy- and resource-intensive wellness and luxury hotel industry?

Purpose of the article: This work aims to show the change in the meaning of sustainability based on the UN's SDGs for the wellness and luxury hotel industry in Europe due to the influence of the COVID-19 pandemic, and to elicit a model for the strategic implication of the SDGs. The inflationary use of the term sustainability will be critically and practically examined. Theses for further research will be derived from the current state of research.

Methods: With the help of a threefold keyword search in Web of Science, a structured literature search is carried out based on 322 hits. The aim is to conduct an evidence-based search for relevant findings to derive research hypotheses for further investigation.

Findings & Value added: The thesis presents the research gap in connection with the driving force of the hotel industry, the wellness and luxury hotel industry, and the SDGs. For this purpose, 10 theses for further research are derived and the state of knowledge confirms the increasing importance of the SDGs as well as the demand for green hotel services.

Keywords: sustainability, COVID-19 pandemics, SDGs, sustainable development goals, hospitality

JEL classification: G33, O44, Z3

1. Introduction

The COVID-19 pandemic is already considered the biggest economic crisis to affect tourism since the "Great Recession" of the 1920s (Gössling et al., 2020; Ozdemir et al., 2021; Romagosa, 2020; World Travel & Tourism Council [WTTC], 2021). Current research identifies a variety of drivers for disruptive processes in the tourism industry. First and foremost, a trend towards even more sustainable and radical ecological measures is identified. The debate goes so far that there is even talk of a war for the future of tourism ("war over tourism") (Butcher, 2020; Higgins-Desbiolles, 2021). Leading scientists argue about the question of growth and responsibility for destinations and their ecological and social environment (Butcher, 2020; Higgins-Desbiolles, 2021). With the emergence of the COVID-19 pandemic in 2020, there are unprecedented global implications and change processes for the tourism industry.

The most important sector is the hotel industry, within which luxury hotels, 4-star superior, and 5-star hotels form the spearhead and draught horses. They are the largest emitters of CO₂, especially due to their offers in the area of wellness, and are also the central greenhouse gas drivers of the tourism industry in a global industry comparison, as American studies currently prove (Gössling & Higham, 2020; Jørgensen & McKercher, 2019; Ozdemir et al., 2021; WTTC, 2021).

Political changes that will begin after the Corona crisis in 2021 and 2022 show strong restrictive tendencies within the EU, especially in Germany. As a result, the question arises as to how wellness

* Corresponding author: maximilian.maas@euba.sk

hotels should comply with sustainability standards in the future and at the same time how they can continue to be managed in economic terms. The basis for the considerations and future standards are the UN's Sustainable Development Goals (SDGs), which have been ratified and are valid in the EU. These have been operational since 2015 with the climate conference in Paris and have also implemented the COVID-19 crisis and the resulting challenges (United Nations, 2015, 2022).

In the first step, this paper will review the perspective and relevance of sustainability before the COVID-19 pandemic within the hotel industry, in particular the wellness hotel industry, and, in contrast, examine the perspective after the pandemic. The UN's 17 SDGs are a valid framework for the analysis. The steadily increasing environmental protection measures and growing social standards passed by the legislators will increasingly rise the costs of hotel operations. There is a threat of a decline in the quality of service due to closed wellness areas or in some cases severely restricted usability. Furthermore, strong price increases are to be expected due to cost pressure. The question is how these costs and service savings will ultimately be paid for and accepted by consumers. Only through an existing willingness to pay, the willingness to support sustainable development, and accepting corresponding savings in service will a sustainable transformation of the wellness hotel industry be possible in the long term (Kämmler-Burak & Bauer, 2021; Namkung & Jang, 2017).

Also, there is a never-ending debate about the inflationary use of the term sustainability. There are many positive industry examples and trends towards real green hotel concepts and industry representatives, but also evidenced studies about greenwashing and the resulting damage, as well as many doubts about the fact that economic goals beat sustainable ones and are preferred to them. Nevertheless, the sector is expected to undergo a transformation process that will transform the entire industry into a sustainable driving force and set an example for all other stakeholders (Bramwell et al., 2017; Gössling et al., 2020; Namkung & Jang, 2017; Nunkoo et al., 2021).

1.1 Object of research for this paper - the wellness hotel industry

The methodology of the SLR requires a clear delimitation and definition of both the object of review and the research objective to search for research gaps and theses in a structured and evidence-based manner. The definition of wellness used in this study and the definition of the wellness hotel industry derived from it are fundamentally based on the approaches of the GWI, the DEHOGA, and the current research literature. The GWI defines wellness on its website and in its publications as follows:

„Wellness is the active pursuit of activities, choices, and lifestyles that lead to a state of holistic health.“ (Global Wellness Institute).

The holistic approach to health is decisive in the definition. This is also highlighted by the Expedia booking platform when looking at the current definition of a wellness hotel.

"A wellness hotel serves the holistic recovery of body, mind, and soul. A team of professionals - from physiotherapists to sports therapists to bath attendants and beauticians - pampers the guest in harmony with the original nature. The successful combination of wellness, cosmetics, and sports leads to a long-term recovery effect for the entire organism." (Expedia, 2019 Translated from German into English by the author).

It is worth mentioning that, in addition to the applicable holistic idea of maintaining, improving, and restoring long-term mental and physical health, harmony with nature can be identified as a central pillar of the definition. The GWI emphasizes the direct link between wellness and the SDGs, or the sustainable development of our economies and societies, in its annual report for 2022. Here, the demands of the United Nations from its annual report on the SDGs are taken up and identified as central drivers for the wellness movement. By definition, wellness stands for a holistic, sustainable approach that combines and is defined by the social, economic, and ecological dimensions of sustainable development (Global Wellness Institute; United Nations, 2022; Yeung & Johnston, 2020, 2022).

In this context, Yeung and Johnston (2022) emphasize the multidimensionality of the wellness definition and the industry itself. This can be represented as follows:

Table 1. Definition of the wellness dimensions according to the GWI

Dimension	Definition
Physical	Maintaining, preserving, and increasing physical health through exercise, nutrition, sleep, etc.
Mental	Grasp the world with the mind. Raising awareness of one's world and living more consciously accordingly.
Spiritual	Being aware of one's feelings and accepting and expressing them. To be aware of and express personal feelings and to be aware of and understand the feelings of others.
Emotional	The search for meaning and the higher goal of human existence.
Social	To connect and engage with others and society itself in meaningful ways.
Environment	Promote positive interactions between people and the natural environment or the health of the planet and people's actions, choices, and well-being.

Source: Own presentation based on (Global Wellness Institute; Yeung & Johnston, 2022).

Depending on the presentation, the literature distinguishes between six, as cited here, and nine or twelve dimensions. The dimensions and definitions of wellness given above are general in nature and are intended to define and explain in a generalist way the whole complex scope of the wellness industry. They already illustrate the connection to the SDGs and the importance of sustainability, which is inherent to the term wellness (Global Wellness Institute; United Nations, 2022; Yeung & Johnston, 2022).

However, the definition of a wellness hotel is needed for the present study, ideally with fixed criteria that are measurable. For the German hotel market, the association criteria of the IHA and DEHOGA can be cited. These have existed since 2005 and define a wellness hotel based on seven criteria, whereby only hotels from the three-star classification of the DEHOGA are taken into consideration. There are three levels for a wellness hotel, derived from the characteristics and the scope of the offer (service quality): w - ww - www, whereby the three levels are to be understood as offer characteristics for the creation of a heterogeneous comparison level (Hotelverband Deutschland [IHA] & DEHOGA Bundesverband, 2005). The following seven areas with corresponding offer criteria must be fulfilled by a wellness hotel in Germany, depending on the W-grade:

1. Close-to-nature location: www for a location in the open countryside up to the minimum criterion for a w, the abstinence from disturbing outdoor and indoor noises.
2. Environmentally conscious operation: environmental management system and other specific measures, all of which must be fulfilled.
3. Wellness-vital cuisine: predominant use of organic products, species-appropriate animal husbandry, wholefood products, and an above-average range of fresh fruit, vegetables, and vegetarian dishes.
4. Immission-free areas: Non-smoking areas, and quiet areas for guests.
5. Offer design: information about the offers, as well as a sauna, and swimming pool are included.
6. Advice and support: services provided exclusively by qualified staff, pre- and post-care advice services.
7. Spa and wellness area: location within walking distance, hygiene, and maintenance, the offer of free drinks and food, the offer of separate showers, toilets, rest areas, pool size, saunas, and other natural bathing areas as well as the number of loungers (IHA & DEHOGA Bundesverband, 2005).

It should be emphasized that here, too, the firm integration of sustainability, especially the environment, is an integral part of the criteria and thus of the definition. Thus, all individual measures must be fulfilled even for the simplest category of a wellness hotel in the area of environment. This includes the following measures in detail:

- „The guest receives advice on how to behave environmentally friendly.
- Employees receive advice and/or training on environmentally friendly behaviour.
- Use of environmentally friendly detergents, cleaning agents, and cleaning products.
- Measures to save water/energy
- Waste management:
 - Measures to avoid waste
 - Composting/waste separation
 - Recyclable material collection system (at least in the kitchen)

- Measures to minimize pollutants
- Measures to conserve raw materials and recyclable materials" (IHA & DEHOGA Bundesverband, 2005).

The definitions given here for the wellness industry and the wellness hotel industry in particular make it clear that these companies are by definition suitable for the integration and implementation of the SDGs and are thus accentuated as a subject of investigation.

1.2 Objective of the paper and research question

This paper is part of a dissertation project on the topic of sustainability in the corporate strategy of European wellness and luxury hotel companies. The explicit aim is to capture the change in sustainability in the companies driven by the socio-economic drivers of the COVID-19 pandemic and, based on the SDGs from 2015, to establish a framework for their integration into the corporate strategy.

For this purpose, the following central research question is defined:

(RQ) How does sustainability in corporate strategy based on the UN's SDGs change for the European wellness hotel industry after the COVID-19 pandemic?

The aim is to explicitly classify the change in the meaning and implementation of corporate sustainability in the European wellness hotel industry after the COVID-19 pandemic. This is recognized by experts as a so-called 'catalyst' or 'game-changer' for sustainable development in the industry. The author sees the increasing importance of an overarching regulation of the definition of sustainability and recognizes the UN's Sustainable Development Goals (SDGs) from 2015, which were originally set up for states. Here he borrows from the first works published on this and observes the trend in annual financial statements to use these SDGs as sustainability standards (Abdou et al., 2020; Barbier & Burgess, 2017; Fonseca et al., 2020; United Nations, 2015). As called for by experts and already partially considered, the SDGs are to serve as a basis for sustainable corporate strategy, but must first be translated and adapted accordingly to serve the requirements of the industry (Barbier & Burgess, 2017; Fonseca et al., 2020; Rubio-Mozos et al., 2020).

The literature review aims to answer sub-research question one:

(RQ 1) How does the importance of sustainability for wellness hotel businesses or the European hotel industry in general change after the pandemic?

The derived objective is:

To capture and identify the relevance of sustainable business management after the COVID-19 pandemic as a possible 'game changer'.

For this purpose, final theses are to be formed which will be verified in the next qualitative research phase with the help of expert interviews.

2. Methods

The basic methodological procedure of the dissertation is based on the mixed methods approach. It follows a sequential flow chart and has three central methodological building blocks:

1. A literature review on the topic, which can be methodically assigned to the procedure of systematic literature research (SLR). It serves to generate the theses that are subsequently subject to the expert survey in the second part of the research. This part of the work belongs to qualitative research.
2. An explorative research part, in which the hypotheses are searched for inductively. For this purpose, 14 experts from the wellness hotel industry will be interviewed about the SDGs and their significance in the sustainability strategy. The second research phase, like the first, is thus to be classified as qualitative research. The evaluation is carried out according to the method of Mayring (2015) with the help of the analysis software MAXQDA 2022 Analytics Pro.
3. An explanatory research part, in which the hypotheses gained are tested through deduction, and the knowledge gained is evaluated for the population of the wellness hotel industry in the EU. For this purpose, the hypotheses obtained from the second part are falsified with the help of a panel survey. In the final quantitative research phase, the data will be analyzed and evaluated with the help of the statistical software JASP and Jamovi.

Figure 1 illustrates the methodological flow chart and the planned research design. In the following, the first research phase relevant to this paper, the SLR, is described and elicited.

Figure 1. Research design

Source: Own presentation

The figure above illustrates that, according to the prevailing textbooks, this is a generalization design (exploratory design) with equal weighting of qualitative and subsequent quantitative research. The aim is to analyze the inflationary discussed topic of sustainability with the SLR methodology suitable for this purpose and the changes in the meaning and perception of the sustainability discussion based on the SDGs (Creswell & Plano Clark, 2018; Greene et al., 1989).

The scope and objective of the search are defined as above and thus searches are carried out in the Web of Science with various keyword combinations. After four search runs with $n > 1,000$ hits each, the final keyword combination is: "sustainable development goals and hospitality" with $n = 322$ hits. Figure 5 describes in detail the whole process of SLR (Dekkers et al., 2022). Thus, $n = 40$ papers are included in the detailed abstract analysis, of which $n = 26$ are subsequently used for the content analysis. In the first reading, the content analysis leaves 18 papers for the thesis formation. After the second reading and with the help of a backward and forward search, seven more titles can be used for the final qualitative synthesis $n = 25$ (Durach et al., 2017; Snyder, 2019; Tranfield et al., 2003). These are divided into the following SJR journal categories:

Figure 2. Journal ranking (SJR)

Source: Own presentation

Figure 2 confirms the quality of the analyzed works with a share of 56 per cent of the papers in the Q1 category. In total, 84 per cent of the papers are classified in the top two categories and are analyzed as shown below.

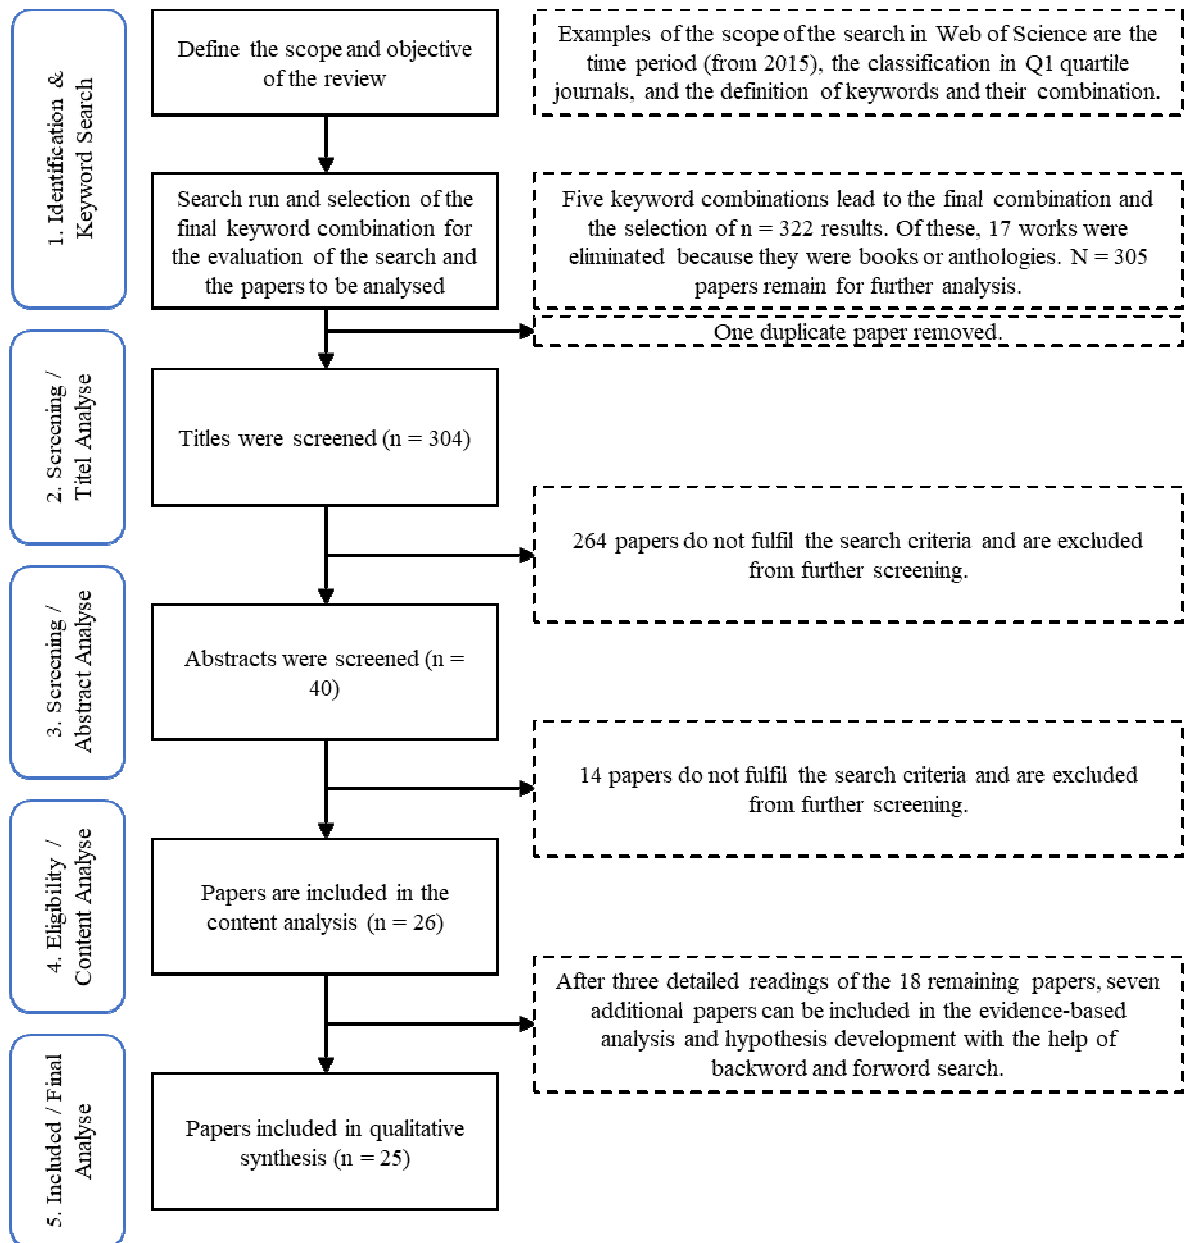

Figure 3. Flowchart of the SLR

Source: Own presentation based on (Durach et al., 2017; Rasoolimanesh et al., 2020; Tranfield et al., 2003)

The most cited journal is Sustainability (Q2) with 28 per cent, followed by the Journal of Sustainable Tourism (Q1). A further 28 per cent of the cited journals each have a paper in the analysis, which supports the diversification of the search and the required interdisciplinarity (Boluk et al., 2019; Font et al., 2019). The following diagram illustrates this relationship:

Figure 4. Most cited journals
Source: Own presentation

3. Results

Work on the implementation and target achievement of hotels about the SDGs confirms the importance and relevance of the SDGs, especially in the luxury and wellness segment. For example, in a study of four- and five-star hotels in Egypt, Abdou et al. (2020) elaborate on the environment-related SDGs (nos. 6, 7, 12, and 13) within Green Star-certified hotels that they contribute to meeting the environment-related SDGs. In their research model, the researchers show how the hotels' green practices address the SDGs and which of the individual goals are implemented downstream in the hotels or are tangential to them. However, the other SDGs are not considered in the research due to the objective and the target group (here the Green Star-certified establishments), as it is only about environmental performance. It is interesting that for the study region of Egypt, the five-star hotels indicate a significantly higher contribution to the achievement of the goals than the four-star establishments. Furthermore, the study highlights that the use of renewable energies (a central requirement of the SDGs) is not yet implemented or is primarily the focus of the hotels' environmental managers. This is consistent with a large number of other studies on this topic. Thus, long-term measures, which are also more costly and complex to implement, are the least common in practice. Here it is important to point to the use of renewable energies, intelligent proactive energy management systems, and grey wastewater (Abdou et al., 2020; Chan et al., 2020; Evans, 2016). Also highlighted is the introductory question on the motivation for the hotels' certification. Here, 52 per cent of the respondents ($n = 48$) state that they do so out of the "commitment of the hotels to ecological sustainability" (Abdou et al., 2020, p. 15).

Another study that qualitatively examines the success of measures to achieve the SDGs in Algeria in agritourism companies confirms their effectiveness (Ait-Yahia Ghidouche et al., 2021). For Europe, the work of Acampora et al. (2022) can show how important proactive communication is in addition to the implemented measures. They confirm for a sample of certified green hotels from Italy that service quality is a multivariate attribute determined by various variables (including environmental awareness and environmental protection measures). The authors also show that customers do not accept any sacrifice in service quality or amenities in hotel service. The quality of service is at the forefront of customers' preferences (Ait-Yahia Ghidouche et al., 2021; Bacari et al., 2021).

For the coast of Andalusia, Spain, researchers have studied how the formation of agglomerations affects the SDGs and the businesses as well as the destinations themselves. In the period from 1960 to 2015, the authors were able to show that the interaction between access to intact and unique nature must be protected, but that the formation of economic units into agglomerations offers economic as well as ecological and social advantages. Complex conflicts of objectives need to be balanced and resolved with the help of government control (Aragón-Correa et al., 2023).

The paper of Baum et al. (2016) uses case studies from the tourism industry to analyze how SDGs 1, 3, 4, 5, 8, and 16 are implemented and achieved at the micro (individual), meso (institutional), and macro (organizational) levels. The theses obtained are: (1) there is a lack of enlightened human resource management in tourism and (2) the tourism and hospitality workforce does not act sustainably. The authors derive therefore the need for:

„This paper endeavours to demonstrate that the tourism sector must commit to the overarching aim of sustainable employment for all tourism workers, which enshrines the protection of basic human rights, especially for women, children, minorities, and those who are less privileged in society. Such sustainability must, at its heart, address the goals set out in the UN's Agenda for Sustainable Development.“ (Baum et al., 2016, p. 13).

Boluk et al. (2019) call in their review critical thinking regarding the SDGs and their role in tourism. They identify the following six future areas for critical thinking: (1) critical tourism research; (2) gender equality; (3) indigenous and alternative paradigms; (4) degrowth and circular economy; (5) ethical consumption and production; (6) governance issues and mechanisms.

Another review that calls for critical and preferential engagement with the SDGs in tourism, in general, is the work of Bramwell et al. (2017). The authors understand this by work that is not subject to the paradigm of narcissism or vanity financed by society, but vice versa serves practice and society and proposes solutions that can be implemented for them. In particular, the treatment of SDGs 1, 2, 3, 4, 5, 7, 10, 11, and 17, which are currently analyzed and dealt with in less depth, is called for, as is practice-oriented and business-relevant research (Bramwell et al., 2017). From a governance perspective, this is what Hall et al. (2023) call for, whereby the authors see the critical evaluation of the SDGs as a governance concept of political decision-making and address here, among other things, the neoclassical basic idea of the inherent growth imperative.

Initial publications analyzing the environmental performance of luxury hotels in Taiwan about their brand value and productivity confirm that sustainable businesses have positive effects. In particular, the fact that consumers increasingly want to pay more for sustainable hotel services (Chen, 2019). In part, this research is contradicted by recent work from Europe, at least in terms of the youth generation's higher willingness to pay. However, there is evidence of an existing preference for sustainable hotel services that are committed to the SDGs (Floričić, 2020).

Nunkoo et al. (2021) find 41 articles that address the SDGs in tourism from 2019. Most of the analyzed papers deal with one of the SDGs and none deals with more than eight SDGs. In doing so, the researchers analyzed that the SDGs should be considered as a complex network of objectives (Barbier & Burgess, 2017; Fonseca et al., 2020). They should all be considered together as one construct. Accordingly, the paper derives interdisciplinarity in SDG research and calls on academia to conduct practice-relevant and all-encompassing research. The importance of the SDGs, especially for practice, should be at the forefront (Nunkoo et al., 2021).

Another recent research that sees the strategic importance of the SDGs and the need for action in political and corporate long-term strategic planning is the research by Scott (2021). In his review of tourism and climate change as the greatest current challenge, he argues that the SDGs cannot be achieved unless climate change is recognized and addressed as a key challenge. The paper defines two key areas of action for future research and as a challenge for tourism as a whole:

1. Decarbonising tourism by 2050 with the final goal of becoming CO₂ neutral.
2. Adapting tourism to a future with climate change and promoting its resilience. Physical impacts such as increased forest fires, water scarcity, refugee surges, food shortages, and extreme heat waves (Scott, 2021).

In their literature-based study, Raub and Martin-Rios (2019) have attempted to map a model for translating the SDGs for hotel companies. In a seven-step approach, the authors derive a transformation process from the individual SDGs to company-specific and relevant goals. The approach remains general and addresses the individual and local circumstances of the companies. The approach, like the previous ones, is based on stakeholder theory and elaborates the SDGs as central overall goals for a sustainable corporate strategy or management. It is recommended that an index be used to derive the importance and feasibility of the SDGs for assessing their relevance to companies (Raub & Martin-Rios, 2019; Rubio-Mozos et al., 2020).

4. Discussion

Based on the results discussed in Chapter 3, the following table summarises the relevant literature and the theses derived from it. It should be noted that three papers do not look at the EU and most have a global horizon (n = 15). The majority of the papers (n = 19) deal with all SDGs or their importance in general, which is in contrast to the first studies that criticize only the one-sided or the consideration of a few SDGs (Bramwell et al., 2017). Seven papers belong to the Methodology Review, three have quantitative methods and seven use qualitative methods.

Source: own presentation

Based on the literature analyzed here, it can be assumed that the SDGs themselves as well as the importance of sustainability in the luxury and wellness hotel industry will continue to increase after the pandemic. In addition to the measures in the companies and the scientific discussion, another driver is the Ukraine war and the implied energy crisis (Sun et al., 2022; Szromek et al., 2023). Thus, the following 10 theses arise for the authors, which need to be examined in the future:

Thesis (1): Measures that fulfil or are tangential to the environmental SDGs are most frequently communicated in practice (SDGs 11, 12, 13, 14, 15).

Thesis (2): Since the beginning of the COVID-19 pandemic, measures to implement and achieve the goals of the social SDGs have increased (SDGs 4, 5, 10, 16, 17).

Thesis (3): The SDGs are to be understood as a complex network of goals that must be seen as a whole along the entire value chain.

Thesis (4): Practice does not recognize the SDGs as an overarching goal framework for corporate strategy.

Thesis (5): Economic goals (SDGs 1, 2, 3, 6, 7, 8, 9) dominate the implemented measures, especially those that lead to cost savings.

Thesis (6): Only by satisfying and cooperating with local stakeholders can the sustainability goals of the SDGs be achieved.

Thesis (7): The guests of the luxury and wellness hotel industry are not willing to accept losses in terms of performance and service quality to achieve a sustainable hotel service.

Thesis (8): Sustainability as defined by the SDGs has become more important in the luxury and wellness hotel industry since the pandemic.

Thesis (9): Guests are willing to pay a premium or higher price for green luxury and wellness hotel services than for conventional ones.

Thesis (10): A sustainable or green hotel service is preferred by the customers or is more in demand than a classic hotel service.

In addition to the research theses derived, the work identifies a research gap. There is a lack of contributions to the European wellness and luxury hotel industry on the topic of integrating the SDGs into corporate strategy, as well as the change in the meaning of sustainability for companies due to the impact of the COVID-19 pandemic. It is a paradox that the wellness hotel industry, which by definition is concerned with the balance between humans and nature and the physical and psychological health of humans, has such challenges (Boluk et al., 2019; Higgins-Desbiolles et al., 2019; Romagosa, 2020). On the one hand, it wants to sustainably connect and harmonize people and nature, which is the core of the business, on the other hand, wellness, and luxury hotels are among the largest carbon dioxide emitters in the entire industry (Abdou et al., 2020; Global Wellness Institute; IHA & DEHOGA Bundesverband, 2005; Jørgensen & McKercher, 2019; Ozdemir et al., 2021; Yeung & Johnston, 2022). This paradox also confirms the need for research as well as for practical measures.

Conclusion

As a limitation of the present work, it must be mentioned that the completeness of the literature considered cannot be guaranteed. In particular, networks and clusters of topics and authors can be concretized with the help of bibliometric analyses (Nunkoo et al., 2021). Similarly, the literature review in this paper focuses on papers and neglects conference papers and books as well as contributions to collected works. In doing so, it follows the prevailing literature. However, this is a further limitation, as these works are categorically excluded (Durach et al., 2017; Snyder, 2019).

Another future question will be at what point companies are willing to invest sustainably. For this purpose, the author proposes the return on sales value based on data from the DEHOGA, the IHA, the Federal Statistical Office (Fachserie 6 Reihe 7.1) as well as the industry indicator of the REFI industry rating Germany. The author calculates the arithmetic mean for the years 2011 to 2019, the pre-Corona year, which is three per cent (FERI Trust GmbH, 2022; Statistisches Bundesamt [Destatis], 2022).

This paper confirms the presumed research gap that there is no relevant research on the implementation of the SDGs in the European luxury and wellness hotel industry. Similarly, no work has yet established the specific link between the COVID-19 pandemic and the changing importance of sustainability for business strategy. The evidence-based literature review shows a clear increase in the importance of sustainable hotel services. Another driver is the energy crisis with the start of the Ukraine war, especially in Europe. In addition, since the pandemic, an unprecedented conflict has arisen in the tourism research community about the future and social responsibility of global tourism. Growth critics

and neo-classicists are opposing each other and challenging each other conceptually from a "business as usual" to the end of tourism. Companies, especially those offering the highest quality of service, luxury and wellness hotels, are in the midst of the "war of tourism" and must strategically decide how to position themselves in the future and which markets they want to or can penetrate (Butcher, 2020; Higgins-Desbiolles, 2021; Romagosa, 2020).

Acknowledgements

The scientific paper is part of the dissertation with the working title: "Sustainability in the corporate strategy of European wellness hotels as a generic approach based on the UN SDGs and the experience of the COVID-19 Pandemic".

Business Skills of Tourism University Graduates: Insights from Slovak Labour Market

Zuzana Gajdošíková^{1,*}, Tomáš Gajdošík¹, and Vanda Maráková¹

¹ Matej Bel University, Department of Tourism, Faculty of Economics, Tajovského 10, 975 90 Banská Bystrica, Slovakia

Abstract

Research background: Today's highly complex and dynamic labour market needs flexible and skilled employees. However, the environment is changing rapidly and, in addition, the young generation and students are undergoing rapid changes in their characteristic and behaviour patterns.

Purpose of the article: The need to recognize requirements of tourism businesses on soft, hard and sustainability skills, competencies and knowledge of graduate students arises. It has not been comprehensively analysed in the Slovakia, so far. The aim of the paper is to explore the requirements on the business skills, competencies and knowledge of tourism graduates on the international labour market.

Methods: The methodology consists of the identification of relevant tourism organisations in Slovakia, questionnaire survey using CAPI and CAWI method and importance-performance analysis due to its ability to clearly analyse and graphically interpret the importance and performance of skills, competencies and knowledge.

Findings & Value added: The results indicate that the soft skills, competencies and knowledge are of the greatest importance to tourism organisations, followed by hard and sustainability skills. The employers indicated that what graduates lack the most is a proactive approach to work, big data analytics and ability to make and implement a mission statement reflecting sustainability principles. The innovative approach of analysing soft, hard and sustainability skills' requirement together is considered as the basis for higher employability of graduate students. The results have high transferability potential in the area of Central European countries that can affect also wider area of the Europe by preparing graduates for the open market of the European Union.

Keywords: business skills, labour market, tourism university graduates

JEL classification: I23, J24, L83

1. Introduction

Developments in technology, climate change, and growing uncertainty caused by the recent crises put pressure on changes of the skills of university students. Smart business skills combining soft, hard and sustainability features are inevitable. Employers in the tourism sector are not only seeking individuals with technical knowledge and expertise but also those with a diverse range of skills that can adapt to the evolving needs of the industry. Identification of skills' requirements of tourism university students on today's highly complex and dynamic labour market requires knowledge of the market and examination of employers' needs. The aim of the paper is to explore and analyze the importance of soft, hard, and sustainability skills possessed by tourism students in relation to their employability in the tourism labor market. Subsequently, the findings will facilitate the implementation of revisions in syllabi and teaching methods, enabling a more effective alignment of graduates with the evolving demands of the labour market.

Tourism higher education is a major platform for human capital development for the tourism industry and had a mission to assure the quality of graduates and equip them with particular skills, competences and knowledge to enable them to function as sophisticated professionals. During the latter half of the 1950s, a systematic focus on the examination of tourism emerged, transforming it into a subject of scientific inquiry across various disciplines and a key component of higher education (Gúčík, Gajdošík, Lencséssová, 2015) A. Mariotti pioneered the field of higher education institution in tourism

* Corresponding author: zuzana.gajdosikova@umb.sk

during the first half of the 20th century. In 1920/21 he taught tourism at the University in Rome. Since the 1930s, Switzerland, represented by scholars like W. Hunziker and K. Krapf, and Austria, represented by P. Bernecker, have incorporated tourism as a component of economic science in their educational curriculum. Following the Swiss and Austrian model, tourism education was established in Czechoslovakia during the 1960s at the University of Economics in Bratislava and Prague. After the social and political changes in 1989 and the subsequent transformation of Slovakia's economy from a centrally planned system to a market-driven one, the priorities in tourism research and education underwent considerable shifts. Significant changes in the content of study programs in Slovakia occurred during the academic year 1990/91, with the introduction of new subjects aimed at aligning education with the demands of the market economy.

These included subjects such as Tourism Management, Business economics in tourism or Tourism marketing. Significant efforts were also taken to internationalize the teaching process. They included the recruitment of foreign experts, mobility of students and teachers abroad (Kučerová & Gúčík, 2017).

The actual changing situation is having a major impact on the tourism and hospitality sector and this will likely affect the redesign of program curricula. The Covid-19 pandemic has brought the most significant disruption to education in history. The current crisis, dynamic and changing environment cause reshaping of higher education in tourism. The study programs should monitor changes in the industry and examine their curricula and wider approaches to learning to ensure that graduates have the necessary skills and competencies to cope and flourish in their future careers (Siow et al., 2021).

International Standard Classification of Education (ISCED) classifies Tourism as Economic Studies and marks it with the code 10 – services, in the strict sense it regards the personal services (code 101). In this group tourism is included in two study specializations: in 1013 - hotel, restaurants and catering and 1015 - travel, tourism and leisure. It is desirable that higher tourism education would be compatible with this classification. While, there is no international standard for curriculum desing of the tourism and hospitality programs, educational institutions have sought to develop their curricula based on their regional stakeholders' demand for talent and their institutional aims and intended outcomes (Wattanacharoensil, 2014). Dopson and Tas (2004) emphasize the need to add practical content to curriculum planning and development. There is a common belief that input or evaluation and feedback from the community and various stakeholders should be maintained (Tribe, 2002). Moreover, UNWTO (2019) recommends advancing research to identify skills mismatch along tourism value chain and to ensure that education and training systems are responsible to labour market needs. Nowadays there is a call for recognition of worldwide educators' concern for new skills and knowledge that students will need during the future recovery of the tourism and hospitality industry. The existing goals of the curriculum may require modification and strengthening in order to focus on students' preparedness that will help to overcome the challenges of the changing environment. Work practices and worker experiences have set a different course since the Covid-19 and will challenge many of the assumptions that have underpinned previous research in this area, stimulating the need for new research on skills, compteneces and knowledge (Ladkin et al., 2023).

Skills means the ability and capacity acquired through deliberate, systematic, and sustained effort to smoothly and adaptively carryout complex activities or job functions involving ideas, things, and/or people (Costa et al., 2020). In the context of the European Qualifications Framework, skills are described as cognitive (involving the use of logical, intuitive and creative thinking) or practical (involving manual dexterity and the use of methods, materials, tools and instruments) (<https://europa.eu/europass/en/description-eight-eqf-levels>). Soft skills refer to a set of personal attributes, characteristics, and abilities that enable individuals to interact effectively and harmoniously with others in various professional settings. In the context of the tourism industry, soft skills play a vital role in delivering high-quality customer service, building strong relationships with clients, and effectively managing diverse and multicultural teams. Hard skills refer to the technical and specialized knowledge, training, and qualifications that are specific to a particular job or industry (Carlisle et al., 2021; Zaragoza-Sáez et al., 2022). While soft skills are essential for effective communication and interpersonal relations, hard skills are equally important for performing specific tasks and roles within the tourism industry (Baum et al., 2016; Siow et al., 2021). The possession of relevant hard skills increases the employability of tourism students, as it demonstrates their ability to handle job-specific responsibilities with competence and professionalism (Patacsil & Tablatin, 2017). The concept of sustainability skills has gained significant attention in the tourism industry in recent years. Sustainability skills refer to the attitudes and behaviors that contribute to the sustainable development and management of tourism destinations (Saleh et al.,

2022). With growing concerns about environmental degradation, climate change, and social responsibility, tourism organizations are increasingly focusing on sustainability practices (Wattanacharoensil, 2014).

There is no specific term or widely recognized concept of smart skills in the context of tourism. It is possible to derive the essence of smart skills from the smart technologies. The term smart technologies does not indicate that the technology itself is smart, rather individuals and industry can become smarter when using it, as it enables to quickly correspond, sensitively analyse and predict occurring situations (Lee, 2013). Thus, smart skills enable employees to become smart by applying knowledge and using know-how to communicate, analyse and anticipate in the work environment in order to complete tasks and solve problems.

Knowledge is traditionally defined as true justified belief. In other words, knowledge is a state of mind, the person ascribed knowledge can provide good reasons for the content of his/hers belief and this belief is true (Johansson, 2016). In the context of the European Qualifications Framework, knowledge is described as theoretical and/or factual (<https://europa.eu/europass/en/description-eight-efq-levels>).

Competence constitute then of the various skills and knowledge needed for performing the job (Wong, 2020). From the point of view of a student – a future employee, competences are a proof of being able to use knowledge, skills and personal, social and methodological abilities displayed at work or during learning, in professional and personal career. Competences include more than knowledge and understanding and take into account the ability to apply that when performing a task (skill) as well as how – with what mind-set – the learner approaches that task (attitude) (European Commission, 2018).

2. Methods

For the purpose of the study, skills, competences and knowledge were selected according to the previous surveys carried out in this area (Wang, 2009; Carlisle et al., 2021; Zaragoza-Sáez et al., 2022), studies aimed at the future of hospitality education and preparing students for a changing industry (Popely et al., 2021), and the future of work and skills development in tourism by UNWTO (2019). As a complement to the desk research, an analysis was conducted by examining the requirements of the most significant employers in the tourism industry as published on their websites. Based on the results of the analysis, 20 soft, 14 hard and 9 sustainability skills, competences and knowledge were identified (table 1).

Table 1. Identified skills, competences and knowledge

Category	skills, competencies and knowledge
Soft (20)	creative problem-solving, flexibility, adaptability, proactive approach to work, innovativeness, critical thinking, customer orientation, empathy, communication (face to face, online, phone, e-mail), ability to work in a team, diversity - cultural awareness, ethical conduct, being able to create a positive work environment, ability to speak foreign languages, ability to serve customers with various types and degrees of disability, market overview, knowledge of trends and actual situation, hospitality, willingness to help
Hard (14)	online marketing (e.g. SEO, search engine marketing), website analytics (e.g. Google analytics), social media analytics (e.g. Meta Business Suite), content development (copywriting), skills to monitor online reviews, (big) data analytics (machine learning, natural language processing), robotic engineering, applying digital hardware (e. g., augmented and virtual reality skills), database skills, the ability to use different hardware/ devices (computers, tablets, mobiles, Wifi), desktop publishing (for designing brochures, catalogues), office software skills (e. g., MS Word, Excel, Adobe), descriptive data analysis (descriptive statistics), tourism information system skills (e. g., hospitality PMS, GIS, GDS)
Sustainability (9)	understanding of sustainability principles, ability to promote environmentally friendly activities and products, ability to work with local producers, internal sustainability management (applying sustainability principles in a workplace), skills helping to improve the sustainability of suppliers, ability to motivate customers to make more sustainable choices, ability to deal with host-guest interactions and communities, ability to make and implement a sustainability mission statement, policy and action plan, skills related to awareness of local customs (e. g., food, arts, language, crafts)

Source: Based on Carlisle et al., 2021; Zaragoza-Sáez et al., 2022; Popely et al., 2021; UNWTO, 2019.

After the selection of relevant skills, competences and knowledge, field research was carried out. First, a database was created with the contact details of tourism businesses operating in Slovakia. A total of 1 283 contacts (1 000 accommodation facilities, 143 travel agencies, 47 destination management organisations, 92 catering facilities) were collected. Second, the businesses were contacted by email during October and November 2022. After two email rounds, 75 businesses provide information on their requirements on the graduates (table 2). The businesses were asked to indicate the importance and presence of skills, competences and knowledge on a 5-point Likert scale (1 – the least important, 5 – the most important).

Table 2. Structure of the research sample

Business	Number
Accommodation facility	37
Travel agency	18
Destination management organization	14
Catering facility	4
National tourism organization	1
Tour guide	1
Total	75

Source: authors (2023)

The collected data were analysed by importance-performance analysis (IPA) due to its ability to clearly analyse and graphically interpret the importance and performance of skills, competencies and knowledge (Azzopardi & Nash, 2013). The IPA as a powerful diagnostic tool could provide the criteria for optimal categorization of elements in IPA framework, while testing its validity and reliability (Sever, 2015). This enables decision-makers to easily choose the appropriate strategy and address the gap between importance and performance (Marasinghe et al., 2021). The proposed method set the path for reliable assistance in the decision-making process. Moreover, the qualitative analysis was done by the computer-aided qualitative data analysis (CAQDA) process by means of Atlas.ti software. The Word Cruncher Analysis was performed, in order to find out the most frequent words and word clouds were used to graphically present the outcomes.

3. Results and Discussion

The graphical interpretation of the IPA results is presented in Figures 1-3. Applying the data-centered quadrants approach, the results were analysed using the mean values of the available data. By identifying the most crucial attributes, IPA yields insights into which skills, competences and knowledge areas educators should focus. Therefore, it prioritizes actions to suggest the optimal allocation of effort in education, which would be more responsive to employers' needs and, concurrently, enhance and maintain the employability of graduates in the labour market.

Regarding soft skills, competencies and knowledge (figure 1), the most urgent are issues located in the quadrant - Concentrate here. The skills, competencies, and knowledge found in this quadrant are in high demand and hold significant importance for employers. However, the performance and proficiency of graduates in these areas are currently very low. Based on the obtained results, employers agree that critical thinking, proactive approach to work, creative problem solving, flexibility, adaptability and customer orientation should be strengthened during the teaching process. These variables also exhibit the largest gap between importance and performance, indicating that they hold significant value for employers but are the least mastered skills by students. The encouraging result is that both the importance and performance are high and thus the recommendation to keep up the good work is focused on communication, willingness to help, ethical conduct, ability to speak foreign languages, ability to work in a team and being able to create a positive work environment. Similar research (Baum et al., 2016; Hjalager, 2010) has shown that in the tourism sectors soft skills such as communication, interpersonal skills, problem-solving, adaptability and emotional intelligence are highly valued by employers.

Figure 1. Importance - performance analysis of the soft skills, competences and knowledge
Source: own processing (2023)

In terms of equipping students with the necessary hard skills (figure 2), competencies, and knowledge for the labour market, the focus should be directed towards areas that exhibit the most significant gap between importance and performance, such as tourism information systems, content development, and online marketing. According to businesses, not so much attention is required in the domains of big data, website and social media analytics or descriptive data analytics. However, as UNWTO (2019) indicates, big data and data analytics, together with environmental related technologies, emerge as the most valued technologies to consider in term of future skills development. Therefore, in the near future these skills, competencies and knowledge will be more important.

Minimal attention from the point of view of the labor market, i.e. employers is needed for robotic engineering and the application of digital hardware. Graduates are well equipped with office software skills, ability to use different hardware and devices and skills to monitor online reviews.

Figure 2. Importance - performance analysis of the hard skills, competences and knowledge
Source: own processing (2023)

In regards to sustainability skills (figure 3), employers currently do not place significant importance on them, as none of them fall within the concentration quadrant. Skills related to awareness of local customs emerge as the most significant for employers. The majority of variables are positioned in the low priority quadrant, indicating that employers are not yet sufficiently aware of the importance of ensuring sustainable development within the tourism industry. However, this does not imply that they should be disregarded in the teaching process. The current societal changes indicate a pressing need to direct attention towards specific opportunities for addressing the challenges associated with enhancing sustainable development. Similarly, Saleh *et al.* (2022) emphasized the significance of sustainability skills in the tourism industry, noting that employers increasingly value candidates who possess knowledge and commitment to sustainable practices.

Figure 3. Importance - performance analysis of the sustainability skills, competences and knowledge
Source: own processing (2023)

The results indicate that the soft skills, competencies and knowledge are of the greatest importance to tourism businesses (mainly communication, customer orientation, proactive approach to work), followed by sustainability skills (mostly deal with host-guest interactions and communities, skills related to awareness of local customs, ability to work with local producers) and hard skills (notably office software skills, the ability to use different hardware, services, online marketing) and (figure 4).

Figure 4. Comparison of skills, competences and knowledge meaning
Source: own research (2023)

Tourism businesses also expressed their requirements for an ideal employee. According to the word cloud (figure 5), the most important requirement for an ideal employee is flexibility, followed by communicativeness, multilingualism, hardwork, ability to learn and customer-orientation. These findings are in line with the research of Costa *et al.* (2017) where the characteristics of ideal tourism employee (not considering the gender) are personality profile, relevant training/ education, written and spoken English, maturity and competence, motivation, adaptability, knowledge, experience, honesty, ability to work in a team and customer relations skills.

Figure 5. Requirements for an “ideal” employee
Source: own processing (2023)

The employers characterise the university graduate (figure 6), as a person with high expectations, who can work with information and communication technologies, knows a foreign language, is professionally educated, but live in the virtual world, is non-communicative and without interest.

The acceleration method of development of transversal competences in the students’ practical training process was subject of a research held in years 2015-2018 which resulted in the implementation an innovative method of accelerating the development of transversal competences of students by improving the use of practical training (Borsková *et al.*, 2017).

Figure 6. Characteristics of university graduate according to the employers
Source: own processing (2023)

Conclusion

Value added of the research presented lies in the suggested focus of the education process that would be addressing employers' needs and at the same time enhances the employability of graduates in the future labour market.

The obtained results indicate the need for changes in teaching content as well as teaching styles, methods and techniques in order to make a fit between the graduates' skills and the real needs of the labour market represented by the employers' expectations. The obtained results can be applied to the learning process by employing carefully selected student tasks to make a progress in the required skills. Higher education institutions should focus more intensively on developing the critical thinking, proactive approach to work and creative problem solving. Flexibility, adaptability and customer orientation should be more essential part of the learning process. As far as hard skills, there is a need to prioritize the topics of tourism information systems, content development, and online marketing. Employers increasingly value candidates who possess knowledge and commitment to sustainable practices. Additionally, incorporating case studies, leveraging best practices, and engaging students in solving specific assignments and problems from industry can greatly enhance their smart skills development.

All the stakeholders engaged in skills improvement and higher employability of tourism university graduates can benefit from the research results while the authors are considering not only the present expectations but also the future of jobs features and skills needed within the tourism industry. There is a need of systematic research in the field of alumni knowledge, skills and competences in the framework of dynamically changing requirements of job supply within the tourism industry with regards to rebuilding the reputation of the industry and employer branding.

Tajovského 10, 975 90 Banská Bystrica, Slovakia

Abstract

Research background: To ensure the promotion of sustainable tourism practises in natural protected areas, it is crucial to prioritise the conservation and protection of the natural environment while also considering the needs and interests of tourists, tourism businesses and local communities. This necessitates careful planning, management, and monitoring of tourism activities, as well as engagement and collaboration with various stakeholders. However, despite efforts to prioritise sustainable practises in the development of tourism in protected areas, the management of these areas often lacks sufficient information on tourism development. As a result, decisions may not be adequately substantiated and unsustainable tourism development in protected areas can occur.

Purpose of the article: The aim of this article is to examine how protected areas management perceives the availability of data on tourism development.

Methods: The study used a qualitative approach by conducting semi-structured online interviews with managers from 15 natural protected areas in Slovakia, including national parks and protected landscapes. The collected data was analysed using content analysis with the assistance of Atlas.ti 9 software. The study also provides examples of best practices in using data for tourism development by protected area management, which complements the qualitative survey.

Findings & Value added: The study's results offer valuable insights into the perception of protected area management regarding the availability of data on tourism development. The findings indicate a shortage of suitable data on tourism within protected areas, revealing that protected area management is eager to obtain comprehensive data that encompasses the broader impacts of tourism.

Keywords: data on tourism development, management of protected area, natural protected areas, sustainable tourism development

JEL classification: L83, Q26

1. Introduction

Tourism can be likened to an ecosystem due to its intricate and interconnected nature, encompassing diverse stakeholders and components that interact and depend on each other. These components include the destination and its resources, businesses and service providers, tourists, and the government and local communities (European Commission, 2022). Additionally, tourism has significant social, cultural and environmental implications as it has the potential to greatly enhance social cohesion, alleviate poverty, and preserve and promote cultural and natural heritage (Mandić, 2019). Therefore, tourism is often a significant development factor and stimulus that affects destinations, including protected areas.

Protected areas are not isolated entities; instead, they are intricately interconnected with their surrounding environments. The International Union for Conservation of Nature (In Dudley, 2008, p. 2) defines a protected area as "a clearly defined geographical space, recognised, dedicated, and managed, through legal or other effective means, to achieve the long-term conservation of nature with associated ecosystem services and cultural values." Ecosystem services, linked to protected areas, refer to the various benefits that nature provides to human well-being, such as clean air and water, climate regulation, pollination, as well as recreational opportunities (Phelan, Ruhanen, & Mair, 2020). By protecting these services, protected areas contribute to the general health and resilience of ecosystems,

* Corresponding author: matus.marcis@umb.sk

benefiting both nature and society. Protected areas therefore serve as fundamental building blocks for nearly all national and international conservation strategies, receiving support from governments and international institutions and covering almost 12% of the world's land surface (Leung et al., 2018). Within the realm of tourism product offerings, protected areas hold a vital and integral position in various regions and countries. These natural areas, carefully preserved to safeguard their unique ecosystems, wildlife, and cultural heritage, serve as alluring attractions for both domestic and international tourists (Mandić, 2019; Job et al., 2021). Their preservation and responsible management remain essential to ensure their sustainability for tourists seeking unforgettable encounters with the natural world.

However, it is essential to acknowledge that tourism development can have both positive and negative social and economic effects (Buckley, 2017; Mancini et al., 2022). Although nature conservation prioritises tourism over intensive economic activities, an excessive emphasis on tourism can also conflict with conservation goals (Leung et al., 2018). This conflict can manifest in various forms, such as land encroachment, destruction of natural landscapes due to infrastructure construction, disturbances to ecosystems, excessive water and energy consumption, waste generation, light pollution, increased risk of forest fires, excessive noise, and accumulation of waste left behind by tourists (Štrba et al., 2022). Consequently, uncontrolled tourism development may have adverse impacts on the natural resources that it depends on.

To strike a balance between conservation and development, quantifying the extent of tourism development becomes crucial (Ziesler & Pettebone, 2018; Job et al., 2021). This enables a meaningful evaluation of the benefits, both positive and negative, resulting from tourism activities (Slabbert & Du Preez, 2021). Reliable data describing tourism activities, along with efficient and reliable data collection methods, are essential to support the successful management of sensitive protected areas (Slabbert & Du Preez, 2021; Huang, 2023). Data collection on tourism in protected areas usually includes indicators such as the number of visitors, the number of overnight stays, visitor expenditures, visitor behaviour, movement, experience, or ecological impact. The benefits of monitoring include identifying the most visited locations in protected areas, effectively managing visitor flows to protect vulnerable areas, improving the quality of visitor experiences, better infrastructure planning and management, raising awareness of the values of protected areas, and obtaining more funding for infrastructure in high-demand areas (UNESCO & BfN, 2021). Therefore, accurate information underpinning tourism development becomes vital (Xu, Nash, & Whitmarsh, 2020), empowering communities and destinations to unlock the benefits bestowed by the sector.

However, despite efforts to prioritise sustainable practises in tourism development within protected areas, the management of these areas often lacks sufficient information on tourism development. Consequently, decisions may not be adequately substantiated, leading to potential instances of unsustainable tourism development in protected areas (Pickering et al., 2018; Mancini et al., 2022). The availability of data on tourism development in protected areas, as well as the perception of the administration of these areas with respect to these data, remains uncertain. Existing research in this field is often fragmented and focusses primarily on methodologies addressing sociodemographic attributes of visitors, their psychographic attributes before visiting, their behaviour within protected areas, and their experiences and impacts after returning home (Levin et al., 2017; Pickering et al., 2018; Slabbert & Du Preez, 2021). To address this gap, the present study aims to examine how the management of protected areas perceives the availability of data on tourism development. The research approach employed is qualitative, involving semi-structured online interviews with managers from 15 natural protected areas in Slovakia, including national parks and protected landscape areas.

2. Methods

Study context. Currently, in Slovakia, there are special protection areas classified under the 2nd to 5th protection levels, which include various types of protected areas (State Protection of Nature of SR - ŠOP SR, 2023). Among these are nine national parks and 14 protected landscape areas, which are considered "large-size" protected areas (Figure 1). In addition, there are protected sites, nature reserves, natural monuments, and protected landscape fragments, called "small-size" protected areas. A national park (NP) is a protected area with an area of more than 10,000 hectares and represents the largest protected area within the territory of the Slovak Republic. National parks encompass ecosystems that are largely undisturbed by human activity or are located within unique natural structures, contributing to significant natural heritage. The preservation of this natural heritage has precedence over other activities.

On the other hand, a Protected Landscape Area (PLA) is an area that exceeds 1,000 hectares, comprising diverse ecosystems that play a central role in preserving biodiversity and maintaining ecological stability in the landscape. These areas may showcase distinctive landscape features or possess specific forms of historical settlement. In summary, the large-size protected areas cover approximately 23% of the total area of the Slovak Republic (ŠOP SR, 2023).

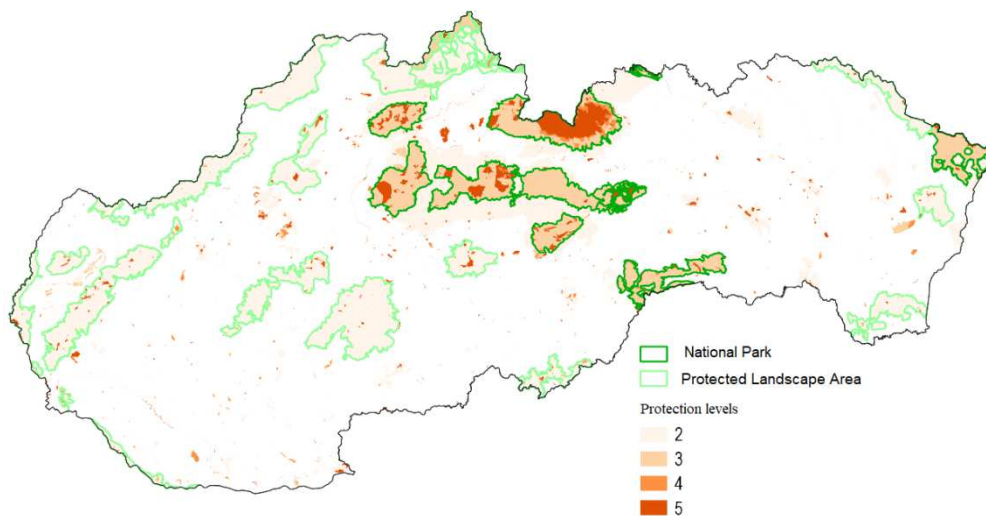

Figure 1. Large-size protected areas in Slovakia
Source: ŠOP SR (2023)

Sampling and data collection. Participants in this study were selected using a purposive sampling technique as part of a non-probability sampling method. Initially, management organisations of "large-size" protected areas, such as national parks and protected landscape areas, were identified and contacted via email to inform them about the research objectives. Once their agreement was obtained and permission to record the discussions was granted, online semi-structured interviews were conducted with 15 representatives from the protected areas between February and April 2023. It should be noted that currently the Slovak protected areas administrations do not have specific positions solely dedicated to tourism development. Therefore, study participants who represent protected area management hold various positions, including directors, environmental educators, botanists, and ecologists (Table 1). All participants recognised the participation of various aspects of tourism in their work, such as providing input on the objectives of the (tourism and recreational) projects, educating visitors, and assessing the impacts of tourism on protected areas.

Table 1. Study participants

Natural protected area	Role/Position
Tatra National Park (TANAP)	Deputy director
Low Tatras National Park (NAPANT)	Botanist/ Ecologist
Poloniny National Park	Environmental education
Slovak Paradise National Park	Environmental education
Pieniny National Park (PIENAP)	Environmental education
Veľká Fatra National Park	Director
Biele Karpaty Protected Landscape Area	Director
Cerová vrchovina Protected Landscape Area	Dendrologist
Horná Orava Protected Landscape Area	Environmental education
Kysuce Protected Landscape Area	Botanist/ Ecologist
Poľana Protected Landscape Area	Ecologist
Ponitrie Protected Landscape Area	Ecologist
Strážovské vrchy Protected Landscape Area	Botanist
Vihorlat Protected Landscape Area	Director
Východné Karpaty Protected Landscape Area	Environmental education

Source: authors (2023)

Following the guidelines of Patton (2014), a set of sixteen questions was created to form the interview protocol. The questions were formulated based on the findings of the literature review, focussing on the importance of tourism data for protected areas. They covered topics such as data collection methods to monitor tourism development, data storage and processing, and the use of data by protected area management. Two independent peers conducted a review of the questions before they were finalised. The questions followed a predetermined order, ensuring consistent wording among all participants, which facilitated the comparison of responses and minimised potential interviewer bias. These interviews were conducted in the Slovak language and had durations ranging from approximately 30 to 55 minutes.

Data analysis. The study used content analysis to examine the data obtained from semi-structured online interviews conducted with 15 representatives of protected areas. Content analysis is a research method that involves systematically evaluating the symbolic content present in various forms of communication. It is an observational approach that seeks to analyse and interpret the meanings and patterns within the collected data. The content analysis followed a six-phase procedure based on Braun & Clarke's (2006) guide, and the analysis was facilitated by the use of Atlas.ti 9 software for computer-aided qualitative data analysis. Atlas.ti is a widely-used qualitative data analysis software that offers a comprehensive suite of tools for managing and analysing qualitative data. It is popular among researchers and professionals in various fields, including social sciences, anthropology, psychology, and market research. The features and functionalities of the software enable efficient data management, coding, and visualisation, facilitating rigorous qualitative data analysis and interpretation.

The six phases of the content analysis process were as follows: (1) An initial reading of the recorded interview data was performed to familiarise with the content. (2) The data was coded using Atlas.ti 9 software, which allowed systematic organisation and labelling of the data. (3) Potential themes within the data were identified, capturing key patterns and ideas that emerged from the interviews. (4) The themes were reviewed and organised to create a coherent structure. (5) Each theme was defined and given a name to accurately represent its content. (6) The results were described and visualised, providing a clear presentation of the findings.

Furthermore, taking into account the recommendations of the study participants, the research also highlights exemplary practises employed by protected area management to use data for tourism development. These examples serve as valuable information that complements the findings of the qualitative survey, further enriching the overall understanding of the topic.

3. Results and Discussion

The national parks and protected landscape areas of Slovakia serve as decisive natural spaces where the interests of nature conservation, economic use, and tourism intersect. Alongside their primary mandate of preserving natural ecosystems, conducting research, and providing education, national parks now also strive for sustainable tourism development by promoting environmentally-friendly forms of tourism (Štrba et al., 2022). The estimated number of visitors to the Slovak national parks is approximately 6 to 8 million people per year (ŠOP SR, 2023). Hence, data that can inform and guide tourism development play a pivotal role in national parks.

On the other hand, from the perspective of protected landscape areas, tourism development does not represent a profit opportunity for their management. The management of protected landscape areas falls under the State Protection of Nature of SR (ŠOP SR), which is governed by its statutes. However, tourism is not among its goals. As a result, protected landscape areas have limited authority in guiding tourism development, despite being continuously influenced by tourism activities.

3.1 Availability of data on tourism development in protected areas of Slovakia

The administrations of protected areas, including national parks and protected landscape areas, recognise the importance of tourism development. For decades, Slovak national parks, such as the High Tatras, Low Tatras, and Slovak Paradise, have been among the most popular destinations for domestic and international tourists. However, the management of national parks had certain limitations due to the lack of legal personality, which restricted their authority in guiding territorial development, including tourism. Conversely, in 2021, a reform was adopted for national parks, granting them legal personality and empowering their administrations to actively pursue the development of tourism as one of their primary missions. As noted by Buckley (2017), the development of tourism within protected natural areas involves intricate relationships that encompass legal, political, economic, social, and environmental aspects.

Multiple stakeholders are involved, including management authorities, tourism businesses, local communities, and non-governmental organisations. Each of these stakeholders has its own interests, priorities, and approaches to data and information. In this complex landscape, understanding the various perspectives and needs related to data and information becomes necessary for effective decision-making and sustainable tourism development in protected areas.

Consequently, national parks have unanimously recognised the importance of tourism development data for their operations. As the representative of the Slovak Paradise National park stated: *“Certainly, yes. That is why we (national park – note of the authors) are a member of the DMO (Slovak Paradise & Spiš Destination Management Organisation), as well as the Park Council. We actively collaborate with local municipalities and landowners, actively participating in the planning and decision-making processes related to tourism in the area. Information about tourism is essential for our activities”*. This importance is also recognised by the administrations of protected landscape areas. In particular, the administration of the Horná Orava considers such data essential due to the considerable public demand for recreational activities and infrastructure initiatives within the protected area: *“Data are indispensable, as the majority of tourism activities in Orava occur in the natural environment within protected areas. The significant demand for new infrastructure and the absence of effective communication in tourism activity planning further emphasize the importance of data”*. Using tourism data, the administration aims to improve communication and improve tourism decision-making processes.

Although the importance of tourism development data is acknowledged, the administrations of Veľká Fatra, Nízke Tatry, and Poloniny currently do not systematically record such data. The reform of national parks has brought about changes in their organisation and management. On the one hand, they have gained more authority, but on the other hand, they have also increased their workforce and responsibilities, necessitating the achievement of personnel and managerial stability. As one director of national park concluded: *“We have not yet systematically carried out the monitoring of tourism development, statistical indicators, or impacts due to insufficient allocation of human and material resources”*. Consequently, despite their significance, tourism data are currently not used by these national parks.

Similar issues were observed by Pickering et al. (2018), as the use of suitable data to monitor the impacts of tourism in protected areas remains a significant challenge for protected area management. Mancini et al. (2022) also point out that protected area management agencies often lack expertise, resources (both human and financial), incentives, and sufficient tourism training. This deficiency leaves them vulnerable to the various pressures imposed by tourism activities.

In the Ponitrie Protected Landscape Area, tourism development data play a vital role in determining the limits of physical carrying capacity to guide tourism activities. However, there is currently a lack of suitable data for such monitoring, and monitoring relies heavily on the subjective opinions of field employees. This situation is similar to that in other protected landscape areas. The responsibilities of protected landscape areas (such as Vihorlat, Poľana, or Východné Karpaty), as defined by law and their primary objectives, do not focus on tourism development. However, they still recognise the importance of information on tourism development for the preservation of specific areas.

Various techniques are used to collect tourism data in different protected areas, with the majority of them focused on monitoring visitor numbers. For example, the Administration of the Slovak Paradise National Park uses digital counters to conduct visitor counts three times a year. Additionally, they track visitor numbers through ticket sales for rafting in the Prielom Hornádu (Hornád Gorge) and entries into the Kysel' Gorge. In the Suchá Belá Gorge, visitor numbers are monitored through a camera accessible on the park's website. They also receive data on the number of overnight stays in the national park area from the DMO Slovak Paradise & Spiš. In the Pieniny National Park, only the tourist trail of the Dunajec Gorge is physically monitored, as it is the most visited location in the area. The Administration of the High Tatras National Park conducts regular visitor monitoring through physical counting carried out by staff in the field. On a selected day at the beginning of August, tourists in mountain terrain are manually counted at the entrances to valleys or other locations. Furthermore, the High Tatras Park Administration collects visitor data from counting devices installed in 20 locations, provided by the Municipality of Vysoké Tatry.

Other studies also pointed out the focus of protected areas management bodies on visitor numbers. Job et al. (2021), in their study examining how visitation is registered in protected areas in Germany, emphasise that advances in technology have expanded the possibilities for counting or estimating visitor numbers. Automated and remote-controlled counting devices have become prevalent, offering significant opportunities for extensive counting at a relatively low cost in data collection. However, as Mandić (2019)

concludes in a review of nature-based solutions for sustainable tourism development in protected natural areas, the implementation of monitoring and visitor management solutions is often closely tied to the objectives of data collection, the unique characteristics of the park and the availability of funding. For example, the Cerová Vrchovina and Východné Karpaty PLAs monitors the density of tourists by assessing the wear and tear of trails and other technical equipment. This approach is also employed in other protected areas; however, it does not involve direct data collection on tourists. Most of the protected landscape areas, including Biele Karpaty, Kysuce, Ponitrie, Strážovské Vrchy, and Poľana, do not have a systematic data collection process for monitoring tourism development. The reason provided by the authorities is the lack of personnel, equipment, and authorisation required to collect and monitor tourism data: "*Currently, we do not have the personnel, equipment, or authorisation to collect data and monitor tourism.*"

Surveys specifically targeting visitors' opinions, such as questionnaires, are occasionally conducted in protected areas, for example, in High Tatras NP, Slovak Paradise NP, and Poľana PLA. The primary reason behind this practise is that protected areas often collaborate with external organisations, such as other institutions, universities, and DMOs, to conduct these surveys for specific purposes, such as achieving project objectives. In their survey-based research on visitor monitoring, Pachrová et al. (2020) emphasise that data collected directly from visitors serves multiple purposes. It allows the creation of accurate visitor profiles and segmentation, while providing valuable insight into their motivations to visit the area. Additionally, these data shed light on the planned (sometimes actual) behaviours of visitors, their satisfaction with their destination experience, and other relevant factors.

Some protected areas, especially national parks, also collect data on the number of visitors to tourist information centres within their territory. When evaluating tourism development, national parks and protected landscape areas often rely on "official" data provided by the Statistical Office of the Slovak Republic (SO SR). However, this data mainly focusses on guests staying in accommodation facilities and the duration of their stay. The local Destination Management Organisation (DMO) is typically responsible for collecting these data and sharing them with its members, including protected areas. However, representatives from protected areas have pointed out that the data provided by SO SR are limited to specific administrative units or, in better cases, to areas under the jurisdiction of the DMO. Therefore, it does not adequately capture the specific details of the protected areas themselves.

Considering that these data are predominantly used for tourism development purposes, some authors have stressed the importance of shifting the focus from solely counting tourists to considering broader socioeconomic and environmental aspects (e. g., Leung et al., 2018; Rasoolimanesh et al., 2023). One way to achieve this is by adopting sustainable tourism indicators that align with sustainability principles, such as the Global Sustainable Tourism Council criteria (GSTC) or the European Tourism Indicator System (ETIS). These indicators can help identify broader processes, monitor changes, and provide measurable information that is understandable to all stakeholders (Marciš & Gajdošík, 2022). However, it is important to note that collecting data for such sustainable tourism indicator systems also poses its challenges.

Data collected by protected area administrations are primarily used to formulate positions and guidelines regarding tourism development activities, including recreational constructions, event organisation, and the development of additional infrastructure. The Slovak Paradise and the High Tatras national parks use data to identify popular visitor destinations, determine the nationality of visitors, prepare information on the repair of technical equipment, and develop opinions on tourism-related activities, such as development plans and infrastructure projects. The administrations of Veľká Fatra National Park and Nízke Tatry National Park have plans to utilize tourism development data for multiple purposes. These include gaining insights into visitor profiles such as tourist flows, behaviour, and demographics, as well as using the data for planning and decision-making related to tourism development. Additionally, the data will be used for monitoring development trends, such as changes in visitation patterns, and for educational initiatives targeting residents and visitors. Natural parks recognise that these data are of utmost importance, as they form the basis for making informed decisions that can influence the development of tourism within the area.

The administrations of selected national parks and protected landscape areas express a strong desire for better access to data on tourism development. Their specific interests lie in obtaining data related to visitors, benefits for the communities, ecological performance of local actors and development of area (Figure 2).

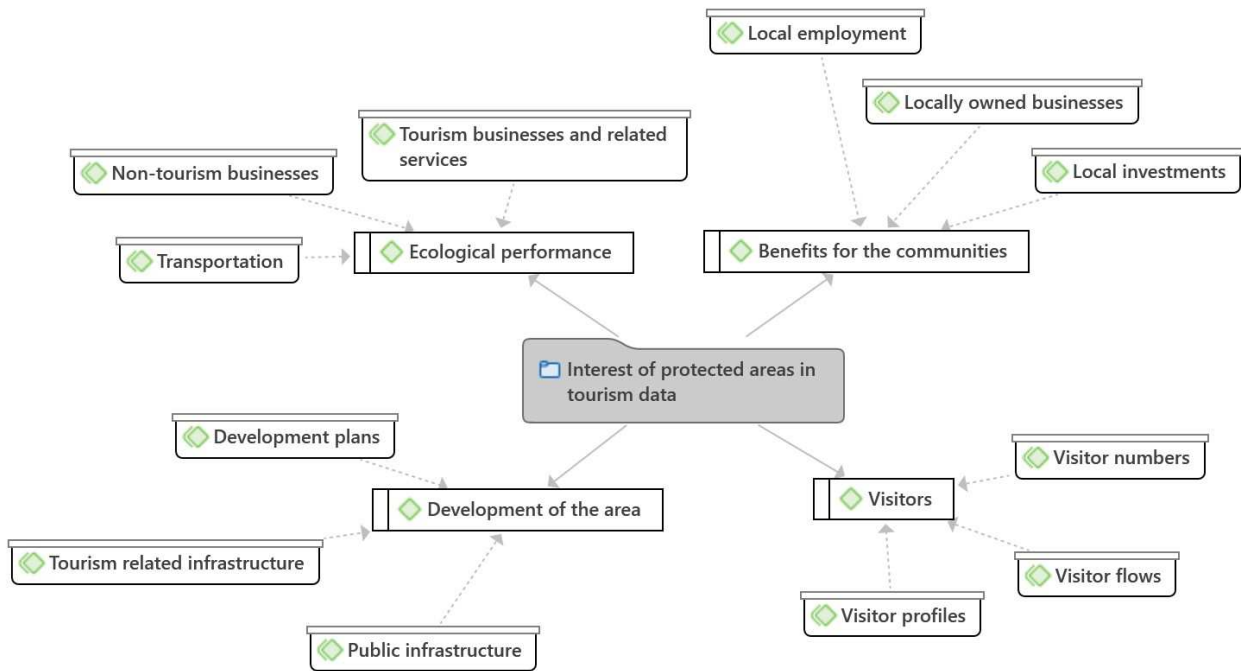

Figure 2. Interest of protected areas in tourism data
Source: authors

In addition to visitor numbers, protected areas also consider other tourism-related information essential, which encompasses the broader impacts of tourism. This includes gathering visitor profiles (characteristics and segmentation), understanding the socio-economic benefits for communities (such as employment opportunities and local investments), assessing the ecological performance of (tourism) businesses, and monitoring the infrastructural and recreational development of the area. This indicates the need for greater involvement of protected area management in broader tourism data spaces, which could combine data from various sources among different actors. However, it is worth noting that most research on monitoring tourism development in protected areas has focused primarily on visitor monitoring, such as tracking visitor flows and analysing visitor activities.

3.2 Best practices in availability of data on tourism development in protected areas

During the interview, the management of the selected protected areas highlighted examples of effective practises in using tourism development data within protected areas. These examples included, among others, the Bavarian Forest National Park in Germany, and the Šumava National Park in the Czech Republic.

The Bavarian Forest National Park is one of Germany's most popular national parks, attracting over 1.5 million visitors each year. To assess visitor numbers and behaviour within the park, park management utilised Volunteered Geographic Information (VGI) and the Global Navigation Satellite System (GNSS) to assess how visitors were spatially distributed throughout the area. This monitoring was carried out through online platforms that offer location-based services (LBS), such as well-known tourism and fitness platforms such as Outdooractive, Komoot, Strava and GPSies. These platforms enable users to connect with LBS communities, share their trips, tours, and photos related to recreational activities such as hiking, running, cycling, cross-country skiing, and mountain biking. Visitors use their smartphones or other GNSS-enabled devices to record and upload their activities. The park authorities considered GPSies, Outdooractive, and Komoot as the primary data sources because these platforms provided extensive information on the routes within the national park. In addition to the GNSS tracks, publicly available data associated with the tours were collected, including tour names, types of recreational activities, creation dates, tour lengths, and metrics such as views and downloads. This approach also allowed the identification of specific trail sections where visitors violated park regulations, enabling targeted visitor management measures both online and in the field. The data obtained from these platforms were compared with the data collected through field-counting devices. The evaluation results revealed that GPSies and Outdooractive platforms were particularly effective in determining the distribution of visitors within the

park, showing trends similar to the data obtained from the counting devices. This study highlights the potential of GNSS-based VGI data to provide detailed and comprehensive insights into visitor spatial behaviour in protected areas. However, relying solely on a single validation against the counted data is insufficient. Regular and systematic validation is desirable, considering the dynamic nature of digital data sources (Horst et al., 2023).

Socio-economic monitoring was conducted in the Šumava National Park in the Czech Republic in collaboration with the Bavarian Forest National Park. The project consisted of two main components. The first component focused on assessing visitor numbers and conducting basic surveys of visitors in the Šumava NP. To achieve this, 34 automatic counting devices of various types were installed, including those capable of distinguishing between hikers, cyclists, and vehicles. The second component involved administering questionnaires on five different topics relevant to both national parks. Key areas of interest included cross-border visitor movement, the perspectives of local residents on national parks, and the regional economic benefits resulting from visitor expenditures. The monitoring process provided the Šumava NP administration with valuable new data that can be used to address areas that received less favourable evaluations from the respondents (Dvořák, 2020).

A good example of a complex attitude to data collecting in protected areas also represents the National Park Service (NPS), USA. The NPS is the agency of the US Department of the Interior that manages the national parks of the United States. The National Park Service preserves undisturbed natural and cultural resources and values for the enjoyment, education, and inspiration of present and future generations. The NPS cooperates with different stakeholders to expand the benefits of natural and cultural resource conservation and outdoor recreation. It launched a website where all data on protected areas in the United States are collected. Visitors can find information about current events, tourism conditions, or warnings. The data further consists of basic information about protected areas, including maps of tourist attractions, accommodation options. Analysing tourism in territories, including monitoring of visitors, expenses, economic multipliers, positive and negative impacts. They also share data on how they support the development of protected areas and also the development of local tribes and communities (The National Park Service, 2023).

In general, these examples emphasise the importance of using various data sources, including digital platforms and field devices, and conducting surveys to gain complete information on tourism development in protected areas. Such data-driven approaches contribute to informed decision-making and effective management of protected areas.

Conclusion

This study examines the perception of protected area management regarding the availability of data on tourism development. The findings emphasise the value of having access to data on tourism development in protected areas for effective management and decision-making. The recent reform that granted legal personality to national parks in Slovakia has recognised the importance of tourism development and empowered their administrations to actively pursue it as one of its main missions. However, there are still limitations in systematically recording tourism data, particularly in certain national parks and protected landscape areas, due to resource constraints.

Despite the recognition of the importance of data, these protected areas face challenges in collecting and using data to monitor tourism impacts and make informed decisions. Most of the research on tourism development in protected areas has concentrated predominantly on visitor monitoring (visitors flows, visitor activities). As evidenced by this study, protected area management strives to acquire comprehensive data that encompasses the wider impacts of tourism. This includes visitor profiles (characteristics and segmentation), socioeconomic benefits for communities (i. e., employment), ecological performance of tourism businesses, and the infrastructural and recreational development of the area.

The study also identified the gap in managerial implications. There is little evidence of academic strategic management activities, despite highlighting their necessity in planning activities in protected areas (Ziesler & Pettebone, 2018; Slabbert & Du Preez, 2021). The overemphasis on visitor numbers as the primary focus of data collection highlights the need to shift towards considering broader socioeconomic and environmental aspects, for example through the adoption of sustainable tourism indicators. It is necessary to collect and utilize data that goes beyond visitor numbers and encompasses a wider range of information to fully understand the impacts of tourism.

The data collected by protected area administrations serve various purposes, including formulating positions, guiding development activities, and facilitating educational initiatives. It is essential to recognise the significance of tourism development data and address the challenges related to data collection and use. By doing so, it will contribute to sustainable tourism management and informed decision-making in protected areas. Tourism can develop and meet the needs of all stakeholders only by establishing its beneficial partnerships. Better cooperation between researchers and management of national parks can lead to evaluating the efficacy of planning development in protected areas, with the emphasis on collecting relevant data (not only) on tourism.

The study's limitation lies in its design, which is based on qualitative research and semi-structured online interviews. The reproducibility of qualitative research is constrained by its subjective nature. The results obtained from this study are specific to the analysed area and cannot be generalised to other destinations. To address this limitation, the authors suggest conducting more in-depth and large-scale quantitative or longitudinal research that considers country-specific factors and incorporates the perspectives of other tourism stakeholders.

Principles of Sustainable Development in Accommodation Facilities in Slovakia

Hana Bieliková^{1,*}, *Viktória Bíziková*¹, and *Viktória Gergelyová*¹

¹ University of Constantine the Philosopher in Nitra, Department of Tourism, Faculty of Central European Studies, Drážovská cesta 4, 949 01 Nitra, Slovakia

Abstract

Research background: The escalating interest in sustainable development principles, coupled with the mounting pressure from media, government, and consumer entities, prompts numerous companies to progressively adopt policies that prioritize environmental friendliness. The implementation of sustainable development principles in the hotel industry in Slovakia is still in its infancy, despite the efforts not only of the European Union, but also of the states themselves to promote a sustainable environment not only in business.

Purpose of the article: The aim of this study is to understand and analyse the implementation and adherence to the principles of sustainable management in accommodation facilities with a focus on hotels and guest houses in Slovakia.

Methods: Quantitative and qualitative research methods were used in this research paper. The quantitative research was carried out in the form of a survey among owners and operators of hotels and guesthouses in Slovakia. The qualitative research was carried out in the form of semi-structured interviews with selected hotel and guest houses owners in Nitra region, Slovakia.

Findings & Value added: The introduction and compliance with sustainable management principles in accommodation facilities in Slovakia is still in its infancy. The introduction and adherence to these principles is mostly carried out by small accommodation establishments, which mainly see the use of sustainable management principles as a competitive advantage over other accommodation establishments.

Keywords: sustainable development, hotel management, tourism, hospitality management, hotel managers

JEL classification: L83, Q010

1. Introduction

The surge in interest regarding sustainable development principles has led to mounting pressure from various sources, such as media, government, European Union and consumers, compelling numerous companies to adopt environmentally-friendly policies. As a result, many businesses are now increasingly focusing on sustainable practices to ensure their long-term viability, combining profitability, environmental responsibility, and social engagement to pave the way for progressive development. In the hospitality industry, sustainable development entails exploring inventive approaches to handle rising electricity and water expenses while considering the moral, ethical, social and political aspects underlying these strategies. By aligning their operations with sustainable practices, business aim to thrive economically while also contributing positively to the environment and society. (Sloan, Legrand & Chen, 2009; Kapera, 2018)

In order to remain relevant and successful, the tourism industry must continuously adapt to the evolving expectations of consumers concerning service quality while also addressing the increasing environmental and social awareness of its customers. With consumers becoming more knowledgeable and experienced, they tend to prefer tourism service providers that have implemented environmentally responsible practices, aiming to reduce their impact on the environment. However, the tourism industry's

* Corresponding author: hbielikova@ukf.sk

response to the growing demand for accommodation, travel and entertainment has led to numerous negative consequences on natural and social environments. To mitigate these adverse effects, adopting a sustainable development (SD) orientation becomes crucial. Sustainable development, as defined in the Brundtland report, refers to a form of development that meets the present population's needs without compromising the ability of future generations to meet their own needs. Embracing this strategic orientation can enable tourism industry to minimize the detrimental impacts of its operations on natural, cultural, and social environments. By doing so, the industry can strive for long-term viability while preserving the well-being of both current and future generations. (Jiang & Kim, 2015; Prud'homme & Raymond, 2015)

Implementing the principles of sustainable development has been rising only very slowly. According to studies made the obstacles hindering the adoption and implementation of sustainable development principles in hotel industry primarily revolve around deficiencies in knowledge and expertise, limited financial and human resources, and inadequate infrastructures (Eldemerdash & Mohamed, 2013).

The existing empirical research on sustainable development practices in the hospitality industry has predominantly focused on the environmental dimension. However, the social and economic dimensions of SD concept have been overlooked in many studies. Furthermore, the few studies that have considered all three dimensions of SD have primarily aimed to address the „why“ and „what“ questions related to hotels' adoption of sustainable development, employing quantitative, survey-based methodologies. Consequently, there is a significant gap in knowledge regarding the „how“ question – the process through which a hotel establishment develops and implements its SD orientation. The current understanding of the factors influencing the development and implementation of SD practices within hotel establishments remains limited. To advance the knowledge in this area, more comprehensive and qualitative studies are necessary to uncover the intricate dynamics and influences that shape a hotel's commitment to sustainable development (Stalcupet al., 2014; Melissen, 2013; Prud'homme & Raymond, 2015).

1.1 Sustainable development and hotel industry

Research findings indicate that a significant majority, exceeding 60% of hotel guests (Kapera & Wszendybyl-Skulska, 2017) advocate for hotels to adopt pro-ecological measures associated with environmental protection, cost reduction, promotional benefits, and a positive enhancement of a hotel's public image. As consumers' understanding of the link between the environment and society grows, pro-ecological initiatives may evolve into a competitive advantage, as some consumers may increasingly prefer products with strong environmental credentials. The tourism industry may face increasing consumer demands and shifts in purchasing behavior, along with the emergence of new consumption patterns, prompting the need for adaptation. For both present and future hotel managers, understanding how to integrate sustainable management systems into hotel industry practices becomes a crucial consideration for maintaining or even enhancing financial performance. As sustainability becomes a key factor in consumer decision-making, hotels that can effectively adopt and demonstrate their commitment to ecological practices may gain a competitive edge in the market (Hendel, 2016; Hendel & Zemla, 2016; Sloan, Legrand & Chen, 2009; Kapera, 2018)

Hotel operators who are cognizant of the numerous potential economic advantages associated with adopting sustainable development principles actively advocate for their involvement in sustainable programs. They also proactively pursue various ecological certificates that can validate specific hotel functions or the overall sustainability of their operations. In 2015, the United Nations (UN) launched an ambitious 15-year plan known as the Sustainable Development Goals (SDGs), aimed at achieving specific targets by the year 2030 to tackle pressing global challenges. The SDGs call for collaborative action from all countries, irrespective of their economic status, to foster prosperity while safeguarding the planet. The goals recognize the interconnectedness of eradicating poverty and implementing strategies for economic growth, encompassing various social needs such as education, healthcare, social protection, job opportunities, while simultaneously addressing climate change and environmental preservation (United Nations, 2023). The Global Sustainable Tourism Council (GSTC) Criteria exhibit a significant correlation with the UN SDGs. Embracing the GSTC Criteria facilitates progress towards meeting the UN SDGs. The GSTC Criteria comprehensively address economic, environmental, and societal dimensions, aligning with the multifaceted objectives outlined in the SDGs. Organizations and companies seeking to contribute to the SDGs will discover that the GSTC

Criteria, alongside other GSTC Recognized Standards, provide potent tools to aid them in rising to the challenges presented by sustainable development. By adhering to the GSTC Criteria, entities can make meaningful contributions to sustainable development, supporting the broader global endeavor to create a more prosperous and environmentally responsible future (GSTC, 2023). Table 1 depicts some of the hospitality industry criteria and indicators for accommodation facilities according to GSTC Industry Criteria.

Table 1. Examples of hospitality industry criteria according to GSTC

GSTC Industry Criteria	Indicators for accommodation facilities
Sustainability management system (SMS)	The SMS is well-documented and encompasses various dimensions, including environmental, social, cultural, economic, quality, human rights, and health and safety issues. Additionally, the system takes into account risk and crises management. Evidence presented in documents indicates the implementation of the SM system. Furthermore, the SM system incorporates a process to monitor and drive continuous improvement in sustainability performance.
Sustainable practices and materials	The project incorporates local materials, practices, and crafts in buildings and design when feasible and suitable. Landscaping and decoration utilize native and endemic plants from sustainable sources, avoiding exotic and invasive species. Plant selection considers their resilience to prevailing or expected conditions, such as drought-tolerant species. Sustainable design, materials and construction practices are employed in buildings, with relevant certifications whenever possible. Furthermore, waste from construction undergoes proper sorting and environmentally responsible disposal.
Community support, local employment, local purchasing	The organization actively collaborates with the local community to identify their needs, opportunities for support and assess the potential benefits and impacts of interventions. Contribution made to local community schemes are documented and tracked by the organization. The local community provided with the chance to access tourism facilities and services offered by the organization. The organization should also measure and manage the proportion of management positions occupied by individuals from the local community. The organization conducts regular audits of its suppliers for goods and services. It measures and manages the proportion of purchases made from locally owned and operated businesses.
Minimize pollution, transport, wastewater, solid waste	Organizations review and identify the potential sources of pollution. Accommodation facilities take the action to minimize and eliminate pollution from the sources covered in the criterion. Organizations provide to guests and staff alternative transport options (e.g. bike rental, car sharing, pick-ups). They also provide and promote to customers on alternative (climate friendly) transport options, for arrival, departure and during their visit. If available, wastewater is disposed of to a municipal or government approved treatment system. Organization has a solid waste management plan. The solid waste management plan includes actions to reduce, separate and reuse or recycle food waste.

2. Methods

The aim of this article is to analyze the compliance with the principles of sustainable development in accommodation facilities in Slovakia. To answer the research questions, qualitative and quantitative research strategy took place. The empirical research was based on a questionnaire survey, which was directed to owners and operators of accommodation facilities, specifically hotels and guest houses in Slovakia. The questionnaire was sent to 424 hotels and guesthouses located in Slovakia, in the time period from May 2022 to May 2023. The questionnaire was completed by 181 accommodation establishments, which means a return rate of 42%. The questions in the questionnaire survey focused on the implementation and adherence to the principles of sustainable management of accommodation facilities, based on the GSTC Criteria (2016). The questionnaire was divided into 4 parts. In the first part the questions are directed to the basic characteristics of the accommodation facility. In the second part we examine the environment and the minimization of negative impacts on it. In the third part, the questions are dedicated to the topic of maximizing social and economic benefits for local communities and minimizing negative impacts. In the last section, we look at the effective sustainable management of the accommodation facility.

Qualitative research was conducted in the form of semi-structured interviews with owners and operators of accommodation facilities in the Nitra region. Twelve owners/operators of hotels (8) and guesthouses (4) participated in the semi-structured interviews. Within the semi-structured interviews we focused on evaluating the results of the questionnaire survey as well as on completing the information regarding the motivation for introducing or managing the accommodation facility in accordance with the principles of sustainable management.

3. Results

There were 4829 accommodation facilities registered in Slovakia by the end of the year 2022. This means that compared to 2021, there was the increase of 6% in accommodation facilities. Thus, a total of 77 thousand rooms and specifically 222 thousand beds were provided to visitors in 2022. On average, there were 56 thousand vacant rooms per day, which represented roughly 128 thousand vacant beds for visitors. (slovak.statistics.sk, 2023)

			Total	181	100%	101 +	0	0%
						Total	181	100%

Source: own processing, 2023

In the first section of our survey, we inquired about our respondents' preferences for environmentally friendly products that meet specific criteria, including durability, energy efficiency and non-toxicity. These products were categorized as building materials, consumer goods, or capital products. Over half of the respondents, precisely 53%, indicated a preference for eco-friendly products. They expressed a strong inclination towards items that promote sustainability, energy savings and a lack of harmful substances. The survey also shows that eco-friendly and sustainable products and materials are used more in accommodation facilities with up to 40 beds. Based on the structured interviews, we found that small accommodation establishments (up to 40 beds) consider the use of eco-friendly materials and sustainable products as their competitive advantage over larger accommodation establishments and at the same time try to use this fact to their advantage through marketing activities. Also a significant majority, as many as 73% of respondents (132 respondents) claimed active usage of natural and environment-friendly cleaning products. The findings reveal a growing consciousness about environmental sustainability and a willingness to adopt green practices in daily life of the accommodation facilities. The introduction of environmentally friendly means into the day-to-day operation of accommodation facilities is again more acceptable in smaller, independent hotels, thanks to a less rigid process of change, as opposed to large, chain hotels, which are bound by certain standards and the selection of suppliers is also a more time-consuming process. These findings were confirmed by qualitative analysis. Changing suppliers is sometimes in large, chain hotels not only a financially but also a resource-intensive process, which operators do not find economically viable, so they often prefer to stay with existing suppliers and resources.

Figure 2. Means of conservation of resources

Source: own processing (2023)

As part of the questionnaire survey, we were also interested in what ways accommodation establishments save resources (Figure 2). The research showed that most accommodation facilities use energy saving lighting. The qualitative analysis showed that most of the accommodation establishments that did not use energy saving lighting have changed this due to the impact of rising energy prices in Slovakia. Relatively few accommodation establishments use alternative energy sources or solar energy and this is mainly in small accommodation establishments (up to 40 beds). The use of solar and other alternative energy sources is partly helped by the non-repayable funds under the call. Currently, small and medium-sized enterprises, including accommodation establishments, can apply for a non-repayable financial contribution for the construction of photovoltaic installations, which is announced by the Slovak Innovation and Energy Agency (SIEA, 2023)

Half of the respondents (49%) exhibit partial support towards the local community and its development. This indicates that they possess a degree of commitment, albeit not to the fullest extent, but they do not entirely neglect the neighborhood surrounding of their accommodations. Twentyfour percent of the respondents answered affirmatively, signifying that they actively endeavour to support the local infrastructure and improve quality of life for the residents beyond their accommodation facilities. These subjects actively contribute to the advancement of the city in which their lodging establishments are situated. Conversely, 27% of respondents solely prioritize their businesses and refrain from engaging in any form of support towards the local community. The fact that quarter of the respondents do not engage in any form of support towards the local community might be caused by the fact of them not knowing the options how to help the community development. Up to 65% of the respondents do not have enough knowledge about sustainability and thus not enough knowledge about the sustainable management system of the business. 20% of the respondents apply a sustainable management system in their operations, which means that the owners of the operations and their employees have an overview of how to manage the business in accordance with sustainability. The remaining 15% of the respondents were not interested in implementing a long-term sustainable management system in their businesses so far. The semi-structured interviews confirmed that the operators of mainly small and medium-sized accommodation establishments do not have an overview of what a manageable hotel management should look like. However, the interviews also revealed that many operators use the principles of sustainable management of an accommodation facility, despite being unfamiliar with the technical terminology. The interviews and observations also revealed that sustainable management of accommodation facilities is mainly practiced in larger and chain hotels that have sustainable management implemented across the board within the hotel chain. The positive news is that the majority (79%) of respondents are interested in learning how to implement sustainable principles in the management of their accommodation facility.

4. Discussion

Despite the mandatory imposition of a sustainable development orientation by hotel chains on their affiliated establishments to enhance corporate image and meet consumer demands (Bohdanowicz, 2005), it is the expectations of stakeholders that serve as the driving force motivating hotel managers to progressively pursue SD initiatives.

On the other hand, the research findings provide evidence similar to Jones, Miller & Comfort (2016) that a growing number of companies view sustainable development as a means to attain competitive advantage. This trend is influenced by several factors, such as the necessity to comply with legal regulations, concerns about escalating costs and scarcity of natural resources, heightened awareness among the general public and shareholders regarding social issues, mounting interest from media, endeavors to differentiate from competitors, and the aspiration to enhance the company's reputation.

Another noteworthy observation to consider pertains to the hotel's geographical placement, which assumes a paradoxical role, simultaneously acting as an inhibitor and a facilitator. On the one hand, the restricted spatial availability within urban settings imposes constraints. Conversely, positioning the hotel within a "natural" environment serves as a motivating factor for the adoption of conservation-oriented practices aimed at preserving this ecosystem.

A positive correlation was established between managers' tangible awareness of environmental concerns (in contrast to mere environmental value endorsement) and the degree to which sustainable development initiatives were embraced within their hotel establishments. This correlation served as a moderating factor influencing the impact of the hotel's size. Consequently, this explains the similarity in sustainable development principles adoption between both the largest and smallest hotels. These findings are in line with Vernon et al's (2003).

Conclusion

The main objective of sustainability is considered to be the creation of appropriate social and economic conditions that ensure the well-being of humanity. Achieving sustainable development requires individuals and communities working together with public actors, businesses and organisations. The main role of the State in this sphere is to support, promote and coordinate socially responsible corporate behaviour. Civil society should continuously influence the corporate sector in terms of the importance and promotion of socially responsible behaviour and sustainability. For a company to be considered a socially responsible organisation, it is necessary to set objectives in the social area (responsible employer - management operations, management strategy, performance, employee involvement and development, setting corporate objectives), the economic area (competitiveness, profitability) and the environmental area (environmental leader, conservation strategy - care for the environment).

A comprehensive implementation of sustainable development principles in tourism hinges on the collaboration among various stakeholders, including hotel owners. However, such a collaboration is more often an exception rather than the norm. The significance of collaboration extends to business owners, encompassing suppliers of products and services to hotels, as well as other organizational entities.

The hotel industry is showing a growing commitment to sustainable development concerning the natural environment and engaging in pro-social endeavors. Nevertheless, the primary emphasis continues to revolve around safeguarding natural resources. The industry's concentration on aspects like energy consumption, water utilization, and waste generation directly correlates with the financial advantages derived from the efficient operation of hotels.

Abstract

Research background: Noise pollution remains a significant environmental concern, leading to a growing demand for noise barriers. However, the conventional production and disposal of noise barriers often impose negative environmental impacts. The circular economy presents a promising solution to address these challenges by advocating the use of sustainable materials, design for disassembly, and the recycling or reuse of materials.

Purpose of the article: This paper aims to explore the potential application of circular economy principles to noise barrier production and circular design strategies. By investigating sustainable and innovative solutions for noise barrier manufacturing, the study seeks to contribute to the development of more sustainable and environmentally friendly approaches to mitigating noise pollution.

Methods: The research adopts a comprehensive approach, including a review of relevant literature on circular economy practices, and their specific implementation within a case study of a noise barrier manufacturing company. Additionally, the study utilizes the Circular Canvas, a practical tool, to identify circular opportunities and prioritize actions within the production process.

Findings & Value added: The paper uncovers various circular opportunities for noise barrier production, such as utilizing sustainable materials, optimizing resource usage, and implementing eco-design principles. The Circular Canvas aids in visualizing and prioritizing these opportunities, enabling the company to adopt more circular practices. By applying circular economy principles to noise barrier production, the study contributes insights to the development of sustainable and environmentally conscious strategies for noise pollution mitigation.

Keywords: noise barriers, circular economy, circular canvas, materials use, waste reduction

1. Introduction

In recent years, the escalating issue of noise pollution has propelled the demand for noise barriers as a vital means of mitigating its adverse effects on both urban and industrial landscapes (Rovňák et al., 2023). However, traditional approaches to noise barrier production often raise concerns about their environmental impact, as they generate significant amounts of waste materials, including PVC, textile waste, metal parts etc.. Embracing the principles of circular economy in this context presents an opportunity to transform the production process, paving the way for sustainable and innovative solutions.

962

The concept of the circular economy, a paradigm that promotes the regenerative and restorative use of resources, has gained traction worldwide as a crucial strategy for achieving sustainability and combatting climate change. By transitioning from a linear "take, make, dispose" model to a circular approach that prioritizes reuse, recycling, and upcycling, businesses can dramatically reduce their environmental footprint and enhance resource efficiency.

The European Union (EU) has taken a pioneering role in advocating and advancing circular economy principles to tackle pressing environmental challenges. Recognizing the imperative of sustainable production and consumption patterns, the EU has laid out comprehensive initiatives to promote the circular economy across various industries.

In 2020, the EU unveiled its new Circular Economy Action Plan (EC, 2020), a blueprint that aims to "close the loop" and transform the way products are designed, manufactured, and used. Under this framework, the EU set ambitious targets for waste reduction, material recycling, and the promotion of eco-design and eco-innovation.

Furthermore, the EU's Circular Economy Package II (EC, 2022), introduced in 2022, outlines specific measures to stimulate the circular economy across all member states. This includes directives on waste management, plastic reduction, and encouraging circular business models.

By investigating the circular potential of noise barrier production and identifying innovative solutions, our research aligns with the EU's efforts to promote circularity in diverse sectors and drive forward the circular economy agenda. Moreover, it contributes to the broader EU mission of fostering resource efficiency and transitioning towards a greener and more sustainable economy and global sustainability initiatives such as Agenda 2030 (EU, 2018) and its sustainable development goals.

2. Literature review

Researchers and institutions have increasingly explored the Circular Economy (CE) paradigm as a promising approach to enhance the sustainability of our economic system (Oliveira et al., 2021; Vence et al., 2019). Comprehensive studies have been conducted to holistically define and conceptualize the CE (Kirchherr, 2017; Montag). The operationalization of the CE gained momentum with the introduction of the first CE standard, BS 8001:2017, by the British Standards Institution (BSI, 2017). According to this standard, the CE is interpreted as an "economy that is restorative and regenerative by design, aiming to retain products, components, and materials at their highest utility and value at all times, distinguishing between technical and biological cycles." The term "restorative" refers to the process of reusing spent resources in the creation of new products, while "regenerative" refers to enabling living systems to heal and renew the consumed resources (BSI, 2017).

Notably, the Ellen MacArthur Foundation (EMF) has played a pivotal role in providing a solid theoretical foundation for CE conceptualization and operationalization. EMF's butterfly figure has been particularly influential as a visual tool to depict a hierarchy of circularity strategies, emphasizing the priority of "reuse–repair–refurbishment–remanufacturing–repurpose–recycling" (Bocken et al., 2017; EMF, 2013).

Building upon EMF's butterfly figure, the CE is intended to be purposely restorative through two types of flow: (1) nutrients re-entering the biosphere and (2) synthetic materials intended for repeated use with limited loss in value (EMF, 2013). Synthetic or mineral materials that can safely remain in a closed-loop system of manufacture, recovery, and reuse, maintaining their highest value through multiple product life cycles, are often referred to as "technical nutrients" (Bocken et al., 2017; Mestre & Cooper, 2017). However, the transformation of undesirable outputs into technical nutrients depends on various circumstances and can change over time due to advancements in technology and economic conditions (Kyriakopoulos et al., 2019).

The Circular Economy (CE) concept represents a recent effort to integrate economic activity and environmental wellbeing sustainably (Khan et al., 2022). In a narrower context, it is one of several concepts that have proven useful in exploring the efficient use of materials and resources (Figge et al., 2018; Shevchenko et al., 2021). However, in terms of implementation, the current landscape remains characterized by diverse interpretations, lacking clear theoretical or paradigmatic clarity regarding the CE concept (Blomsma & Brennan, 2017). Blomsma and Brennan propose viewing the CE as an umbrella concept, given its application in various frameworks emphasizing circularity.

Globally, there is a growing trend pushing the international community to explore pathways for transitioning from linear to circular business models (Awan & Sroufe, 2022; Hofmann & Jaeger-Erben, 2020). Calculations indicate that implementing circular business models in the EU alone could lead to

material resource savings of up to 380 billion dollars, highlighting the business potential of value creation from waste (EMF, 2013).

The concept of Circular Economy (CE) has garnered significant attention among researchers and institutions worldwide, as it presents a promising approach to integrate economic activity with environmental wellbeing in a sustainable manner (Gupta et al., 2019). Scholars have explored diverse measures of CE across European Union (EU) member states, focusing on Small and Medium Enterprises (SMEs) (Bassi & Dias, 2019). Five key CE measures were examined, including water usage optimization, renewable energy utilization, energy consumption reduction, waste minimization through recycling or reusing, and product redesign for material efficiency.

The findings highlighted considerable heterogeneity in the adoption of CE measures among EU countries, reflecting varying levels of implementation (Bassi & Dias, 2019). At the firm level, factors such as firm size, total turnover, and investment in research and development significantly influenced the variation in CE measures within countries. The study also emphasized the relevance of considering the multilevel structure to address the between-country variability, which accounts for 6.1% to 15.1% of the total CE variability (Bassi & Dias, 2019). For EU policymakers, these insights underscore the need to design targeted framework policies to enhance CE practices, particularly within the SME segment.

In the context of the leather industry, Muktadir et al. (2020) identified challenges in implementing CE practices and proposed a decision support framework to evaluate these challenges. The study utilized the best worst method to assess factors hindering CE practices, with "lack of financial support from authorities" emerging as the most critical challenge (Muktadir et al., 2020). This financial constraint poses a significant barrier to the successful adoption of CE practices in the leather industry. The study's results offer valuable guidance to industrial managers and authorities to promote sustainable development in the leather sector.

Khan et al. (2022) addressed the dearth of literature on circular economy practices and aimed to investigate practices essential for transforming linear models into circular economy models. Through a systematic literature review, fifteen circular economy practices were identified and evaluated, with practices such as "consumer awareness," "legislation and policies," and "designing products for circularity" ranking high in importance (Khan et al., 2022). The study provides managers and professionals with actionable insights to optimize resources for effective circular economy adoption.

Barros et al. (2020) explored bioenergy boosters through circular economy practices in agriculture. Their systematic literature review highlighted trends and perspectives in the circular economy context, focusing on electricity generation and biofuel production from biogas as sustainable opportunities in the agro-industrial sector (Barros et al., 2020). European countries emerged as pioneers in this domain, publishing the majority of relevant documents in the last four years.

Shifting focus to the built environment, Joensuu et al. (2020) conducted a literature review to provide structured information for sustainable urban development through circular economy practices. The study identified three main approaches: management for sustainable cities, urban services aligned with circular economy, and cleaner production and construction (Joensuu et al., 2020). The review also suggests innovative concepts like urban-rural symbiosis and emphasizes the importance of cross-sectoral integration and capacity development in successful circular economy implementation.

Lastly, Schroeder et al. (2019) investigated the relevance of circular economy practices to the implementation of Sustainable Development Goals (SDGs). Their study revealed that CE practices have the potential to directly contribute to several SDG targets, with strong relationships identified in areas such as clean water and sanitation, affordable and clean energy, decent work and economic growth, responsible consumption and production, and life on land (Schroeder et al., 2019). The paper also explored potential synergies and trade-offs between CE practices and specific SDG targets, suggesting CE as a versatile "toolbox" for achieving multiple SDGs.

Collectively, these studies shed light on the diverse application and significance of circular economy practices across various industries and sectors. While these studies provide valuable insights into the implementation of CE practices in different areas of economic activities, it is important to note that there is currently no specific study focusing on the application of CE in the production of noise barriers.

Despite the lack of a dedicated study on noise barrier production, the existing literature provides a foundation for understanding CE practices in different contexts. The findings from these studies can be used as a reference point to explore the potential application of CE principles in the noise barrier manufacturing process. Given the importance of addressing waste management and resource efficiency in noise barrier production, conducting a study that investigates how circular economy strategies can be integrated into this specific industry would be a valuable contribution.

Therefore, this research on the possibilities of applying circular economy principles in the production of noise barriers has the potential to fill a significant gap in the literature. By focusing on the practical application of CE concepts in this specific context, it can offer insights and innovative solutions that align with the broader CE movement. By utilizing the knowledge from the reviewed studies as a starting point, this research can pave the way for the development of sustainable and circular noise barrier production processes that align with EU initiatives and contribute to achieving sustainable development objectives. The research question that guides this study is: How can circular economy principles be effectively applied to the production of noise barriers, considering the utilization of waste materials and the enhancement of sustainable practices?

3. Methodology

In our endeavor to examine the production process of noise barriers and explore opportunities for implementing circular economy principles within a real-world industrial setting, we employ the case study approach. The case study is a well-established research method that facilitates a thorough exploration and analysis of a specific real-life situation or phenomenon within its natural context. This method proves particularly valuable when investigating complex, unique, or context-dependent issues, as it allows for a comprehensive understanding of the subject of study (Yin, 2009).

3.1 Research Design

This research employs a case study approach to investigate the application of Circular Economy (CE) principles in the production of noise barriers. The case study design allows for an in-depth exploration of a specific company engaged in noise barrier manufacturing, offering a comprehensive understanding of its current practices and opportunities for circularity. By utilizing the Circular Canvas tool, the research aims to identify potential areas for implementing CE strategies within the company's production process.

3.2 Case Selection

The case selection process involves identifying a company that specializes in the production of noise barriers. The selection criteria prioritize companies that demonstrate a commitment to sustainability and resource efficiency. Furthermore, the chosen company should be representative of the broader noise barrier manufacturing industry to ensure the findings are relevant and applicable to other similar enterprises.

3.3 Data Collection

Data will be collected through a combination of primary and secondary sources:

- **Interviews and consultations:** Semi-structured interviews will be conducted with key stakeholders within the company, including management, production personnel, and sustainability experts. The interviews will explore the company's current production processes, waste management practices, and potential opportunities for incorporating CE principles.
- **Document Review:** Company documents, reports, and sustainability policies will be reviewed to gain insights into existing practices and the company's environmental performance.
- **Observations:** On-site observations will be carried out to understand the company's operations, waste generation, and resource utilization.
- **Secondary Data:** Existing literature, industry reports, and best practices in the field of circular economy and noise barrier production will be reviewed to contextualize the findings and identify relevant frameworks for analysis.

3.4 Circular Canvas Application

The Circular Canvas, a tool designed to assess the circularity potential of a company, will be applied to the selected noise barrier manufacturing company. The canvas will guide the exploration of different aspects of the company's operations, including product design, material sourcing, waste management, and product lifecycle. By mapping these elements on the canvas, the research will identify gaps and opportunities for incorporating circular economy principles into the company's production process.

3.5 Data Analysis

The data collected from interviews, document reviews, observations, and the Circular Canvas application will be analyzed using thematic analysis. Themes and patterns will be identified to determine the current practices and challenges in the noise barrier production process. The analysis will also focus on potential areas for circularity integration and highlight opportunities for waste reduction, resource optimization, and sustainable material usage.

3.6 Findings and Recommendations

The research will present the findings from the data analysis, highlighting the company's current circularity status and potential pathways for implementing CE principles in noise barrier production. Based on the analysis, specific recommendations will be formulated, providing actionable strategies to enhance circularity and sustainability within the company's operations.

3.7 Limitations

It is essential to acknowledge potential limitations, such as the generalizability of findings due to the focus on a single case study. Additionally, the research may face challenges related to accessing confidential company data and the potential bias of interviewees towards portraying a positive image of their organization.

3.8 Ethical Considerations

Ethical considerations will be prioritized throughout the research process, ensuring informed consent from participants and maintaining data confidentiality. The research will adhere to ethical guidelines and regulations governing data collection and analysis.

The case study methodology, coupled with the application of Circular Canvas, provides a robust framework to examine the implementation of Circular Economy principles in noise barrier production. By investigating a specific company and utilizing a practical tool for analysis, the research aims to contribute valuable insights to the circular economy discourse and offer tangible solutions for the sustainable development of the noise barrier manufacturing industry.

4. Results

Through an extensive analysis of the company's noise barrier production process, interview with company's representatives, observation of technological process, analysis of internal documents and databases, and a comprehensive review of relevant literature, our objective is to identify opportunities for the effective implementation of Circular Economy (CE) principles. Our research employs a case study approach, focusing on a company engaged in noise barrier manufacturing, to gain in-depth insights into its current practices and potential avenues for circularity. We begin by mapping the material flow, including the quantities of input materials utilized in noise barrier production, as well as the amount of waste generated during the process.

The noise barrier manufacturing process involves a diverse range of input materials, such as various technical fabrics, noise barrier layers, reflective elements, edging, threads, brackets, rings, and adhesive tapes. Collaborating closely with production operators, managers, and internal records, we diligently track the waste generated during material reception and processing:

1. **Technical Fabric:** Forming the foundation of each noise barrier, technical fabric made of PVC constitutes three layers: PVC film, fibreglass mesh fabric, and another PVC film. The combination of these layers enhances the technical fabric's properties, providing exceptional strength and elasticity, making it suitable for demanding conditions and ensuring durability over extended periods. Annually, an average of 61,271 m² of technical fabric, in varying colors and sizes, is processed.
2. **Mesh:** Similar to PVC technical fabric, mesh technical fabric comprises PVC material but possesses a structure with numerous holes due to the fibreglass mesh. Used mainly in large banners and some noise barriers, mesh serves an essential function in trapping sound waves and dust particles, while also acting as a windbreak and withstanding harsh weather conditions. Approximately 12,703 m² of netting is processed each year.
3. **Polyester coated fabric (PCF):** Comprising a textile surface layer (polyester) and a PVC layer, PCF is a versatile material applied in various industries. Its role in noise barriers is to prevent water penetration while allowing breathability. Approximately 63,721 m² of PCF is processed annually.

4. **Recycled Cotton:** Serving as a fundamental component within the noise barrier's construction, recycled cotton is positioned between the PVC and PCF layers, providing stability and shape to the barrier. Around 19,070 sheets of recycled cotton are processed yearly.
5. **Reflective Elements:** Essential for visibility during reduced light conditions, reflective elements are sewn or welded onto the noise barrier. Annually, about 32,646 linear meters of reflective elements are processed.
6. **Edging:** Enhancing the barrier's appearance, edging is sewn around the perimeter to conceal weld joints and maintain product integrity. An average of 121,947 linear meters of edging is processed yearly.
7. **Threads:** Indispensable for sewing tasks, threads are used for attaching edging, installing brackets and buckles, and securing recycled cotton. Approximately 890,034 linear meters of thread, with varying colors and lengths, are processed each year.
8. **Brass Rings:** Fixed around the barrier's outer perimeter, brass rings provide stability and serve as attachment points. An average of 283,658 brass rings are processed annually.
9. **Brackets & Buckles:** These elements facilitate the transportation of noise barriers and are attached from the rear to maintain aesthetics. Around 19,070 brackets and buckles are processed each year.
10. **Adhesive Tapes:** Double-sided adhesive tapes are utilized to securely hold recycled cotton against the PVC membrane. Approximately 87,559 linear meters of adhesive tape are processed annually.
11. **UV Printing Ink:** UV-resistant ink in various shades is used for industrial printing, with specific graphics tailored to individual clients. Approximately 360 liters of ink are processed yearly.

Figure 1 illustrates the quantity of recoverable waste generated in the noise barrier manufacturing process.

Figure 1. Quantity of recoverable waste in kg
Source: own processing

The comprehensive mapping of input materials and waste generation provides valuable insights into the company's current circularity status and lays the groundwork for identifying opportunities for enhancing circular economy practices within noise barrier production.

In the next step, we utilized the Circular Canvas, a comprehensive and practical tool, to identify circular opportunities and prioritize actions within the noise barrier production process. The Circular Canvas is a visual and analytical framework that allows us to assess the circularity potential of the company and explore various dimensions of circular economy principles.

The Circular Canvas utilized in this study was created based on the template developed by the Circulab academy (Circulab, 2023). This structured framework provides a comprehensive outline of the business model, encompassing diverse flows, and facilitates the identification of critical implications for stakeholders, regional contexts, and ecosystem impacts. Embracing this tool empowers the development of solutions that not only cater to individual user needs but also consider the broader system within which the organization operates. Adopting a systemic approach fosters a holistic way of thinking, ensuring a mindful consideration of crucial aspects and encouraging the design of regenerative solutions. By

employing the Circular Canvas, businesses can actively cultivate sustainability, promote circularity, and contribute to the preservation and revitalization of the natural environment.

Together with representatives from the company under investigation, we collaboratively developed the Circular Canvas tailored specifically for the noise barrier production process, as visually depicted in Figure 2. This endeavor aimed to explore and identify circular economy opportunities within the company's industrial practices, fostering a positive impact on the environment while enhancing business sustainability.

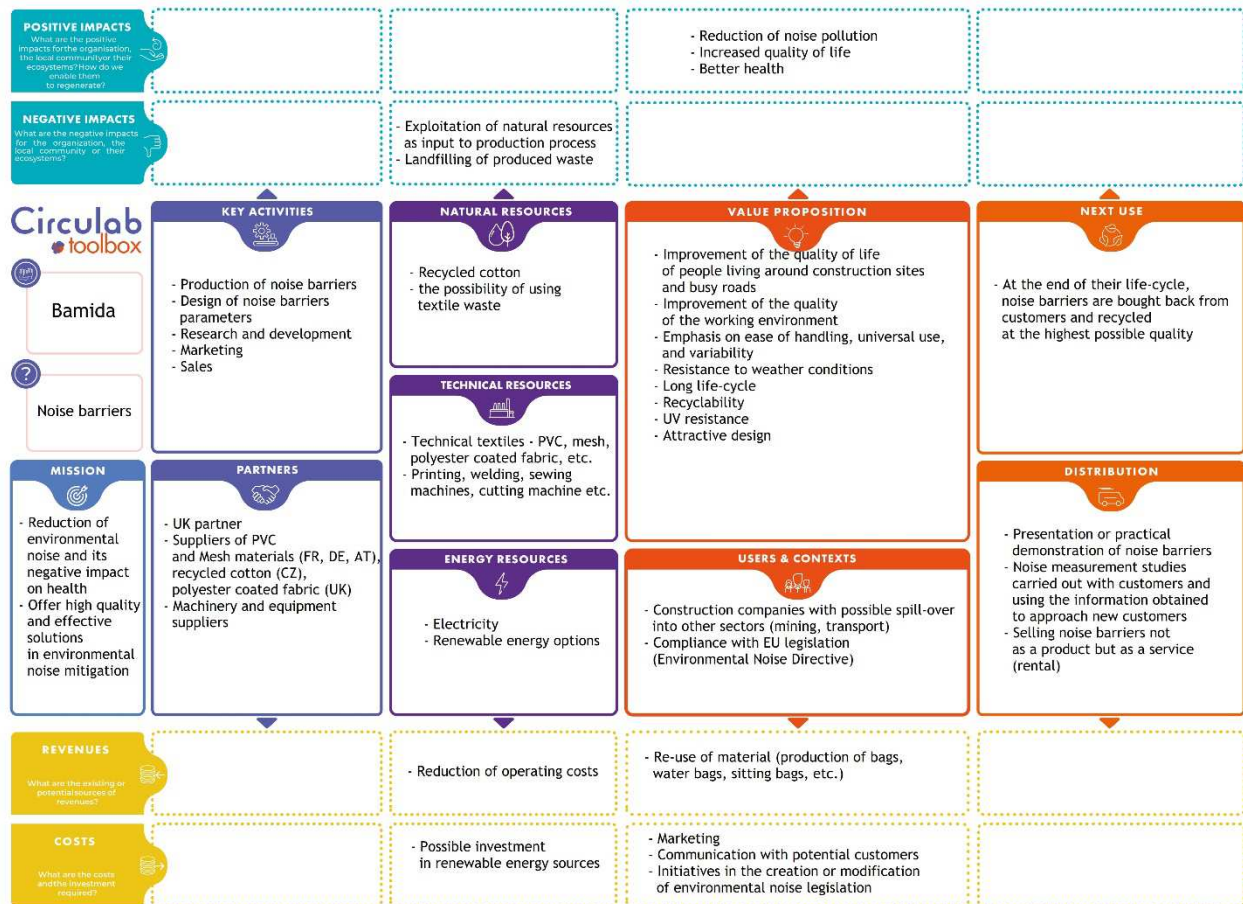

Figure 2. Circular Canvas of Noise barriers production
Source: own processing based on Circulab template (Circulab, 2023)

By applying the Circular Canvas to the noise barrier manufacturing company, we systematically assessed its circularity potential, identified areas for improvement, and prioritized actions to enhance circular economy practices. This methodological approach ensures a practical and actionable framework for advancing the company's sustainability and circularity goals in the noise barrier production process.

5. Discussion

Our investigation, focused on the possibilities of integrating circular economy principles into noise barrier production, holds significant promise in addressing a critical gap in the existing literature. This study, centered on the practical application of circular economy concepts within this specific context, offers insights and innovative solutions that align closely with the overarching circular economy movement. Leveraging insights garnered from reviewed studies, our research aims to pave the way for the formulation of sustainable and circular noise barrier production processes that resonate with EU initiatives and contribute to the realization of sustainable development goals.

Our analysis reveals a substantial volume of unutilized waste materials, such as paper rolls, cardboard, and PVC waste, which could be upcycled into new products, thus streamlining noise barrier production and minimizing waste generation (Kerdlap et al., 2019). Paper rolls and cardboard can be collected and sent for recycling. The recycling process involves breaking down the cardboard into fibers, which can then be used to create new cardboard products. By recycling the cardboard rolls, the company

can reduce the demand for virgin cardboard materials and minimize the environmental impact associated with cardboard production.

PVC foil can be recycled or upcycled into new products. Recycling PVC involves converting the material back into its original form to create new PVC products. Additionally, PVC can be upcycled into other useful items, such as PVC-based accessories (handbags, purses), furniture components (sitting bags, pillows), or non-structural construction materials. By reprocessing or upcycling the PVC foil waste, the company can extend the life cycle of the material and reduce the need for new PVC production.

As the company may face limitations in handling this issue independently, it has the opportunity to explore collaborative efforts with other industries (Janssen & Stel, 2017) that can derive benefits from the waste produced in noise barriers production. For instance, industries reliant on cardboard packaging or in need of PVC-based materials may find significant value in reusing or recycling the waste generated during the noise barrier production process. By forging partnerships with such industries, the company can establish a closed-loop system where its waste materials become valuable resources for others, contributing to a more sustainable and circular economy approach.

By embracing circular economy principles in noise barrier production, the company stands to gain numerous benefits:

- **Sustainability Leadership:** Implementing circular practices can position the company as a sustainability leader in the industry, enhancing its reputation and attracting environmentally conscious customers.
- **Resource Efficiency:** Circular approaches optimize resource utilization, reducing material consumption, and minimizing waste generation, leading to cost savings and improved profitability.
- **Environmental Conservation:** By minimizing the use of virgin materials and promoting recycling and reuse, the company can significantly reduce its environmental footprint, contributing to global efforts in combating climate change and conserving natural resources.

Conclusion

Our case study demonstrates that the integration of circular economy principles in noise barrier production offers opportunities for sustainable and innovative solutions. By emphasizing sustainable materials, and material reuse and recycling, the company can transition towards a more circular approach, benefiting its economic performance while contributing to environmental conservation and mitigating noise pollution. As noise barriers continue to play a vital role in addressing noise pollution, the successful application of circular economy principles in their production holds the potential for a greener and more sustainable future.

Despite the valuable insights gained from this study, there are certain limitations that should be acknowledged. The case study focused on a specific company in a particular industry, which might limit the generalizability of findings to other sectors or contexts. Additionally, the implementation of circular economy principles requires complex systemic changes that involve various stakeholders, regulations, and market dynamics. The study mainly concentrated on waste materials generated during the production process and their potential circular uses, neglecting other aspects of circular economy implementation, such as extending product life or redesigning business models.

Future research endeavors could extend the scope of investigation to explore the broader implications of circular economy principles in noise barrier production, including the assessment of their long-term economic viability and environmental impact. Furthermore, a comparative analysis of different circular economy strategies across various industries could provide a more comprehensive understanding of the challenges and benefits of circularity integration. Additionally, the development of practical guidelines or frameworks tailored to noise barrier production could assist companies in effectively adopting circular practices and maximizing their benefits.

In conclusion, the implementation of circular economy principles in noise barrier production not only presents a viable solution for enhancing the company's sustainability practices but also aligns with the objectives of prominent global initiatives such as the European Union's Circular Economy Action Plan and the United Nations' Sustainable Development Goals (SDGs). By adopting circular practices, the company contributes to the achievement of SDGs such as Goal 12 (Responsible Consumption and Production) and Goal 13 (Climate Action) by promoting resource efficiency, reducing waste, and mitigating environmental impacts.

Furthermore, this research highlights the value of using the Circular Canvas as an effective tool for exploring circular economy opportunities in the industrial context. The Circular Canvas facilitated a comprehensive analysis of the company's production process, helping to identify key areas for circularity integration.

Abstract

Research background: The study focuses on examining the influence of urbanization and low-carbon energy sources on CO₂ emissions in EU countries through panel data analysis. It aims to contribute to the understanding of the relationships between carbon emissions, urbanization, economic growth, energy consumption, and the use of renewable and nuclear energy sources.

Purpose of the article: The research aims to address three key questions: (1) Are there short-term and long-term relationships among the variables of interest? (2) How do carbon emissions relate to the independent variables during different time periods? (3) Can urbanization, economic development, energy consumption, and the proportion of renewable/low-carbon energy sources influence carbon emissions and contribute to achieving carbon neutrality targets?

Methods: The study employs various econometric models, including panel models Mean Group Estimation (MG), Pooled Mean Group Estimation (PMG) and Common correlated Effects Model (CCE) to analyze data from 22 EU countries spanning the period from 1992 to 2019. These models facilitate the examination of the relationships between the variables of interest.

Findings & Value added: The findings of the study provide valuable insights into the short-term and long-term relationships among carbon emissions, urbanization, economic growth, energy consumption, and the use of renewable and nuclear energy sources. The research highlights the dynamics of carbon emissions and their interactions with independent variables over different time periods. Additionally, it sheds light on the potential influence of urbanization, economic development, energy consumption, and the proportion of renewable/low-carbon energy sources on carbon emissions and their relevance to achieving carbon neutrality targets. The research findings contribute to the existing knowledge by offering valuable insights for decision-makers and policymakers. They can inform the formulation of new or revised policies aimed at fostering a carbon-neutral and environmentally sustainable economy at both the EU and national levels.

Keywords: urbanization, CO₂ emissions, economic growth, energy consumption, panel data, EU countries

JEL classification: O13, P18, Q43

1. Introduction

Climate change, driven by rising greenhouse gas emissions, poses a significant threat to the planet and human well-being. The Intergovernmental Panel on Climate Change (IPCC) states in its latest report that urgent and decisive action is required to limit global warming to well below 2 degrees Celsius above pre-industrial levels (IPCC, 2022). Carbon dioxide (CO₂) emissions, a major contributor to climate change, necessitate a thorough understanding of their drivers and effective mitigation strategies.

Within this context, the European Union (EU) has emerged as a prominent force in pursuing the transition towards a low-carbon economy. A key aspect of this endeavor lies in comprehending the factors that influence CO₂ emissions and devising effective strategies to mitigate their impact.

The process of urbanization, characterized by the rapid growth and increased population density of cities, holds significant implications for energy consumption patterns and subsequent carbon emissions.

* Corresponding author: jana.chovancova@unipo.sk

The migration of individuals to urban areas has led to a surge in energy demand for powering transportation systems, buildings, and industrial activities. Consequently, these trends have contributed to escalating CO₂ emissions, unless proactive measures are implemented to foster sustainable urban development practices and promote the adoption of low-carbon energy sources (Li et al., 2022; Musah et al., 2021; Verma et al., 2021; Zhijian Wang et al., 2021; Xu et al., 2019).

According to the United Nations Human Settlements Programme (UN-Habitat), urbanization is a crucial factor in the fight against climate change. As UN-Habitat states: "Urban areas are responsible for over 70% of global energy consumption and greenhouse gas emissions. Sustainable urbanization is key to mitigating climate change and achieving sustainable development" (UN Habitat, 2020).

Concurrently, the integration of low-carbon energy sources, including renewable energy and nuclear power, has gained momentum across many countries. Multiple studies have investigated the intricate relationship between clean energy consumption, economic growth, and CO₂ emissions, consistently affirming the mitigating effect of renewable energy sources on CO₂ emissions (Adebayo et al., 2022; Chovancová et al., 2021; Petruška et al., 2021; Petruška et al., 2022; Radmehr et al., 2021; Vural, 2020). In a comprehensive analysis, Ozcan & Ari (2017) examined the nexus between nuclear energy and economic growth in 13 OECD countries. Their findings supported the feedback hypothesis, revealing a positive long-term impact of nuclear energy on GDP in six of the countries. On the other hand, Anwar et al. (2019), analyzing data from 59 countries, found that a higher proportion of nuclear energy led to reduced CO₂ emissions, with the exception of upper-middle-income countries.

These alternative energy sources offer promising opportunities to curtail carbon emissions by replacing fossil fuel-based energy generation. However, it remains crucial to explore and analyze the extent to which these low-carbon energy sources effectively contribute to emission reduction, particularly within the context of urbanization.

To address this research gap, this study aims to assess the impact of urbanization and the utilization of low-carbon energy sources on the trajectory of CO₂ emissions in EU countries. By employing a rigorous panel data analysis approach, we investigate the intricate relationships between carbon emissions, urbanization dynamics, economic growth patterns, energy consumption levels, and the proportion of renewable and nuclear energy sources. Through this research, we seek to provide valuable insights into the complex interplay of these factors and contribute to the formulation of effective policies for achieving carbon neutrality targets in the EU and beyond.

2. Data and methods

This study analyses the effect of energy consumption, renewable energy consumption, nuclear energy consumption, urban population, and gross domestic product on CO₂ emissions. The analysis utilizes data from 22 European Union (EU) countries from 1992 to 2019. Due to data availability, these 22 EU countries were selected for the analysis: Austria AUT, Belgium BEL, Bulgaria BGR, Czech Republic CZE, Denmark DNK, Finland FIN, France FRA, Germany DEU, Greece GRC, Hungary HUN, Ireland IRL, Italy ITA, Luxembourg LUX, Netherlands NLD, Poland POL, Slovenia SVN, Slovak Republic SVK, Spain ESP, Romania ROU, Portugal PRT, Sweden SWE, and United Kingdom GBR. The relationships between the six variables were examined. The list of investigated variables along with their abbreviated names used in the analyses is as follows:

- Carbon dioxide (CO₂) emissions per capita (tons) – CO₂,
- Urban population (% of total population) – Urban,
- Gross Domestic Product (GDP) per capita (thousands USD) – GDP,
- Total energy consumption per capita (MWh) – TEC,
- Energy produced from renewable sources per capita (MWh) – RES,
- Energy produced in nuclear power plants per capita (MWh) – Nuclear.

To examine the relationships between the six variables, data were sourced from publicly available databases. The World Bank provided data on GDP per capita, the Global Carbon Atlas offered data on CO₂ emissions per capita in tons, and Our World in Data supplied data on energy use per capita in kWh, urban population as a percentage of the total population, energy produced from renewable sources in MWh per capita, and energy produced in nuclear power plants in MWh per capita.

2.1 Descriptive statistics

The primary focus of this study is to examine the impact of the urban population variable on per capita carbon dioxide (CO₂) emissions, along with investigating the influence of other mentioned variables. Additionally, the study aims to explore the relationship between per capita CO₂ emissions and various other variables within a multidimensional framework. The variables, except for nuclear power, were logarithmized prior to model testing and estimation. The descriptive statistics of the variables in the entire dataset consisting of n = 616 observations are presented in Table 1.

Table 1. Descriptive statistics of investigated variables, all 616 observations

Variable	Unit	Mean	Std.Dev	Min	Max
CO2	tons per capita	8.784	3.721	3.818	31.253
Urban	% of total population	72.093	12.462	49.130	98.041
GDP	thousands USD per capita	30.406	17.058	4.504	124.591
TEC	MWh per capita	44.345	17.233	17.920	114.632
RES	MWh per capita	4.259	5.394	0.055	26.539
Nuclear	MWh per capita	4.637	5.726	0	23.385

2.2 Overview of the methods used to investigate the relationship between variables

Various methods were used to investigate the relationship between the variables under study. A progression from simpler to more complex methods was chosen. Significant results from the simpler method whose diagnostics led to doubts about the validity of its application were used to select parameters in the more complex method subsequently used. The chapter concludes with the resulting model describing the nexus between the dependent variable Log_CO2 and the independent variables Log_Urban, Log_GDP, Log_RES, Log_TEC and Nuclear. The list of used methods is as follows:

- Panel models: Fixed Effects (FE), Random Effects (RE),
- Pooled Mean Group Estimation (PMG) – Error Correction Model (ECM),
- Mean Group Estimation (MG) – ECM,
- Dynamic FE estimation - ECM,
- Common correlated effect model (CCE).

The methodology flow is captured on Figure 1.

The following correlation coefficients in Table 2 were calculated from the original, untransformed data and serve to provide initial brief information about the relationship between the variables under study.

Table 2. Correlation coefficients from untransformed data

	CO2	Urban	GDP	RES	TEC	Nuclear
CO2	1					
Urban	0.3841***	1				
GDP	0.3848***	0.4553***	1			
RES	-0.2240***	0.1214***	0.2230***	1		
TEC	0.7540***	0.6464***	0.5231***	0.278***	1	
Nuclear	-0.1679***	0.3261***	-0.0550	0.4620***	0.3551***	1

Note : ***, **, * stand for significance level at 1%, 5% and 10%

Source: Own processing – in Stata

We conducted a multicollinearity test on the independent variables Log_GDP, Log_TEC, Log_Urban, Log_RES, and Nuclear using the Variance Inflation Factor (VIF). The VIF values are presented in Table 3.

Table 3. Variation Inflation Factor

Variable	VIF
Log_GDP	2.32
Log_TEC	2.27
Log_Urban	2.03
Log_RES	1.63
Nuclear	1.62

Source: Own processing – in Stata

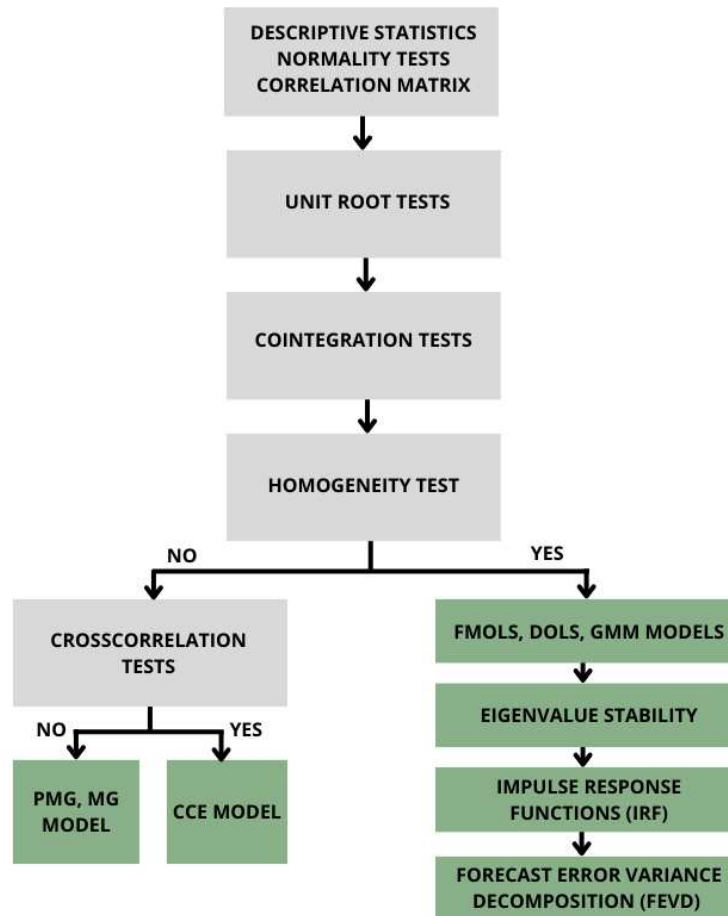

Figure 1. Methodology flow

For a reliable model, the VIF values should not exceed 5. Fortunately, all the variables exhibit VIF values significantly below this threshold. This indicates that multicollinearity among the input variables can be excluded, allowing us to consider models that include all the variables.

3. Results

3.1 Panel models

In addition to the previously considered cross-sectional variables, the panel model incorporates a time variable. The analysis covers 22 countries ($N = 22$), spanning the period from 1992 to 2019 ($T = 28$), resulting in a total of 616 measurements. The suitable model is selected from the options of Fixed Effects (FE), Random Effects (RE), and Pooled model.

The tests and parameters for the FE and RE models are presented in Table 4. The results of the FE test (F test) are promising, with a p-value of 0.00, indicating the rejection of the hypothesis that all specific constants are equal to zero. Similarly, the results of the RE test (Wald test) are favorable, with a p-value of 0.00. The regression coefficients of the FE and RE models are closely aligned and exhibit the same signs. Notably, the coefficient for Nuclear is only significant in the RE model.

Table 4. Fixed Effects and Random Effects model

Dependent: Log_CO2	Fixed Effects model		Random Effects model	
	Coef	P> t	Coef	P> t
Log_Urban	-0.3261	0.000	-0.3547	0.000
Log_GDP	-0.0774	0.000	-0.0744	0.000
Log_RES	-0.0404	0.000	-0.0430	0.000
Log_TEC	1.1752	0.000	1.1698	0.000
Nuclear	-0.0013	0.136	-0.0028	0.001
cons	-0.2534	0.044	-0.1882	0.117

Source: Own processing – in Stata

According to the panel models, an increase in Urban, GDP, RES, and in the case of RE, Nuclear, leads to a decrease in CO₂ emissions per capita. Conversely, an increase in TEC results in an increase in per capita emissions. Therefore, the panel models suggest that higher levels of urbanization contribute to reduced CO₂ emissions.

To ensure the accuracy of the model selection (FE, RE, Pooled), the Hausman test and the Breusch-Pagan Lagrange multiplication test (Table 5) were employed. The results of both tests indicate a preference for the fixed effects model.

Table 5. Model fit tests

Test	H ₀	p
Hausman	Preferred model is RE	0.001
Breusch-Pagan Lagrange multiplier	No panel effect	0.000
Pesaran CD test	Residuals are not correlated	0.000
Modified Wald test for groupwise heteroskedasticity	Homoskedasticity (or constant variance)	0.000

Source: Own processing – in Stata

3.2 Panel unit root tests

Unit root tests were conducted to determine the nature of the random variable, specifically whether it follows a non-stationary process of type I(1) (Choi, 2001; Harris & Tzavalis, 1999; Kwiatkowski et al., 1992). Initially, the logarithmic variable itself was tested, followed by its first difference. The following unit root tests were employed:

- Fisher (Augmented Dickey-Fuller Test) - Time trend, lagged difference 1;
- Fisher (Phillips-Perron unit root test) - Time trend, lagged difference 1;
- Im-Pesaran-Shin (Im et al., 2003) - Time trend, lagged specification 1;
- Levin-Lin-Chu (Levin et al., 2002) - Time trend, lagged specification 1;
- Breitung - Time trend, lagged difference 1;
- Hadri - Time trend.

Based on the majority of tests, it can be concluded that the variables exhibit first-order integrability, denoted as I(1).

3.3 Panel cointegration tests

Cointegration tests were employed to determine whether there exists a long-term stable relationship between the variables. This indicates that economic time series, driven by certain economic theories, do not diverge over time and return to equilibrium after short-term fluctuations. The following tests were used:

- KAO test - Lags(1)
- Pedroni test - AR parameter is panel-specific, includes panel-specific time trend, Lags(1)
- Westerlund tests - include panel-specific time trend

Among the ten tests, two tests do not reject the null hypothesis of no cointegration (the third Kao test and the second Westerlund test). Consequently, further estimation of the cointegration relationship between the analyzed variables can be pursued.

3.4 Estimation of heterogeneous panels

The test for column homogeneity yields a p-value of zero, indicating the need to employ heterogeneous panel methods. The estimation approaches used to determine the cointegration relationship are the Mean Group Estimator (MG) and the Pooled Mean Group Estimator (PMG). (Pesaran et al., 2001) proposed MG and PMG estimators that consider both short-run and long-run dynamics. They introduced a restriction on the coefficients of the long-run relationship, which can be uniform across all entities. The PMG model is estimated using the maximum likelihood method. Additionally, this regression can be estimated with different coefficients for the long-run relationship for each entity, and then the average is calculated, leading to the MG estimator.

3.5 Pooled Mean Group Estimation (ECM)

The dynamic PMG estimator assumes that the coefficients of the cointegration vector are the same for all entities, while the speed of adjustment (ec) and the short-run coefficients may differ across entities.

Table 6. Pooled Mean Group Estimation, Error correction form (PMG)

D.Log_CO2		Coef	Pvalue	95% Conf. Interval	
Long-run	Log_Urban	-1.9124	0.000	-2.3520	-1.4728
	Log_GDP	-0.1016	0.000	-0.1270	-0.0762
	Log_RES	-0.0928	0.000	-0.1171	-0.0685
	Log_TEC	1.1426	0.000	1.0440	1.2412
	Nuclear	-0.0097	0.000	-0.0123	-0.0071
Short-run (SR)	ec	-0.2079	0.000	-0.2912	-0.1245
	D.Log_Urban	-0.5383	0.852	-6.1752	5.0985
	D.Log_GDP	0.0295	0.356	-0.0330	0.0920
	D.Log_RES	-0.0959	0.000	-0.1447	-0.0469
	D.Log_TEC	0.8927	0.000	0.7321	1.0531
	D.Nuclear	-0.0074	0.000	-0.0112	-0.0035
	cons	0.5849	0.000	0.3510	0.8187

Source: Own processing – in Stata

Table 6 presents the model results, wherein the coefficient for the Urban variable is statistically significant. The other coefficients corresponding to the long-run relationship at the top of the table are also significant. However, in terms of the short-run relationship (SR) at the bottom of the table, the coefficients for Log_GDP and Log_Urban are not significant.

3.6 Mean Group estimation (ECM)

For Mean Group Estimation (Table 7), the coefficients for both the long-run and short-run relationships are calculated separately for each entity, and then the average is determined. In comparison to PMG, there are fewer coefficients that reach significance, but their signs remain consistent.

Table 7. Mean Group Estimation: Error Correction Form (MG)

D.Log_CO2		Coef	Pvalue	95% Conf. Interval	
Long-run	Log_Urban	-1.8208	0.199	-4.6015	0.9599
	Log_GDP	-0.1194	0.241	-0.3192	0.0803
	Log_RES	-0.1304	0.003	-0.2178	-0.0431
	Log_TEC	0.9309	0.000	0.6816	1.1803
	Nuclear	0.0001	0.987	-0.0126	0.0128
Short-run (SR)	ec	-0.6219	0.000	-0.7653	-0.4784
	D.Log_Urban	-17.6639	0.335	-53.5640	18.2361
	D.Log_GDP	0.0506	0.238	-0.0335	0.1348
	D.Log_RES	-0.0196	0.325	-0.0587	0.0194
	D.Log_TEC	0.4824	0.000	0.2828	0.6819
	D.Nuclear	-0.0034	0.141	-0.0080	0.0011
	cons	2.7268	0.138	-0.8803	6.3340

Source: Own processing – in Stata

3.7 Dynamic FE estimation (ECM)

The Dynamic FE estimator constrains the coefficients of the cointegration vector, the speed of adjustment, and the short-run coefficients to be the same across all entities. When employing this model, only the GDP and TEC variables exhibit significant coefficients in the long-term relationship, as can be seen in Table 8.

In all three models, the coefficients generally exhibit the same signs, except for the Nuclear variable in the long-run relationship. However, the significance of the coefficients varies across the models. The PMG model demonstrates the highest number of significant coefficients. Notably, the error-correction speed of adjustment parameter (ec) and the long-run coefficients are of particular interest. If the ec parameter is significantly negative, it indicates a long-run relationship between the

dependent variable, Log_CO2, and the independent variables Log_Urban, Log_GDP, Log_RES, Log_TEC, and Nuclear, suggesting a return to long-run equilibrium. The speed of adjustment values are as follows: -0.20788 for PMG, -0.6219 for MG, and -0.1535 for DFE. In all three cases, the p-value is 0.

Table 8. Dynamic Fixed Effects Regression (DFE)

D.Log_CO2		Coef	Pvalue	95% Conf. Interval	
Long-run	Log_Urban	-0.4165	0.120	-0.9417	0.1086
	Log_GDP	-0.1042	0.001	-0.1634	-0.0449
	Log_RES	-0.0311	0.079	-0.0659	0.0035
	Log_TEC	1.3522	0.000	1.1614	1.5429
	Nuclear	0.0001	0.981	-0.0067	0.0068
Short-run (SR)	ec	-0.1535	0.000	-0.2016	-0.1055
	D.Log_Urban	-0.1006	0.874	-1.3479	1.1466
	D.Log_GDP	0.0231	0.023	-0.0412	0.0875
	D.Log_RES	-0.0925	0.000	-0.1058	-0.0791
	D.Log_TEC	0.8719	0.000	0.7904	0.9534
	D.Nuclear	-0.0068	0.000	-0.0085	-0.0051
	cons	-0.0542	0.479	-0.2043	0.0959

Source: Own processing – in Stata

To determine the appropriate model, the Hausman test is employed. The null hypothesis of the test is as follows: H0: Difference in coefficients is not systematic. The results of the tests are presented in Table 9.

Table 9. Hausman tests

	Test	Models	Pvalue
1.	Hausman	MG, PMG	0.550
2.	Hausman	MG, DFE	0.000

Source: Own processing – in Stata

The first test compares the MG and PMG models, indicating a preference for the PMG estimator over MG. In the second test, the choice lies between MG and the DFE model, favoring the MG model over DFE. Consequently, the PMG model is preferred.

In the previous models, we did not test for the presence of cross-correlation between entities (countries), which can lead to biased and inconsistent estimates. Tests for weak cross-sectional dependence (CSD) reveal strong cross-correlation among all variables. Table 10 presents the results of testing for strong cross-sectional dependence (CSD).

Table 10. Testing for strong cross-sectional dependence (CSD)

	Alpha	CD	CDw	CDw+	CD*
Log_CO2	0.978	53.02***	-2.57***	813.45***	1.17
Log_GDP	1.00	78.73***	-3.09***	119.51***	-3.01***
Log_RES	1.005	55.61***	-2.82***	840.94***	4.01***

Log_Urban	0.959	28.63***	-3.42***	1072.29***	3.52***

Source: Own processing – in Stata

In situations like these, the Correlated Effect Model (CCE), as proposed by (Ditzen, 2018, 2021), can be employed. The parameter estimates of the CCE model are presented in Table 11.

In situations where countries do not have nuclear power plants, such as AVT, DNK, GRC, IRL, ITA, LUX, POL, and PRT (as mentioned in the Data and Methods section), the variable Nuclear had zero values. However, the calculation using the xtdcce2 algorithm in Stata failed due to this reason, and as a result, the variable Nuclear was omitted in the CCE model.

Unlike the previous models, the CCE model exhibits the fewest significant coefficients. Among the Long Run coefficients, the Log_RES and Log_TEC variables show significance. The CD statistic yields a p-value of 0.1486, and the Estimation of Cross-sectional Exponent (alpha) is calculated as 0.5631. This indicates that the residuals of the CCE (PMG) model can be considered weakly cross-sectional dependent.

Table 11. Correlated Effect Model (CCE) (EU – 22) (PMG)

D.Log_CO2		Coef	pvalue	95% Conf. Interval	
Long-run	Log_Urban	0.2958	0.849	-2.7511	3.3428

The CCE model exhibits even fewer significant coefficients compared to the previous case. The CD statistic yields a somewhat unsatisfactory value (p -value = 0.0789), while the Estimation of Cross-sectional Exponent (α) is at an acceptable level of 0.5702. Unfortunately, the speed of adjustment (ec) is not statistically significant. Moreover, we anticipated a significant effect of the Nuclear variable on reducing CO₂ emissions, considering these countries have non-zero nuclear power generation.

4. Discussion

The impact of urbanization on CO₂ emissions can vary across studies. Some studies find a positive relationship, indicating that higher urbanization levels lead to increased emissions (Abbasi et al., 2021; Z. Ahmed et al., 2019; Zhen Wang et al., 2019) due to energy consumption, transportation demands, and industrial activities in urban areas. However, other studies suggest that well-planned and sustainable urbanization strategies can contribute to reduced emissions (Krähmer, 2020; Raihan, 2023). These strategies involve promoting compact cities, efficient public transportation, and the integration of renewable energy sources. The varying results may be attributed to differences in urban planning approaches, policy measures, and regional contexts.

The positive association between GDP and CO₂ emissions is a commonly observed trend. As economies grow, energy consumption tends to increase, resulting in higher emissions. However, the relationship between economic development and emissions intensity (emissions per unit of GDP) is more nuanced. Some studies indicate that advanced economies with higher GDP levels exhibit lower emissions intensity, reflecting a decoupling of economic growth from carbon emissions (Chovancová & Vavrek, 2022; Menegaki, 2014). This can be attributed to the adoption of cleaner technologies, energy efficiency measures, and shifts towards service-oriented economies.

Similar to the findings in this study, numerous studies highlight the significant role of renewable energy sources in mitigating CO₂ emissions (Omokanmi et al., 2022; Özokcu & Özdemir, 2017; Siksnyte & Zavadskas, 2019). The expansion of renewable energy capacity, such as solar, wind, and hydropower, has been associated with reduced reliance on fossil fuels and subsequent emissions reductions. Policies promoting renewable energy deployment, such as feed-in tariffs, renewable portfolio standards, and financial incentives, have been effective in encouraging the transition to low-carbon energy systems.

The positive relationship between energy consumption (TEC) and CO₂ emissions observed in this study aligns with previous research that highlights the importance of energy efficiency measures. Studies consistently emphasize the need to enhance energy efficiency across sectors, including buildings, transportation, and industrial processes, to reduce energy demand and associated emissions (Ahmed et al., 2017; Mahi et al., 2021; Petruška et al., 2021). Policies targeting energy-efficient technologies, building codes, and energy management practices can significantly contribute to emissions reductions.

The impact of nuclear energy on CO₂ emissions reduction is a topic of ongoing debate and varies across studies. Some research suggests that nuclear power can serve as a low-carbon energy source, providing a stable and reliable baseload capacity (Brook et al., 2014; Kartal et al., 2023; Pao & Chen, 2019). However, concerns related to safety, waste disposal, and public acceptance have influenced the stance on nuclear energy adoption in different countries (Karakosta et al., 2013). Some studies argue that the long-term costs and risks associated with nuclear power may outweigh its potential benefits in reducing emissions, while others advocate for its inclusion in a diverse low-carbon energy mix.

The findings emphasize the need for integrated and targeted policy measures that address multiple dimensions of sustainability and prioritize a transition towards a low-carbon future. Further research and exploration of non-linear models, along with consideration of regional and country-specific factors, will continue to enhance our understanding of CO₂ emissions dynamics and inform effective mitigation strategies.

Conclusion

In conclusion, all the models utilized in this study indicate the presence of both short-term and long-term relationships between CO₂ emissions and the independent variables. The findings from the PMG model reveal that in the long run, variables such as Urbanization, GDP, renewable energy sources (RES), and ₂Nuclear have a significant effect on reducing CO₂ emissions, whereas total energy consumption (TEC) leads to an increase in emissions. In the short run, only RES and Nuclear exhibit a significant impact on CO₂ reduction, while total energy consumption maintains a similar effect as in the long run.

The question arises as to whether factors such as urbanization, economic development, energy consumption, and the utilization of renewable/low-carbon energy sources can influence carbon emissions and contribute to achieving carbon neutrality targets. Although the impact of urbanization was inconclusive in all models, further exploration utilizing non-linear models, such as Threshold models, would be beneficial to delve deeper into the relationship between urbanization and CO₂ emissions.

Additionally, the PMG model did not satisfy the criteria of weak cross-correlation, prompting the use of the CCE model. However, applying the CCE model to both the overall group of countries under study and the subgroup of countries utilizing nuclear power yielded less clear-cut impacts of the analyzed variables. When considering all countries, similar effects were observed for renewables and energy consumption in the long run, with only energy consumption having a significant impact in the short run. However, for countries utilizing nuclear energy, the CCE model demonstrated significant limitations, particularly with the speed of adjustment parameter, rendering the model impractical for application.

The findings suggest that the examined variables do have a significant influence on CO₂ emissions, and further research is warranted to explore the complexities of these relationships, particularly in the context of urbanization and the use of nuclear energy.

Future studies could benefit from investigating non-linear relationships between urbanization and CO₂ emissions using Threshold models, which may provide a more comprehensive understanding of how urbanization dynamics impact emissions. Additionally, more in-depth analysis is needed to elucidate the influence of nuclear energy on CO₂ emissions, considering its varying effects across different country contexts and income levels.

Furthermore, by exploring other variables and factors that might influence CO₂ emissions, such as policy measures, technological advancements, and international collaborations, and encompassing a

broader set of variables, future studies can better inform policymakers on effective strategies for achieving carbon neutrality targets and fostering a sustainable and environmentally conscious economy both within the EU and on a global scale.

Abstract

Research background: Increased production and consumption of beverage packaging requires their subsequent appropriate recovery and recycling. One of the effective forms of beverage packaging recovery and also a way of reducing littering and related environmental pollution are the deposit-refund systems.

Purpose of the article: Only a few studies analyze and include the public's perception associated with the adoption of deposit-refund systems. The aim of the paper was to evaluate the significance of deposit-refund systems in Slovakia from the perspective of consumers in selected regions.

Methods: The primary data were obtained by the online questionnaire survey. We focused on the comparison of Slovakia's regions, specifically the Prešov and Bratislava regions, i.e. regions where various socio-economic differences are evident. The methods of descriptive and analytical statistics were used to analyze the collected data.

Findings & Value added: The results indicate that the awareness of deposit-refund systems is at a high level, the majority of the respondents agree with their introduction and the frequency of use achieves good results despite the beginning of their introduction in Slovak conditions, but does not yet fully reflect their knowledge and agreement with their introduction. No significant statistical differences were found in the region variable within the questions concerning the knowledge, introduction and location of deposit-refund systems, which may indicate that the deposit-refund systems were implemented correctly in the conditions of the Slovak regions.

Keywords: deposit-refund systems, beverage packaging management, consumers' perspective, Slovakia

JEL classification: H23, Q53, Q58

1. Introduction

The growing world population requires more and more food. This in turn leads to an increasing amount of packaging waste such as bottles, boxes and foils (Gomez et al., 2009). The share of packaging material in the total environmental impact of the product can be up to 45%, depending on the type of food and packaging material (Del Borghi et al., 2014). Packaging plays a fundamental role in the production of food and beverages as well as in supply chains. In addition to informing and attracting end consumers, packaging also protects and preserves the quality of food and beverages. Although there has been a steady increase in the volume of recycled and recovered waste in the European Union in recent years, the volume of packaging waste produced per year actually increased from 161.9 kg per capita in 2007 to 177.6 kg per capita in 2019 (Eurostat, 2023). The growth of social concerns regarding the deterioration of the environment has encouraged the promotion of more efficient and sustainable means of dealing with waste generation and management (Roca i Puigvert et al., 2020). Countries needed reform that would channel waste towards recycling, thus maintaining sustainability between resources and the environment (Xing et al., 2020). Recycling generally conserves natural resources and promotes biodiversity to improve the long-term sustainability of the global ecosystem (Ayodele et al., 2018; Robaina et al., 2020). Recycling

* Corresponding author: roman.novotny@unipo.sk

eliminates harmful waste and environmental pollution, which has beneficial effects on human health and other living creatures (Jabbour et al., 2019). Recycling is the basis of one of the effective means of reducing environmental impacts and ensuring extended producer responsibility, which is a deposit-refund system. Deposit-refund systems effectively transfer waste streams from final disposal to reuse or recycling. Compared to other collection systems, they have a better effect on the treatment of scattered and hard-to-regulate solid waste. Therefore, the key area of application of deposit-refund systems has become the packaging of beverages, which is related to its large amount, scattered consumption and high intensity of pollution (Zhou et al., 2020).

Under beverage packaging deposit schemes, consumers have to pay a "packaging deposit" as an added price to the products purchased. This deposit is returned when consumers return used packaging to the point of sale in good condition for identification and take-back (Roca i Puigvert et al., 2020). The deposit-refund system has been implemented in many countries around the world and has led to increased recycling and reduced environmental pollution. Finland, for example, has a long history of deposit-refund systems for beverage packaging. The deposit-refund system has existed in Finland since 1950, with the first system being used for refillable glass bottles. Single-use metal beverage cans were added in 1996, single-use PET bottles in 2008, and single-use glass bottles in 2011. Thanks to a well-set system and public support, the collection rate in 2022 was more than 90% in all three cases (PALPA, 2023). In Germany, a beverage packaging buyback system has been in effect since 2003, covering PET, glass and metal bottles and cans. According to the system operator, the overall return rate of disposable packaging in Germany is 98%. These examples not only indicate that much less waste enters the environment, but also that a successful circular economy model has been created within the area, that can be followed. And many countries are currently implementing it based on these successful results, in 2022 and 2023 for example, Latvia, Slovakia, Romania, Turkey, Greece, Malta, Portugal, Ireland and Scotland (TOMRA, 2022). However, due to the large differences in national conditions between different countries, the specific ways of implementing deposit-refund systems are not the same (Zhou et al., 2020).

Siritorn (2021) describes comparisons of economic instruments of environmental policy, and deposit-refund systems are among the instruments with the best results. The application of deposit-refund systems significantly reduces environmental pollution and contributes to the efficient recycling of a large amount of recycled materials (Lavee, 2010). The deposit-refund system was gradually applied to other products, such as lead batteries, motor oils, tires, various hazardous materials, electronics and others (Walls, 2011).

The deposit system is a proven solution for more than a billion beverage containers that are introduced to the Slovak market annually. In the past, a significant part of the packaging ended up where it shouldn't - unsorted, unrecycled or thrown in nature. Thanks to the deposit-refund system, it is possible to increase the current collection rate of beverage packaging to 90%, i.e. to the level set by the European Union for the member states by 2029. Without the introduction of beverage packaging deposit-refund systems, which are constantly gaining popularity, it will be difficult to impossible to achieve this goal. The deposit-refund system started operating in Slovakia on January 1, 2022. Disposable plastic bottles and beverage cans with a volume of 0.1 l to 3 l are backed up. Each backed-up bottle or can has the symbol "Z" in the recycling arrows and the text "backed up". Only packages marked in this way are backed up and consumers can return them to the collection point for 15 eurocents. It is possible to return the packaging in any store that is involved in the deposit system. There are already approximately 3,000 such places throughout Slovakia. It is not possible to implement a complex system overnight, but the deposit-refund system results for the first year of operation exceeded all expectations. Optimistic scenarios counted on a maximum of 60% of returned beverage packaging, but the return of PET bottles and cans exceeded 70% (Ministry of Environment of the Slovak Republic, 2023).

The implementation of such a system, on the other hand, also means significant expenses, and its effectiveness is related to increasing the rate of recycling, which depends to a decisive extent on the involvement and participation of the public. Roca i Puigvert et al. (2020) conducted a study whose results indicate that attitudes and underlying motivations, as well as subjective norms and perceived ability, resources and opportunities for recycling, are decisive for the public's intention to adopt deposit systems. According to the results, the public also very sensitively perceives the information provided regarding deposit-refund systems for beverage packaging, which has the potential to change waste recycling behavior. Recycling, which is the main principle of deposit systems, is behavior guided by principles, that is, the attitudes it creates and the resulting intention to recycle are influenced by personal values and experienced social pressures, which needs to be responded to in further research by examining various

factors, as currently very few studies analyze and include public perception associated with the adoption of beverage packaging deposit-refund systems (Viscusi et al., 2011).

2. Methods

The purpose of the research of the presented study was aimed at evaluating the importance of deposit-refund systems in Slovakia from the point of view of consumers in selected regions. The study focuses on the comparison of two regions of Slovakia, namely the Prešov and Bratislava regions. The selected regions were chosen on the basis of regional disparities, which have been recorded in them for a long time in economic, social and environmental areas (Michálek & Podolák, 2014).

For the purposes of analysis, primary data were used, which were obtained using a questionnaire survey. The questionnaire contained 18 questions, while 4 questions were aimed at finding out the socio-demographic characteristics of the population and the other 14 questions were aimed at finding out attitudes in relation to deposit systems for beverage packaging, specifically knowledge, satisfaction and frequency of using deposit systems and other general opinions on the introduction and use of deposit systems in the given regions. Respondents could answer the questions based on a 5-point Likert scale. The selection of the research sample is based on the selection of respondents who meet certain criteria. In the case of the research in question, it was about criteria of representativeness from the point of view of the regions of residence - Prešov and Bratislava regions and gender affiliation. We asked the respondents to fill out the questionnaire through online platforms and social networks, focusing on various regional groups and pages that can be described as opinion-neutral.

The methods of descriptive and analytical statistics were used to analyze the collected data, while the Statistica program was used. The Shapiro-Wilk test and the Kolmogorov-Smirnov test were used to test normality, the data did not show a normal distribution, therefore we used non-parametric tests, namely the Mann-Whitney U test to test the differences between groups of respondents and the Spearman correlation coefficient to test the association between different variables.

The data collection was carried out from 14.02.2022 to 31.03.2022, while the research sample, after cleaning the data from incomplete answers and respondents from regions other than those under investigation, consisted of 201 statistical units (respondents' answers). The average age of the entire sample was 36 years. The youngest respondent was 18 years old and the oldest was 68 years old. The average age in the Bratislava region was 33 years and in the Prešov region 39 years. Table 1 shows detailed data on the distribution of variables according to gender, region of residence and maximum achieved level of education.

Table 1. Characteristics of sample selection

Characteristics	Frequency	Percent
Gender characteristics:		
Male	69	34.3
Female	132	65.7
Region of residence:		
Bratislava	84	41.8
Prešov	117	58.2
Maximum achieved level of education:		
High school	96	47.8
University	105	52.2

Source: own processing

Compared to the selection plan, the biggest differences were identified in the area of gender characteristics and relatively high representation of university-educated respondents. The above can be seen as a limitation, but no significant distortion of the results is expected.

3. Results

In the next part of the study, the results of the analytical processing are presented - they are divided into three parts. The first part is focused on the descriptive analysis of the achieved results, where the most important and interesting findings are selected. The second part analyzed the differences in the selected variables in terms of the region of residence of the respondents. The third part is focused on assessing the relationships between the selected variables.

As part of the questionnaire, after socio-demographic questions, we investigated the main source of information about deposit-refund systems for beverage packaging from the point of view of consumers. Respondents from the two investigated regions most often obtain information about this type of deposit systems by means of the internet, 33% of respondents indicated this possibility. The second most common source of obtaining information is the television with 31% of respondents, the third is social networks with 17%, followed by other information sources with 6%, which the respondents did not have a choice to select. The options family and acquaintances, print or radio reached 5% or less. The results showed that the most frequently used sources for obtaining information are the internet and television.

Furthermore, we investigated the respondents' knowledge of the concept of deposit-refund systems for beverage packaging, while in the Bratislava region up to 93% of respondents answered definitely yes, in the Prešov region it was 86%. The results show that the respondents are familiar with the topic of deposit-refund systems for beverage packaging.

In the following question, respondents were asked to agree with the statement that deposit-refund systems are a suitable method for collecting and recycling beverage packaging. According to the answers of the respondents from the Bratislava region, we record a clear agreement (I definitely agree) with the suitability of the introduction among 50% of respondents and moderate agreement (rather agree) among 32% of respondents, in the Prešov region 55% of respondents definitely agree and 33% of respondents rather agree. According to the described results, we can conclude that the deposit-refund systems of beverage packaging were received positively and the purpose of their introduction was understood correctly.

According to the results of the previous questions, the majority of respondents know the term and agree with the introduction of beverage packaging deposit-refund systems, but as for the frequency of use, the results of which are shown in Figure 1, only 13% of respondents in the Bratislava region use the possibility of deposit-refund beverage packaging "always" when it is possible, in the Prešov region it is 10% of respondents. On the other hand, among the respondents, the most frequent answer was the „very often“ use of deposit machines, which was assigned the second highest degree of frequency of use, and this answer was indicated by 31% of respondents in the Bratislava region and 38% of respondents in the Prešov region. The results of the question indicate relatively positive behavior of the respondents in relation to the use of beverage packaging deposit-refund systems.

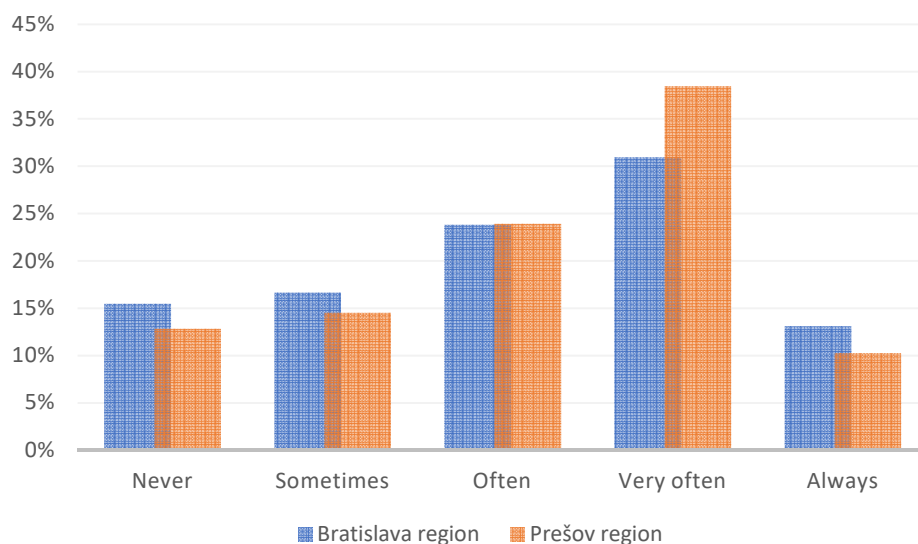

Figure 1. Frequency of use of beverage packaging deposit-refund systems
Source: own processing

In the next question of the questionnaire survey, we investigated the opinion on the sufficiency of the promotion of deposit-refund systems of beverage packaging in Slovakia. Only 37% of respondents from the Bratislava region and 39% of respondents from the Prešov region answered positively (definitely yes, rather yes). A negative answer (definitely not, rather not) was given by 45% of respondents from the Bratislava region and 43% from the Prešov region. The results indicate that the perception of the promotion of beverage packaging deposit-refund systems in Slovakia is not entirely ideal.

The following question focused on determining satisfaction with the location of deposit machines. Respondents within the Prešov region most often marked the option "rather satisfied", which was marked by 43% of respondents, and the neutral answer "neither satisfied nor dissatisfied", which was the second most common answer and was marked by 31% of respondents. Within the Bratislava region, respondents most often marked the option "neither satisfied nor dissatisfied", which was favored by 27% of respondents and 26% of respondents chose the second most frequently marked option "rather satisfied". In both regions, the third most frequently indicated option was "definitely satisfied". Negative answers (definitely dissatisfied and rather dissatisfied) were indicated by 25% of respondents in the Bratislava region and 14% of respondents in the Prešov region. The results indicate that the respondents are generally rather satisfied with the location of the deposit machines.

The last of the questions selected from the questionnaire survey focused on the impact of the introduction of deposit-refund systems for sorting other plastic waste in the household. The vast majority of respondents sort plastics as they did before the introduction of deposit systems, so the introduction of deposit systems did not significantly affect the sorting habits of other plastic waste in households. On the other hand, 30% of respondents in the Bratislava region and 26% of respondents in the Prešov region sort other plastic waste more than before the introduction of beverage packaging deposit-refund systems, which we consider a positive result.

For further statistical testing, we used the Shapiro-Wilk test and the Kolmogorov-Smirnov test for the normality of the variable distribution to test the normality of the investigated variables. Normality tests showed that the data did not have a normal distribution. Based on the nature of the data, the Mann-Whitney U test was used for statistical testing of differences between groups of respondents and the Spearman correlation coefficient was used for testing the association between different variables.

In the first analysis of differences, we wanted to test the existence of statistically significant differences in the knowledge of the concept of deposit-refund systems for beverage packaging between respondents from the Bratislava and Prešov regions. The output of the statistical difference testing using the Mann-Whitney U test, shown in Table 2, points out that the Z value is 0.93 and the statistical significance value of the test is 0.35, which is more than the selected alpha value (0.05). According to the results, there is no statistically significant difference in the knowledge of the concept of deposit-refund systems for beverage packaging between respondents from the Bratislava and Prešov regions.

Table 2. Results of the first analysis of differences

Mann – Whitney U test	Z value	p value
4480.50	0.93	0.35

Source: own processing

In the next analysis of differences, we wanted to test the existence of statistically significant differences in the evaluation of deposit-refund systems as a suitable method for the collection and recycling of beverage packaging between respondents from the Bratislava and Prešov regions. The output of the statistical difference testing using the Mann-Whitney U test shown in Table 3 points out that the Z value is -0.19 and the statistical significance value of the test is 0.84, which is more than the selected alpha value (0.05). According to the results, there is no statistically significant difference in the evaluation of deposit-refund systems as a suitable method for the collection and recycling of beverage packaging between respondents from the Bratislava and Prešov regions.

Table 3. Results of the second analysis of differences

Mann – Whitney U test	Z value	p value
4776.00	-0.19	0.84

Source: own processing

The last analysis of differences was aimed at testing the existence of statistically significant differences in the perception of satisfaction with the location of deposit machines for beverage packaging between respondents from the Bratislava and Prešov regions. The output of statistical difference testing using the Mann-Whitney U test shown in Table 4 points out that the Z value is -0.30 and the statistical significance value of the test is 0.76, which is more than the selected alpha value (0.05). According to the results, there is no statistically significant difference in the perception of satisfaction with the location of deposit machines for beverage packaging between respondents from the Bratislava and Prešov regions.

Table 4. Results of the third analysis of differences

Mann – Whitney U test	Z value	p value
4733.00	-0.30	0.76

Source: own processing

In the first association test, we wanted to test the existence of a statistically significant relationship between the frequency of use of beverage packaging deposit systems and the perception of satisfaction with the location of beverage packaging deposit machines. The output of statistical testing of the association using the Spearman correlation coefficient, shown in Table 5, shows that the value of the statistical significance of the test is 0.002, which is less than the selected alpha value (0.05), so according to our results, there is a statistically significant relationship between the frequency of using deposit-refund beverage packaging systems and the perception of satisfaction with the location of beverage packaging deposit machines. The value of Spearman's correlation coefficient is 0.36, which indicates a moderate strength of the relationship between the variables (Dancey & Reidy, 2011).

Table 5. Results of the first correlation analysis

Spearman ρ	p value
0.36	0.002

Source: own processing

The second association test was aimed at testing the existence of a statistically significant relationship between the frequency of use of beverage packaging deposit-refund systems and the sufficiency of promotion of beverage packaging deposit-refund systems. The output of statistical testing of the association using the Spearman correlation coefficient, shown in Table 6, shows that the value of the statistical significance of the test is 0.875, which is more than the selected alpha value (0.05), so according to our results, there is no statistically significant relationship between the frequency of using deposit-refund beverage packaging systems and the sufficiency of the promotion of deposit-refund beverage packaging systems.

Table 6. Results of the second correlation analysis

Spearman ρ	p value
0.012	0.875

Source: own processing

The results of the difference tests did not confirm the existence of differences in the investigated variables from the point of view of the respondents' regions of residence, which may indicate that the region of residence does not influence differences in the perception of the significance of deposit-refund systems for beverage packaging in Slovak conditions. Correlation tests revealed the existence of a significant relationship in one case, namely between the frequency of use of beverage packaging deposit-refund systems and the perception of satisfaction with the location of beverage packaging deposit-refund machines. We will describe the results in more detail in the discussion.

4. Discussion

In fulfilling the objective of the study in question, we reached several results, which we will summarize and interpret in this section.

When investigating the main source of information about deposit-refund systems, we found that respondents most often get information about deposit-refund systems from the internet and television. It should be noted that in other questions the respondents achieved a high level of knowledge of the concept and agreement with the introduction of deposit-refund systems for beverage packaging, i.e. the promotion before their launch had its effect, but on the other hand, the frequency of use is slightly behind and the respondents were rather skeptical when asked about the sufficiency of the promotion, which may indicate that the promotion and highlighting of economic, environmental and social benefits should be continued at least to some extent even after the deposit-refund system is launched and combine the internet and television, i.e. the main sources of information to be focused on, with the media that were marked by fewer respondents, that is, by social networks, which have a great influence especially on the younger generations, or by the press or radio, which have an influence more on the older generations, since the

non-marking of some media may also indicate that there was a lack of relevant information about deposit-refund systems.

According to the results of the questionnaire survey, we can say that the level of awareness about deposit-refund systems for beverage packaging is favorable in the studied regions. The results show that the subject of deposit-refund systems for beverage packaging is already widely known in Slovakia, probably mainly due to their introduction and related promotion. Furthermore, the results indicate that despite the greater burden on consumers when collecting and depositing this type of waste, deposit-refund systems for beverage packaging were mostly received positively and their introduction was understood correctly by consumers. The results of the question regarding the frequency of use of beverage packaging deposit-refund systems indicate relatively positive behavior of the respondents in relation to the use of beverage packaging deposit-refund systems, on the other hand, the results still do not reflect the general knowledge and agreement with the introduction of beverage packaging deposit-refund systems. On the other hand, at the time of filling out the questionnaire, the operation of deposit-refund systems was in its infancy, therefore the given results can be considered positive. Over time, it will be necessary to verify changes in consumer behavior with the help of further research and in case of stagnation or unfavorable development proceed to implementation of appropriate measures, e.g. renewal of campaigns and more intensive promotion.

As was partially mentioned above, we conclude from the results that the promotion of deposit-refund systems for beverage packaging in Slovakia cannot be described as completely ideal, and it was probably necessary to highlight the importance of deposit-refund in the media not only in its launch, but even after that. One of the concepts that are currently very relevant in Europe, directly related to voluntary instruments of environmental policy, which also include deposit-refund systems, and it is necessary to incorporate them in the promotion of deposit-refund systems, is the concept of the circular economy. This model will be more and more important in the future and brings economic, environmental and social benefits to the public, which need to be prioritized.

The results of the question aimed at determining satisfaction with the location of deposit machines indicate that the respondents are generally satisfied with their location, but there is probably still room for improvement in both regions. The number of machines has increased over time, so the question would need to be repeated as part of further research, i.e. when the system is fully operational.

Regarding the question of the impact of the introduction of deposit systems on the sorting of other plastic waste in the household, it is obvious that the vast majority of respondents sort plastics as they did before the introduction of deposit-refund systems, so the introduction of deposit-refund systems did not affect the habits of sorting other plastic waste in households to a greater extent. A positive finding is however the fact that quite a few respondents in both regions sort other plastic waste more than before the introduction of beverage packaging deposit-refund systems, which may indicate that this measure also had indirect effects on positive behavior in relation to other plastic waste.

The results of the differences tests did not confirm the existence of differences within the investigated variables from the point of view of the respondents' regions of residence, which may indicate that the region of residence and related regional disparities do not have an influence on the differences in the perception of the significance of deposit-refund systems for beverage packaging in Slovak conditions, and from this point of view, the deposit-refund systems were introduced correctly in the conditions of Slovak regions. Correlation tests revealed the existence of significant associations in one case, namely between the frequency of use of beverage container deposit-refund systems and the perception of satisfaction with the location of beverage container deposit machines, indicating that efforts to increase the frequency of use of deposit machines should consider their location as one of the important criteria.

Conclusion

The consumption of used beverage containers is increasing in the world, while these plastic, glass or metal containers have a significant negative impact on the environment. In many countries, this waste is becoming a critical problem and therefore the introduction of adequate waste management strategies is essential. Among the sustainable waste management systems we can also include deposit-refund systems for beverage packaging, which directly reduce the environmental impacts related to waste disposal, but also reduce the consumption of raw materials. In general, the goal of deposit-refund systems is to increase the level of recovery of beverage packaging, and this goal has been successfully met in many countries around the world, leading to the mitigation of environmental pollution.

The aim of the research of the presented study was to evaluate the importance of deposit-refund systems in Slovakia from the point of view of consumers in selected regions. In the study, we focused on the comparison of the Prešov and Bratislava regions. When comparing these regions, we did not find any significant differences within the investigated areas. In further research, however, it is necessary to examine other factors of recycling participation and involvement in Slovak conditions, e.g. the potential effect of sociodemographic variables such as age, education, gender or economic situation. It would be no less interesting to explore the motivation factor, without which consumers are unlikely to engage in recycling behavior. It is widely accepted that values, attitudes and behaviors are crucial in determining recycling behavior (Strydom, 2018; Passafaro et al., 2019).

The results of the questionnaire survey indicate that the level of awareness of deposit-refund systems for beverage packaging is favorable in the studied regions, deposit-refund systems are perceived as a suitable method for the collection and recycling of beverage packaging and the frequency of use of deposit-refund systems for beverage packaging indicates relatively positive behavior of respondents in relation to the use of deposit-refund of beverage packaging. For example, in relation to the above, the performed analysis of the correlations suggests that in efforts to further increase the frequency of use of deposit machines, it is necessary to take into account their location as one of the important criteria. Although the frequency of use of deposit-refund systems for beverage packaging does not yet reflect the results within the framework of general knowledge and agreement with the suitability of introducing deposit-refund systems for beverage packaging, on the other hand, deposit-refund systems in Slovakia are still in their infancy and the overall results within the given areas can be evaluated positively. Another positive finding is the fact that quite a few respondents in both regions sort other plastic waste more than before the introduction of deposit-refund systems for beverage packaging, which can be described as a positive phenomenon that may deepen even more over time. The described results, together with the data on the return of PET bottles and cans at the level of 70% for the first year of operation of the system, can be described as a success of this economic instrument of environmental policy in the conditions of Slovakia. However, changes in the perception of deposit-refund systems and the context resulting from their introduction should not be neglected and it is necessary to monitor them over time. When solving any problems with the deposit-refund system in Slovakia or when trying to upgrade it, e.g. with the introduction of new items suitable for deposit-refund, instructions and inspirations from other countries, where deposit-refund systems have been working for many years and achieved excellent results, are also still available.

Abstract

Research Background: The “European Climate Law“ aims at achieving net zero carbon dioxide emissions within the next 27 years. It is based on the findings of the IPCC and its climate outlook for the 21st century. However, there are serious doubts about IPCC computer models and concerns that measures to curb emissions are not balanced by the possible benefits.

Aim: We want to show the economic impact of climate legislation and bring new facts and aspects to the scientific debate that serve as justification. Furthermore, we find that climate science on global scale is not really settled and we designed a suitable experimental setup to clarify this important question

Methods: We reviewed relevant EU legislation, and performed lab and field measurements of infrared back radiation depending on varying CO₂ concentrations compared to atmospheric CO₂ concentration. To assess the potential economic impacts of current EU legislation, we surveyed with experts from different fields.

Findings & Value added: Our findings corroborate the repeatedly voiced doubts that increased CO₂ will lead to dramatic climate effects. We see clear evidence for saturation of IR absorption at current CO₂ concentrations in the atmosphere. A qualitative expert survey points at the potentially negative economic impact of present EU climate legislation.

Keywords: european climate law, IPCC, EU Green Deal, CO₂ saturation, experiment, measurement, economic impact assessment

JEL classification: O52, O39, K32, C90, Q20, Q54

1. Introduction

The EU considers climate change as an existential threat and wants to reduce net greenhouse gas emissions by at least 55% by 2030 and down to 0% by 2050 within the "EU Green Deal". Economic growth should be decoupled from the use of energy resources contrary to traditional thinking and practice. It therefore sees fighting climate change as one of the most important targets although Europe contributes less than 10% to the world population and CO₂ emission.

There is considerable dissent about the impact of growing CO₂ levels on temperature increase and their implications on living conditions. While the IPCC and the EU are predicting strong and negative effects John Christy (Christy, 2017) has shown that all of the climate models fail the test to match the real-world observations by a significant margin. Moreover, clouds are also scientifically not fully understood and therefore a big question mark in global climate models (Wild, 2020).

With a relative low cost experimental setup we measured the IR back radiation from varying CO₂ levels within a given N₂ atmosphere. The results confirm previous findings about infrared CO₂ saturation within the earth's atmosphere. Measurements were also performed studying the potential thermal forcing of additional CO₂ against clear night skies. These results will be discussed in more detail somewhere else and their interpretation should be seen as another contribution to the general discussion about correct climate measures to be taken.

* Corresponding author: steiner@str2030.at

Human activities have a profound and often negative impact on the environment. The concept of planetary boundaries (Steffen, 2015) provides a general framework for the different aspects of environmental degradation, with biodiversity loss and the change of nitrogen cycles among the areas of greatest concern. Human activities influence the climate in a multitude of ways. Soil sealing causes the urban heat island effect, increasing temperatures significantly compared to surrounding, non-urban areas (Phelan, 2015). Changes in the chemical composition of the atmosphere by emitting CO₂ and aerosols have an impact (Portner et al., 2022) as well as aircraft-induced clouds (Kärcher, 2018).

2. Methods

The main objectives of this paper are: On the one hand, to present reasonable doubts regarding the safety and reliability of the scientific basis as justification of the EU climate legislation and on the other hand, to show what massive impact this legislation would have on EU citizens and the EU economy.

Review of relevant EU Legislation and analysis of justification. We analyzed specific EU legislation relevant to the topic of this paper. Specifically, this analysis refers to REGULATION (EU) 2021/1119; REGULATION (EU) 2018/842, and Directive 2003/87/EC.

Own measurements and experiments

Due to the lack of specific measurements and experiments on the topic we made measurements ourselves. We describe our measurement setup in 3.1. First results for laboratory and field measurements are in 3.2 and 3.3. We will investigate two additional aspects here: Is there a saturation of back radiation due to increased greenhouse gas concentrations? Has this saturation limit already been reached at the current CO₂ levels in the atmosphere?

Economic impact assessment by expert survey

Political and economic impacts for three different stakeholder groups were determined through expert interviews. Six experts have been interviewed, face to face and independent of each other. They are from several scientific fields. The arithmetic mean was calculated from these ratings.

The three different stakeholder groups are:

- EU citizens & Mittelstand
- EU member states & EU
- international corporations

Each of these six interviewed experts are out of different scientific fields: Ecology, physics, energy, entrepreneur, environmental engineer, data management,

Ratings:

Green = positive for this stakeholder

Red = negative for this stakeholder

Black = neutral for this stakeholder

1 = Minimum impact, 9 = maximum impact

3. Results

Two different experimental setups

The focus was in measuring whether greenhouse gases (GHG) have indeed the potential to increase the temperature through thermal back-radiation as a function of their concentration. Two questions arise here. Is there actually a saturation limit on back-radiation due to increased GHG concentrations? Has this saturation limit already been reached at current CO₂ levels in the atmosphere?

Figure 1 explains the setups for Lab and Outdoor Modes. In Fig. 1a (“Lab Mode”) a cooling compression device is placed below the so-called cooling plate. The measurement cylinder with a thin Polyethylene (PE) foil is hermetically sealed and thermally insulated by appropriate seals. On the opposite site the Calcium chloride (KCl) Window glass faces the laboratory ceiling. The IR detector is mounted in the center of the window and thermally stabilized. According to the Second Law of Thermodynamics, the warmer surroundings of the laboratory radiates towards the colder cooling plate and warms the variable GH gas concentrations. The back-radiation is then measured with the IR sensor from Thorlabs[®]. In Fig. 1b the test cylinder is rotated by 180°, the cooling compressor is removed and replaced by the clear night sky.

The measurement cylinder is first filled with pure N₂. After thermal equilibrium is reached, CO₂ is added in 50ml steps. The CO₂ concentration is measured with a fast and sensitive gas sensor. The IR sensor reacts instantaneously to changes in the gas composition (see 3.2. and 3.3.), as it reacts to the reflected power.

In the field test arrangement, the IR sensor takes the place of an astronomy-type terrestrial observer of space, "looking" through the troposphere into space. By gradually feeding additional CO₂ into the measuring cylinder, it can be observed whether there is a measurable change (increase) in the reflected power. This experiment can also be done using other GH gases.

Figure 1. Experimental setup for (a) “Lab Mode” using a cooling compressor and (b) “Outdoor Mode”
Source: own drawings

First results laboratory measurements

After some small improvements to the measurement setup, we obtained reproducible results for various CO₂ concentrations when measuring in the Lab-Mode. Fig.2 shows the averaged data for each 50ml CO₂ adding for two different runs.

Figure 2. Lab-Mode back-radiation after adding CO₂ in 50 ml steps into pure N₂ atmosphere
Source: own processing (2023)

Further details and theoretical background to these results will be published elsewhere. It should be sufficient for the reader to see that even in a 75 liters cylinder of 1 m length, saturation behavior can be observed with respect to longwave infrared absorption due to CO₂ GHG additions. It is easy to understand that for longer air columns (>> 1m) the saturation is already achieved at low CO₂ content. Such technical details will be discussed in the forthcoming paper.

First results of field measurements

To have direct evidence that the addition of CO₂ to the current levels of 420 ppm does not cause any measurable additional back radiation, we used the outdoor mode in Fig. 3. The initial results show that the addition of CO₂ does indeed not cause any measurable additional back radiation. Since the detector is set to measure only such changes, the measurement confirms the hypothesis of complete saturation of the CO₂ bands.

This part of the experiment is set up to use only a realistic environment, i.e. measurements in the real atmosphere. The effects of an increased CO₂ concentration in the measurement apparatus simulate an increased total CO₂ concentration in the whole atmosphere. This also accounted for any factors, such as aerosols, that would prevent IR radiation from passing through. The use of pure N₂ as a test substance only in the 1 m of the measurement apparatus is justifiable, since the back radiation power sensor looks into the entire real atmosphere, except in the first meter.

Figure 3. Outdoor-Mode back-radiation after adding first CO₂ in 50 ml steps into pure N₂ atmosphere. Source: own processing (2023)

Finally, Freon ($C_2H_2F_4$) was added, resulting in an immediate increase in backscattered IR radiation. This proves qualitatively and quantitatively that CO_2 -contents can increase by a factor of 2 without having catastrophic effects on the global climate. This cannot be said for other GH gases in atmosphere with currently low concentrations. However, since almost 90% of the IR spectrum in the relevant wavelength (13-16 μm) is already covered by the actual existing gases in the atmosphere (mainly water vapor, CO_2 , O_3 and others) there is not much room left for any absorption by additional IR-active gases.

Figure 4. Measurements of the infrared emission spectrum of the cloud-free atmosphere at the surface looking upward. Data courtesy of David Tobin, Space Science and Engineering Center, University of Wisconsin-Madison
Source: Petty, 2006, p. 223

Our measurements correspond well to Fig. 4, which does not support significant Atmospheric Thermal Enhancement (ATE) increase by additional atmospheric CO_2 .

Possible economic impact assessment

Political and economic impact assessment for 3 different stakeholder groups which are:

- EU citizens & Mittelstand
- EU member states & EU
- international corporations

are presented in Table 1. The following is a summary of the assessments from 6 expert interviews. "Mittelstand" is a very important society group in German-speaking Europe (A, D, CH). The word "Mittelstand" has no equivalent in English or Slovak. Briefly, "Mittelstand" are SME owners, their family members and sympathizers.

Table 1. Political and economic impact assessment

		EU Citizen, "Mittelstand"	EU States, EU	International corporations
1	More conscious use of energy and resources	4 4	3 4	1,5 1
2	Strengthening of regional structures and regional added value	8	5,6	4
3	Jobs in the region	6 4	5 5 4	4 4
4	Green deal, Keynesian approach - artificial increase of demand (like 1930 new deal USA)	3	7	6 7
5	CO ₂ taxation = increase government revenue to stabilize budget	9	9	2,3
6	Investment uncertainty and creeping devaluation of equipment, real estate, etc.	8,75	5 4,5	5 5 2
7	Price uncertainty - supply	8,75	5 4,5	5 5 3
8	Reduction of individual mobility	7,5	4 8 5	7 2
9	Planned economy and command economy	8	6 5	8
10	Constant increase of prices of all goods, because of rising energy costs	7,6	5 5,3	4,3 9
11	"Mittelstand" will downsize at the expense of corporations	9	5	8,5
12	Gradual collapse of the (export) economy	9	8	6
13	Migration of all (energy-intensive) value-adding businesses to non-EU countries.	8	7,3	5 9 5
14	Thus complete dependence on the world market, foreign trade deficit	8	7,75	7 4,5
15	Rise of the shadow economy, bungling, crime (fuel theft, firewood theft)	8,3	6	4,6
16	Competent and capable people emigrate (brain drain etc.)	6,6	7,6	5 3

Source: own processing (2023)

Table 1 shows the summary ratings of the expert interviews. For some questions, there are strong divergent assessments by the experts - such as "jobs in the region" or "investment uncertainty". In fact, these topics are very difficult to predict.

In the overall picture, the experts are unanimous in postulating massive effects on EU citizens, EU economy and SMEs in particular.

4. Discussion

In addition, it is worth noting that EU publishes the results of EU-wide surveys at approximately annual intervals to try to show how the majority of the EU population assesses the importance of climate change, the need for action, and the benefits of action (European Commission, 2023a).

EU Press release July 2023: "A huge majority of Europeans believe climate change is a serious problem facing the world (93%), according to a new Eurobarometer survey published today" (European Commission, 2023b).

Looking at the latest survey in detail (European Commission, 2023c) only 17% - instead of 93% of all Europeans - according press release - are considering climate change to be the single most serious problem (page 10), and the trend is downward (18% April 2021). Thus, this somewhat deeper look at the latest Eurobarometer surveys shows the difference between public and published opinion.

Overview of European Climate legislation

EU climate regulations comprise a multitude of directives and regulations. Their overarching goal is reach net zero CO₂ emissions by 2050.

The so called „European climate law“ (REGULATION (EU) 2021/1119) came into force in 2021. This Regulation sets out a binding objective of climate neutrality in the Union by 2050. Union-wide

greenhouse gas emissions and removals regulated in Union law shall be balanced within the Union at the latest by 2050, thus reducing emissions to net zero by that date, see Fig5.

Figure 5. GH gas emission trends, projection and targets EU
Source: (European Parliament, 2018b)

Net zero means that annual carbon dioxide emissions must not exceed annual carbon dioxide sequestration (= uptake and storage of carbon) by carbon sinks. The most important carbon sinks are the growing forests in Europe. New technologies - such as carbon capture and storage (CCS) - may be able to bind CO₂ permanently. However, this technology has not yet been developed to market readiness (see Fig.6). The CCS process is also very energy intensive and thus expected to be very expensive.

Figure 6. IEA CCU CO₂ capture projects, current and planned vs. the net zero scenario 2020-2030
Source: (International Energy Agency, 2020)

Although the „European climate law“ will allow for carbon dioxide emissions in the future, reaching net zero requires dramatic and rapid emission reductions.

Article 3 of the „European climate law“ describes the tasks of the European Scientific Advisory Board on Climate Change. The board has to consider the latest scientific findings of the IPCC reports and identify actions and opportunities needed to achieve the Union climate targets.

The „European Climate Law“ calls climate change an „existential threat“ and states that „it is necessary to address the growing climate-related risks to health, including more frequent and intense heat waves, wildfires and floods, food and water safety and security threats, and the emergence and spread of infectious diseases.“ (European Parliament, 2021)

Article 1 of the REGULATION (2023/857) “on binding annual greenhouse gas emission reductions by Member States from 2021 to 2030” (European Parliament, 2023) „lays down obligations on Member States with respect to their minimum contributions for the period from 2021 to 2030 to fulfilling the Union’s target of reducing its greenhouse gas emissions by 30 % below 2005 levels in 2030“. Mandatory reduction targets differ between member states. Bulgaria has a reduction target of 10%, Slovakia has a target of 22,7% less emissions in 2030 compared to 2005, while Sweden and Germany have to reduce their emissions by 50%.

Directive 2003/87/EC3 (European Parliament, 2003) established a scheme for greenhouse gas emission allowance trading within the Community.

Member states are allowed to emit a certain amount of CO₂ per year. If they exceed this amount, they must purchase allowances. As member states are allowed to emit less and less CO₂ per year and the costs for allowances will increase, it is very likely that the emission of CO₂ will become extremely expensive in the near future.

Justifications of EU for Climate legislation and our criticism

The European Climate law is justified by an alleged existential threat and a growing number of deadly natural disasters including extreme weather events and infectious diseases.

Extreme weather events have been recorded for a long time. An overview of the state of studies on extreme weather events in the U.S. is provided by the Climate Science Special Report (CSSR) as part of the Fourth National Climate Assessment (NCA4) (Wehner et al., 2017). Droughts and hurricanes have not become more frequent in the United States (Heim, 2017) (Klotzbach et al., 2018). A recent analysis of the Emergency Events Database (EM-DAT) suggests a linear upward trend to around mid-century of the 20th century, followed by rapid increase to the turn of the new century and then a declining trend through 2022 (Alimonti et al., 2023). Although the increase in heat days over the last hundred years is well documented for Europe, there is no clear evidence of an increase in extreme weather events in Europe. The same is true for floods in Europe (Blöschl et al., 2019). Forest fires in the Mediterranean region have decreased slightly since 1980 (European Environmental Agency, 2021).

On the contrary, the number of deaths from extreme weather events has declined dramatically over the last 50 years (World Meteorological Organization, 2021). Globally, the death rate from infectious diseases has decreased by more than 50% since 1990 (Institute for Health Metrics and Evaluation, 2022).

Taken together, these undisputed facts point at improved living conditions around the world, including in Europe. In light of these findings, the rationale put forward by the EU seems highly questionable.

The rising economic costs of natural disasters are well documented (Centre for Research on the Epidemiology of Disasters, 2023), but can be attributed to the fact that both human population and world economy have grown substantially since 1900. More and more property is being hit by disasters. Florida, a state particularly vulnerable to hurricanes, has nearly doubled its population since 1990 (WorldPopulationReview, 2023). In its latest Assessment Report (Portner et al., 2022), the IPCC notes that “many poor communities, especially in regions with high levels of vulnerability and inequality, are less resilient to diverse climate impacts”. Resilience to natural disasters is provided by improved infrastructure such as flood protection facilities, early warning systems, or emergency vehicles. Effective protection of forests and mangroves will also increase resilience against extreme weather events. None of the above mentioned measures has anything to do with the CO₂ content of the atmosphere. On the contrary, the IPCC does not explain how a transition from reliable fossil energy to less reliable renewable energy contributes to building more resilient infrastructure in the poorest countries.

Other factors to be considered

The U.S. Environmental Protection Agency provides a list of the natural and human-caused factors that influence climate trends, with particular emphasis on the correlation between the increase in atmospheric CO₂ and the rise in global average temperature in recent decades (U.S. Environmental Protection Agency, 2023). In a report for the Congressional Research Service, Jane A. Leggett, an expert on energy and environmental policy, uses selected citations from the history of climate science research to illustrate the evolution of scientific understanding and confidence regarding the drivers of recent global climate change (Leggett, 2018). The citations she selected emphasize the central role of man-made CO₂ as the primary cause of global warming. Current climate policy focuses monocausally on anthropogenic atmospheric carbon dioxide concentrations, but climate science has yet to conclusively resolve many questions about the drivers and interrelationships of climate. Climate science usually underestimates the importance of astrophysical, geophysical and singular factors, e.g. solar and cosmic radiation variations (Svensmark et al., 2021), geomagnetic disturbances, radioactive decays and radiochemical effects and energetic geological events. Only recently has it been found that underwater volcanic eruptions (Jenkins et al., 2023) can change seawater temperatures by an order of magnitude. Another fact that has not been as well studied was the change in radioactivity of the seafloor due to underwater nuclear bombing tests in the years between 1950 – 1970. The activation of rare earth materials (Stosch, 2016) (Stettler et al., 1979) on the seafloor is a source of energy and warms the water. On the other hand, no reasonable explanation has been found for the decline in temperatures over an extended period after 2000. In a sound and strong climate model that clearly demonstrates the detrimental influence of anthropogenic carbon dioxide, it should not be possible to have periods of falling or stagnating global average temperatures while carbon dioxide levels are steadily increasing. But we must insist that such deviations from predictions be plausibly analyzed and that there be a serious and honest discussion about the limitations of predictions and the risks of wrong IPCC conclusions. Not only is the path to addressing negative environmental impacts at stake, but we also face the risk of taking wrong and irreversible actions that could in fact lead to a catastrophic outcome for citizens and the economy as opposed to the expected benefits.

Is climate science really settled?

There is reason to doubt it. Science does not understand all the mechanisms behind the actual climate. Most predictions are based on complicated, bloated computer models that are not tested for robustness. Systematic errors and assumptions to achieve favorable outcomes need to be exposed. Currently a discussion about the climate narrative in the EU is hardly possible, neither on a political nor scientific level. This circumstance is evocative of the well-known human psychological vulnerabilities in connection with "group think" (Janis, 1972) and the associated problem of fatal wrong decisions.

Science must be open and controversial to guarantee successful insight. Only scientific discourse - ideally supported by real measurements and experiments - leads to real solutions and clarifications. In the past, scientific and political misconceptions have been challenged by experimental verification and direct observations, such as the heliocentric world view (16th century) or Albert Einstein's proof of general relativity on May 29, 1919, on the occasion of a solar eclipse and the accompanying measurements. Measurements and experimental confirmations/falsifications create an important gain in knowledge. To initiate and contribute to an objective scientific discussion, we have developed a simple experimental setting that we propose for further, more rigorous studies.

Conclusion

The described regulations of the "European climate law" will have a massive impact on European citizens and our economy. The European climate law is being justified by an alleged existential threat from a growing number of catastrophic natural disasters, including extreme weather events and infectious diseases.

This paper questions many of the arguments and facts used to support such rigid legislation measures. Such controversial issues cannot be considered as scientifically settled. Political decisions made on an unsettled basis bear the risk of social disaster due to wrong predictions from hypothetical computer models.

Very alarming is also the fact that EU internal discussions and decisions are passed on to the outside (*the latest scientific findings of the IPCC reports come into play*).

Cited studies of renowned experts and first results of our own experimental laboratory and field measurements raise reasonable doubts about the EU & IPCC climate narrative. The authors are also very

concerned that there is no open political and technical discussion on the topic of global warming and its causes postulated by the IPCC and the EU. This paper is intended to help renew a factual discussion.

Abstract

Research background: As part of global efforts to achieve sustainable development, the 2030 Agenda and its Sustainable Development Goals (SDGs) have been adopted as a comprehensive framework for addressing key global challenges, including poverty, inequality, climate change and environmental protection. Effective monitoring and evaluation of progress on these goals requires reliable and measurable indicators that can provide concrete information on progress in different areas

Purpose of the article: The aim of this paper is to identify and analyse key indicators for measuring progress towards the 2030 Agenda SDGs. This study focuses on the selection of indicators that are able to provide objective and measurable information on progress towards each goal, while reflecting the broader socio-economic and environmental contexts.

Methods: The study uses a combination of quantitative and qualitative methods to select and evaluate indicators. The quantitative analysis involves a statistical assessment of data availability and consistency, while the qualitative analysis focuses on assessing the relevance and accuracy of indicators in relation to the SDGs. Data were collected from a variety of publicly available sources, including international databases such as those of the United Nations and the World Bank.

Findings & Value added: The results of the study show the importance of the selected indicators as an effective tool for monitoring and evaluating progress towards the SDGs. Key challenges were identified, including inconsistent and incomplete data, and the importance of technological innovation for more accurate data collection. The study also highlights the need for a comprehensive approach to interpreting indicators that includes an understanding of the broader socio-economic and environmental contexts. The results provide valuable information for policy makers, research institutions and other stakeholders, and support global efforts to achieve a more sustainable and equitable world for all.

Keywords: sustainable development management, sustainable development indicators, multi-criteria analysis

JEL classification: Q01, Q58

1. Introduction

The importance of the 2030 Agenda goals for sustainable development is highlighted by many authors (Allosio, Zucca, Carrara, 2022; Anderson et al, 2021 Campagnolo et al 2018). Field many need to intensify integrated and coordinated efforts to achieve the SDGs, Policies should be implemented to promote sustainable socio-economic development, address environmental pollution, promote financial development and increase the use of renewable energy. These policies should take into account the interrelationships between these variables and should aim for inclusive and sustainable economic growth (Allosio, Zucca, & Carrara, 2022). Anderson et al (2021) point to the importance of understanding the interactions and impact between the Sustainable Development Goals (SDGs) and their targets in order to promote supportive interactions and overcome barriers in the long run.

* Corresponding author: emilia.huttmanova@unipo.sk

An assessment of the interlinkages between economic growth, pollution, financial development and renewable energy consumption in the context of Sustainable Development Goals (SDGs) 8, 13, 10 and 7 is discussed by Zheng et al (2022). The econometric analysis conducted in the study shows that these variables interact in the long run, indicating the interlinkages between the four SDGs. Findings from causality and variance decomposition analyses confirm the existence of robust causal relationships among the variables. Alternative causality estimators were used to test the robustness of the causality-related findings. Based on these critically important causal relationships, the authors recommend a set of interactive policies related to the SDGs.

The analysis of the interactions between the 2030 Agenda's Sustainable Development Goals (SDGs) and their relevance for SDG assessment is also addressed by Tremblay et al (2020). The authors analysed the Sustainable Development Goals (SDGs) and their targets based on the five pillars of the 2030 Agenda: people, planet, prosperity, peace and partnership. They classify the SDGs and targets according to the quantification system used to classify the SDGs and examine the interactions between the SDGs and targets. They find that similar classifications lead to more positive interactions and that there are synergies between the goals of different classifications.

The relevance of the 2030 Agenda goals for assessing sustainable development through the SDG index and dashboards is discussed by Sachs et al (2021). They examined country performance on the SDGs in 193 countries using a wide range of indicators. They identify six key transformations needed to implement the SDGs.

1.1 Models in sustainable development assessment

Due to the complexity of sustainable development, much research has focused on developing models that can comprehensively address this challenging issue.

The CapSEM model provides a set of methods and tools for companies and organisations to track, measure and improve sustainability performance. By grouping these tools by level, it is easier for companies to consider their use and determine which tools are useful to address the environmental, economic and social impacts associated with their operations and processes. Fet, Knudson, and Keitsch (2023) suggest placing the Sustainable Development Goals (SDGs) along the four levels of the CapSEM model to serve as a starting point for engaging organizations on the goals and their objectives. This approach helps to conceptualize the linkages between SDGs and sustainability dimensions. The combination of the CapSEM model and the SDGs provides a systematized approach to engaging with the goals and helps to simplify complex goals for companies burdened with sustainability requirements. It serves as an essential baseline for engagement and sustainability improvement.

The SDG systems model developed by Anderson et al (2021) focuses on the development of a dynamic SDG model that accounts for interactions between SDGs and their targets over time. The results of the model can support decisions on prioritizing actions for SDGs.

Mabhaudhi et al (2021) used the nexus planning model to monitor and evaluate progress towards the SDGs. The link between SDGs and nexus planning facilitated sustainable resource management in an integrated manner, addressing cross-sectoral synergies, value addition and trade-offs across interconnected sectors. The linkages established between nexus planning and the SDGs strengthened cross-sectoral collaboration and revealed measures for cooperative management and governance through evidence-based interventions.

Optimization techniques used in modelling and analysis of economic indicators to achieve the UN Sustainable Development Goals are discussed by Modibbo et al (2021). The authors extensively discuss optimization techniques used in the modeling and analysis of vital economic indicators, with goal programming (GP) and its variants being the most commonly used techniques. Other multi-criteria optimization techniques used include the analytic hierarchy process, Fuzzy-AHP, entropy method, ranking of preferences by similarity to ideal solution (TOPSIS) technique, Fuzzy-TOPSIS, VIKOR method, combined trade-off method, and data envelopment analysis.

Stanujkic et al (2020) propose a model for assessing progress towards the 2030 Agenda Sustainable Development Goals. The authors propose the use of the combined trade-off solution (CoCoSO) and Shannon entropy methods for this assessment. They consider the obtained results to be fully objective and rational and the applied model is considered applicable for this type of analysis. The model allows for the ordering of countries depending on the success of countries in meeting the SDGs.

Campagnolo et al (2018) developed a composite multidimensional index to assess sustainability worldwide. It was used to create a global ranking of current sustainability performance for 139 countries.

Indicators focused on the UN Sustainable Development Goals were selected for the index. The indicators were organised into three pillars: economy, society and environment. A total of 26 indicators were normalized to a common metric and aggregated into the index.

The overview presented here is by no means a comprehensive overview. It monitors some of the relevant scientific work that has recently addressed the issue of assessing sustainable development through indigenous algorithms to objectify the state and developments in sustainable development, specifically taking into account the goals defined by the 2030 Agenda.

2. Methods

Our analysis focused on the selection and validation of indicators used to measure progress towards the 2030 Agenda goals. These indicators were selected for their ability to provide objective and measurable information on progress against each SDG. This process was inspired by methodological approaches used in similar studies, including the application of modern portfolio theory and systems modelling to the SDGs.

A combination of quantitative and qualitative methods was used to select indicators. The quantitative analysis involved a statistical assessment of data availability and consistency, while the qualitative analysis focused on assessing the relevance and accuracy of the indicators in relation to the SDGs.

The quantitative analysis was based on an assessment of data availability at country level for each indicator that is defined, described and targeted by Agenda 2030. The data availability of the relevant indicators was assessed, in particular in terms of their transparency, comparability over time and completeness.

Thus, the main criteria for selecting indicators in the quantitative analysis were their relevance to the specific SDG objectives, measurability, data reliability, and the possibility of comparison across different geographic and socio-economic contexts. Emphasis was placed on selecting indicators that are able to provide a clear and objective view of progress towards the 2030 Agenda goals.

Data for the indicators were collected from various publicly available sources, including international databases such as those of the United Nations, the World Bank, and other relevant organizations. Particular attention was paid to the timeliness, reliability and comparability of these data.

The qualitative analysis was based on an assessment of indicator relevance: each indicator was assessed in terms of its relevance to the specific SDG targets. Consideration was given to how well the indicator reflects the key aspects of the goal and its relevance to sustainable development. Contextual Analysis was then conducted: for each indicator, a contextual analysis was conducted, which included an assessment of the social, economic and environmental factors that may influence the indicator values. This analysis helped to understand how different conditions and policies affect progress towards the SDGs. Finally, SDG experts and stakeholders were consulted to further understand and validate the selection of indicators. These interviews provided further insights into the meaning and interpretation of the indicators.

Although the indicators were carefully selected and analysed, several challenges and limitations were identified. These include incomplete data for some regions or groups, potential data bias, and difficulty in interpreting complex indicators. These factors were taken into account in the assessment and interpretation of the results.

3. Results

As we also state in the literature review, there has been a long-standing demand in the academic, but not only in the academic field, to move towards objectivisation of the measurement of results achieved in the pursuit of goals to ensure sustainable development at the micro-, meso- and macro-levels.

Sustainable development is such a complex issue that it needs to be approached in an interdisciplinary manner and hence the evaluation of this robust system itself is challenging.

As noted above, our research at this stage has not focused on creating a model for assessing the status and changes in the state of sustainable development at the country level, but on selecting appropriate indicators that could describe changes and levels of the phenomenon for both spatial and temporal comparisons.

The assessment model should on the one hand be comprehensive, i.e. covering all key aspects of sustainable development, and on the other hand relatively simple and open to modification. In this case, comprehensiveness should be ensured by representing all or as many as possible of the 2030 Agenda's SDGs. The simplicity of the model should be ensured by identifying one representative for each goal, i.e.

an indicator that contributes as comprehensively as possible to the substance of each individual 2030 Agenda goal.

Based on the previous theoretical background, an analysis was carried out to assess the extent to which it is possible to objectively verify the success in achieving the 2030 Agenda goals using selected indicators from publicly available sources. This section presents our own findings.

Indicator selection and validity: key indicators were identified that measure progress towards the SDGs. These indicators include, but are not limited to, indicators in areas such as poverty, health, education, gender equality, clean water, clean energy and economic growth. In evaluating these indicators, it was found that while they provide useful insights, they can be limited due to incomplete or outdated data.

The final selection of 14 indicators from the 17 goals of the 2030 Agenda was based on the desire to provide a representative overview of key areas of sustainable development, focusing on those indicators and goals that are most frequently discussed and have wide data availability. This approach was chosen given that some goals may be more integrated or overlap with other goals and therefore their separate analysis may be less telling than for other goals.

For example:

Goal 17: "Partnership for the Goals", despite its importance, is more about mechanisms and collaborative strategies than about concrete, measurable results. This goal supports the implementation of the other goals, but does not have as many specific, separately measurable indicators.

Goal 16: "Peace, justice and strong institutions" is also extremely important, but its indicators are often more complex to measure and may require complex qualitative analysis.

Our selection therefore focused on those goals that are most measurable and provide clear quantitative indicators of progress. This can ensure that the analysis is specific and based on hard data. However, it is important to note that all the goals of the 2030 Agenda are interlinked and together form a comprehensive framework for sustainable development.

Also excluded were goals where it is objectively problematic at the country level to identify the status or change. In this case, it was SDG 14: Life below water, which is dominated by coastal countries in the indicators.

For landlocked countries, the selection of relevant indicators for SDG 14 ('Life below water') is somewhat specific, as these countries do not directly face the problems of oceans and seas. However, some indicators of SDG 14 can be adapted or interpreted to be relevant for inland waters such as rivers, lakes and freshwater ecosystems.

One such indicator may be 14.2.1: Percentage of national water area covered by effective systems for the protection of marine and coastal ecosystems. While this indicator is primarily focused on marine and coastal ecosystems, the principle of conservation and sustainable management of water resources is equally applicable to freshwater ecosystems of inland countries. Measuring and protecting biodiversity, water quality and ecosystem services in these areas are also key to achieving the SDGs.

Another option is to focus on 14.7.1: Sustainable fisheries, which is also relevant to inland waters, as river and lake fisheries can have a significant impact on the economy and food security of inland countries. This indicator can help monitor how fish resources are managed and protected in inland waters.

These examples show how global goals such as SDG 14 can be adapted and interpreted to be relevant to the specific contexts of landlocked countries.

The above mentioned uses of the defined indicators are suggestions on how the existing set of indicators could be used to measure sustainability also in those conditions or countries that objectively cannot contribute directly to the achievement of the selected SDGs in general (of course, they are indirectly measurable: e.g. through consumption, etc.). In the absence of an extension or modification of indicators at the supranational level in the given goal for this area, we abstract from the identification of a single representative that could be used for the assessment of the status and evolution of the achievement of the SDGs among arbitrary countries.

For a detailed analysis of progress towards the 2030 Agenda goals, the following specific indicators have been selected to reflect different aspects of sustainable development:

Table 1. Overview of indicators as representatives of the SDGs

Goals	Indicators	Reason for selection
SDG 1: No Poverty	1.2.1 Share below the national poverty line	This indicator directly reflects the economic aspect of sustainable development and is key to assessing success in the fight against poverty.
SDG 2: Zero Hunger	2.1.1 Prevalence of undernourishment	Hunger and food security are fundamental pillars of sustainable development and this indicator helps to monitor progress in this area
SDG 3: Good health and well-being	3.2.1 Under-5 mortality rate	This indicator is key to measuring improvements in health and wellbeing, which are central components of the SDGs
SDG 4: Quality education	4.1.2 Ensuring children complete their education	Education is essential for sustainable development and this indicator provides an overview of access to and quality of education
SDG 5: Gender equality	5.5.1 Women in political positions	This indicator reflects progress on gender equality, a fundamental aspect of social justice and sustainable development
SDG 6: Clean water and sanitation	6.1.1 Safe drinking water	Water and sanitation are basic human needs, and this indicator helps monitor achievements in this area
SDG 7: Affordable and clean energy	7.2.1 Renewable energy	Transition to sustainable energy sources is key to environmental sustainability
SDG 8: Decent work and economic growth	8.5.2 Unemployment rate	This indicator reflects economic stability and is key to assessing economic development and the quality of job opportunities
SDG 9: Industry, Innovation and Infrastructure	9.5.1 Research and Development (R&D) spending	Investment in research and innovation is essential for technological progress and sustainable development.
SDG 10: Reduced inequalities	10.1.1 Income growth inequalities	This indicator measures the rate at which the incomes of the poorest 40% of the population are improving, which is key to assessing efforts to reduce income and economic inequalities..
SDG 11: Sustainable cities and communities	11.2.1 Public transport access	This indicator reflects the quality of life in cities and the availability of infrastructure
SDG 12: Responsible consumption and production	12.5.1 Recycling rates	Recycling is key to reducing the environmental impact of consumption and production
SDG 13: Climate action	13.2.2 Total greenhouse gas emissions per year	This indicator is essential for measuring progress on climate change
SDG 14: Life below water	N/A	see comment before the table
SDG 15: Life on land	15.1.1 Forest cover	The choice of this indicator allows us to measure and evaluate progress in the protection and restoration of forest ecosystems, which is essential for sustainable development and biodiversity conservation on the planet.
SDG 16: Peace, justice and strong institutions	N/A	see comment before the table
SDG 17: Partnerships for the goals	N/A	see comment before the table

Source: authors research (2023)

These indicators were selected based on their ability to provide a comprehensive and multidimensional view of progress towards the 2030 Agenda goals. The selection was made with regard to data availability and quality, ensuring objective and reliable analysis.

4. Discussion

Our analysis focused on the selection and evaluation of indicators to measure progress towards the 2030 Agenda's Sustainable Development Goals (SDGs). Indicators were selected based on their ability to provide objective and measurable information on progress and a combination of quantitative and qualitative methods were used to assess them. This discussion focuses on the key aspects, challenges and implications identified in our research.

- **Relevance and measurability of indicators:** the selected indicators effectively reflect key aspects of each SDG and provide a measurable basis for assessing progress. For example, the indicator "Share of forest area in total land area" for SDG 15 effectively indicates the status and health of terrestrial ecosystems. This measurability is essential for providing concrete and actionable information for decision-making and policy.
- **Complexity and challenges in interpretation:** while indicators provide a useful tool for assessment, they also present challenges in interpretation. For example, the indicator "Income growth of the bottom 40% of the population" for SDG 10 can be affected by a variety of economic and political factors. It is therefore important to consider the broader context when interpreting the data.
- **Comparability and consistency of data:** one of the key findings was the variability in data availability and quality between different countries and regions. This inconsistency can make it difficult to make accurate global comparisons and assess overall progress towards the SDGs. For example, data on "Under-five mortality" for SDG 3 may be incomplete or outdated in some regions.
- **The importance of technology and innovation:** research has highlighted the importance of technological innovations such as IoT and machine learning in data collection and analysis. These technologies can make a significant contribution to more accurate and timely data collection, which is key to assessing progress.
- **Socio-economic and environmental factors:** The analysis showed that socio-economic and environmental factors play a crucial role in achieving the SDGs. For example, the indicator "Share of renewable energy in total energy consumption" for SDG 7 reflects not only technological progress but also political and economic decision-making.
- **Implications for policy and decision-making:** The results of the analysis have important implications for the formulation of policies and strategies. Effective use of the indicators can help governments and organisations better target their resources and initiatives to achieve the SDGs.
- **Need for further research and data:** Our analysis also highlighted the need for further research and better data collection, particularly in areas with incomplete or inconsistent information.

Overall, the selected indicators provide a valuable basis for assessing progress on the SDGs. Their effective use and interpretation requires a comprehensive approach that includes not only quantitative analysis but also qualitative assessment and contextual understanding.

"It's all about information" - a phrase we are often confronted with has a special meaning in this case. The quest for the most objective assessment of status or change, the assessment of success in a comprehensive assessment of the level of sustainable development, is based on relevant data.

Theory and practice know many metrics, methodologies, tools, models for assessing sustainable development. We are also trying to make our small contribution to the issue. However, it will be very difficult to take an objective position on such a complex issue without sufficient relevant and comparable data. Nevertheless, this should not discourage researchers from studying this socially (but not only socially) desirable issue more and more comprehensively, as the research results can be an important decision-making tool for modifying national and transnational policies in this field.

Conclusion

Focusing on the selection and analysis of indicators to measure progress on the 2030 Agenda's Sustainable Development Goals (SDGs), our study revealed key aspects and challenges associated with assessing global sustainable development. The selected indicators provide a measurable and objective

basis for tracking progress on goals such as reducing poverty, improving health and education, protecting biodiversity, and promoting a sustainable economy and environment.

The research has highlighted the importance of a comprehensive approach to assessing sustainable development that includes both quantitative and qualitative analysis and takes into account the broader social, economic and environmental contexts. The findings highlighted the need for better data collection and consistency, as well as the importance of technological innovation for more accurate data collection and analysis.

The study also highlighted the importance of indicators to inform decision-making and policy formulation. Effective use of these indicators can help governments, organisations and other stakeholders better target their resources and initiatives to achieve the SDGs.

Ultimately, our findings contribute to a better understanding of the challenges and opportunities associated with measuring and achieving sustainable development. In doing so, they support the global effort to achieve a more sustainable and equitable world for all.

Abstract

Research background: Slovakia is currently considered a country with sufficient high-quality water resources. However, it faces extensive pollution of these vital assets, coupled with inadequate water management practices, which is becoming a severe problem in relation to their sustainability. The adverse repercussions of water resource pollution resonate directly through the diminished quality of life for the populace and the deterioration of broader environmental components. Thus, the imperative to address this issue is undeniably urgent.

Purpose of the article: The paper is oriented to evaluating the possibilities of using the floating trash barriers as a product of the circular economy in curbing water resource pollution.

Methods: The study encompasses experimental investigations into utilisation of the floating trash barriers, exploring its role as a sustainable solution for water management.

Findings & Value added: The floating trash barrier itself is a product of the circular economy, as it uses waste (waste material) in its production, and at the same time its function is environmentally beneficial for society. This research adds value by demonstrating its multifaceted contributions to society and the environment.

Keywords: circular economy, sustainability, floating trash barrier, water resources, pollution

JEL classification: Q5

1. Introduction

Preserving the quality of water resources has become an increasingly urgent concern. Historically, Slovakia has been renowned for its abundant and pristine water resources. However, due to the impact of human activities and climate change, it is imperative that we focus more on sustaining the quality and quantity of our water resources.

Water, which plays a pivotal role in the development of human civilization, is significantly affected by climate change (Kopáček et al., 2021; Stelian & Juhasz, 2022, as cited in Šulyová & Kubina, 2022). These findings emphasize the necessity of enhancing resilience, efficiency, and quality within water resources management, both in urban settings and water management institutions (Šulyová & Kubina, 2022).

According to Marciniuk-Kluska and Kluska (2023), one of the major challenges associated with waste is its contribution to water, soil, and air pollution. The combination of precipitation and septic processes results in leachates containing heavy metals and acids, which negatively alter the composition and pH of surface and groundwater, among other effects.

Water pollution stems from diverse sources and manifests in various forms. For instance, Valentin et al. (2023) discuss the widespread adverse impact of microplastics from waste in aquatic environments, which often lead to devastating consequences such as irreversible changes in aquatic biodiversity and health issues in the population. The presence of microplastics in aquatic environments is steadily on the rise.

One effective method to prevent pollution in aquatic resources is the use of various species of barriers (Slaninka, Kordík, Mikita, 2010). Reactive barriers, in particular, are a passive approach to

* Corresponding author: martin.rovnak@unipo.sk

impeding the spread of contaminated groundwater fronts, especially in sensitive aquatic areas where remediation is challenging or costly (Bica et al., 2008).

Our paper explores innovative approaches to environmental management, exemplified by the use of bore walls to reduce pollution, specifically from municipal solid waste, in the Ružín reservoir.

The Ružín reservoir spans the territorial boundaries of municipalities in the Košice-suburb and Gelnica districts. The quality of its water is influenced by both natural factors and human activities, primarily municipal waste, in the surrounding catchment areas. In the Gelnica district, two major tributaries, the Hornád and the Hnilec rivers, flow into the reservoir. These tributaries pass through areas that were heavily mined and processed for ores in the past, significantly affecting water quality and leading to the accumulation of heavy metals in the reservoir's sediments. In the Košice-suburb district, the Opátka and Belá watercourses feed into the reservoir, with sporadic exposure to anthropogenic activities and geological influences. However, during floods and high-flow periods, the accumulation of municipal waste on the water's surface becomes evident (Office of Public Health, 2019).

The Ružín dam has long grappled with recurrent pollution issues caused by waste flowing in from the Hornád and Hnilec rivers. Preventing their formation is only possible through systematic work in the community and education among citizens (Vrábl'ová, 2009). Rural communities should be examined through a "dual approach" as both contributors and receivers of plastic pollution leakage into the natural environment (Mihai et al., 2021). The influx of waste is particularly pronounced during "big waters" or floods when these swollen rivers carry waste from unauthorized dumps along their banks. Thus far, the approach has been reactive, focusing on waste removal from the dam's surface, with the burden falling on those who contribute very little or not at all to the pollution (such as the municipalities of Margecany and Jaklovce, and the Ružín Waterworks Authority). However, this does not address the root cause, as the waste returns with each subsequent flood. Black dumps continue to form on the stream banks, as revealed by field research (Vrábl'ová, 2009).

A significant portion of the waste on the water surface comprises plastic waste. Although the introduction of a refundable deposit system in 2022, covering PET beverage bottles and aluminum cans, has led to some improvement in waste accumulation, plastic pollution persists during heavy rainfall or persistent rains. Therefore, it is crucial to address the consequences of this pollution, as the reservoir serves as a vital source of water, energy, recreation, fishing, and flood protection. The use of floating trash barriers represents one systematic approach to capture and manage waste effectively.

The circular economy, broadly defined, is a regenerative and sustainable economic model that seeks to minimise waste and the continuous use of resources by closing the loop on product lifecycles. Unlike the traditional linear 'take, make, dispose' approach, which leads to resource depletion and environmental degradation, the circular economy promotes the reuse and redesign of materials, products and processes. It encourages practices such as recycling, reuse and re-use of materials, thereby reducing the demand for new resources and limiting the generation of waste (Shevchenko et al., 2021).

The principles of the circular economy are closely aligned with addressing the pervasive problem of water pollution. By applying circular economy practices to this problem, we can promote a more sustainable and proactive approach to protecting our water resources. This includes developing and deploying technologies that trap pollutants and waste, such as the floating garbage barriers mentioned in this study. Such innovations not only reduce water pollution, but also uphold the ethos of the circular economy by repurposing waste materials for productive use, contributing to a greener and more resource-efficient future.

2. Methods

The primary objective of this paper is to introduce an environmental management approach aimed at safeguarding water resources from pollution. Specifically, this paper focuses on assessing the feasibility of employing borehole walls as a component of the circular economy to reduce water pollution.

To achieve this goal, the paper employs a combination of analytical and synthetic methods, as well as a case study approach centered around the use of floating trash barriers in the context of the Ružín reservoir. Additionally, in order to provide a comprehensive understanding of floating trash barriers, their construction, production, and utilization will be presented through best practices.

Furthermore, the investigation into the viability of implementing floating trash barriers has also been conducted through experimental research.

3. Results

3.1 Floating trash barriers in the process of protecting water resources from pollution

The concept of floating trash barriers has emerged primarily as a response to the pressing societal need to actively and effectively combat watercourse pollution caused by the escalating consumption and production of waste, often exacerbated by inadequate waste management practices among the population. Presently, a variety of floating trash barriers exist, differing primarily in their capacity to capture pollutants and the methods they employ. These variations encompass the materials used, design specifics, and outward appearance, all tailored to the specific application and the type of waste they aim to intercept.

Within the global market, numerous manufacturers offer a diverse array of floating trash barriers in their product portfolios. Nevertheless, the majority of these barriers are designed for capturing petroleum products and chemical pollutants, which constitute liquid waste. A much smaller proportion of these products are specifically designed for capturing solid waste. In freshwater streams and reservoirs, floating trash barriers are primarily engineered to intercept solid debris floating on the water's surface.

Currently, the most prevalent types of floating trash barriers encompass foam-filled barriers, self-inflating and inflatable variants, barriers employed for firefighting, and those dedicated to trapping debris and unwanted elements afloat on the water's surface. However, while they may exhibit slight variations in appearance and technological design depending on the intended application, the overarching objective of all floating trash barriers remains consistent: mitigating the expansion of surface contamination, be it in the form of liquid or solid pollutants, within water bodies and watercourses.

3.2 Use of floating trash barriers in the Ružín reservoir

Floating trash barriers employed for passive solid waste collection harness the force of the water's natural flow within the watercourse. These barriers are relatively straightforward to install and remove from the water's surface, requiring minimal time and effort. Operating them is also hassle-free, primarily involving the management of collected waste on the water's surface in accordance with the quantity of debris captured. However, there is a drawback to such barriers, stemming from their construction, which predominantly comprises rigid and inflexible plastic components. This inflexibility makes storage, transportation, and on-site installation challenging tasks. Moreover, many of these floating trash barriers incorporate a rigid, water-impermeable layer within their submerged portions, hindering water flow in the upper layers of the current. This exacerbates tension on the barrier in stronger water currents, potentially resulting in accelerated material wear due to elastic deformation over time. In the worst-case scenario, this could lead to the complete rupture of the barrier at its weakest point.

The limitations mentioned above are effectively addressed through the unique design of the floating trash barriers we have presented and tested (manufactured by Bamida, s.r.o.). In this design, almost all primary barrier components are crafted from PVC film/fabric using an upcycling process, effectively transforming residual materials into a new product. This approach not only benefits water management and aquatic ecosystems but also contributes positively to the broader environment by reducing waste generation during the manufacturing process of these floating trash barriers.

The crux of this floating trash barrier's design lies in the use of more flexible and elastic materials, specifically a special type of PVC film. These materials exhibit properties ideally suited for this application, granting the barrier significantly greater flexibility and maneuverability during storage, transportation, and installation at the intended location.

The development of these specialized floating trash barriers, tailored to the protection of water resources, was preceded by a comprehensive field investigation. This investigation encompassed an assessment of the quantity and types of waste within the reservoir, along with an evaluation of the location and conditions pertinent to the installation, operation, and service life of the floating trash barriers. Additionally, the study examined their environmental sustainability and efficiency in capturing waste within the Ružín reservoir's specific conditions.

Figure 2. Waste captured with the use of a burrow wall in the area of the Ružín water reservoir
Source: authors (2023)

As part of our research endeavors, we have designed, installed and tested a specialized type of floating trash barriers (Figure 1 – 5), meticulously crafted for the purpose of capturing solid waste from both the water's surface and its immediate vicinity. These innovative trash barriers have been developed and manufactured by Bamida, s.r.o., and they boast a distinctive set of functions and characteristics. These floating trash barriers were specifically designed and tested within the Ružín water reservoir, resulting in the following features:

- **The Visible Section Above the Water Surface** (Figure 3, 4): This visible section serves dual purposes of buoyancy and tensioning. It comprises a buoyancy component, crafted from a hydrophobic material, which keeps the trash barrier afloat. Additionally, there is a clamping component designed to apply tension to the trash barrier against a steel structure situated along the watercourse's bank. The visible part of the trash barrier primarily collects the bulk of waste (Figure 2), often significantly less dense than the water itself.
- **The Submerged Section Below the Water Surface:** The submerged section plays a crucial role in bearing weight and applying tension. It is composed of a mesh skirt with inherent properties that do not impede the flow of water while effectively capturing solid waste with a density akin to that of water. This section also incorporates a load chain, oriented almost vertically, creating a wall-like structure. An essential element within the 'invisible part' is a tensioning mechanism employed to apply tension to the lower portion of the trash barrier, securing it firmly against a steel structure positioned at the watercourse's banks.

Figure 4. Installed floating trash barriers in the area of the Ružín water reservoir
Source: authors (2023)

Figure 5. Installed floating trash barriers in the area of the Ružín water reservoir
Source: authors (2023)

The above-mentioned special design of the floating trash barriers allows the capture of floating waste from water areas and watercourses, which are mostly contaminated with common municipal and bulky waste, plastics and, last but not least, biological waste (e.g. tree branches), which tends to occur and float on the water surface. This solution contributes significantly to simplifying the maintenance of clean watercourses, but also to efficient water management. At the same time, this non-invasive intervention in the environment does not reduce the quality of life of aquatic organisms or the quality of the use of the reservoir as a recreational space. On the contrary, such environmental intervention removes negative elements from the environment.

Another advantage of floating trash barriers is their visual potential. Visually, floating trash barriers are highly variable and can be individually designed and manufactured 'tailor-made'. Floating trash barriers can be produced to blend in as much as possible with the environment where they will be placed, or conversely they can become an interesting visual element in the environment.

3.3 Floating trash barriers as a sustainable and circular product

In addition to their primary function of protecting water resources from pollution, floating trash barriers can be considered as a product that fully represents sustainability and circularity in up to three ways (Figure 6):

1. Noise barriers (the so-called original product = product 1) enhancing and protecting the quality of the environment and the quality of life.

Waste material from the production of another environmentally oriented product (noise barriers) primarily intended to protect the environment and quality of life is used for the production of the floating trash barriers. Thus, at the very beginning of the production cycle, there is an environmentally oriented product - a noise barrier - whose aim is to protect the environment and quality of life.

2. Reutilization of noise barrier waste.

The floating trash barrier, as the final product, exemplifies the essence of a circular economy. Its constituent materials are originally derived from the waste generated during the production of noise barriers (often referred to as echo barriers). The concept of crafting these floating trash barriers emerged from the imperative to maximize the utility of this waste, effectively putting into practice the principles of waste reuse. This involves repurposing waste materials, particularly residual PVC fabrics resulting from noise barrier production.

3. Floating trash barriers (a new product = product 2) improving and protecting the quality of the environment and quality of life.

Primarily, the floating trash barrier serves to trap pollutants in watercourses and water reservoirs, thus directly contributing to the elimination of environmental pollution. The product's very intended use and mission is pro-environmental and is an important element in the environmental management process, in ensuring the sustainable use and preservation (quality) of water resources. Thus, in the production circle, the floating trash barrier represents a new product enhancing/protecting the quality of the environment and quality of life.

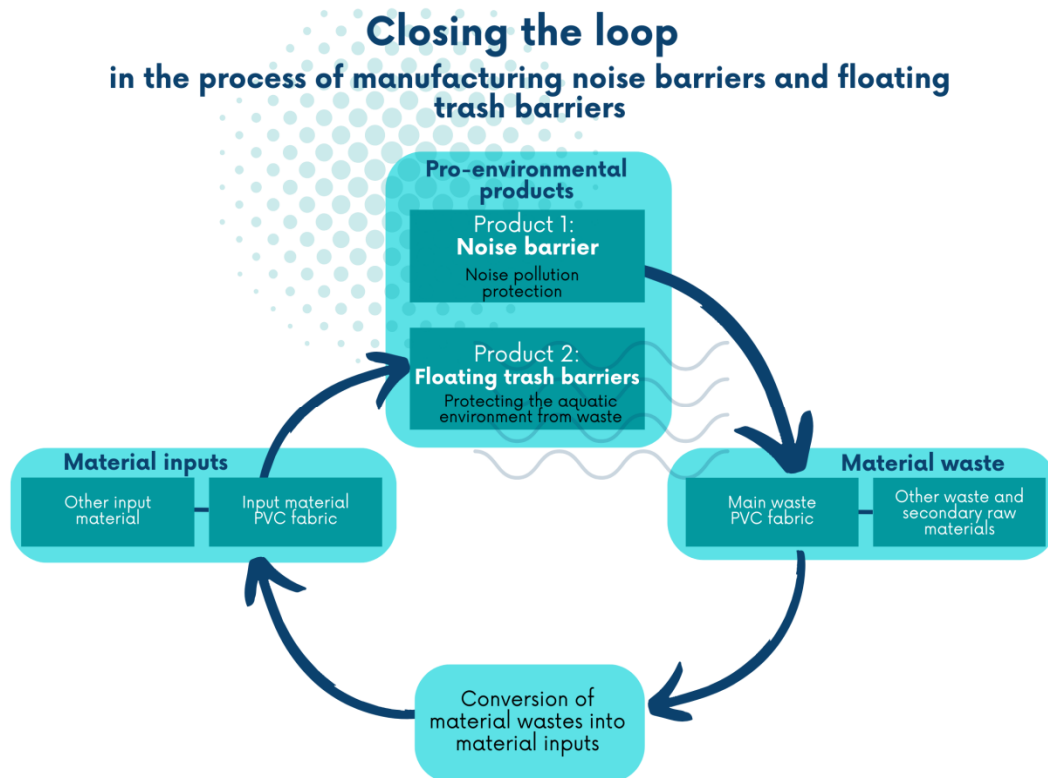

Figure 6. Closing the loop in the process of manufacturing noise barriers and floating trash barriers
Source: authors (2023)

This production process reveals a compelling triple pro-environmental impact, effectively transitioning from a linear production cycle to a circular one thereby enhancing its pro-environmental value. Simultaneously, it leads to a reduction in waste generation and conserves valuable resources (Figure 6).

Conclusion

The application of floating trash barriers to combat watercourse pollution holds practical significance in the field of environmental protection. These barriers themselves exemplify a product of the circular economy, as their production involves the utilization of waste materials, all the while fulfilling a crucial environmental role for society. The waste captured through the deployment of floating trash barriers possesses potential for further recovery, as highlighted by Marciniuk-Kluska and Kluska (2023), where municipal waste can be harnessed, for instance, in the generation of electricity. Waste, in all its abundance, stands as an untapped and vast reservoir of energy resources.

The use of floating trash barriers in the preservation of water quality, as well as overall quality of life, brings forth a multitude of positive impacts. These benefits extend not only to users and producers but also to the broader public. This research, therefore, enhances its value by showcasing the multifaceted contributions it makes to both society and the environment.

Abstract

Research background: Psychological flexibility, rooted in acceptance and commitment therapy (ACT) principles, has gained recognition as a vital trait for leaders. It involves adapting to changing circumstances, managing emotions effectively, and staying aligned with personal and organizational values. Research in this area explores how leaders who cultivate psychological flexibility among themselves, and their teams can foster innovation, resilience, and a culture of continuous learning in the workplace. Human leadership emphasizes the holistic well-being of employees, recognizing them as individuals with unique needs and aspirations. It emphasizes empathy, ethical conduct, and work-life balance as core principles. Studies in this domain explore how human-centered leadership practices contribute to employee satisfaction, retention, and the ethical integrity of organizations, ultimately driving long-term success.

Purpose of the article: This article aims to explore and elucidate the significance of psychological flexibility and human-centered leadership in the context of the 21st-century workplace. It aims to provide insights into how these concepts shape modern leadership practices and their impact on organizational culture, employee well-being, and overall effectiveness.

Method: A quantitative survey was administered to a broader cross-section of professionals across different sectors to investigate the interplay between psychological flexibility, human leadership qualities, and their impact on thriving in the 21st-century social space.

Findings & Value Added: We found that by incorporating psychological flexibility into human leadership, managers can cultivate a work environment characterized by nurturance and growth that embraces change, fosters collaboration, and empowers employees to thrive amidst the dynamic challenges of the contemporary working place social spaces.

Keywords: psychological flexibility, human-centered leadership, organizational culture, employee well-being, innovation

1. Introduction

Psychological flexibility is a fundamental psychological concept that encompasses a person's ability to cope with life's challenges as well as cognitive, emotional, and behavioral events. Rooted in Third Wave Cognitive Behavioral Theory, particularly Acceptance and Commitment Therapy, psychological flexibility plays a critical role in improving the quality of life for individuals and those around them. This literature review examines the components of psychological flexibility and its application in people management, considering the evolving demands of 21st century reality. The review highlights the importance of psychological flexibility in fostering empathy, adaptability, resilience, and other essential skills for effective leadership according to the demands of 21st century reality.

In the dynamic and unpredictable landscape of the 21st century, leadership requires a new perspective and practice that provides responses to the social needs of global society, rapid change, uncertainty, and technological development. Leaders in this era must develop skills that help them act flexibly and creatively while being a human role model who leads their environment to develop an integrated approach that combines leadership with participation, cooperation, and a quick and creative response to different situations and needs. Psychological flexibility is a key component in developing mental and affective adjustment skills, making it an important component for leaders in the 21st century. This paper explores the concepts and foundations of psychological flexibility from the perspective of acceptance and commitment therapy and its implications for effective and humane leadership in addressing the challenges and needs of our time.

The 21st Century brings new challenges. This period is characterized by accelerated technological developments, leading to the need to deal with increasing complexity, rapid changes, and growing uncertainty, in addition to frequent changes in values, goals, social and personal perceptions, needs, qualifications, and skills. Growing individualization and social diversity, expanding economic and cultural uniformity, and frequent changes in values, goals, social and personal perceptions, needs, qualifications, and skills characterize this period's technological development. This reality requires rapid and multidimensional adaptations.

Current and future citizens face new challenges, such as uncertainty, growing individualization and social diversity, expanding economic and cultural uniformity, and exposure to natural disasters caused by climate changes resulting from ecosystem degradation.

In the 21st Century, therefore, flexibility becomes an important skill. A frequently changing world brings the skills to handle effectively with a high degree of uncertainty. Flexibility drives one to navigate between changing situations, identify needs, act quickly, efficiently and responsibly, and contribute skills. The High levels of flexibility help to adapt to change and build the ability to act efficiently in different environments and situations. Studies mapping skills and competencies that are required to be specified in the 21st Century presented three key areas of skills: literacy skills, social skills, and personal skills (Fuchs, 2022).

Social space is multifaceted in various fields, encompassing the immediate environment where humans exist and interact. Social space is an interdisciplinary research topic studied in various fields like sociology, psychology, urban planning, political science, geography, and architecture, exploring its influence on human behavior and vice versa. In this research, we focus on the workplace's social space in our generation, examining how it shapes behavior and influences individuals and organizations. It recognizes that physical and social surroundings influence human behavior and interactions, shaped by political, economic, cultural, and historical factors. The key aspects of the social space include: 1. The Immediate Surroundings, including physical spaces (homes, workplaces) and social networks, affect behavior and attitudes. 2. Impact of Location (inside the Immediate Surroundings): One's place within a social space can significantly impact behavior due to imposed norms and expectations. 3. Influencing Factors: Political, economic, cultural, the shape of the social space structure, resources, and character. 4. Dynamic Evolution: Rapid transformations due to technology, politics, economics, and culture. 5. Interactive Relationship: Individuals adapt to and influence their Immediate Surroundings, involving physical and mental adaptations (Fuchs, 2003; Petkova & Chukov, 2019).

The Human leadership model, researched and validated by Fishbein (2021), we explore in this article is one of the ideal models for leading employees in our generation, and as we will see here - psychological flexibility can be considered the key to the Human leadership model and the application of the acquired tools.

The challenges and complexities of the modern world are increasingly shaping workplace dynamics. Employees and managers now confront unique circumstances that demand adaptability and a nuanced understanding of the evolving social space within and outside the workplace. In this evolving landscape, effective leadership involves understanding and embracing the complexity of individuals transitioning between different roles and experiences. It requires creating a workplace environment that values diversity, promotes adaptability, and provides the necessary support and guidance for employees to excel in their multifaceted lives.

The world's diverse challenges can bring complexity and uncertainty. The world is becoming more complex and uncertain, requiring individuals to navigate multifaceted issues. They experience individualization from one side but the development of growing gaps of social diversity. People have diverse backgrounds and values, leading to various perspectives and expectations. Furthermore, despite

globalization, there are various economic and cultural norms and growing environmental concerns because of the growing vulnerability to natural and technological hazards.

Workplace as a Unique Social Space. Workplace expectations, laws, rules, and limitations may differ from the broader social space. Employees must adapt to these workplace-specific rules and regulations, which can highly differ from their everyday life experiences. On the other hand, managers are tasked with leading employees with diverse experiences and roles outside of work. Employees can switch roles and experiences rapidly, such as transitioning from gaming to a professional role. Moreover, managers must balance the expectations and behaviors associated with different roles, ensuring employees meet workplace demands.

From the Human Leadership model point of view, effective leadership is based on communication and empathy. Leaders should maintain open communication and demonstrate empathy, acknowledging the varied experiences of their team members. They should have clear expectations for workplace behavior and performance while recognizing that individuality is vital. They should train and support them to help employees bridge the gap between their diverse experiences, which can be beneficial. The manager should embrace the multifaceted employee. Recognizing that employees bring various experiences and skills from various aspects of their lives can lead to innovative solutions. Encouraging employees to balance their diverse roles and responsibilities can enhance well-being and job satisfaction (Fishbein, 2021).

Our research assumptions are:

1. Workplaces today differ from those in the past. Workplaces are now considered social spaces with rules, laws, and limitations that may not align with individuals' experiences outside of work. This disconnect can create challenges for both employees and managers.

2. Psychological flexibility is a crucial quality for employees in adapting to the demands and constraints of the modern workplace. It implies the ability to effectively adjust one's mindset and behavior to navigate different aspects of life, including the workplace.

3. Managers face the challenge of leading employees who may have diverse backgrounds, experiences, and expectations. Traditional authoritarian leadership styles may not be effective in this context, as employees bring various experiences and skills from their outside lives, which may only sometimes align with their work roles.

4. The "Human leadership" model is based on the encounter of psychological flexibility.

5. A psychologically flexible manager who uses the human leadership model and encourages his employees to apply the tools and principles of psychological flexibility strengthens his ability to understand and relate to the diverse experiences and skills that employees bring to the workplace and the efficiency and output he will receive from his employees.

1.1. Psychological flexibility

Psychological Flexibility is the ability to experience the present consciously and non-judgmentally and to act according to one's chosen values (Marom et al., 2011). Psychological Flexibility forms the basis for processes of appropriate choices and attentive and conscious behavior. These processes give rise to a wide array of physical and cognitive strategies and help an individual change the role of his inner experience through flexible conduct in the face of thoughts and events (Rolffs et al., 2018). In general, the elements of psychological flexibility include awareness of the present, adapting to situations and events, having a flexible perspective, and balancing conflicting needs and behavior consistent with values (Kashdan & Rottenberg, 2010). According to Hayes, Strosahl and Wilson (2012), six parallel and interrelated processes serve as the foundations of psychological Flexibility: Acceptance – the state of being ready, willing, and able to experience private events without trying to change their frequency, content, or form. Cognitive Diffusion – the ability to differentiate between thoughts, feelings, physiological sensations, and impulses in evaluating real events while fully aware of the present and choosing effective and relevant behaviors. Mindfulness of the present – an active, attentive, full, non-judgmental awareness of the present moment. "Myself as an observer" is a multi-dimensional perception of oneself as more than the sum of one's experience. Values - Selected principles that shape personality, which are freely chosen by the individual, which define processes and are linked to patterns of action, directing and organizing the individual's behavior (ibid), providing him with a sense of meaning. Committed Action - Strengthening effective behavior patterns that help individuals reach value-based goals (Yuval, 2011). The scales of processes that constitute the foundations of psychological flexibility are dynamic and are responsible for shaping the patterns of interaction of the individual with his environment (ibid.).

There is a parallel between the processes that make up psychological flexibility and similar processes that are defined as self-control, emotional regulation, and self-regulation (Fuchs, 2021). Kashdan and Rottenberg (2010) refer to executive functions, default mental states, and personality configurations as three significant factors that form the basis for psychological flexibility. Executive functions generate significant neuropsychological support for self-regulation, which reflects brain activity primarily in the frontal lobe and enables behavioral choices based on integrating cognitive abilities and goals. Executive functions are a system of high-level cognitive control processes and have a significant role in the navigation and success of all day-to-day activities. They are responsible for choices, decisions, risk assessment, planning, awareness processes and breaking habits, setting priorities, behavioral sequence, coping with changing situations, etc. (Miyake & Friedman, 2012). Executive functions are related to important aspects of health and function both at the physical level and at the mental level (Snyder, 2013). Deficient performance in these areas will impair the individual's ability to develop psychological flexibility (Kashdan & Rottenberg, 2010). Executive control is an example of a skill derived from executive functions. Executive control includes awareness of a situation combined with the ability to focus on the fundamental aspects of the situation. Executive control enables correlation between a situation and behavior, emphasizing the context and an authentic response based on awareness and not the result of an automatic pattern. Executive functions also include dealing with distressing situations and openly accepting thoughts, emotions, and sensations of any kind (ibid.). Challenges and tensions are an integral part of life and are significant factors in an individual's development and maturation. The ability to experience, cope with, and organize different thoughts and feelings affects emotional well-being (Robinson et al., 2004). Executive functions also include working memory, information processing speed, and the ability to regulate behavior (Kashdan & Rottenberg, 2010).

These factors are important for psychological flexibility because when utilized properly they help the individual to see complex situations via several vantage points and representations and to select the appropriate responses and actions for each situation (ibid.). In summary, executive functions are a significant factor in the ability to regulate responses, adapt responses to reality, set goals and achieve them. The ability to be attentive, to accept and tolerate stressful situations, and to use memory skills helps the individual identify contextual clues and select appropriate responses in individual and social situations. Default mental states - Psychological flexibility depends on the individual's ability to make efficient and balanced use of the mental energy he invests in current events in his immediate environment, and the energy he will have to invest in significant future situations (ibid.). Automatic processes such as heuristics, stereotypes, and habits help us to make a balanced effort in interpreting and responding to the environment. However, processes of this kind make the individual draw conclusions about themselves, others, and the world around them based on limited knowledge and misconceptions (Dunning, Heath & Sols, 2004).

Heuristics are simple mental procedures that help to find quick but incomplete answers and solutions to difficult questions (Kahneman et al., 1982). Heuristics help us navigate social environments and deal with the myriad of verbal and nonverbal information that exists in social interactions (Kashdan & Rottenberg, 2010). Heuristics and stereotypes enable us to draw conclusions and to establish responses to conclusions daily (ibid.). Heuristics and stereotypes are very resistant to reconsideration and change. Often, the information they provide is neither accurate nor relevant, makes it difficult to identify other relevant information or to gain new insights, and prevents one from experiencing and taking part in varying personal situations (Kahneman et al., 1982). Psychological flexibility helps shape our automated processes in more efficient and better ways. To do so, one must recognize the tendency to automatically put into play social judgment and preferences based on habits, limitations of biased social judgment, habits and preferences, and the fact that automatic, habit-based activity ultimately reduces actions resulting from freedom and flexibility (Kashdan & Rottenberg, 2010). Personality configuration also has a significant impact on psychological flexibility. Neuroticism, self-control, Positive affect and openness to experience are personality dimensions that can be tested for psychological flexibility. Positive affect enables flexible thinking and flexible behavior. It expands the range of possible thoughts, feelings, behaviors, and modes of action in any given situation. Positive affect expands attention, enhances work memory, increases creativity, and enables openness to new knowledge and a variety of perspectives (Johnson & Fredrickson, 2005). These traits contribute to effective, thorough and qualitative decisions. Openness and curiosity and readiness for new knowledge and new experiences leads to a willingness to tolerate all sorts of experiences and emotions that may naturally arise because of coping with new stimuli (Kashdan & Rottenberg, 2010).

When an individual acts out of openness and willingness, he sees in unfamiliar situations an opportunity to find meaning in his actions, to expand the self. Openness allows for multiple perspectives and creative thinking and is related to tolerance and compassion. Balanced self-control or the ability to modify cognitive and behavioral tendencies is another major factor in psychological flexibility (Kashdan & Rottenberg, 2010). People with balanced self-control have more flexibility and perseverance, their psychological well-being is higher, and they experience more satisfaction in life and fewer instances of psychopathology (Fuchs, 2021).

Self-control helps to inhibit gratification, resist impulses, and control thoughts and emotions to achieve behavioral flexibility (Kashdan & Rottenberg, 2010). At the same time, the individual's natural ability to control himself may limit psychological flexibility. Psychological flexibility refers to an attentive orientation that forms the basis for the individual's awareness of his thoughts and feelings while understanding them as thoughts and feelings that do not necessarily indicate reality itself. This awareness allows a person to continue to act according to his or her values even when he experiences emotions and thoughts that may interfere with his actions (Biglan, 2009). Studies have shown a positive relationship between psychological flexibility and empathy and caring, as well as an inverse relationship between psychological flexibility and bias and prejudice (ibid.).

Social problems such as wars, terrorism, prejudices, interpersonal conflicts and conflicts between groups created based on lack of care, erroneous assessments, hostility and environmental pressures. Thus, raising the level of caring among people by raising psychological flexibility may be a solution to many social problems (ibid.). On the other hand, labeling, prejudice, and false beliefs may lead to problematic, maladaptive and avoidance behaviors (ibid.).

1.2. Social Space - The Mobile Human

The social space has been dramatically changed under the influence of globalization. The latter creates the conditions and gives a chance to the unknown mobility human so far. But alongside this, on an equally unknown scale, it produces random occupations that are the source of alienation among people. Globalization ruins many of the boundaries typical of traditional societies. But it also ruins the limits of the risks, forcing the modern human to live in a society that is labeled with global risks. From the point of view of its anthropological implications, globalization cannot be judged by the terms of comfort or apocalypse.

The world in which we live is a world of movement, a world in which everything is dynamic and often leaves in our minds the image of chaotic and disorder in our happenings. The world today is mobile, highly mobile. This peculiar definition of reality carries at least two meanings:

On the one hand, "this" world is a world of continuous, rapid change. Perhaps the hallmark of this movement is the words of A. Toffler (Toffler, 1970), who defined the life of modern man as a life in a permanent "shock of the future" (Toffler, 1970, p. 7), which brings renewal that makes it difficult human adaptation.

On the other hand, Anthony Giddens (Giddens, Duneier, & Appelbaum. 2011) illustrates the mobility of the modern world with the definition "If we imagine the whole history of mankind as one day, agriculture is invented at 23.56 hours, and civilizations - at 23.57. The development of modern societies begins only in 23 hours, 59 minutes and 30 seconds! Still, over the last thirty seconds of this "human day" perhaps more changes have occurred than all the time before them." (ibid., p. 123). The dynamics of change in our times are so great that we can find two "neighboring" generations live so differently as if they were living in different centuries.

Nevertheless, when our time is characterized as a time of mobility, this designation is not only in a metaphorical sense. The modern world is mobile in both the transportation and the direct meaning of the word - today, people are as if they are continuously on wheels, in airports, on high-speed roads, on electronic highways, and so on. Bauman (1999) argues that the life ambitions of today's man "Most often are expressed in terms of mobility, freedom in choosing the place, traveling, exploring the world." (ibid., p. 145). However, tourism and occupational mobility are only two dimensions of modern mobility. Meanwhile, millions of people migrate from native places and countries to bring their lives to other parts of the world. Each of these mobility trends produces dual effects - on the one hand, it leads to the mutual opening of the world, to the dropping of many of the traditional borders between states and people, but on the other, it produces new frontiers and conflicts.

Bauman (1999) provides a good example of the human dimension of globalization, outlining the emerging new sociality among some modern people. He cites Agnes Heller (in Bauman, 1999), who in

turn tells of a businesswoman who speaks five languages and has three apartments in three different places. "The type of culture in which it participates is not a culture of a certain place, it is the culture of time. This is the culture of the absolute present. Let's accompany her on her constant journeys from Singapore to Hong Kong, London, New Hampshire, Tokyo, Prague, etc. She stays at the same Hilton hotel, eats the same lunch sandwiches, or if she eats Chinese food in Paris and French - in Hong Kong. It uses faxes, phones, computers, looks at the same movies and discusses the same problems with the same people." (ibid., pp. 114-115).

The contemporary man, though still not at the scale of Bauman's character, is relieved of locality and of his "statehood", gradually acquiring a cosmopolitan consciousness. In other words, a state of consciousness that challenges any territorial, national, state, or geographical confinement. Cosmopolitanism denotes the feeling of belonging to the world and the commitment to universal values. It is a sign of the moral maturity of mankind, overcoming the limitations and intolerance of such antipodes as racism, irrational patriotism and nationalism. The cosmopolitan personality is or, at least, is making ever more serious attempts to engage in human causes, while also enjoying deep respect and recognition for existing cultural practices. But it is also necessary to say that cosmopolitanism is eclectic in its own way: its forms of expression are constantly changing, as if without its own center, the cosmos of the cosmopolitan consciousness is a center which is in constant motion. At the same time, the cosmopolitan consciousness of man does not release him from calling them non-cosmopolitan attachments. Even cosmopolitan in spirit, individual human subjectivity will always be a carrier of specific characteristics derived from origin, from bio-anthropological affiliation, from value and moral specifics. But they are not leading. These specifics are rather the individual nuances in the richness of the cosmopolitan personality. The criticism of the global cosmopolitan community is that it is not enough to simply be imagined and propagated by the various calves, info and mass media. And it is necessary for mankind to put the strong foundations of wider political unions, to embrace more and more diverse types of cultural communities. This criticism is reasonable.

Indeed, the process of cosmopolitanism is in its beginnings, but in general it is irreversible in its idea. This process is and will be accompanied by inevitable contradictions and difficulties coming from different directions. There are many problems that will be encountered, and which must be overcome. Some of them are the following: the post-nationalist movements and the confrontation in the social communities implanted by them; ethnic xenophobia; historical prejudices that are remnants of distant ages in the consciousness of people living in the 21st century (Petkova & Chukov, 2019).

Along with all the challenges (positive and negative) arising from globalization, which change people's way of life, with a history that is unknown in history so far, this dynamism first reflects on the human soul. It turns out that globalization, mobility, the dynamics of time, as they are subjected to sociological or philosophical analysis, are so much the subject of psychology. Today we talk about mental disorders such as anxiety, panic, depression, etc., which show how uncertain the modern man is from this dynamically changing setting around him. A person now lives in a compressed time, often having to perform several operations - for example, by talking on the mobile phone to search for information on the Internet and at the same time often reading in a foreign language by considering the information he reads. All of this is extremely heavy on our minds. Such accumulated over-fatigue and over-stress have led to the creation of a concept like burnout (Petkova, 2021).

The Mobile person becomes more and more important as a topic of modern social research. In connection with its study, specialized academic centers are created, scientific journals are published, congresses are held. At the same time, mobility is beginning to impose a new paradigm in the social sciences. One of its first authors is the well-known British sociologist John Urry (1999). Urry considers it necessary to formulate such a paradigm because, in his view, the mobile person with his continuous spatial mobility modeled and modified modern societies so that they became difficult to reason in the framework of the present paradigm. Urry believes that any attempt to analyze or study globalization and global change is the same as analyzing and exploring "mobilities" and "mobility" (ibid., p. 49), which "are the basis of social life and should be the basis of sociological analysis" (ibid.). He believes that previous sociology has neglected people's "mobility", such as compactness or mass, as well as autonomy or "self-mobility" (ibid.). This lack of interest in the prior sociology of an autonomous personality could be explained by the lack of unregistered, important social personal interactions. Still, this new mobile person lives in some societies that are less likely to "reshape", so Urry (1999) allows himself to continue to use traditional concepts and ideas for civil society. But the image of this society through his gaze is more refined. The difference, he says, is that: on the one hand, this society allows for a greater and more easily

achievable opportunity for political change as well as for more active participation of the autonomous mobile individual and his influence on real politics; and to release from the sphere of state control and to create a kind of mobile technological social control from or through "mobilities" or through all those new boundaries and dependencies that originate from them. The latter are new forms of habiting man and the space around him from: a light car that radically changes the social spatial human being, through the media (mobile or virtual) to ideas, possessions and information, as well as the resources needed for their production, and then for their exploitation. These nobilities form the need for the already mentioned new paradigm for social research.

This, so to speak, a new "sociology beyond the enduring societies" (ibid., p. 10) through the "mobilities" (ibid., p. 49) broadens the latest debates on globalization and theorizing for and on the modern way of life. By providing analysis, it is revealed how mobilities rebuild social life in terms of inequalities in it - inequalities that arose from the difference in time, space, space, objects, etc., in terms of travel, changes in their ideas, images, messages, waste products and money across international borders, as well as the consequences of these mobilities, which we will have to break through our experience gained over time, space, our way of living, or ignorance us. The changes that globalization has brought about in our societies have led to "Dismissing the roles of the traditional definitions of the notion society - it is increasingly difficult to give some static definition of it" (Urry, 1999, p. 15).

Society increasingly needs to be characterized by flexible expressions such as: organic, functional, integrating and reproducing entities. And what imposes these flexible terms is the dramatic increase in the flow of trans-and over-national forms of associations, so the traditional notion of society becomes even less plausible. What then happens about the function of sociology, since it is science that can best answer the question of what is happening to human sociality? For Urry (1999) this is the challenge to the new sociology. It offers a peculiar manifesto to create a scientific social paradigm for the study of what is emerging as "post-society" (ibid., p. 7). The mechanism, and perhaps the language in which we can read the coordinates of this "post-society," are the so-called "metaphors" (ibid., p. 10). Urry argues that some metaphors are "scientific" (ibid., p. 29) more useful than others. He intends to overcome the static and centered concept of "society" (ibid.) more useful than others. He intends to overcome the static and centered concept of "society" (ibid.) with the help of metaphors indicating different forms of mobility. The metaphors developed in the theory of Urry reflect the movement not only of humans but also of "non-human hybrids" (ibid., p. 29): for example: "information, commodities, even the crises" (ibid., p. 30). The most important of these mobile metaphors in Urry's project are "networks, streams and periphery" (ibid., p. 32). It can be said that Urry is the first since Castells (2004) a social thinker who shows that thinking through concepts like "network". Urry provides several advantages over large structure ideas that are more centralized and less flexible than networks themselves. These networks "produce" and are derived from complicated and long-lasting connections that pass-through space and time between peoples and things " (Urry, 1999, p. 34).

The flow of people, money, information, commodities, crises, etc. are "moving", "entering" and "coming in" (Kingsley, & Urry, 2009, p. 64) in the social landscape, "travel" (Kingsley, & Urry, 2009, p. 64) inside and outside the societies.

In "Sociology Beyond Societies: Mobilities for the Twenty" Urry (1999) uses these (and other) mobile metaphors to address various issues related to travel, senses, time, housing, citizenship, etc. The common thing here is that there is a constantly changing worldview. Urry gives considerable room to explore the means for human mobility, highlighting the extremely important "role of the vehicle" (ibid., p. 98). Unlike all other times, in the modern age man can rely on fast-moving vehicles - trains, planes, cars, etc. As if they allow a person to live a little longer, saving him from time to carry your own body from point A to point B at a faster speed. It would not have happened to the same degree of security, speed, possibility of carrying additional luggage if the man relied solely on his own strength. Vehicles are at the root of modern human mobility by reducing the lost in ineffective times that man can carry himself "here" and "there" into space. At the same time, they expand and divide social spaces, making them more accessible and unlimited. Moving through social space, labor, or any other kind of human activity is about 'staying' or living in a place. The idea of Urry and Kingsley (2009) for "housing" (ibid., p. 67) is somewhat close to that of Martin Heidegger (Heidegger, 2010). As far as the dwelling is a place in which "the man remains, he finds himself and manifests himself freely, without any worries, his own intimacy" (ibid., p. 20) or expresses and feels comfortable - "the dwelling is a kind of human continuation" (ibid.).

Urry and Kingsley (2009) point to the following problematic processes that will disturb the future of our mobile societies: global warming and the global consequences of it; oil supply problems, as well as the

distribution of spheres of influence over it in the future; enhancing digitization in many different aspects of economic and social life as well as problems surrounding the recycling of unnecessary electrical products; massive population growth in the world, etc.

The theory by Urry (1999) has been a serious criticism lately. A debate in his theory provokes the theses related to the idea of "forming a new paradigm" (Urry, 1999, p. 5) with which to explore the social space in the conditions of accelerated and mass mobility. According to McKinnon and Trzebiatowska (2014, p. 67), Urry has not sufficiently clarified what these post-societies will be beyond the static. They are analyzing Urry (1999), "Sociology Beyond Societies: Mobilities for the Twenty", wrote: "In discussing travelers, John Urry (Kingsley, & Urry, 2009) makes a significant analysis of tourists, travelers and tourists, but without valid reason refuses to theorize the various types of "forced migration that causes at least 150 million migrants worldwide." (McKinnon, & Trzebiatowska, 2014, p. 69).

On the other hand, part of the comparisons that Urry (1999) makes purely social, using examples of mobiles such as "marching soldiers", "fighter jets" (Urry, 1999) should not be used as the key moves themselves, "They would sooner rather than be" launching a missile "(Urry, 1999, p. 79) are social activities or activities "(McKinnon, & Trzebiatowska, 2014, p. 75).

In other words, it could be said that Urry (1999) presents a peculiar manifesto of sociology adapted to the 21st century, using as an example the mobilities that the 20th century people used. McKinnon and Trzebiatowska (2014) also criticize the lack of a clear statement, which is only implied by Urry (1999) regarding the movement of cash flows in the global financial system. And the latter is certainly one of the most dramatic and important spheres in the post-social space of global societies. Irrespective of the critique of Urry's theoretical platform (Urry, 1999), it is a good incentive for activating search in modern social theory. The mobility of man in the age of globalization becomes a factor that will increasingly change the characteristics of social space and, with it, the structure of society. The scientific toolkit, which has worked well in a relatively sustainable society, will become increasingly inefficient in view of the ongoing and deepening changes due to the increasing mobility of modern human. (Petkova & Chukov, 2019)

1.3. Leadership in a changing world

The 21st century demands that we move from the perspective of solving puzzles to solving mysteries. Constant change brings new ideas and behaviors. Leadership in a changing world requires a transition from an approach that focuses on planning to one that focuses on creating and becoming. This situation requires an understanding that change is situational, flexible, and adaptive, and the ability to respond and act in changing situations. The dynamic reality of the 21st century requires a willingness to learn and evolve from situations of internal and external uncertainty, to let go of control, to experience coping, and to learn together. It is a necessity that entails a transition from a hierarchical model of leadership to an open and collaborative model of leadership that operates within the framework of interpersonal leadership and human development (Dumas & Beinecke, 2018).

Leadership in a global society requires critical thinking and the development of problem-solving skills, technology orientation, adaptability, and pragmatic and practical skills. Good communication skills, the ability to build interpersonal relationships, form teams, and collaborate with internal and external parties (Goleman et al., 2007).

Leadership in the 21st century requires a high degree of adaptability as well as a variety of behaviors that meet needs. It is based on values, motivations, and needs and manifests itself in the leader being a personal, flexible, and visionary model who acts transparently and has confidence in leading group processes, practices, and social processes (Dumas & Beinecke, 2018). It leads and develops skills and abilities from the trust of its people and through training and education. and is focused on creative, transformative, ethical, and spiritual integrative processes (Trilling & Fadel, 2009).

In the 21st century, managers face a rapidly evolving and competitive global economy. To achieve their goals, they must adopt new approaches to leadership, recognizing that many traditional skills from the 19th and 20th centuries are no longer effective in today's work environment. The 21st-century leadership landscape demands a departure from traditional approaches and a shift towards adaptability, continuous learning, and a deep understanding of both technological and human aspects. Leaders who embrace these principles are better equipped to guide their organizations through the challenges and opportunities of the modern era.

Key points to consider: Today managers must motivate and empower their followers by equipping them with the skills and knowledge necessary to excel in their roles. This not only fosters individual

growth but also propels the organization forward. Effective leadership in the 21st century demands adaptability and flexible thinking. Managers should be prepared to embrace change and implement strategies that are responsive to evolving circumstances. The "growth mindset," as proposed by Dweck (2007), is crucial for managers. This mindset encourages continuous learning, resilience in the face of challenges, and a belief that abilities can be developed over time. Managers need to possess information skills, digital literacy, and a commitment to environmentally and socially responsible behavior. These competencies are essential for navigating the modern global economy. Emotional intelligence (Goleman, 1998) and social intelligence (Goleman et al., 2007) are invaluable attributes for managers. They enable managers to connect with their teams on a deeper level, understand and manage emotions effectively, and navigate complex social dynamics.

1.4. The Afik Model of Human Leadership and How It Serves in the 21st century

The differences between the various leadership approaches and models lie primarily in how leaders move others to action. The Afik model of human leadership (Fishbein, 2019) was originally developed and empirically validated to understand human leadership's effects on motivation in the workplace. The theory of humane leadership states that the components of humane leadership are the most important characteristics that are essential for successful leadership. The change in organizational and social models according to the changing reality, challenges, and needs of the 21st century also leads to changes in key leadership characteristics, perceptions, and goals. In this literature review, we will examine the characteristics of Afik's human leadership model to determine the effectiveness and relevance of human characteristics to the 21st-century leadership model and the importance of psychological flexibility in developing these skills and qualities.

Habel (2002) found that leaders with strong relationship management skills treat others with kindness, sensitivity, and compassion. Relationship management centers on connecting with other people and building strong relationships. However, it also focuses on developing people through inspirational leadership, building teamwork through collaboration, and resolving interpersonal conflicts. Leaders who excel in relationship management have good communication skills and are adept at using their influence to ensure positive results. Relationship management skills are particularly important for public health leaders, given the field's highly collaborative nature. Over the years, adaptations and changes in leadership perceptions and models can be seen following social, cultural, and environmental changes. We see a shift from one-dimensional, goal-oriented models to multidimensional models that speak of a combination of professional and personal characteristics and factors in the leader's image (Fishbein, 2019).

Humane Leadership goes beyond building positive relationships with one's followers. Humane leaders are driven by kindness and deep concern for their followers. They see themselves as servants responsible for their subordinates' well-being and as nurturers who help others discover their voices and inner potential and guide their personal and professional development accordingly so that they, too, can become leaders. Humane leaders are attentive listeners who express sincere appreciation and offer constructive feedback through ongoing dialogue (Cornett, 2017).

Within the Afik model of human leadership, some qualities, characteristics, and models were defined, analyzed, and tested to create a new model that defines and expands the understanding of human leadership and the need for any form of a practical tool to improve human leadership. Leadership is about influencing others to act to lead people, raise their motivation, and achieve the goals of the organization. Hence, as the researcher found, operational skills – the ability to turn a vision into reality – are at its core. The difference between different leadership approaches and models lies not so much in the what or even the why of leadership but rather in how leaders influence others to act. To show the scientific value of the Humane Leadership model, this model was validated through garnering empirical support. The Humane leadership theory holds that an executive manager who does everything to meet the task without considering the personal treatment of each employee sends a message to his subordinates that they are less important to him than the work itself. Such a manager needs to improve in human relations and can benefit from improving his leadership skills. The literature describes several traits essential for successful leadership, and many of the ideas presented were integrated into the Afik model of Humane leadership (Fishbein, 2019).

Visionary - "Vision has long been a quality and characteristic defining leadership" (Coers, 2018, p. 1). He has a vision; he perceives what will happen in the future, can think a few steps ahead, and bases his actions on that knowledge. He understands processes and what their potential outcomes might be. He is

skillful at analyzing situations and constantly considers and assesses processes and outcomes to plan and prepare follow-up plans (ibid.).

Action Taker - takes calculated risks. He is flexible and adapts to changing situations, prepares for crises, and is very decisive. This kind of a leader is a change-maker who takes initiative and seeks creative solutions (Wanasika, 2009, p. 7); call the action Taking leader a Strategic Leader: "strategic leadership as a person's ability to anticipate, envision, maintain flexibility, think strategically, and work with others to initiate changes that will create a viable future for the organization. This second definition captures several characteristics: future orientation, cognitive ability, ability to focus on the big picture, interpersonal relations, propensity to act, and risk-taking" (Wanasika, 2009, p. 7).

Sets Clear Goals - focuses on what is relevant. The leader can differentiate between what is significant to the process and what is extraneous and sets clear operational goals, and he "is cognitively complex enough to hold both short-term and long-term goals simultaneously" (Wanasika, 2009, 7).

Realistic – "A realistic leader is characterized by untenable and selfish morality, which is neither lasting nor certain" (Brzezińska, 2020, p. 180). He does not live in a fairy-tale world. His "goals arise about what is desirable, possible, and necessary out of necessities, not desires and dreams" (Wanasika, 2009, p. 7). He operates rationally, makes logical choices, and explains his decisions and actions. He never uses the excuse, "Because I want to...". He justifies everything he does.

Provides Clear Instructions - The leader has good communication skills. He is assertive, very available, and gives clear and precise instructions. Hoch (2014) calls the leader who provides clear instructions the Pragmatic Leader. The "pragmatic leader provides clear instructions about the team procedures and ways of working; may lead to uncertainty about the correct direction the team may take" (Crespo-Gonzalez & Quintero, 2020, p. 33).

Perseverance - very focused and disciplined, is "better at overcoming obstacles and can work with distant objects in view". He adheres to the mission and is passionate about seeing projects through to the end (Kirkpatrick & Locke, 1991, p. 51).

Persuasive Negotiator - has powerful coaxing skills. He seeks out-of-the-box solutions and knows how to bring people around to his viewpoint. He believes in fair play. "This leader understands the other side's story, is open to persuasion, uses reciprocity to build trust, matches appeals to the other side's circumstances, seeks agreements that feel fair to both sides, recognizes how people process information through stories as well as analysis" (Foster, Mansbridge & Martin, 2015, p. 74).

Role Model - A Positive Motivator. He is inspiring and very professional and treats his subordinates with respect. A leader who "uses role modeling to influence others", "with a socialized power motive, uses power to achieve desired goals or a vision. Its use is expressed as the ability to develop networks and coalitions, gain cooperation from others, and resolve conflicts in a constructive manner" (Kirkpatrick & Locke, 1991, p. 53).

Kindness – "The relationship between kindness and leadership is a topic of fundamental importance for the organization's well-being" (Haskins, Thomas & Johri, 2018). Baker & O'Malley (2008) "Have advocated that leading with kindness is effective in both optimizing organization performance and building high commitment workplace cultures and is a moral duty" (Caldwell, 2017, 2). This leader loves and cares for his staff. He develops relationships with his employees' families, loves his subordinates, and helps them solve their problems. He believes caring for others inspires them to follow him as a leader, and he stands up for the people he leads.

Honesty and Integrity – "are virtues in all individuals but have special significance for leaders. Without these qualities, leadership is undermined. Integrity is the correspondence between word and deed; honesty refers to being truthful or non-deceitful. The two form the foundation of a trusting relationship between leader and followers" (Kirkpatrick & Locke, 1991), "Empowerment of workers in social sphere - challenges and opportunities". He is loyal to superiors and subordinates alike. He is loyal to the organization, adhering to the organization's policies, nurturing the organization's culture, and does not abuse his position of authority or power. He does not use force or fear tactics or practice cheap populism to achieve his goals. He is honest, reliable, accountable, and stable, maintains a calm demeanor, and never plays the blame game (Smith & Harrison, 1986).

The Wandering Around Listener - listens patiently. He listens to both sides when there is a disagreement or conflict and puts his ego aside when contemplating a solution. Listeners "are effective information gatherers because they are good listeners and encourage subordinates to express their opinions. In Peters' terms, they stay in contact with the rest of the organization by "wandering around". Leaders actively seek information from outside the organization. Good leaders also disseminate

information widely so that followers will understand why decisions are made and how their work fits into the organization's goals." (Kirkpatrick & Locke, 1991, p. 57).

Interpersonal Skills and Emotional Stability - belief in teamwork. He collaborates to improve achievements, consults with others before making important decisions, is not afraid of strong colleagues, and is open to others' opinions. He says what he means and means what he says. He "remains even-tempered ... generally do not become angry or enraged ... emotional stability is especially important when resolving interpersonal conflicts and when representing the organization ... he retains emotional control and fosters trust and teamwork" (Kirkpatrick & Locke, 1991, p. 55).

Delegates - delegates responsibilities. He trusts subordinates to help reach goals and shares the credit and responsibility for results. "Delegating leadership style gives confidence as the manager recognizes and celebrates employee achievement and inspires challenge and innovative ways to reach the goal" (Lynch, 2015 in Alčauskienė, Vitkienė & Grigaliūnienė, 2019). "It is stated that this style supports and allows a high degree of staff autonomy as employees are allowed to engage in planning and administration. In this case, the manager delegates responsibilities to employees to see how the job progresses. This style is most appropriate when employees are competent in performing tasks and willing and confident in their abilities and knowledge" (Alčauskienė, Vitkienė & Grigaliūnienė, 2019).

Lifelong Learner Professionalism – "puts the knowledge base into practice" (Garman et al., 2006, p. 219). seeks to grow and learn. He deliberately surrounds himself with more knowledgeable people than he is and constantly strives for improved professionalism. "Professionalism involves cultivating and managing working relationships with others. Effectiveness in delivering and receiving constructive feedback is a hallmark of professionalism. Maintaining networks with colleagues and participating in a professional association are also highly important activities" (Garman et al., 2006, p. 220).

Nurturer - challenges and nurtures staff. He is supportive, offers positive feedback, shows others how to improve, and gives people a second chance, all to improve achievements. "Rewarding professional development, and valuing members of the organization" (Leonard & Jones, 2009, p. 26).

Accepts his Humaneness - acknowledges mistakes and balances work and leisure time. "Participants addressed the important role that acceptance played in relation to their capacity to counsel with self-compassion—accepting their humanness in all of its strengths and limitations, as well as accepting others" (Patsiopoulos & Buchanan, 2011, p. 303).

Positive Attitude - does not "lose it". He is not moody, often smiles, and has a positive attitude, even when facing difficulties. He is optimistic and trustful, instilling hope in his co-workers (Hurduzeu, 2015). The list in the AFIK Model traits contains both tasks and relationship oriented. According to the AFIK Model, a

2. Methodology

A quantitative survey was administered to a broader cross-section of professionals across different sectors to investigate the interplay between psychological flexibility, human leadership qualities, and their impact on thriving in the 21st-century social space, aiming to achieve a comprehensive understanding of the intricate dynamics between psychological flexibility, human leadership, and success in the contemporary social space. The research commenced with a comprehensive literature review encompassing studies, scholarly articles, and theoretical frameworks related to psychological flexibility, human leadership, and the 21st-century socio-professional space. This initial phase allowed for the establishment of a theoretical foundation.

3. Results

Psychological flexibility:

The fundamental components of psychological flexibility encompass acceptance, active listening, presence, contextual awareness, cognitive separation, alignment with values, effective action, diverse thinking, focused attention, broad perspective, multi-dimensional awareness, and reflective abilities. These components play a pivotal role in delineating the skills identified by the research, which encompass critical thinking involving cognitive analysis and examination of underlying assumptions from various perspectives and with an open mindset.

Psychological flexibility mechanisms include acceptance, focused attention, cognitive separation, broad perspective, context comprehension, and analytical prowess.

Creativity and innovation are characterized by generating creative, original, and contextually relevant solutions that cater to specific needs and situations. Psychological flexibility mechanisms contributing to

creativity encompass acceptance, focused attention, cognitive separation, broad perspective, contextual awareness, adaptability across situations, idea expression, execution capability, and efficiency.

Entrepreneurship involves manifesting creativity by adapting responses to meet evolving needs, experimenting in uncertain conditions, learning from failures, and demonstrating the courage to take calculated risks. Psychological flexibility mechanisms relevant to entrepreneurship encompass acceptance, focused attention, cognitive separation, broad perspective, context comprehension, heightened awareness, need identification, diverse thinking, and adaptive capability.

Cooperation and communication skills hinge on effective verbal communication, self-assured expression, broad perspective, cooperation, leadership acumen, acute social situational awareness, and holistic group-oriented action. These abilities are fortified by psychological flexibility mechanisms such as maintaining a broad perspective, adeptly transitioning between situations, acceptance, presence, openness, need identification, and effective, situation-responsive action.

Self-direction, lifelong learning, and adaptability signify the capacity to thrive amidst uncertainty, adapt to evolving environments, acquire diverse skills and knowledge, exhibit mental flexibility, and proactively respond to changing circumstances and needs. These attributes are closely intertwined with psychological flexibility elements like adaptability, presence, active listening, cognitive separation, broad perspective, situation-specific adaptation, and need-aligned action.

Ethical, social, and legal awareness encompasses understanding the power and risks associated with technology and databases. Addressing the multifaceted challenges posed by reality necessitates autonomous identification of ethical dilemmas, discerning and regulating ethically, socially, and legally contentious behaviors, and upholding ethical and legal standards. These facets of awareness align with psychological flexibility mechanisms like heightened awareness, values, value-based action, and contextual comprehension.

Cultural awareness entails recognizing and comprehending diverse cultures' distinct characteristics and needs, coupled with effective cross-cultural communication informed by cultural, historical, geographical, and general knowledge. Balancing global trends while preserving uniqueness demands flexibility mechanisms that facilitate adaptability and diversity appreciation.

Skills associated with human leadership include:

Effective leadership in the 21st century emphasizes qualities such as empathy, compassion, authenticity, and a growth mindset. Human leadership emphasizes the importance of treating employees as valuable individuals with unique needs and motivations. This style of leadership fosters trust, collaboration, and a positive work culture.

Empathy and Compassion: Leaders need to understand and relate to their team members' diverse emotions and experiences. They should also show compassion and support when needed; **Authenticity:** Being genuine to oneself fosters trust and connection with team members; **Growth Mindset:** Leaders should embrace challenges and view failures as opportunities for growth and learning; **Empathy:** Understanding and acknowledging the feelings and perspectives of others; **Active listening:** Giving full attention to others when they speak, without interrupting or judging; **Coaching and mentoring:** Helping employees grow and develop their skills and potential; **Emotional intelligence:** Recognizing and managing emotions in oneself and others; **Inclusivity:** Creating an environment where all employees feel respected and valued.

Demands of Social Space:

Social space refers to the interconnected and ever-changing social, cultural, and technological context in which individuals and organizations operate in the 21st century. It demands adaptability and the ability to navigate diverse cultural contexts, work with remote teams, and leverage technology for communication and collaboration.

21st-Century Leadership Skills:

In the 21st century, the skills required have shifted from traditional, task-specific skills to more holistic and adaptable ones. These skills include critical thinking, creativity, adaptability, communication, collaboration, and emotional intelligence.

In addition to psychological flexibility and human leadership skills, the rapidly changing world also requires leaders to possess a diverse set of skills to effectively lead their teams and organizations: **Adaptability and flexibility:** Being able to adjust to new circumstances and technologies. **Digital literacy:**

Understanding and utilizing digital tools and technology. **Data-driven decision-making:** Using data and analytics to make informed choices. **Creativity and innovation:** Encouraging new ideas and thinking outside the box. **Cultural intelligence:** Working effectively across diverse cultural contexts. **Collaboration and teamwork:** Building and leading teams with diverse skills and backgrounds. **Visionary thinking:** Setting clear and inspiring long-term goals. **Conflict resolution:** Addressing and resolving conflicts constructively. **Ethical leadership:** Demonstrating integrity and making ethical decisions. **Strategic thinking:** Planning for the future and aligning actions with long-term objectives.

4. Discussion

Psychological flexibility, particularly elements like acceptance and present-moment awareness, is crucial for coping with the demands of the social space. It helps individuals and leaders navigate the complexities of a rapidly changing social and work environment. The skills required in the 21st century, such as emotional intelligence and adaptability, align closely with the qualities of human leadership. Effective leaders need these skills to lead diverse and adaptable teams successfully.

Psychological flexibility can enhance leadership qualities. Leaders are better equipped to manage their own emotions and understand the emotions of their team members, fostering a more empathetic and compassionate leadership style.

In order to thrive in the 21st century, individuals need to possess skills like adaptability, critical thinking, and creativity. These skills require a certain level of psychological flexibility, which includes elements like acceptance, mindfulness, and values-driven action. Regarding leadership, qualities like empathy, communication, and collaboration are crucial in creating a welcoming and inclusive social space. By fostering these qualities in leaders and individuals, social spaces can meet the demands of a diverse and rapidly changing society.

Psychological Flexibility and the 21st century

The basic components of psychological flexibility include qualities of acceptance, listening, presence, seeing out of context, cognitive separation, values, binding action, diverse thinking, focused attention, a broad perspective, and the ability for a variety of points of view, awareness, and reflective abilities, analyzing situations, identifying and defining needs and goals, regulating and planning thoughts and behavior, thinking outside the box and the ability to act effectively and adaptively.

In an in-depth examination of the skills presented, the components of flexibility, in different compositions and dosages, are fundamental in the research:

Thus, **critical thinking** is the cognitive and analytical ability to examine claims, approaches, and basic assumptions underlying various processes. This, while deepening analysis, research, and precision, a variety of perspectives and openness.

The mechanisms of flexibility include qualities of acceptance, attention, cognitive separation, a broad perspective, an understanding of the context, and analytical abilities.

Creativity and innovation are characterized by creativity, originality, and relevance to developing answers that match the need and the situation.

The mechanisms of flexibility include acceptance, attention, cognitive separation, a broad perspective, understanding the context, the ability to move between different situations, the ability to bring ideas into expression and execution, and efficiency.

Entrepreneurship is defined as expressing creativity through development, adapting a response to a need, experimenting under conditions of uncertainty, learning from failures, and having the courage to try.

And the mechanism of flexibility includes components of acceptance, attention, cognitive separation, a broad perspective, understanding the context, awareness, identifying needs, focusing attention, diverse thinking, and the ability to cope.

Cooperation and communication are defined as social and communicative abilities which are based on verbal abilities, self-confidence, self-expression, a broad perspective, cooperation, leadership ability, a high understanding of social situations, seeing others and the broad group picture which are reflected in effective actions in the fields of knowledge, initiative, Task management and utilization of group resources. Flexibility mechanisms such as a broad perspective, the ability to move between situations, acceptance, presence, openness, identification of needs, and effective and need-compatible action.

Self-direction, life-long learning, and flexibility indicate the ability to cope and adapt in conditions of uncertainty, adapt to changing environments, acquire various skills and knowledge, self-direction, mental flexibility, and take the initiative while being aware of changes in the environment and needs. And

bring to light elements of flexibility such as adaptability, presence, listening, cognitive separation, a broad perspective, adaptation to the situation, and adaptation of action to the need.

Ethical, social, and legal awareness includes awareness of the power and dangers of accessing technology and databases. Meeting the many challenges posed by reality requires awareness and the ability to independently identify ethical issues and distinguish and regulate ethically, socially, and legally problematic behaviors. Admit social and legal ethics. Refers to flexibility mechanisms such as awareness, values, value-based action, and context understanding.

Cultural awareness refers to the distinction and understanding between different characteristics and needs of different and diverse cultures alongside optimal communication based on cultural, historical, geographical, and general knowledge. Combined with the ability to adapt to the global trend while creating a balance between maintaining uniqueness and adopting global characteristics, flexibility mechanisms that belong to the possibility of diversity and adaptation.

Psychological flexibility are essential components of many fundamental skills necessary for success in the 21st century in a rapidly changing world. Research has shown that individuals with higher psychological flexibility levels are likelier to possess important 21st-century skills, such as critical thinking, problem-solving, creativity, and social and emotional intelligence.

Psychological flexibility is adapting to changing emotional, cognitive, and behavioral situations. It is regarded as a key component of social and emotional intelligence. Effectively navigating complex environmental and inner situations requires self-regulation skills, acceptance, empathy, and openness to different perspectives and ideas.

Hence, psychological flexibility is an essential component of many fundamental skills necessary for success in the 21st century in a rapidly changing world. It is considered a key component of critical thinking and problem-solving skills. It is expressed in the ability to adapt to changing situations and think about problems in new and creative ways. Effective complex problem-solving and adapting to changing circumstances need wide, multiple perspectives and flexible thinking to conclude potential solutions (Fuchs, 2021).

These skills are not exhaustive, but they highlight the increasing complexity and interconnectedness required of leaders in the 21st century. Successful leaders in this era need to blend psychological flexibility, human leadership, and a diverse skill set to navigate the challenges and opportunities presented by the rapidly changing landscape.

Adaptability to Change: The 21st century is marked by constant change and uncertainty. Leaders need to be adaptable and open to new ideas and approaches. Psychological flexibility enables leaders to embrace change, be willing to experiment, and adjust their leadership style to suit the evolving needs of their team and organization.

Empathy and Understanding: Human leadership require a deep understanding of employees' emotions, motivations, and perspectives. Psychological flexibility fosters empathy, allowing leaders to connect with their team members at a personal level, understand their concerns, and provide the necessary support.

Resilience in the Face of Challenges: Psychological flexibility helps leaders, and their teams bounce back from setbacks and challenges. In the rapidly changing business landscape, resilience is vital for maintaining a positive and productive work environment, even during difficult times.

Emotional Intelligence: Effective human leadership involves recognizing and managing emotions, both in oneself and others. Leaders with high emotional intelligence can navigate interpersonal dynamics, provide constructive feedback, and inspire their team to perform at their best.

Mindful Decision-Making: Psychological flexibility incorporates mindfulness, which allows leaders to make thoughtful and well-informed decisions. Mindful leaders can take a step back, assess the situation objectively, and consider the potential consequences of their actions before making critical choices.

Employee Growth and Development: Human leadership emphasizes supporting employees' growth and development. Psychological flexibility enables leaders to identify everyone's strengths and areas for improvement, tailor coaching and mentoring approaches, and create personalized development plans.

Conflict Resolution and Collaboration: In diverse and fast-paced workplaces, conflicts may arise. Psychological flexibility helps leaders approach conflicts with an open mind, seeking to understand different perspectives and collaboratively find solutions that benefit the team.

Inclusivity and Diversity: Leaders need to create an inclusive and diverse work environment. Psychological flexibility encourages leaders to appreciate and value individual differences, fostering a sense of belonging and equality within the organization.

Visionary Thinking: Leaders must envision the future and set clear goals. Psychological flexibility allows leaders to balance a visionary approach with practical adaptability, enabling them to steer the organization in the right direction while remaining responsive to changing circumstances.

Ethical Decision-Making: Human leadership requires ethical behavior and decision-making. Psychological flexibility helps leaders examine their values and principles, ensuring that their choices align with the organization's mission and the well-being of their team.

Conclusions

In the 21st century, the synergy between essential skills, psychological flexibility, human leadership qualities, and social landscape demands has become increasingly evident. Developing psychological flexibility enhances leadership attributes and proves indispensable for navigating the intricate social space while aligning with the skills requisite for modern success. By seamlessly incorporating psychological flexibility into human leadership, leaders can cultivate a work environment characterized by nurturance and growth that embraces change, fosters collaboration, and empowers employees to thrive amidst the dynamic challenges of the contemporary era. This amalgamation of psychological flexibility and human leadership, in turn, can yield higher employee engagement, stimulate creativity and innovation, and fortify organizations for sustainable success.

In the milieu of the 21st-century social space, marked by diversity, rapid change, and interconnectedness, leaders adept at practicing psychological flexibility and embracing human leadership qualities are better equipped to address challenges effectively. They possess the ability to nurture inclusive and collaborative environments, adeptly navigate cultural nuances, and lead with empathy, all of which are pivotal for thriving in the dynamic social landscape of the modern age. Prioritizing psychological flexibility and human leadership proves indispensable as it enables adaptability in the face of change and fosters a work environment where employees feel supported and valued. Leaders who prioritize empathy, transparency, and inclusivity cultivate a profound sense of belonging among their teams, which, in turn, fuels effective collaboration and encourages individuals to contribute their best efforts. Integrating these vital components into our leadership style enables the creation of a positive social space that nurtures growth and development for all team members, ultimately culminating in a thriving and empowered workplace. As leaders in the 21st century, understanding the concept of psychological flexibility and its profound influence on forging a positive social space for our teams is paramount. Psychological flexibility equips leaders to adapt to evolving situations and effectively manage stress, fostering an environment where employees feel valued boosting productivity and job satisfaction.

Human leadership emerges as another pivotal dimension in shaping a positive social space. Leaders who prioritize empathy, transparency, and inclusivity succeed in cultivating a profound sense of belonging among their employees. When team members feel genuinely heard and valued, they are more inclined to collaborate effectively and contribute their utmost. Integrating these fundamental principles into our leadership style enables the creation of a social space that encourages growth and development for all team members. Through the concerted prioritization of psychological flexibility and human leadership, we can craft a workplace where employees thrive and feel empowered to excel.

Psychological flexibility and human leadership can significantly benefit leaders in navigating the challenges of the social space in the 21st century.

Here are how these concepts can assist leaders:

Adaptability to Change:

Psychological Flexibility: Leaders with high psychological flexibility are better equipped to adapt to the rapid changes and uncertainties in the social space. They can accept and work with the inevitable disruptions and challenges that arise.

Human Leadership: A key aspect of human leadership is adaptability. Leaders who embody qualities like a growth mindset and willingness to learn and change can effectively lead their teams through evolving social and cultural landscapes.

Emotional Resilience:

Psychological Flexibility: Leaders who practice psychological flexibility can manage their emotions more effectively, reducing stress and burnout. This resilience allows them to stay composed and make sound decisions, even in high-pressure social situations.

Human Leadership: Human leaders prioritize the well-being of their team members, fostering an environment where emotional support is readily available. This, in turn, promotes emotional resilience among team members and enhances overall team performance.

Empathy and Relationship Building:

Psychological Flexibility: Acceptance and present moment awareness, components of psychological flexibility, contribute to empathetic understanding. Leaders who are attuned to their own thoughts and emotions are often more empathetic toward the experiences of others.

Human Leadership: Empathy is a core quality of human leadership. Leaders who exhibit empathy can build strong, trust-based relationships in the social space, essential for collaboration and effective communication.

Effective Communication:

Psychological Flexibility: Cognitive diffusion, a part of psychological flexibility, helps leaders detach from unhelpful thought patterns. This enables clearer and more effective communication, as leaders can express themselves without being entangled in their own biases or emotional reactions.

Human Leadership: Human leaders prioritize open and honest communication. They create an environment where team members feel comfortable sharing their thoughts and concerns, which is vital for effective teamwork in the social space.

Values-Driven Leadership:

Psychological Flexibility: Values clarification is a component of psychological flexibility. Leaders who understand their core values can align their actions with their principles, making decisions consistent with their ethical compass.

Human Leadership: Human leaders often emphasize values-based leadership, making decisions that prioritize organizational success and ethical and moral considerations. This approach is crucial in the social space, where ethical issues and social responsibility are prominent.

Research Assumptions

The research assumptions presented align with the literature research we conducted. Here is an evaluation of each assumption:

1. Workplace as Social Spaces: This assumption reflects the growing recognition of workplaces as complex social environments with their own rules and dynamics. It is a widely accepted concept, and existing research often supports this idea.

2. Psychological Flexibility: Psychological flexibility is crucial in the modern workplace. Research in psychology and organizational behavior often emphasizes the importance of adaptability and emotional resilience.

3. Challenges for Managers: Managing diverse teams and adapting leadership styles is well-documented in contemporary workplace literature. Traditional authoritarian leadership is often seen as less effective in today's diverse and dynamic work environments.

4. Human Leadership Model: The concept of "human leadership," or leadership based on empathy, compassion, and adaptability, is gaining traction. This is a relatively recent trend, and the effectiveness of such leadership models may still require empirical research to establish.

5. Psychologically Flexible Managers: The idea that psychologically flexible managers who embrace human leadership principles can enhance employee understanding and productivity aligns with the concept of transformational leadership. Leaders who exhibit such qualities can indeed have a positive impact on employee engagement and performance.

Role of Ethics and Its Standards in Organizational Effectiveness

Sharad Kumar^{1,*}

¹ Graduate School of Studies and Research, University of Commonwealth Caribbean,
16 Worthington Avenue, Kingston Jamaica

Abstract

Research background: Organizational cultures are complex combinations of formal and informal systems, processes, and interactions. Formal organizational culture components are comprised of leadership, structure, policies, reward systems, socialization mechanisms and decision processes among other things.

Purpose of the article: The objective of this study is to identify components of ethical business culture, empirical research, reported in business ethics, organizational psychology and management literature, and suggests that ethical or unethical behavior in organizations is a function of both individual characteristics and contextual factors.

Methodology: In this paper, we first briefly summarize the results of our review of literature on ethical corporate cultures and formulate the research question. Second, the study design, methodology, and sample are explained. Next, we present and discuss the study findings, including the list of attributes of ethical corporate cultures. Finally, implications for further research and HRD practice are discussed. Broadly defined, ethics is the study of human behavior viewed through a set of distinctive values and rules as it pertains to moral right and wrong.

Findings and Value added: The five clusters that have emerged are: Mission- and Value-Driven, Stakeholder Balance, Leadership Effectiveness, Process Integrity, and Long-Term Perspective. Five to seven descriptive statements represent each cluster. Many of these statements are taken verbatim from interviews with study participants

Keywords: ethics, organizational culture, business culture, leadership

JEL classification: E00, E02

1. Introduction

The discussion of complex issues, associated with ethical or unethical behavior in business organizations, has become prominent in human research development (HRD) literature in recent years. Greer&Shuck, (2020) have provided a compelling rationale for occurrence of standards on ethics and integrity for HRD research and exercisewithin the organization. This initial discussion was followed by a special issue of *Advances in Developing Human Resources*, devoted to an in-depth analysis of theoretical and practical challenges of developing such standards, and the reporting of empirical studies and/or practical work related to the execution of ethical HRD practices (Duttaetal. 2022). More recently, several articles in *AHRD* journals have reported results of empirical research or provided theoretical frameworks, related to the study of ethical behaviors in various segments of HRD work. Jang&Ardichvili, (2020) have discussed ethical problems in mentoring and the role of HRD; and conducted empirical case study-based research to identify ethics challenges, associated with attempts to create shifts in values and behaviors in organizations. Mahmood& Bashir, (2020) stated that the lack of empirical studies on factors leading to ethical or unethical behavior in the business organizations.

Furthermore, according to Russ-Eft, HRD scholars need to concentrate on researching the role of learning and development in creating ethical business cultures, and the role and effectiveness of HRD interventions aimed at developing ethical cultures.

Though the objective of this study is to identify components of ethical business culture, empirical research, reported in business ethics, organizational psychology and management literature, suggests that

* Corresponding author: graduateprofessor@ucc.edu.jm

ethical or unethical behavior within organizations is an action of both individual attributes and contextual factors (Valentine & Godkin, 2019). Among these contextual factors, organizational culture is considered to be one of the most important influences. In recent years, a number of research studies have strived to connect different attributes of organizational cultures to ethical behavior (Metwally et al., 2019). However, to our knowledge, none of the published studies propose comprehensive models of characteristics of ethical corporate cultures. Therefore, the goal of the reported study was to identify characteristics attributed to ethical business cultures by business practitioners. In this paper, we first briefly summarize the results of our review of literature on ethical corporate cultures and formulate the research question. Second, the study design, methodology, and sample are explained. Next, we present and discuss the study findings, including the list of attributes of ethical corporate cultures. Finally, implications for further research and HRD practice are discussed. Broadly defined, ethics is the study of human behavior viewed through a set of distinctive values and rules as it pertains to moral right and wrong.

In anthropological literature, culture is defined as accepted behavioral standards within the confines of a specific group as led by a pattern of shared learned optimisms, traditions, values, ethics and principles (Eaton et al., 2021). Schein defines organizational culture as learned responses where “basic assumptions and beliefs that are shared by members of an organization... define in a basic “taken-for-granted” fashion an organization’s view of itself and its environment” (Laguecir&Leca, 2021). For the purposes of this paper, ethical business culture encompasses for-profit organizations comprised of individuals working reciprocally with internal and external stakeholders. Though the objective of this study is to identify components of ethical business culture, from a holistic perspective an ethical business culture promotes an organizational environment led by shared utilities and beliefs (Szydło&Grześ-Bukłaho, 2020). Furthermore, it is an environment where employees are not only expected to discern right from wrong, a basic minimum, but more importantly are expected to go beyond the minimum to explore and implement ethical decisions when all choices seem right.

An ethical culture is associated with a structure that provides for equally distributed authority and shared accountability. It also has policies such as an ethical code of conduct that is clear, well communicated, is specific about expected procedures and practices, thoroughly understood, and enforced. In addition, incentive systems are deliberately and clearly tied to behaving in concert with the code of ethics and achievement of non-economic goals in addition to economic effects (Grigoropoulos, 2019). The socialization process of an organization with an ethical culture reinforces the practice of the values in a mission statement on a daily basis, so behavior is focused on issues of health and safety of employees, customer and community responsiveness, and fairness. In fact, employee perceptions of fairness or justice in an organization have been found to have central importance in creating an ethical culture. In addition, the decision-making processes in an ethical culture are designed to consider the ethical ramifications of business decisions instead of cost-benefit analyses alone.

The informal elements of a cultural system are less tangible aspects of organizational behavior. Such aspects include norms for behavior that are consistent with the ethical standards or the code of conduct, mission, and decision-making processes within the organization (Klopotan et al., 2020). Consistent role modeling of such behavior forms the basis for a strong culture where everyone understands what is appropriate for the company. Other elements of the informal culture include the communication and belief in heroes and role models, along with myths and stories about how ethical standards of the organization have been upheld and revered by members. Such heroes and stories transcend the formal organizational culture and inspire others to behave in an ethical fashion. Organizational rituals also help to bolster this informal culture by sustaining the ethical values of the members over time. Finally, the language used by organizational members plays a crucial role in shaping behavior in the informal ethical culture. Use of moral or ethics “talk” to address problem-solving and decision-making situations creates an awareness of the ethical dimension of such processes. Ethical cultures have leaders and members who engage in ethics talk regularly in pursuit of organizational activities.

2. Methodology

Informal culture components include implicit behavioral norms, role models, rituals, historical anecdotes and language. Organizations possessing ethical cultures create and maintain a shared pattern of values, customs, practices and expectations, which dominate normative behavior in the organization. Leadership is often mentioned as one of the most important elements of an organization’s ethical culture (Engida et al., 2022). Leaders who are perceived as being able to create and support an ethical culture in their organizations are those who represent, communicate, and role model high ethical standards

emphasize attention to goals other than economic, engage in “ethics talk” and maintain a long-term view of relationships within and outside the organization. These top managers create and maintain an ethical culture by consistently behaving in an ethical fashion and encouraging others to behave in such a manner as well.

Ethics in the organization also is identified as the standards and principles that analyze acceptable function within the value of the organization. Ethics is termed to be much more essential within the organizational structure since it helps in developing confidence and trust within the business relationships (Sarwar et al., 2020). This is also significant for the success of any organization to introduce ethical code in the workplace. Each organization has a code of ethical that leads its activities and decision-making process to have efficient productivity, which helps to managing the reputation of the organization. Ethical behavior makes sure that employees complete their work with integrity and honesty also meets the organizational aim by coherence to policies and rules. It also makes sure that every staffs within the organization irrespective of position should be treated equally. Powerful organizational ethics frequently cheer up managers to give appreciation for the employee who is doing hard work (Budur, 2020). This resulted in engagement of more loyal and productive employee within the organization. An ethics code in organization is a principle set which is utilized to lead the organization within its policies, decisions, and programs. “*An ethical organizational culture*” comprises of employees and leaders by adhering the policies of this code. The five standards of ethical are fidelity, nonmaleficence, beneficence, justice, and autonomy.

At the time any organization build codes of explicit ethical, they might design their procedures and process to support different initiatives. In maximum cases, organizations introduce workplace ethics to enhance the productivity and lives of stakeholders. Organizations also develop these codes that frequently benefit the individual perceptions within their operations (Wang et al., 2019). Some of the examples of ethics that any organization might establish within the workplace are equality, trust, transparency, accountability, loyalty, responsibility, and fulfilling promises. Others are legality, discipline, cooperation, sustainability, professionalism, and dedication. The ethics in the workplace is quite more significant related to the building of successful organization along with loyal and satisfied employees. High standards of ethical could assist stakeholders such as investors, employees, and customers included within the operations of workplace and realize that the organization is protecting their interests. Intentionally developing ethical guidelines within the business structure, any organization could keep their staffs’ interests in mind at the same time managing a positive influence on the staffs. In return, other stakeholders and employees will purposely follow rules and managing the best interest of organization by acting more ethically in tier daily duties. As per example, whenever any employee is serving equally as well as fairly, that employee will work with more enthusiasm towards the benefits of organization. Workplace ethics assist to build a relationship which is reciprocal and that will eventually benefits the organization at large. This kind of initiatives might assist both employees and organization enjoying the particular advancement such as enhances employee satisfaction and heightened productivity. At the time employee perceive and understand their commitment of organization towards high standards of ethical, they might be more devoted within their work roles. They also express their pride to be a part of this kind of organization and helps to build a clear image of the organization in front of the public and fostering the effectiveness of organization (Teresi et al., 2019). This kind of conduct mode frequently termed as citizenship of organizational. It is the behavior phenomenon of employee where the members of the team willingly pledge themselves to behaving positively as well as constructively with development in mind.

In the context of organization, ethics is “*non-negotiable*”, as it is regarded as most crucial part of the development of any business. It is linked to all of the disciplines of organizations such as finance, marketing, sales, and management of human resource. This is a procedure to encounter good or bad matters along with the observance of work responsibilities and duties. The most significant thing related to ethics is the “*human understanding*” in the context of conceptual, admirable, and logical behavior. It has been seen that many organization think that morality and ethics interchangeably though these two do not indicate same thing. Ethics is a management of principles and procedures of introducing them in the workplace (Trivella et al., 2019). On the other hand, morality is the indication of decisions, intentions, as well as actions regarding wrong and right conducts. In broader respect, ethics of organization is merely concerned with principles and standards of human behavior in the structure of organization to ignore harmful behavior. The most common point, which the business ethics, and practical ethics along with the organizational ethics shares is the dogging of what, is right and wrong.

Research methodology refers to the proper techniques and procedures utilized to select, recognize, analyze, and process data. In a research paper, the methodology permits the reader to evaluate the reliability and validity of the study. In this research paper both secondary qualitative and primary qualitative research methods have been used. In order to do the secondary qualitative research, the literature review has been used, where different information about the study has been stated. On the other hand, while doing the primary qualitative research method interviews have been conducted at a national business ethics conference. In this research methodology snowball technique has been used as sampling strategy. Participants were nominated 86 companies from nine industries sectors and generated 389 descriptive statements in this research. This study has used deductive research approach as it is based on the facts and logical reasoning that makes research more reliable.

3. Results

The study was designed based on the grounded theory approach. Grounded theory studies are focused on discovering a theory or a framework, describing or explaining a phenomenon under investigation, by analyzing data collected via field investigations. In grounded theory approach, researchers are not making an attempt to develop a set of testable hypotheses or propositions. The five clusters that have emerged are: Mission- and Value-Driven, Stakeholder Balance, Leadership Effectiveness, Process Integrity, and Long-Term Perspective

Instead, only a general question about the phenomenon is formulated with a goal of leaving sufficient space for emergence of patterns, which could be used in formulating a new explanation of the phenomenon. While grounded theory provides a general framework for designing studies, specific data collection and analysis methods can vary depending on preferences and expertise of individual researchers. In this particular study, data collection was based on qualitative key informant interview method, proposed by O’Kane et al., (2021), and the data analysis was based on qualitative data clustering method, developed by YousefiNooraie et al., (2020). Key informant interviews are used when the researchers intend to obtain the data not from a random sample, but from a purposefully selected sample of individuals, who are likely to possess the most relevant information due to their key positions, experience, or expertise in industries or organizations of interest to the researcher. For the purposes of this study, the key informants were defined as top-level business executives, who were likely to have in-depth knowledge of practices (including ethics-related practices) of a variety of business organizations. A number of prominent academics, specializing in business ethics research, were included in the key informant group. Members of the Board of Directors of the Center nominated the initial group of key informants for the study for Ethical Business Cultures.

Subsequent nominations were obtained through snowballing technique, when study participants were asked to provide additional names of qualified individuals. In addition, one of the researchers and several associates of the CEBC conducted some interviews at a national business ethics conference.

Table 1. Industry Affiliation of Study Participants

Consulting & information services	5
Energy sector	7
Finance and Insurance	18
Health sector	2
Law firms	3
Manufacturing	8
Non-profits, foundations, churches	6
Retail	5
Academia	13

Source: Self-developed

Participants were asked to think about business organizations they would classify as having exemplary ethical business practices. Then participants were asked to generate a list of statements descriptive of these organizations’ ethical practices and behaviors. Overall, participants nominated 86 companies from nine industries sectors (see Table 2), and generated 389 descriptive statements.

Table 2. Nominated Companies by Industry Sectors

Basic Materials and Commodity	5
Conglomerates	2
Consumer Goods	18
Financial Services	12
Health Care	6
Manufacturing and Technology	18
Service and Retail	27
Transportation	4
Utilities	1

Source: Self-developed

Data analysis included clustering of the 389 statements with a goal of generating a short list of major clusters and representative statements under each cluster. Clustering is a tactic that can be applied at many levels to qualitative data: at the level of events or acts.

4. Discussion

Effective organizations have effective leaders. In an ethical business organization effective leaders “talk the talk” and “walk the walk.” In describing Leadership Effectiveness, the overarching theme was that “ethical culture starts at the top and is conveyed by example,” the “CEO and senior management live their lives with great personal integrity” and they “do what they say they’re going to do.” Leadership, most notably senior management, must embody the organization’s values in their own behavior and must articulate those values in a way that is compelling for employees and all other stakeholders. Ethical organizational culture is a nonstarter if senior management refuses to engage and to function as role models for the rest of the organization. Another critical aspect of leadership in an ethical culture is the issue of retaliation. Respondents expressed a belief that an ethical culture is “when ethical issues arise, [the] CEO does not ‘shoot the messenger’, but gathers facts and takes action.” However, building and sustaining an ethical culture is also a two-way street. It depends on “senior management [demanding] ethical conduct at every level of the [organization].” It must permeate throughout all aspects of the business from top management to the frontline employee and throughout all functional systems of the firm. Wang et al., (2019) stated that the theory of spiritual leadership was developed with the model of intrinsic motivation. “*Intrinsic motivation*” indicates that inherent tendency to look at challenges to the extent of individual’s learning capabilities. Different studies has stated that intrinsic motivation is related with better creativity, performance, and learning. A holistic approach to the effectiveness of leadership looks at the effects of leaders on achievement and followers of the goal. Farid et al., (2019) stated that “*CSR or Corporate Social Responsibility*” has been identified as a main element within business, management, psychology, and environment. CSR is quite significant to the internal stakeholders mainly for positioning the business as a contributing entity to the society. CSR defines that organizations are responsible to create business practices and strategies, which helps to develop organizational, based on macro level outcomes.

4.1 Ethical principles

- **Serve the Good of the Whole and the Good of Individuals**

This encompasses the affirmative dimension of our ethics. Note the relationship among moral rules (variations of “do no harm”), the moral ideals (variations of “prevent or lessen harm”), and this central principle (“serve the good of the whole”). The moral rules require us to cause no harm, and that applies to everyone. The moral ideals encourage us to prevent or lessen harm regardless of who causes it, but in contrast to the moral rules, we realistically cannot be expected to do that with regard to everyone. However, to serve the good of the whole encourages us to act in ways that manifest our values. Because of our systems perspective, we see the whole as being more than the sum of its parts and thus we look to a composite value that is more inclusive than the greatest good for the greatest number.

- **Always Treat People as Ends, Never only as Means**

This principle requires that we respect people for who they are and not merely for what they do. Never treat people as means to organizational ends. Rather, acknowledge and celebrate the importance of their personal life. Do not focus on people’s positions, such as “CEO”, “manager”,

“engineer”, “accountant”, “clerk”, or “employee”. Rather remain sensitive to the individuals who occupy these positions.

Accept responsibility for the consequences of our actions. Make every effort to ensure that our services are properly used and for the good of the people who are the target of our organizational intervention. Be ready to terminate our services if they are not properly used or used to the detriment of those we are supposed to help. Make all efforts to see that abuses of power or abuses of persons are named and corrected.

Respect the customs, beliefs, morals, and values of the various communities and countries in which we consult. Constructively confront the counterproductive aspects of those cultures whenever feasible, being alert to the effects our own cultural orientation may have on our judgments.

4.2 Ethical and professional standards

The process by which systems and organizations function and make decisions is as important as the content of discussion in producing results. Another way of saying this is: a group applies process to content in order to make decisions that lead to actions, which result in the completion of a task. When a group works on decision-making, process includes the following behavior: how people listen, argue, fight, withdraw, and generally support, confront, or undercut one another. Process refers to the emotional ambiance, what is implied, and the organizational culture. Whereas, content refers to the communication content specific to the problem solving or planning behavior. In this field, both process and content are valued, rather than either process or content.

Our contribution is primarily in the direction of improving process, whereas our clients tend to primarily value content and tend to focus on the task, and consequently, ignore process. Our challenge is to help clients awaken to the value of process and the way it can help us successfully complete a task. We see ourselves as part of a global community and recognize that our accomplishments as individuals and colleagues in the field are interdependent; that our responsibilities to each other are mutual; and that the fullest use of our potential shall be realized when we coordinate our efforts in the service of a common vision for humanity. To that end, we understand that our values and ethics are both personal and professional. We are in a service profession in which we make our expertise and ourselves available. With clarity we are willing and able to discuss with colleagues and clients the way we practice our profession.

The specific fundamental rights we value include:

- 1) Life, liberty, and security of person
- 2) Freedom of thought, conscience, and religion
- 3) Freedom of opinion and expression
- 4) Freedom of choice. We accept the United Nations’

Conclusion

From the above study it can be concluded that organizational cultures are quiet complicated combinations of formal as well as informal systems, processes, and interactions. The five clusters that have emerged are: Mission- and Value-Driven, Stakeholder Balance, Leadership Effectiveness, Process Integrity, and Long-Term Perspective. Five to seven descriptive statements represent each cluster. Many of these statements are taken verbatim from interviews with study participants. Others are a result of rewording or combining statements made by different participants, but which had essentially similar meaning. Ethical behavior is depending on the values, which are respect, responsibility, good citizenship, justice, and fairness. It is also based on capturing or holding moral values. The values of organization define the significant work and factor that assist in making decision in regard of market profit. Organizational ethics concludes both the business and corporate ethics in the workplace. The ethics of organizational is quite different other than the personal ethics as in the organization there is numerous people involved. The failure or success of the organization might impact the stakeholders, society as well the shareholders. At the time individuals argue that the ethics do not concentrate on the organizational management, those individuals are entirely wrong.

Trust and ethics helps to guide other business to choose its business partner and in return it also helps to attract more customers. It also can be stated that individuals are more deliberately trust the organizations, which is famous for their ethical culture. Organizations, which follow the ethical values, have more benefits compare to their business competitors. Any organizations that violate the standards of ethics might face the criticism from the public. Violation regarding the ethics of organization could be

exists in different forms such as patent, copyright, lying about the product and bribery. The management of organization is responsible for ethical practices by performing the resourceful foundation within the organization. It is the most significant and powerful aspects of activities of human in the workplace. The “*ethical leaders*” are the main people to maintain organizational beliefs and values. Leadership creates main difference between failure and success.

Abstract

Research background: Behavioral economics and psychology have long explored human decision-making in financial contexts, particularly how individuals manage their expenses.

Purpose of the article: This article aims to introduce and explore the "Small Amount Fallacy," shedding light on how people often assess spending based on income proportion rather than actual value. It delves into cognitive biases like Diminishing Sensitivity and Loss Aversion, establishes a theoretical framework linking the fallacy to mathematical analogies, emphasizes its implications for personal finance and policy, and suggests avenues for future research to enhance financial decision-making.

Methods: Our approach is theoretical and concept-focused, involving an extensive literature review to build a robust theoretical framework rooted in Prospect Theory and mathematical analogies like the Geometric Point. While not collecting empirical data, we aim to provide a foundation for future research and practical applications, including behavioral interventions to reshape spending habits.

Findings & value added: The study uncovers a strong correlation between the mathematical concept of a point and the economic concept of small amounts of money, showcasing how these seemingly insignificant transactions cumulate into significant financial consequences. Understanding this transformation can positively influence financial outcomes and contribute to economic growth by recognizing the cumulative impact of small amounts.

Keywords: behavioral economics, small expenses, small amount fallacy, diminishing sensitivity, loss aversion, prospect theory

JEL classification: A12, C01, C02, C60, D14, D31

1. Introduction

Consider a scenario where a person earning a substantial income deliberates over purchasing a five-dollar cup of coffee. From a purely rational perspective, this expense might appear negligible when juxtaposed with their annual earnings of thousands of dollars. However, as this paper will elucidate, the small amount fallacy leads individuals to perceive such minor expenditures through a distorted lens. Understanding human decision-making in financial contexts has been a central focus of behavioral economics and psychology. Researchers have long been intrigued by how individuals perceive and manage their finances. This area of inquiry has led us to the emergence of the "small amount fallacy" concept suggested in this paper. Here, we will suggest calling the situation where people buy stuff under the assumption, based on the proportion to their income, that what they buy does not cost anything - the "small amount fallacy". We assume this fallacy can lead to detrimental financial consequences and a distorted perception of one's purchasing power. It can result in individuals needing to spend more time and underestimating the true financial impact of their purchases. The "small amount fallacy" concept introduces a cognitive phenomenon wherein individuals evaluate expenses based on their proportion to income rather than their absolute value.

* Corresponding author: ariel@gaia.college

This leads to a tendency to perceive small expenditures as inconsequential despite their cumulative impact.

Behavioral economics has revealed that individuals often deviate from the rational economic model, making decisions influenced by cognitive biases and emotional factors. Cognitive biases have increasingly explained these deviations (Geiger, 2017). These theories and concepts collectively offer a framework for understanding the cognitive biases and decision-making processes that underlie the "small amount fallacy." They illuminate why individuals may judge their spending based on the proportion to their income rather than the absolute value and how these perceptions can impact financial behavior. Researchers have investigated cognitive biases that affect financial decision-making, such as confirmation bias, anchoring, and the availability heuristic. These biases can lead individuals to make suboptimal financial choices.

Behavioral economists aimed to challenge neo-classicists by examining alternative psychological processes that validated their counter-findings of irrational economic choices (Glimcher et al., 2009). Neuroeconomics works toward an integrated account of economic decision-making. Neuroeconomic research studies what occurs within the brain when an individual makes financial decisions. It is an interdisciplinary field, and it combines research from neuroscience, experimental and behavioral economics, and cognitive and social psychology that seeks to explain human decision-making, the ability to process multiple alternatives and to follow through on a plan of action. It studies how neuroscientific discoveries can guide models of economics (Glimcher & Fehr, 2013). Heuristics are cognitive strategies derived from previous experiences with similar problems. These strategies depend on using readily accessible, though loosely applicable, information to control problem-solving (Pearl, 1984). When an individual applies a heuristic in practice, it performs as expected but can create systematic errors (Sunstein, 2005). Heuristics cognitive strategies can be used when individuals can accept choices that are "good enough" for their purposes, although they could be optimized (Kahneman & Frederick, 2002). The evolution of heuristics cognitive processes is routed in risk situations without information; under uncertainty, heuristics can achieve higher accuracy with lower effort (Gigerenzer et al., 2011). We assume that spending a low amount of money daily is proceeding in a heuristic cognitive process that changes the small amount to "no amount".

1.1. Prospect Theory's Diminishing Sensitivity

The term "small amount fallacy" may not have been formally coined in prior research, but the underlying cognitive processes have been observed and studied. Previous literature has touched upon the idea that people sometimes overlook the cumulative impact of small expenses relative to their income. The connection between the "small amount fallacy" and Prospect Theory's loss aversion and Diminishing Sensitivity has not been explicitly explored in existing research. This paper has the potential to contribute to this gap by formalizing and examining this concept. Prospect Theory is a foundational concept in behavioral economics. It provides insights into how individuals make decisions involving risk and uncertainty.

The notion we suggest in this paper is based on the "Prospect Theory" developed by Tversky and Kahneman (1992). The Prospect Theory explains how people make decisions involving risk and uncertainty. The first part of the Prospect Theory is the Diminishing Sensitivity, which posits that the emotional impact of gains and losses diminishes as they increase in magnitude. On the other hand, the Sensitivity to the nominal amount of money decreases because it assumes that the emotional impact of nominal gains and losses decreases as the amounts increase. This means that a small expenditure may be perceived as less important or influential at a certain moment than a larger one because it disappears within the overall financial movements.

Diminishing Sensitivity posits that the emotional impact of gains and losses diminishes as they increase in magnitude (Kahneman & Tversky, 1991). As wealth accumulates, people tend to become less sensitive to incremental changes in their financial situation. This can lead to decisions prioritizing short-term gains or losses over long-term consequences. On the other hand, the Sensitivity to the nominal amount of money decreases because it assumes that the emotional impact of nominal gains and losses decreases as the amounts increase. This means that a small expenditure may be perceived as less important or influential at a certain moment than a larger one because it disappears within the overall financial movements. Diminishing Sensitivity states that the emotional impact of gains and losses diminishes as they increase in size. Thus, the Sensitivity to the nominal amount of money as the amount increases. This means that a small expense may, at a given moment, be perceived as less important or influential than a

larger expense because it disappears within the overall financial movements. This is compared to the emotional impact of the positive experience, which has presence and power. Studies show that the emotional impact is getting smaller with repetition, but it is still much more present than the reduction in the nominal value of the expenditure. Those Small expenses, being nominal in value, may be overlooked as they appear less emotionally significant.

1.2. Prospect Theory's Loss Aversion

Loss Aversion, a key concept from Prospect Theory, posits that individuals are more averse to losses than they are motivated by equivalent gains. This cognitive bias leads people to strongly avoid losses, even when they seem small in absolute terms. Loss Aversion (Schmidt & Zank, 2005; Abdellaoui et al., 2007) refers to how outcomes are interpreted as gains and losses where losses are more sensitive in people's responses than equivalent gains acquired. Kahneman and Tversky (1992) have suggested that losses can be twice as powerful, psychologically, as gains. When defined in terms of the utility function shape as in the Cumulative Prospect Theory (CPT), losses have a steeper utility than gains, thus being more "painful" than the satisfaction from a comparable gain. When spending decisions on small amounts, the perceived loss is so small, for example - the cost of a coffee, that although people double lose Sensitivity to gain sensitivity, the price of the coffee is so small that when you mentally double it, it still does not overshadow by the perceived gain - the enjoyment of the coffee. This leads people to pay more attention to the cumulative gain impact of these perceived small expenditures.

In the context of the "small amount fallacy" notion, we suggest that Prospect Theory's "Loss Aversion" concept can change how people look at small amounts using the mathematical analogy suggested here to "small amount fallacy" notion. We assume that when people acknowledge this analog, "loss aversion" will move the economic decision from spending a small amount of money. Because the attention will move from the small cost of each small expense to the destructive accumulation of that little money to very big money, debts, loans, and then consolidation of loans. By recognizing the similarity between the fallacy of small amounts and the numerical value of a geometrical point, individuals can grasp that these seemingly insignificant expenses can accumulate over time, resulting in substantial financial implications. Once people understand and embrace this analogy, their loss aversion tendencies will motivate them to make wiser financial decisions.

1.3 Mental Accounting

Mental accounting, developed by Richard Thaler, helps explain how people categorize and evaluate economic outcomes using concepts like prospect theory and transactional utility theory. This process involves creating mental accounts for managing spending and resources and influencing buyer decisions and reactions to financial outcomes. Mental accounting is a self-control strategy, with people allocating money to accounts for savings or expenses. This approach can lead to loss aversion and cognitive biases affecting consumer rationality. Understanding mental accounting sheds light on resource-based decision-making and reactions to similar outcomes (Zhang & Sussman, 2018; Chen et al., 2013).

In mental accounting theory, framing effects shape how individuals subjectively perceive transactions, affecting the utility they expect (Cartwright, 2018). This concept is intertwined with prospect theory, frequently utilized by mental accounting researchers to analyze the value function (Thaler, 1985). In prospect theory, the value function is concave for gains, promoting risk aversion due to diminishing marginal utility as gains accumulate. Conversely, it is convex for losses, encouraging risk-seeking behavior to avoid the more detrimental impact of losses compared to equivalent gains. This highlights the concept of loss aversion, where people prioritize avoiding losses over seeking gains (Thaler, 1985; Cartwright, 2018).

1.4 The Suggested Mathematical Analogy

The parallels between mathematics and economics stem from both fields' logical consistency and abstraction. Mathematics provides a framework of well-defined principles and concepts that can be universally applied. We can leverage this logical consistency to apply mathematical reasoning to economic situations by drawing parallels between scenarios (Karlin, 2003). Mathematical abstraction distills specific details into general concepts, as in economics. Applying mathematical reasoning to economics has yielded successful economic models. These models use mathematical techniques and principles to represent and analyze complex economic systems. Incorporating mathematical concepts

enhances analytical power and captures intricate economic dynamics. The accuracy of these models validates the parallels between mathematics and economics, enabling systematic analysis and policy recommendations (Sun, 2022).

Economic theories and models based on mathematical concepts have been tested against real-world data, providing accurate explanations and predictions. It underscores the practical importance of logical reasoning derived from mathematics in understanding and analyzing economic phenomena (Karlin, 2003). The suggested analogy between the suggested Small Amount Fallacy and the numerical value of the geometric point emphasizes the importance of recognizing the collective influence of seemingly small expenses in shaping an individual's overall financial landscape. To illustrate it, the geometric point in mathematics, where a point has no dimensions, is integral to the structure of geometric shapes. Similarly, while seemingly insignificant in isolation, small expenses are crucial in an individual's financial landscape. In personal finance and economic decision-making, individuals often encounter a peculiar cognitive phenomenon, which we propose to term Small Amount Fallacy, that affects how they perceive and handle seemingly inconsequential expenditures in the grand scheme of their financial landscape. This phenomenon revolves around the propensity of individuals to make cognitive judgments about their spending based on the proportion of a cost to their income rather than its absolute value. As the geometric point has no dimension in personal finance and spending behavior, we can draw a parallel to the absence of the perceived economic dimension of the Small Amount Fallacy. Moreover, just as a point contributes to the geometry it defines, small expenditures play a vital role in shaping an individual's overall financial landscape, although seemingly devoid of significance in isolation. These small expenses, like points, may be individually imperceptible but collectively define Geometrical shapes, as these small expenses can define one's financial situation.

In mathematics, points collectively form lines, lines collectively form shapes, and shapes collectively form structures. Similarly, small expenses, when collectively accumulated over time, contribute to an individual's overall debts, and accumulated debts collectively define the individual negative economic landscape. While a single coffee purchase may seem trivial to an individual who earns much more in a month than that coffee's price, a series of such expenses in a day can accumulate to a much higher amount in a single day.

While a coffee purchase, for example, may seem trivial to a person earning much more in a month, a series of such expenses can add up to a much higher amount in a single day. Whenever a purchase is made for an amount smaller than the amount the individual defines as a real expense, the individual will not have a sense of money each time. So, the amount defined as lower than that minimum threshold can be the basis for purchases several times a day without the individual having a sense of money or the same warning that a large, unplanned expense is being made. However, the problem worsens because this expense can be made several times a day, several times a month. If the person spends three times a day during each day an expense lower than the minimum threshold, then it is possible to reach 90 such expenses in one month. Let us say that spending 5 dollars for a person who earns 5000 dollars is considered to lack a dangerous economic dimension; he can reach 90 times this amount "under the radar of danger". In the case of the example, it adds up to almost 10% of the monthly salary, which could be a serious blow to the monthly budget. So, just as points are crucial for defining geometric structures, small expenses play a structural role in an individual's financial life. They contribute to the overall budget, financial goals, and long-term well-being.

Furthermore, recognizing the significance of these small expenses may be essential for financial decision-making. In this way, the Geometrical Point Analogy underscores the importance of acknowledging the role of small expenses in shaping an individual's financial landscape. While they may appear minuscule, their cumulative impact can have profound implications for financial well-being, akin to how points collectively define the geometry of shapes and structures.

1.5 From Concept of Zero to Geometric Progression

In mathematics, zero is a fundamental concept representing absence or zero value. "Zero's null-like nature... on the one hand, it is a bona fide cardinal number, yet on the other, it is linked to ideas of nothingness and non-being" (Barton, 2020, p. 3823). It is often represented as a point on a number line. As a mathematical point, zero is unique as it marks the origin or starting point from which numerical values are measured in both positive and negative directions. "Mathematically, a concept of zero plays a significant role in our natural, integer, and real numbers theories. For instance, when considering an algebraic structure (e.g., a group) under addition, zero often serves as the identity element (since for any

number n , $n+0=n$)" (ibid.). When we consider the concept of zero as a point, in terms of accumulation, it is transformed from a point to a line. This transformation occurs through the process of repeated accumulation. Let us examine this transformation in more detail. "Philosophically, our understanding of zero is tied up with classical questions concerning the status of non-being" (ibid.). Zero can be a mathematical point on a number line separating positive and negative values. As a point, it has neither magnitude nor direction.

As Barton, 2020 (p. 3823) states, "We will examine the epistemology and metaphysics of zero concerning the cardinal number zero, whereby cardinal numbers we mean those numbers that correspond to responses to questions of the form "How many Φ ?" where Φ is some descriptor of a collection of discrete individuals. We will use the term "collection" in this paper to talk about any collection-like reference to objects, for example, we could be referring singularly to a (semi) set of some objects, plurally to those objects considered together". The concept of zero begins to change through repeated accumulation to a collection of Φ . Accumulation refers to the gradual addition or aggregation of quantities over time. In mathematics, accumulation can be thought of as repeatedly adding small steps to a starting point. As these steps accumulate, the point representing zero gradually becomes a line. This line represents the accumulation of values over time. Each incremental addition helps to lengthen the line, creating a continuous representation of accumulation. The line that emerges from the accumulation process represents the evolving quantity that results from repeated additions. It shows the evolution from zero, the non-existence of a quantity, to a continuous and measurable range of values. This transformation illustrates the importance of repeated accumulation in mathematics. This concept of transforming zero into a line through repeated accumulation can be applied to various mathematical contexts, such as infinitesimal calculus, where integration involves the accumulation of infinitesimally small increments to determine the total value. Like the Adding Up Pieces model (Ely, 2017).

Mathematical induction is a logical reasoning technique used to prove statements about mathematical objects that hold for infinite cases (Telloni & Malara, 2021). In the context of converting zero to a line, mathematical induction can be used to prove the validity of the conversion for each successive increment. Using mathematical induction, we can prove that adding a small increment, starting at zero, results in a new value that extends the line. Continuing this process, each additional addition lengthens the line formed by the accumulation. The logical conclusion from mathematical induction ensures that the transformation from a mathematical point to a line holds for any number of increments (ibid.).

Geometric progression is a sequence of numbers where each term is created by multiplying the previous term by a fixed ratio. The accumulation process can be considered a geometric progression when converting from zero to a line, where each increment is added based on a fixed ratio or proportion. Let us think of the accumulation process as a geometric progression. We can analyze the behavior of the line and determine its length or size based on the number of increments added and the ratio of each increment (Grabner, 1983).

1.6 From a Two to Three-Dimensional Forms on Coordinates

The transformation from a two-dimensional to a three-dimensional form, mathematically and economically, carries significant implications. Mathematically, this transformation involves introducing an additional coordinate, typically denoted as Z . In three-dimensional space, objects can be represented with depth, height, and volume, enabling the study of spatial relationships and other properties inherent to three-dimensional geometry. In the economic context, the transition emphasizes the critical importance of accumulated money reaching a positive or negative pivotal point.

The transition from a two-dimensional to a three-dimensional financial form represents expanded possibilities, increased complexity, and the potential for financial independence. It emphasizes strategic decision-making, effective risk management, and achieving long-term financial goals. Reaching this critical point signifies personal goal attainment, freedom from financial constraints, and a solid foundation for the future. The three-dimensional representation reflects expanded financial capacity, flexibility, and autonomy. On the negative side, regarding significant expenses as "zero" can lead to reckless spending habits and a lack of financial awareness. Ignoring the cumulative impact of expenditures can result in a positive balance and financial stability. Recognizing the value of even small expenses is crucial for responsible financial management and long-term goal achievement.

1.7 The Positive Side - Accumulated Wealth

Psychological flexibility (Fuchs, 2022) for shifting the attention from the zero cost of something we will gain to the accumulated effect and debt we will find ourselves because of it. Nevertheless, we assume that once people can see it, using the mathematical analogy that examines this so well will give people the power to shift the focus needed for the gain for free to the accumulated deep debt. Moreover, once we manage to do it, we can move their attention from the deep debt to the positive side of the mathematical analogy coordinates - where accumulated wealth is situated. Managing accumulated wealth becomes challenging as the financial form transitions from a line to a more complex shape. Diversifying, risk management, and asset allocation are necessary to maintain and grow financial form. The complexity of accumulation requires informed decisions, considering income fluctuations, spending patterns, interest rates, and investments. Techniques like financial modeling and data analysis help individuals gain insight into their financial form's structure and dynamics. The multidimensional nature of the financial form incorporates time, investments, income sources, and liabilities, enabling long-term planning for financial stability. Transitioning from a simple line to a complex form signifies increased financial decision-making complexity. Evaluating risks and rewards becomes essential, necessitating diversification and understanding the impact of changes. Long-term financial planning becomes crucial for aligning decisions with goals. Preserving and growing wealth requires prudent investment decisions and adapting to market conditions. Recognizing the implications of this transition helps individuals build financial security, seize opportunities, and create a positive impact for future generations through legacy planning and philanthropy.

2. Methodology

Our paper is focused on theoretical analysis and does not involve collecting data but aims to develop a concept with potential implications for future research and behavioral change. Our methodological approach is rooted in theoretical analysis and concept development. We aim to provide a robust theoretical basis for understanding the "Small Amount Fallacy" while highlighting its potential for practical applications and future empirical research. This approach paves the way for a comprehensive exploration of the concept's impact on financial decision-making and its potential to drive positive behavioral changes in personal finance.

This section outlines the methodological approach employed in exploring the "Small Amount Fallacy" concept. Our approach is primarily theoretical and conceptually oriented, aiming to lay the foundation for future empirical research and practical applications related to behavioral economics and personal finance.

Literature Review: Our methodological approach begins with a comprehensive review of the existing literature in behavioral economics, cognitive psychology, and financial decision-making. We analyze relevant theories and concepts, such as Prospect Theory, Diminishing Sensitivity, and Loss Aversion, to identify gaps and potential connections that can explain the "Small Amount Fallacy."

We synthesize the findings from the literature review to develop a theoretical framework for understanding the "Small Amount Fallacy." This involves integrating concepts from various sources to explain the cognitive biases and psychological mechanisms that underlie this phenomenon.

Mathematical Modeling: To illustrate the cumulative impact of small expenses, we construct a mathematical analogy related to the numerical value of the geometric point. This analogy is a theoretical tool to visualize and explain how seemingly trivial expenses can accumulate into significant financial consequences.

Implications for Behavioral Change: While our primary focus is on theoretical development, we discuss the practical implications of our conceptual framework. We explore how understanding the "Small Amount Fallacy" can inform financial education programs, policy interventions, and behavioral change initiatives.

Future Research Directions: In this methodological approach, we emphasize the importance of our work as a foundation for future empirical research. We suggest that future studies can validate our theoretical framework through data collection and behavioral experiments, ultimately assessing its effectiveness in changing spending habits.

3. Results: Small Amount Fallacy Theoretical Framework

The "small amount fallacy" is a cognitive phenomenon in financial decision-making characterized by individuals making judgments about their spending based on the proportion of a cost to their income rather

than its absolute value. This leads to the tendency to perceive small expenditures as insignificant or negligible, even when cumulatively, they can substantially impact one's financial well-being. This framework seeks to elucidate the concept and its underlying psychological mechanisms.

Theoretical Framework Key Principles:

Individuals tend to evaluate expenses not in absolute terms but concerning their income or financial context. The proportion of an expense to one's income is often more salient than the absolute cost of the expense.

Loss aversion, a concept from Prospect Theory, explains that people are more averse to losses than they are motivated by equivalent gains. This bias can lead individuals to prioritize avoiding small losses, like the cost of a coffee, even when it might seem inconsequential relative to their income. Diminishing Sensitivity posits that the emotional impact of gains and losses diminishes as their magnitude increases. Small expenses may be perceived as less emotionally significant because they disappear within the broader context of financial movements.

The "small amount fallacy" hinges on the cumulative impact of repeated small expenses. While a single small expense may seem trivial, the aggregate effect can be substantial over time. Failure to recognize the cumulative impact of these expenses can result in financial mismanagement, especially when they recur frequently.

Cognitive biases like anchoring and framing can exacerbate the "small amount fallacy." For example, suppose individuals anchor their perceptions of a reasonable coffee price to a high-end coffee shop. In that case, they may be more willing to spend on expensive coffee without realizing the cumulative cost.

The degree of financial literacy and awareness plays a role in how individuals perceive and respond to small expenses. Those with higher financial literacy may be more attuned to the cumulative impact and make more informed decisions.

Cultural and societal factors and personal financial goals can influence the degree to which the "small amount fallacy" affects individuals.

To illustrate the cumulative impact of small expenses, we employ a mathematical analogy linked to the numerical value of the Geometrical Point. This analogy serves as a theoretical tool, providing a visual explanation of how seemingly inconsequential expenses can amass into substantial financial consequences. This mathematical analogy not only helps change the perspective on financial risk but also demonstrates how a lack of dimension can become a tangible reality through persistence and repetition. Moreover, it showcases the potential for economic transformation, illustrating how one can shift from a negative financial reality to a positive one.

4. Discussion: Small Amount Fallacy – Insights and Implications

The results of our research offer valuable insights into the psychological and behavioral underpinnings of financial decision-making. It underscores the complexity of financial decision-making and the significant role that seemingly insignificant amounts play in shaping individuals' economic outcomes. Addressing the "small amount fallacy" requires a multifaceted approach that combines financial education, awareness-building, and effective visual tools like mathematical modeling. By understanding the psychological mechanisms, we can empower individuals to make more informed and responsible financial decisions, ultimately contributing to improved financial well-being and economic stability. We can draw several significant conclusions and implications by examining the theoretical framework and key principles.

Our findings confirm that individuals often assess expenses concerning their income or financial context, not in isolation. This proportionality bias can lead to perceiving small expenses as insignificant, even when they collectively impact financial well-being. This highlights the need for financial education emphasizing absolute value and encouraging a holistic view of expenses.

The observed impact of loss aversion and diminishing sensitivity on the "small amount fallacy" reinforces the idea that people are more inclined to avoid small losses than to pursue equivalent gains. To address this bias, financial literacy programs should focus on building resilience against loss aversion and promoting a more balanced assessment of expenses.

Our research underscores the importance of recognizing the cumulative effect of small expenses over time. The failure to do so can lead to financial mismanagement, especially when these expenses recur frequently. Encouraging individuals to track and consider the long-term implications of their spending habits is crucial.

Cognitive biases like anchoring and framing can exacerbate the "small amount fallacy" by distorting individuals' perceptions of reasonable expenses. Mitigating these biases may involve raising awareness of how they influence spending decisions and encouraging individuals to reconsider their reference points.

The role of financial literacy and awareness in shaping responses to small expenses cannot be overstated. Our findings suggest that those with higher financial literacy may be more attuned to the cumulative impact of small expenses and make more informed decisions. Therefore, investing in financial education programs is pivotal to addressing the "small amount fallacy."

Cultural, societal, and personal factors significantly influence the degree to which individuals succumb to the "small amount fallacy." Tailoring financial education and intervention strategies to consider these influences is essential for their effectiveness.

The mathematical analogy, employing the geometric point concept, is a powerful tool for illustrating the cumulative impact of small expenses. It not only shifts perspectives on financial risk but also demonstrates the potential for economic transformation through persistence and repetition. This visual representation can be incorporated into financial education curricula to enhance understanding and promote responsible financial behavior.

Conclusions

In Behavioral Economics, individuals often exhibit irrational behaviors and neglect the long-term consequences of their actions (Sunstein, 2013). From a budgetary and economic management perspective, recognizing the significance of seemingly inconsequential amounts and incorporating them into financial planning can enhance financial well-being. The formalization and exploration of the "small amount fallacy" concept represent a novel contribution to the field. This scientific understanding may be one of the most intriguing factors of economic suffering in the developed world. It explains why people all over the developed world have very good salaries but live in debt and suffer every month trying to understand where their money disappears. It can also have practical implications for personal finance, budgeting, financial literacy programs, economic policies, and financial product design, ultimately promoting more informed financial decision-making. Policymakers can benefit from understanding how small amounts impact the economy, especially in initiatives aimed at poverty reduction or income equality. Policies such as microfinance and support for small businesses can leverage these amounts to stimulate economic growth. Financial institutions can offer tailored products like micro-loans and micro-savings accounts to cater to individuals with limited resources, promoting financial inclusion. As proposed in this paper, the formalization and exploration of the "small amount fallacy" concept represent a novel contribution to the field. Prior studies have touched on related cognitive biases and spending behavior but may have yet to address this specific fallacy explicitly. Understanding the "small amount fallacy" can have practical implications for personal finance, budgeting, financial literacy programs, economic policy considerations, and the design of financial products and services. This research aims to promote more informed financial decision-making by shedding light on this cognitive bias. By recognizing the long-term consequences of seemingly insignificant expenses, individuals will be more inclined to prioritize their financial well-being, moving from short-sighted spending habits to informed choices and financial stability.

The study underscores the importance of recognizing the impact of seemingly insignificant amounts in economic contexts, shedding light on debt accumulation dynamics and its implications for economic growth. It emphasizes the importance of continuous additions and their cumulative effects on individual and societal financial outcomes. This study bridges mathematics and economics, offering insights into financial accumulation and its role in shaping economic outcomes. Exploring parallels between mathematical concepts and economic scenarios provides a unique perspective on financial strategies, risk assessment, and long-term planning. The theoretical framework developed through conceptual construction empowers individuals and policymakers to make informed decisions, optimize financial outcomes, and promote economic stability.

Abstract

Research background: Effective classroom management is characterized by the consistent application of classroom procedures and routines that provide clarity about behavioral expectations. Consistency creates order and helps build confidence. Active student participation in educational processes as part of a management strategy contributes to positive classroom behavior.

Purpose of the article: This study examined the effects of an intervention program based on cognitive-behavioral principles on the assimilation of the common semantics of discipline management in the classroom. The intervention program was conducted in the context of discipline and behavior management and general classroom management over one year with thirty 4th grade students in an elementary school.

Methods: The research is action research within a qualitative method. The data was mainly analyzed thematically. This, along with a quantitative measurement of behavior change based on participant reports.

Findings & Value added: The results show that the application of the cognitive behavioral principles for behavior management in the classroom leads to a better social and emotional climate, reduces violence, and increases students' well-being, sense of protection and belonging, and classroom skills. The intervention program and its outcomes form the basis for a general model of classroom management, discipline management, and behavior management. Because there are clear principles guided by defined goals, phases, and tools, this model can be applied to other environments and needs in terms of environmental management, goals, and objectives for review, accuracy, and optimization.

Keywords: classroom management, discipline management, self regulation, cognitive behavioral intervention, behavior

JEL classification: O03, I01, I03, Z01

1. Introduction

Managing discipline in the classroom refers to the ability to positively control student behavior and allows for the creation of a learning community (Valente et al., 2019).

According to Franklin & Harrington (2019), the classroom is a shared learning space where knowledge and functions are formed to help students shape their futures. The responsibility for a positive and formative experience with positive outcomes is shared between the teacher and the students. A positive learning experience in the classroom requires a balance between a variety of student needs and environmental factors. It requires the co-creation of a learning environment characterized by respect, empathy, trust, and interest. Effective behavior management strategies contribute to a positive classroom climate. They strike a balance between applying laws and rules and maintaining curiosity and inquisitiveness.

Effective classroom management is characterized by the consistent application of classroom procedures and routines that provide clarity about behavioral expectations. Consistency creates order and helps build trust. Active student participation in pedagogical processes as part of a management strategy contributes to positive classroom behavior (Freiberg et al., 2019). Effective management reduces stress, regulates behavior, and enhances students' sense of belonging, competence, and legitimacy (Valente et al., 2019).

* Corresponding author: hila.ariel@gmail.com

Management skills that focus on classroom behavior have been divided into proactive and reactive skills. Proactive skills include designing a program that provides a meaningful and tailored learning experience that allows the student to participate. Integrating direction and focus into learning processes helps increase student persistence in terms of concentration, focus, and participation (Nagro, Fraser & Hooks, 2019). Adjusting teaching and learning processes to the pace of the class. Implementing monitoring and reflective processes while understanding the causes and circumstances of student behavior and consistently using reinforcers to influence behavior, achievement, engagement, and success (Malik, 2020).

Reactive strategies are less effective in managing behavior (Malik, 2020) and yet it is a necessary skill to manage discipline in the classroom to correct disruptive behaviors and prevent escalation (Mielke & Farrington, 2021). Reactive action involves the use of consistency (Wang et al., 2020), immediacy and purposefulness in response, and establishment as an expected response to create awareness, order, and a link between behavior and response (Freiberg, Oviatt & Naveira, 2020)

Behavior problems and disorders are terms that group together problematic or disruptive behavior, defiant, oppositional behavior, antisocial disorders, and conduct disorders. Conduct disorders refer to the violation of social rules and negative actions toward others such as aggressiveness, lying, and stealing (Goldstein et al., 2023). From studies conducted over the years, a high percentage of elementary school children are at high risk of developing a conduct problem during their school years (Olivier et al., 2020). Behavior problems among students in the classroom can arise for a variety of reasons. Some are related to environmental factors, others to factors related to the individual. They can be influenced by developmental background, various types of learning disabilities, emotional state, difficulty driving, sense of competence, sense of belonging, educational challenges, mismatch of learning with the student's talents, and other external and internal factors (WHO, 2019). Studies have shown that how the classroom is managed and how discipline is handled in the classroom has a significant impact on classroom climate, behavior, and educational outcomes (Valente et al., 2019).

Cognitive-behavioral intervention is based on an approach that includes cognitive and behavioral components and aims to change individual behavior. It utilizes basic cognitive processes that are responsible for successful problem-solving processes. Studies have shown that this type of intervention is able to improve self-monitoring mechanisms and thus social problem-solving skills in a variety of situations and structures. Therefore, this type of intervention helps reduce the risk of developing behavior problems (McDaniel et al, 2023).

The complexity of treating behavior problems, their negative effects, and the importance of effective and adaptive developmental outcomes underscore the importance of studying and developing tools and responses to this complex issue.

1.1 Behavior problems in the classroom

Emotional and behavioral problems (EBP) or disorders (EBD) include any behavioral patterns that are abnormal compared to the norm and developmental level. They can be classified as either "internalizing" or "externalizing". Externalizing behavior problems and disorders are manifested in the violation of social rules and negative actions toward others (Fossum et al., 2021).

Violence is an extroverted behavior characterized by the exertion of an unpleasant stimulus, physical or verbal, toward the other. Studies distinguish three types of violent behavior: reactive violence, which can result from activating events that cause the individual to behave violently. Instrumental violence, which helps the individual to satisfy his needs when he is unable to achieve his goal in an acceptable way; and violence for its own sake, which arises from severe emotional problems that are sometimes a consequence of the environment (Eliram, 1982). Another distinction is between violence that results in physical harm and violence that results in psychological harm. This type of division focuses on the secret motives that cause the violent act (Marom et al., 2011). This categorization led to examining violence at the level of its underlying factors as well. In the literature based on frustration-anxiety theory, violence is divided into reactive and proactive violence. Reactive violence occurs in response to violence that causes anger and frustration, and aims to reduce the level of anger and frustration by hitting the perpetrator. This type of violence has a more positive prognosis than initiated violence (Ibid.).

Initiated violence is based on past experiences. The individual has learned that a violent response will help him or her achieve various goals and is therefore activated whenever the individual wants to achieve his or her goals. Other subdivisions refer to the differences between the behaviors that characterize

violence, distinguishing between direct violence and indirect violence, and between verbal violence and physical violence (Ronen et al., 2007).

1.2 Patterns of victimization during the elementary school years

Victimization is a common stressor in school-aged children and can affect the child's future development. Children who suffer from persistent bullying and an unprotected social-emotional climate (Mandira et al., 2020) are at increased risk of developing psychological and behavioral adjustment problems such as loneliness, low self-esteem, anxiety, depression, externalizing problems, and school dropout (D'Urso & Symonds, 2021). Violent behavior is not only harmful to the environment of the violent child, but also to the development and functioning of the violent child, who is at risk of social rejection, dropping out of school, and developing criminal behaviors (Ferrara et al., 2019).

An association has been found between an early victimization experience during the elementary school years and the continuation of the pattern of bullying victimization in later years (Wu et al., 2023). The early years of elementary school are a significant and important time to observe the child's developmental process and understand why certain children are victimized and others are not, and how the change in victimization patterns is related to their behavior and its context over time.

As the child progresses through the developmental stages of acquiring complex cognitive skills, patterns of violence decrease. It is likely that there is a relationship between these two processes (Gaffney et al., 2021).

Cognitive skills are related to mechanisms of self-control, information processing, and emotion control. These mechanisms enable individuals to control and regulate their behavior and moderate the relationship between sensitivity and aggression (Mitsea, et al., 2021). Violence control and behavior regulation become possible for a child as he or she acquires tools and skills that enable him or her to behave socially.

The development of self-control skills enables the child to activate mechanisms of observation, monitoring, and self-reinforcement, to use accepted social models, and to control his or her behavior (Marom et al., 2011).

1.3 Cognitive-behavioral theory - development, perception and intervention

The classical "cognitive-behavioral" model was developed in recognition of the interrelationships between cognition and behavior, as well as the emotional state and general functioning of the organism, and assumes a connection between the way individuals perceive events in their lives and their feelings, physiological reactions, and behavior. According to this concept, a person's feelings and behavior are influenced by the interpretation he or she gives to the events in his or her life, rather than by the events themselves (Beck, 2014). Cognitive-behavioral intervention methods use strategies aimed at bringing about change in thinking, feelings, and behavior (Kendall, 2012). Their foundation is the individual's belief system, behavioral strategies, and understanding of the beliefs and behaviors that characterize them. A cognitive-behavioral intervention program addresses the acquisition and establishment of a cognitive change in the thinking and belief system to achieve stable emotional and behavioral change (Beck, 2014). It relies on an approach that includes cognitive and behavioral components to change individual behavior through its influence on the basic cognitive processes responsible for successful problem-solving processes and to improve self-monitoring mechanisms. It affects social problem-solving skills in a variety of situations and structures. Therefore, this type of intervention helps reduce the risk of developing behavior problems, contributes to positive social functioning, and promotes a visible and hidden impact on individual development (McDaniel et al, 2023).

One of the most important issues in child care is the issue of cognitive processing and the distinction between "cognitive impairment" and "cognitive bias" Processing impairment is caused by a lack of attention to information and a lack of foresight that affects behavior and its outcomes. Cognitive distortion refers to a disorder of thought processes (Kendall, 2012).

Impulsive behavior results from cognitive impairment, which manifests itself in the inability to let thinking precede action, as opposed to cognitive distortion, which indicates active but distorted processing (Kendall, 2012).

The self-regulatory system is at the heart of any daily process. Its components mediate the influence of the external environment on individuals and provide them with the basis for purposeful action. Consistent, reliable, and frequent self-observation leads the individual to success in self-regulation.

A child's self-regulation skills can influence his or her adjustment to the school environment in which he must function independently and without dependence on the presence of his or her primary caregivers (Wellington, 2022).

2. Methods

The purpose of this study was to examine the effects of classroom discipline management using a cognitive behavioral intervention program on students' acquisition of self-management and self-regulation skills, the extent of behavior problems in the classroom, and the social and academic emotional climate in the classroom.

The sample consisted of thirty 4th grade students in an elementary school in Israel. The vast majority of the children in the class have been learning together for about five years, i.e., since pre-compulsory kindergarten. Of them, 8 are girls and 22 are boys, aged 9-10, living in Jerusalem or surrounding areas. 16 of the children in the class were diagnosed with learning disabilities or ADHD, and 14 of the children were not diagnosed (Table 1).

Table 1. Study Population – children

	N	%	Mean
Gender			
• Girl	8	26.66	
• Boy	22	73.33	
Age			9.4
Origin			
• Abroad	2	6.66	
• Israel	28	93.33	
Place			
• Jerusalem	24	80	
• Outside Jerusalem	6	20	
Diagnosis			
• Adhd	9	30	
• learning Disability	7	23.3	
• undiagnosed	14	46.7	

Source: own processing (2023)

Research tools: In-depth interviews: semi-structured in-depth interviews to capture staff feelings about the class before and after the intervention program.

open-ended face-to-face interviews were conducted on predetermined general topics to understand students' feelings and needs.

Participant observation: participant observation was conducted in the classroom to directly and personally intervene in the lives and processes of the students and to experience the reality of the classroom together with them. The Observations focused on events that occurred during common class time related to self-management and self-regulation, as well as the general atmosphere in the classroom during class time and extracurricular activities. In addition, classroom discussions were recorded to monitor the program and its outcomes.

Open-ended questionnaires: Twice a year, open-ended questionnaires were distributed before the end of each semester regarding students' experiences in the classroom

The intervention included the use of cognitive and behavioral tools. The goal was to teach strategies and tools to strengthen and develop self-reflection, self-management, and self-regulation in the first phase.

In the second phase, goals were established to support classroom discipline in creating a positive social and emotional classroom climate and to manage student behavior.

At the same time, the process of introducing and acquiring tools and semantics continued.

The program was created and implemented using a variety of tools:

Tools to assimilate behavioral routines: as the school year began, the schedules, lesson system, and accompanying lessons were created in the spirit of the intervention plan to create a unified and consistent language and a sense of framework and safety.

Permanent Lessons: Three permanent weekly lessons were incorporated into the system to learn and use program language, role play, learn tools and strategies, learn through stories, practice social discourse, practice reflection skills, reflect, and create daily report pages.

Monitoring Boards: behavior boards were created and posted in the classroom to provide consistent, orderly, and engaging monitoring of the behavior process.

Self-management board: a self-management board was created based on the cognitive behavioral model derived from the emotional-rational method. The board is divided into quarters to distinguish between an event, a thought, an emotion/feeling, and a reaction.

In applying the model, a specific work routine was established (Figure 1).

Reaction stages: An axis for reaction stages was placed under the circle to practice observing behaviors and reactions (Figure 2).

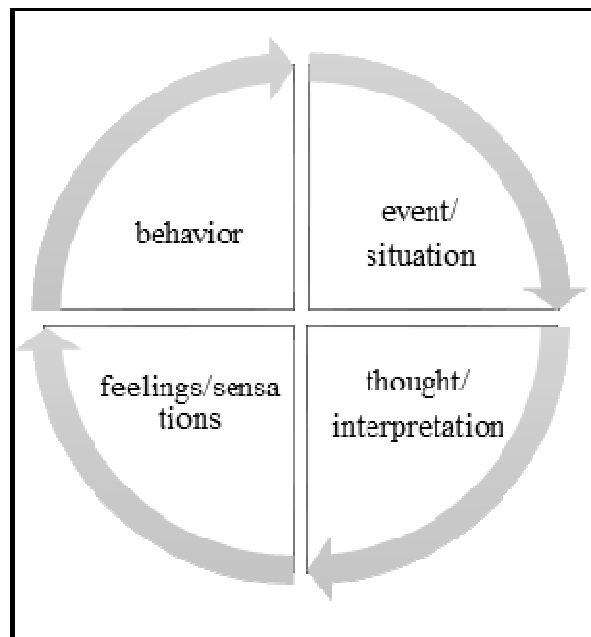

Figure 1. Self management wheel
Based on Albert Ellis (1957), in (Beck, 2014)

Figure 2. reaction stages

3. Results

The results obtained combine data that indicate qualitative processes that indicate a change in perceptions and experiences as a result of the discipline and behavior management program. Measurable data indicate a reduction in maladaptive behaviors and an improvement in adaptive behaviors in the classroom.

Analysis of the results of the social climate:

The results describe a comparison between the responses on the reflection questionnaires completed by the children at the end of third grade before the intervention program and at the end of fourth grade after the program.

The questionnaires completed by the children contained closed and open-ended questions. The closed questions were rated on a scale of 1-5: 1 - never, 3 - sometimes, 5 - always, 2,4 - intermediate situations between always and sometimes or between sometimes and never.

The results describe a comparison between responses on reflection questionnaires completed by children at the end of third grade before the intervention program and at the end of fourth grade after the program (Table 2).

Table 2. reflection sheets comprasion

statment	Mean - Before	Mean – After
"I choose my friends by myself"	1.76	4.33
"My friends respect me and my opinions"	2.63	4.43
"I manage to avoid conflicts and arguments with friends and reach a solution in pleasant ways"	1.53	4.36

Source: own processing (2023)

In relation to the proverb "I choose my friends by myself"

Numerical results: 70% of the students were found to have a numerical increase in the legitimacy and ability to choose their friends, 30% were ranked in the highest scoring group at the beginning of the program and the score was maintained. 60% of children rated the statement with the highest score at the end of the year compared to 30% at the beginning of the year.

Verbatim Results: At the beginning of the year, 70% of subjects reported some difficulty finding a friend they would like to play with. At the end of the year, all children said their social status in the classroom had improved. 40% of the children reported a personal process they went through regarding their personal responsibility in choosing friendships.

In relation to the statement, "My friends respect me and my opinions."

Numerical Results: A numerical increase in the feeling of being respected was observed in 80% of the subjects, no change was observed in the remaining 20%, while in 10% of them the statement was rated with the highest score from the beginning and in another 10% there was no improvement in the feeling of being respected in the class. 60% of subjects rated the statement with the highest score at the end of the year, compared to 10% at the beginning of the year.

Verbatim results: At the beginning of the year, 80% of subjects were dissatisfied with the level of respect they received from their classmates, and 10% said they did not know how to refer to a verb. At the end of the year, 80% of subjects reported feeling a change in the overall class climate. 10% indicated that their feeling in class was not good.

In reference to the saying "I manage to avoid quarrels and arguments with friends and find a solution in a pleasant way".

Numerical results 50% of the subjects observed a numerical increase in the feeling that they manage to behave better in conflict situations. No change in outcome was observed in the remaining 50%. 60% of the subjects rated the statement at the maximum score at the end of the year, compared to 10% at the beginning of the year. No decrease in score was observed in any of the subjects.

Verbatim results: At the beginning of the year, 50% of subjects said they did not need conflict management tools. 30% saw no personal responsibility for their involvement in fights. 30% referred to their personal responsibility. 20% said they had tools to help them solve problems. 10% referred to their general feeling about classroom interactions and communication. At the end of the year, all subjects reported improvement in dealing with conflict. 70% of subjects said they purchased tools to help them

manage conflict and solve problems. 30% of subjects were positive about the process and the general atmosphere in the class and said they had expanded their social circles.

The next question asked students to say what they would keep in the class and what they would improve in it. The question included only a verbal description without a numerical representation. At the beginning of the year, 90% of the subjects felt that there was something to improve in the class socially. 60% of them experienced the class as an unsafe place and reported bullying towards them or their classmates. 10% reported feeling disrespected. 20% reported that they would like to expand their social circles and opportunities to play with friends.

20% reported that noise and anger affect the atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% felt there was nothing left to improve. 10% felt everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the children's attitude towards each other should be improved.

As for what students wanted to keep in the classroom: At the beginning of the year, 70% of subjects wrote that they would keep their best friends. 30% did not find anything on the social level in the classroom that they would like to keep. At the end of the year, 70% of the children referred to the flow in the class and the general social climate, 40% of the subjects described the improvement of the children's behavior towards each other. 20% of the subjects the presence and effectiveness of the acquired tools for self-management and problem solving. 30% mentioned the good atmosphere and pleasant feeling in the class. 75% of the 30% who did not find what they wanted to preserve at the beginning of the year found things they would preserve.

At the level of the defined goal of social climate and social communication, there was a significant improvement in the children's feeling about their social status and an increase in their overall good feeling in the classroom. 20% reported that noise and riots affected the atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% felt there was nothing left to improve. 10% felt everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the children's attitude towards each other should be improved.

Results of a circle for self-management, guided discovery, and mantras:

Results describe a comparison between content brought up during observations, conversations with children, and class discussions at the end of third grade before the intervention program and at the end of fourth grade after the program.

At the level of the defined goal of habituation and internalization and application of the principles of the program and the reference tables At the end of the year, most children had acquired the circle of self-management and the tools for observation, internalized the stages at the cognitive level and the emotional level, and used them to achieve defined behavioral goals, such as: social climate, rules of discourse, social play.

At the level of defined goal of rules of discourse: significant improvement was observed in the ability to engage in attentive, appropriate, and respectful classroom discourse.

At the level of the defined goal of a social game, the intervention helped in acquiring tools to manage a social game.

Results of the reaction phases: according to the students' reports, using the reaction stages as an available, practical, and clear tool helped them avoid impulsive and violent behavior. At the beginning of the year, 51.7% of the children reported that they were victims of verbal violence expressed in humiliation, insults, threats, social ostracism and boycott, compared to 17.24% at the end of the year. At the beginning of the year, 24.13% of students reported having suffered physical violence, compared to 10% at the end of the year. At the beginning of the year, the percentage of children who required repeated treatment and activation of personal programs due to violent behavior was 30%, compared to 6% at the end of the year (Table 3).

Table 3. violent and victims compression

	Percent – before	Percent – after
Violent behavior (physical or verbal)	31%	6%
victims of physical violence	24.13%	10%
victims of verbal violence	51.7%	17.24%

Source: own processing (2023)

4. Discussion

The intervention program primarily required clear classroom management, which included classroom organization, i.e., creating the weekly and daily schedule and establishing regularities and routines in the classroom. The organized and orderly environment structure that created by the intervention program was important and central element in building a framework that facilitates productive learning academically and socially (Allen, 2010).

Studies have shown that there is a clear correlation between classroom management, the establishment of clear and consistent rules and expectations, and an infrastructure that allows for student participation in decision making, and a decrease in violence and bullying (WHO, 2019). It can be concluded that maintaining an organized and orderly work environment has helped to improve classroom climate, which is reflected in the improvement of how students feel in the classroom by making more connections to learning and having a sense of security. The uniqueness of the study is reflected in the fact that the behavioral problem was included as a major theme in the classroom management objective and that a cognitive-behavioral intervention program was activated in a school setting with a large group of thirty students. The reflective and metacognitive work affected automatic responses and the system of beliefs and perceptions. It also helped students discover for themselves for the first time skills and potentials in several areas, including mastering appropriate social discourse and finding a place in the social group. The goal of the intervention program was to develop self-management skills in students through cognitive and behavioral tools to improve class management and classroom climate. The intervention program led to an improvement in the students' self-regulation and self-monitoring skills. It expanded their awareness and personal responsibility. The results of the intervention illustrate the importance of classroom and discipline management for effective problem solving skills. Changing thinking, learning and monitoring skills lead to development and implementation of an independent self-management system and learning new behaviors.

The results of the study show the importance of classroom management and how through a slow and structured process, through small successes and reinforcements, self-management skills were acquired by the students. The requirement to reflect daily helped internalize and process reflective observation as a tool to examine thoughts, feelings, and behaviors. The process of internalization and establishment involved regular instructional sessions in which automatic thoughts, belief systems, perceptions, and resulting cognitive patterns, feelings, and emotions and their effects on behavior were made conscious. Research findings suggest that students were able to moderate their feelings of anger and consequently their behavior by focusing on classroom reflection and changing their automatic thoughts.

Conclusion

The purpose of the study was to examine the relationship between a program combining cognitive and behavioral classroom management principles and tools and students' self-management skills and behavior. The study also examined the relationship between working on self-management skills and improving classroom climate, reducing behavioral difficulties, and increasing students' sense of safety and involvement. Findings suggest that purposeful classroom management based on structure, clarity, stability, and consistency supports the development and acquisition of self-control, self-regulation, and self-management skills. Skills that influence individual behavior and facilitate positive, effective, and productive group behavior. The study was conducted over one year with a group of students. It did not include a control group to examine the effectiveness of another program or the natural developmental processes of adolescence without the implementation of a program. The study proposed an intervention model to manage group behavior by improving individual self-management skills.

In order to use this model as a management model in different settings and institutions, it needs to be tested on different types of groups, needs, ages, and goals.

School Management through an Emotional Lens: Fostering Student-Teacher Engagement and Academic Excellence

Eli Tsarfati^{1,*}

¹ University of Ljubljana, Education Faculty, Kardeljeva ploščad 16, 1000 Ljubljana, Slovenia

Abstract

Research background: In addition to the acquisition of knowledge, a school should consider the emotional needs of students and teachers as well as the needs of some students for therapeutic interventions. For effective management of such a complex system, a methodology for providing guidance and response for both student and teacher was needed.

Purpose of the article: Using an intervention program, teachers used action research to proactively and in a transparent manner work to resolve academic, emotional, and therapeutic issues. The effects of this program, based on management models that defined precise tasks and the functioning of the school, is explained.

Methods: In the Action Research study (Kaniel, 2014), quantitative and qualitative techniques of collecting data were used along with in-depth interviews. Evaluation of the program was accomplished through two different methods of evaluation which looked for congruence between what was intended to happen and what actually happened.

Findings & Value added: When focus was placed on individuals in a systemically and holistically adjusted way, children's functioning as independent learners increased, as did teacher satisfaction. The trust of the community within the school and in the education system grew and there was a significant improvement in the mutual relations between all of those involved as the teachers, parents, and students worked together in an organized fashion.

Keywords: school management model, systemic approach, humanistic education, elementary school

1. Introduction

Today and for decades, school organizational management culture is based on providing detailed guidelines and policies based on every source except the individual classroom and teacher. Field personnel—the teaching staff—do their best to fulfill these to the best of their abilities and understanding, but often these conflict with a teacher's strengths or what her experience and intuition tell her the students need. Sometimes they even conflict with each other, leaving teachers in a “no-win” situation. This study proposes a more effective method in which the educational team is a fully responsible and active partner in the process. It uses

a systematic approach and operates in a holistic and coordinated manner from the bottom—from the field—up to the administration.

The model, Humanistic Systemic School Management Model (HSSMM), is modular and also draws inspiration from educational models that focus on involvement and emotional communication, critical pedagogy in which the emphasis is on empowering teachers and students in cooperation with parents and superiors.

The HSSMM seeks to redefine the responsibilities and the need to develop clear and accurate determinations of classroom needs by combining holism with a systematic view of the educational field. This way there can be a successful and effective combination of diverse management ideas and methods that complement each other, empower teachers to work to the maximum of their individual strengths, and provide targeted education to meet the particular needs and temperaments of individual classes and even

* Corresponding author: eli5001@gmail.com

students. Simply put, it exchanges the present “one size fits all” model that fails many students and burns out the best teachers with a model that empowers and differentiates both student and teacher needs while avoiding a free-for-all because it is based in a coherent management system.

We used evaluation methods that provided data for consideration of students’ progress and achievement, as well as for teaching and classroom management decisions. Within the action research study we used mixed methods of research. Quantitative questionnaires validated the model to all stakeholders. Quantitative research data was supported by qualitative research using semi-structured interviews for students, parents, and teachers as well as an in-depth interview of each participant of an advisory committee. We attempted to identify the factors that contributed to overall school satisfaction, checking parental involvement and satisfaction, school administration involvement, teacher effectiveness, and children’s achievements. The results of the research was a new school management model, contributing new knowledge in the field of school management and educational leadership that focuses on creating educational opportunities for all students while ensuring sustainable solutions. See Figure 1.

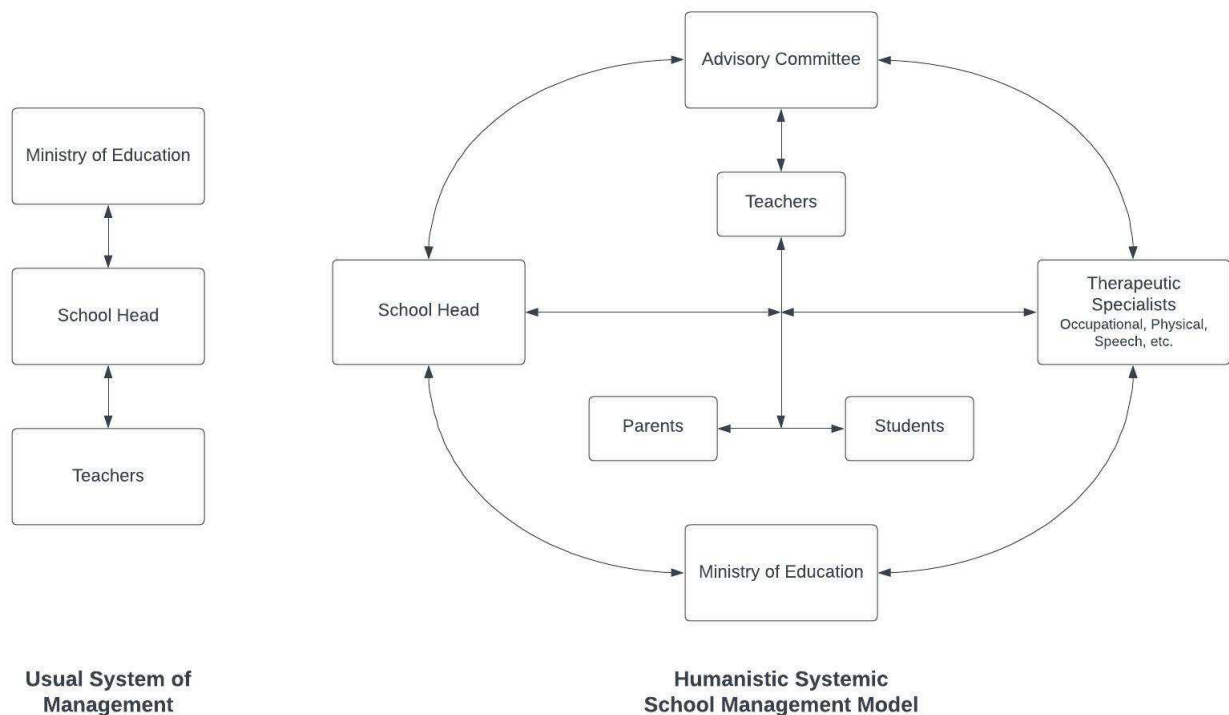

Figure 1. Comparison of Traditional and HSSMM Management
Source: Tsarfati (2023)

1.1 Educational Systems and Change

In the traditional departmental education model that has been the dominant school organization model since the late 19th century, every academic subject is separate from the others. Especially within larger schools, educators may report to different heads who report to a higher-level administration (Rose, 2012). In spite of a great deal of research and many new models, in practice education systems are generally very traditional structures that do not tend to change (OECD, 2016).

The contradiction between the extensive preoccupation with change and the lack of change in practice is due in part to the fact that most of the research deals with aspects that require not only change but also reflections on the nature of the desired change, rather than with practical and systematic aspects involved in implementation of the change such as monitoring the effects of reforms and using different policy tools to implement them. An axiom of ours was that true change in education should focus on improved learning and should benefit all the stakeholders.

Pedagogical reform concerns the study content and methods of both teaching and assessment, while organizational reform concerns aspects such as organizational structure, the salary system, etc. Just as there are pedagogy reforms that adapt and develop over time, so modern management approaches must

adapt to the dynamism and the needs that arise from the field. This implementation refers to the systemic approach of the way the school is managed and the operations in it (Eisenberg & Selivansky-Eden, 2019).

In constructing the Humanistic Systemic School Management Model (HSSMM) we have used elements of various management models that researchers like Schechter (2011) have explored, including: (1) constructing an understanding of how to support teachers, empowering them to promote student learning; (2) developing shared aims, identity, and purpose, encouraging effective communication and responsibility for school processes; (3) encouraging collaborative processes promoting better teaching and learning; (4) promoting individual and collective efficacy; (5) situating teacher training in the unique educational context at hand; (6) promoting collective learning by establishing organizational structures, methods, and practices wherein management takes on the role of facilitator of mutual learning; and (7) modeling learning as a shift in perspective, thereby promoting learning in which teachers can assemble, refine and negotiate meanings. Moreover, our model is also inspired by both (8) the Cultural Feminism model, which focuses upon emotional attachment and engagement (Beck, 1994), and (9) Critical Pedagogy, that includes empowering students to become active and engaged citizens who are able to actively improve their own lives, making connections between school and the broader community (Kincheloe, 2008).

There is no contradiction between the systemic and humanistic views. The systemic approach outwardly desires perfection, but in practice there can be no perfection. Holistic education in its entirety is the application of the systemic approach with an over-all view that incorporates humanistic elements overlooked by the systems approach, including the sometimes dramatic lack of perfection. Thus there can be a successful and efficient combination of diverse managerial ideas and methods that complement each other.

1.2 A deeper look at the holistic-systemic blend

The connection between holistic education and the systemic approach promotes team spirit and cooperation in the education system (Adiges, 2010). The HSSMM approach brings together all the different parties--students, teachers, therapists (occupational, physical, speech, psycho/social, and any others), administrators, and community—and connects them to promote learning and the achievement of educational goals. These local information sources are an important part of the system. They provide detailed and complete understanding of aspects of the educational environment that are often overlooked in the traditional management model.

The collaboration ensures an improvement in educational processes, permits freedom and creativity in educational frameworks, expresses effective management of the system, and promotes renewed interpretations and systemic thinking about the goals of education. With all parties working together, the decision-making process is naturally transparent and builds trust.

The flexibility that develops is critically important because modern education faces many and complex challenges, such as technological changes, social changes, and fluctuations in the field of information. Refinement of the connection between holistic education and its systematic delivery allows for a broader understanding of what is happening in the school because participants must participate actively, not merely be mirrors reflecting back what they think is a desired response.

1.3 Implementation of the systemic-humanistic approach to management

The essential problem within school management is that bureaucratic procedures and interfaces make it difficult to move freely within the system. Schools run on strict schedules of hours, standards, supports, diagnoses, and teacher requirements. Participants understand education-related issues through these frameworks (Chapman, 2002). They have indifferent explanations for understanding educational phenomena (Burton & Bartlett, 2020) and do not have tailor-made solutions to presented problems. Oplatka (2015) shows that a person's position in the system affects the problems he identifies, and he frames the solutions or creates multiple perspective awareness for each problem. All in all, the system fails the many who fall between the cracks.

Academic innovation requires experience and change in pedagogical practices, learning approaches, student evaluations, and professional collaborations. According to Eisner (1992), any important and educationally significant reform requires reference to five study dimensions: the intention, the structural, the educational, the pedagogical, and the assessment. The connections between all the factors are crucial because they constitute a systemic point of view and not just adapted solutions to the presented problems (Ben-Peretz, et al., 2011). Author Stefko et al. (2014) also stresses the aspect of communication and its importance.

According to systemic thinking, systemic change can occur at all levels of the system (Sharan, Y. & Sharan, S., 2021), and the entire process must be based on autonomy, responsibility, dialogue, trust, involvement, and continuity (Chapman, 2002). The “big picture,” which emphasizes the interrelationship between the components and not the components themselves, makes it possible to find solutions to problems because the connections become clearer and the solutions more accessible (Shaked & Sharan, S., 2021).

These educational processes and their implementation led us to develop what we call Targeting in Particular or TIP—in other words, special focus (Figure 2). Chapman (2002) discussed the importance of implementing multidisciplinary humanistic education according to personalized goals and seeing these as a whole. We accomplish this through TIP.

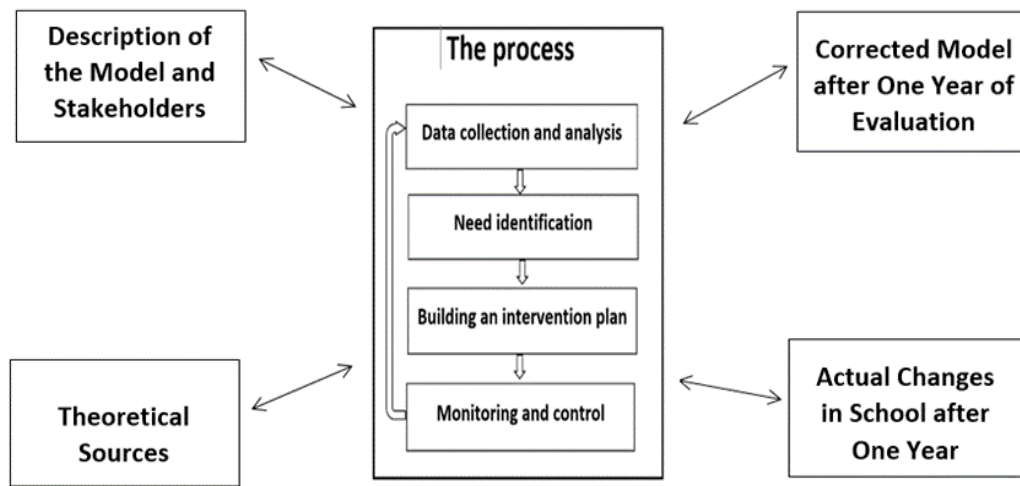

Figure 2. The TIP model - "targeting in particular"
Source: Tsarfati (2020)

1.3.1 Combining the holistic and systemic approaches

The relationship of the holistic approach to each student is reflected in a complete, detailed portrayal of each child, constructed with the help of measurable tools obtained from all the partner teachers who surround the student as well as from an in-depth analysis and discussion by the advisory committee. Parents are recruited to the process because their involvement is also important.

The systemic approach enables precision in details because information moves directly between the officials, according to their professionalism and specialization, and not through several bureaucratic levels. It includes an understanding of the mechanisms of achievement and the development of learning in a targeted manner. It also emphasizes the connections between different aspects of knowledge in the education system. The combination provides each teacher encouragement and support for the needs that arise from the field, and is a suitable answer to the indifference and bureaucracy that exist today.

Critical to the success of the management process is the implementation of the overall humanistic-systemic approach involving input from the many sources. Operation involves recruitment of parents; empowerment and development of teaching teams with an individual-focused team structure; development of multi-system professional units including mapping, diagnosis, guidance, counseling, and treatment; in-depth mapping of the students; social, family, academic, emotional, therapies if needed, and their synchronization. Personal, class, and school data are presented to the advisory committee working with each group which then develops action plans for each level—personal, classroom, and school. It is this breadth of input that creates the in-depth, complete picture needed.

This integration of modalities creates a system in which each child’s personality, strengths, and weaknesses are known and understood. Students are exposed to a variety of educational approaches, topics, and areas of knowledge in different subjects in order for them to identify connections that they want to deepen. Students are able to make informed choices about the areas in which they choose to develop while the educational staff provides precise guidance using all the educational approaches that have developed over time. In this environment the students learn to be responsible and significant partners

in their own success. They begin to consider and then develop a personal dream that they would like to fulfill. Development of such goals provides both a basis for success as well as a sign expressing success of the process.

1.3.2 The breadth of input

Parents (or parent substitutes who are responsible for children) have a primary role in children's development, both educational and psycho/social. In our study, the school recruited parents as active partners in the educational process with an emphasis on connecting and strengthening the relationship between the child and the parents. Using the Shoham process, a long-standing practice that allows parents and mentors to be around the student during learning/experience, parents took part in an ongoing and consistent procedure together with their children. Each meeting was recorded and documented. It was then evaluated by the student. This action strengthened and restored the desired and expected status of the parent, developing a common and fruitful dialogue between the teacher and parent following challenges that arose during the meetings.

An advisory committee consisting of three educator teachers, one counselor, one psychologist, and one individual coordinator was an important part of the process. Personal, class, and school data were presented to the committee for consideration. Based on the comments of these specialists, action plans were devised at the personal, classroom, and school levels.

The committee met for a week to discuss classes according to a schedule prepared in advance. In preparation for the meetings, each educator was responsible for collecting data from the professional teachers and other professional parties using a special form to ensure necessary information was provided. Because of the structure and preparation, the meetings provided a professional environment for discourse, for discussion, to receive answers, and to make decisions about the student/study group/class.

Each class met twice with the advisory committee. This committee was the replacement for the standard pedagogical meeting with multi-professional committees, providing individual-focused scrutiny not possible in the old system.

Each teacher formulated a way to deal with students' differences and to create conditions for the realization of each student's abilities. This is necessary because each student is unique and special, and learning is a personal, conscious, and informed process that takes place in a social context through interactions with significant adults and peer group members, in and out of the classroom. Thus the curriculum needs to be individual-focused in order to allow each child to realize learning and to reach academic, social, and emotional goals.

All the critical data was collected by the class teacher, who also conducted a discussion about each child in front of the committee. Because of this, each student could be helped to progress from where he or she was.

Teachers developed a deeper knowledge of their students, including the characteristics of different cultures. They also acquired professional knowledge and tools for teaching and working with gifted, average, and struggling students. Evaluation of teacher-student relationships allowed for better prediction of cognitive and school achievements than did evaluation of functioning of the students themselves, as predicted by Hamre and Pianta (2001).

The application of new knowledge gained was integrated into the actual teaching and work processes. This created an enabling and nurturing environment in which students were empowered and their curiosity was developed while their special needs of each were taken into account.

1.3.4 Curriculum

When there is a rich, challenging, and supportive learning environment, a connection is made possible for teachers to process information and deepen their students' growth. A curriculum was adapted to teaching-learning including various aspects including mental, emotional, social-value, sensor-motor, and spatial. At the same time, the students' progress was monitored and quality feedback was provided for their promotion while each student was given the opportunity to express him- or herself and to feel a sense of belonging, acceptance, and appreciation.

1.3.5 Responsibility for student advancement

In this model, the responsibility for the advancement of all students rests with the complete staff of the educational institution. The teaching staff must recognize the differences that exist between students; a climate and educational concept that supports and promotes a response to diversity is critical. A consistent

diagnostic system in the field of learning, support-inclusion, treatment, and updating must be maintained. The ability to include and promote learners is important, as is providing diverse opportunities for teachers including further training, mentoring and accompaniment, and counseling. Teachers need an increase of periodic training hours to increase their toolboxes.

A separate team is necessary to provide support for the educational team and to lead the overall support system. Also needed are increased resources for the institution to promote student learning and growth. Pooling and maximizing resources for optimal utilization while prioritizing other educational initiatives is sometimes necessary. Peer learning and collaboration between the various professional bodies is necessary in relation to the needs of both staff and students.

All of these requirements were met by the HSSMM model.

2. Methods

Before the start of the year, as well as during it, an ecological diagnosis was built in an orderly and systematic way describing the current situation and the desired situation (see Table 1). The collected data, consisting of questionnaires, interviews, trainings and so forth, were carefully measured and selected in a continuous and unceasing process. An analysis and correlation examination was performed on the data to make sure that the direction did indeed point to the desired goal.

Table 1. Schedule of action research activities of stakeholders

Month Who	May-June	July- August (School Holiday)	September through November	December	an- Feb	March through June
Counseling Committee	-Resource discussion -Year summary	-Data collection and analysis -2 days of evaluation	First round: -assignment check -Data processing-optimization -Examination of resource pooling			Second round
	-Professional training -Internal professional meetings					
Teachers	-Testing children	-Input data -Complete forms -2 days of evaluation	First round after data collection	Implementatio n of decisions		Second round of meetings after data collection
Involved Parents			First conference	Second conference	-Third conference -Parent questionnaire	
Students	Undergoing tests and examinations	School holiday	-Placement in focus groups -Transition between study groups			
						Climate questionnaire

Source: Tsarfati (2020)

The distribution of resources and the harnessing of all teachers as partners in planning and implementation was critical. Great care was used to strive for and maintain the required balances to encourage cooperation.

2.1 Setting

The research was carried in an elementary school that included students from the age of 6 (first grade) to the age of 11 (6th grade). Each level had two classes for a total of 12 classes in the whole school. This amounted to about 240 students total. Each class had an educator who was the head of the class, the elementary teacher. There were 28 additional professional teachers. The social composition of classes was heterogeneous. One class was defined as a special education class for students with special needs.

Every year tests and mapping were conducted for all students towards the end of the year. These were used to create proactive action plans to be carried out through the advisory committee. The only exceptions were the two groups of children who moved up from kindergarten to first grade. These

students were mapped towards the end of the first quarter. These assessments were used as information for consideration in making decisions related to achievements (Kusmaryono et al., 2019).

2.1.1 Research population

The research year began in May of the school year before the majority of the research. It was carried out in grades 1-6 with children between the ages of 7 and 12, for a cohort of 240 children who were all students at the school. There were also 200 parents, or at least one parent for each student (some students were siblings). Twelve educators were involved as well as an advisory committee consisting of three teacher-educators, one counselor, one psychologist, and one coordinator.

2.1.2 Quantitative research

The quantitative research aimed to determine how the implementation of the model affected the students' learning and understanding (See Figure 3).

Figure 3. Systemic overview of students' educational and emotional data
Source: Tsarfati (2023)

For the students, this involved checking their achievements in May and June. Additionally, each student had a learning and motivation questionnaire that looked at his or her sense of connection with the teacher and with the school.

In March and April there was an evaluation of the questionnaires, which included questions with open-ended answers.

Teachers had a motivation questionnaire completed by August 15. Parents had two satisfaction questionnaires, one in September and one in June. Both parental and teacher questionnaires included open questions.

2.1.3 Qualitative research

The advisory committee was given in-depth interviews about the process that influenced their career path in the education system, about implementing this new approach, about their motivation, and if and how it changed the way they saw and experienced their careers. Also investigated was their willingness to implement innovative pedagogy.

3. Results

In order to study this management model, the educational team was recruited. Each member had a significant role along with the right to choose to focus on their area of strength in order to implement the educational model and contribute as an important contributor to the process.

This intervention model of school management was implemented in the school when the partners understood that education leads to progress through a combination of psychology and pedagogy. As long as a teacher has significant data and an overview of both each student and each class, the teacher will be able to be more precise in his or her work. By implementing this school management model, the teachers were able to develop their individual intellects and at the same time their social/emotional abilities.

The process was regulated in stages in a modular manner using means of action based on databases for the implementation during the study year as well as for future implementation in more educational environments (Whitehead, 2009). Miller (1998) shows that teacher leadership and administrative leadership work collaboratively to create more democratic and participatory school organizations. For this reason, the diagnoses were made through a consulting group, the school's advisory committee, and can be adapted following the values-based educational agenda in each school.

The teacher questionnaires provided a snapshot of the comfort teachers had in their roles and in their school. Some questions required responding to a scale of one (worst) to five (best). To the question, "To what extent do I have the necessary tools at school to succeed and to express my abilities?", 35 percent selected 5, 65 percent chose 4, and none rated their abilities below that. When asked, "To what extent do I feel comfortable in the teachers' room?" answers were spread more widely, with 55 percent answering 5, 36 percent answering 4, 1 percent answering 3, and 1 percent answering 2.

Answering an open question about the teacher's room, one teacher wrote, "The teacher's room has a good and pleasant climate for talking with co-workers. There is caring, understanding, help, and listening to the needs of others, acceptance, and help." A second teacher responded, "In the teachers' room there is a lot of happy giving and encouragement, and of course a lot of investment of each and every one of us in our roles. We could improve, for example by celebrating birthdays for teachers born in the same month and adding more atmosphere of belonging to the teachers' room."

At the close of the research study, 56.7 of the parents reported significant improvement in their child's performance; 23.3% reported slight improvement; 11.7% reported no significant improvement, and 8.3% either did not respond or only responded to the open-response part of the question.

The question, "What does your child's educator/classroom teacher know about your child, considering both his academic situation and outside interests?" had six possibilities ranging from "little" to "very much." Slightly more than 48% of parents selected the highest response, 24.2% the second-highest, 21% the third-highest, 3.2% slightly below the midpoint, and 3% the very lowest, with none selecting the second-lowest choice. Parent comments on the open response questions averaged a high satisfaction level with teachers.

Regarding student responses as far as emotional connection was concerned, 54.2% of students rated their teachers highest on a scale of 1 (lowest) to 4 (highest) in response to the statement, "Most of the teachers give me the feeling that I can do well in school." 40.6% of students agreed with the next statement, "sometimes yes and sometimes no," 4.2% said "generally no," and 3.1% responded "I never got this feeling from a teacher."

In response to the pedagogic element, students replied to the statement, "Most of the teachers clearly explain to me the material they teach." The 38.5% agreed with the highest level, while 50% said "sometimes yes and sometimes no." 14.6% responded "in general no," and 2.1% responded "I never had this feeling from a teacher."

4. Discussion

This paper presents a new humanistic management model for schools focusing on the function of the model and its contribution to the school. The development process of the teaching staff was presented through continuous action research (Whitehead, 2009).

This was a reflective self-study, and its purpose was to help improve the work in a rational and controlled process. The study introduced a shared reflective autobiographical narrative (Zeichner, 2001) to help understand personal and social situations through action research. The work was carried out with the possibility of analysis and presentation in a circular way, without a break. Sharing this research enables reflection and helps build a systemic-pedagogical theory that can be used to help solve educational problems (Whitehead, 2009) and implement the educational milestones.

In general, the relationship between holistic education and the systemic approach focuses on a central understanding of the educational system as a central system with coordination, work sharing, and common understanding among the various components within the system. This is a reality that guarantees the improvement of educational and learning processes and results in an improved educational environment.

The entire system can be made more effective for the planning and implementation of educational processes when there is a central understanding of the educational system. Increasing proper cooperation between the various components in the system and systemic thinking on both the effects of the actions and on the broad educational goals is possible with the humanistic/systemic management approach described here.

This model involves the promotion of the development of teams as well as influencing the individual components of the education system, most notably teachers and students. The students improve and develop when the teachers and administrators develop and renew themselves. Therefore, central importance is given to the training and professional development of the staff in the education system.

Conclusion

In this article we present an effective new school management model, the Humanistic Systemic School Management Model. We have seen that this model leads to happier and more successful teachers and students. The very fact that the teachers, who work in the field and are the human capital of the school, are involved in all the details, in the processes, and are partners in the action research allows the system approach to be fully assimilated.

Broad recent knowledge in education management documents the benefits of using a holistic systemic approach. The goal of this study was to develop, apply and evaluate a method to teach administrators how to implement a holistic systemic management approach in the education system, in order to provide an integrated and fruitful learning experience for students. This was done in a practical, step-by-step modular fashion while integrating managerial practices. As a first step, it was critical for administrators to understand the basic principles of the holistic systemic approach in education.

In order to accomplish this managerial goal, it was necessary to also focus on professional development of the educational staff. Thus important ideas and activities were introduced that examined different ways of measuring student progress in an effective and creative way. Main aspects of the holistic systemic approach in education enabled the understanding of the central principle of seeing the student as a whole, thinking outside the box, recognizing and addressing diverse learning ability, and the ability to influence proactive learning processes. This had to be taught and encouraged. Additionally, administrators were encouraged to be creative and to integrate the holistic systemic approach into all processes and decisions in the education system.

The results of the research show how the suggested model, based on the Systemic Approach and with the addition of the humanistic holistic approach, when applied to education, establishes a new modular school management model. The interactions among teachers, parents, and students is a critical part of this model as they provide a guide for the direction of the school, including identifying both strengths and weaknesses.

This new knowledge in the field of school management and educational entrepreneurship can be used to create entrepreneurial opportunities as well as opportunities within school systems for individuals and populations while ensuring sustainable solutions. It permits high precision and professionalism in managing the various components of the school to improve student achievement and satisfaction, teacher effectiveness and satisfaction, and the development of a warm, supportive, and positive school climate.

Sustainability in Healthcare: A Conceptual Study

Viktória Ali Taha^{1,*}, Veronika Škerháková¹, and Ema Scholtz¹

¹ University of Presov, Faculty of Management and Business, Department of Management, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: There are a lot of issues that policy makers and healthcare professionals should consider with regards to sustainability, including how to assure quality and incorporate financial, environmental, cultural and societal aspects to maximise the likelihood of a sustainable system. Although researchers in healthcare have emphasised the issue of sustainability, this concept is not sufficiently explored and poorly researched in our conditions. A need exists for theoretical and empirical studies of sustainability in healthcare.

Purpose of the article: The aim of this study is to describe, explore and explain the concept of sustainability in healthcare.

Methods: Conceptual analysis is based on a series of focused articles covering many of the domains that are encompassed in this broad spectrum and still overlooked area of sustainability in healthcare. The basis is secondary data from literature searches and articles published in indexed databases over the last 6 years.

Findings & Value added: The purpose of the article is to summarize literature about the issue of sustainability in healthcare context (with a specific focus on the sustainability pillars and sustainable employability) and thus provide a contribution to the scholarly conversation about the issue.

Keywords: sustainability, healthcare, sustainability dimensions, sustainable employability

JEL classification: M0, I1, Q01

1. Introduction

Today, the issue of sustainability is not only socially important, but also crucial for all organizations that want to build and maintain their competitive position. Sustainability seeks to balance and optimize environmental, social, cultural and financial interests. Sustainability in healthcare is a particularly challenging task as it involves healthcare organizations covering a wide range of facilities, operations, processes and activities. Hospitals and other healthcare facilities use a lot of energy, food and materials, which means they also cause environmental pollution. Last years there are strengthening tendencies to make a healthcare sector more sustainable and to reduce the sector's negative effects on climate and the environment (for instance by implementing environmentally friendly technologies, green building, reducing its carbon emissions and mass waste, recycling and reuse contaminant disposal, water efficiency, using green cleaning agents).

Sustainability is a continuous process of improvement, collectively completed through communication, action, follow-up, and benchmarking. „Sustainability is seen as a holistic worldview that provides the ability to adapt and integrate paradigms, where the key element is the system of humans and the rest of life, and each member of the system has its role and place in the individual-to-global system according to the living system principles of wholeness, change, and relationships“ (Mostepaniuk et al., 2023). Calabrese et al. (2023) (based on the work of other authors) argue that, health sustainability refers precisely to the ability of systems to promote the long-term health and well-being of people within society. Sustainable are considered those health systems that manage to balance the interests of stakeholders, while having the ability to improve, innovate and develop continuously. The sustainability of a system in this perspective involves a balance between cultural, social, economic, and environmental factors. The aim of the paper is based on the study of the scientific literature theoretically clarify the issue of sustainability in healthcare.

2. Methods

The paper has a character of conceptual study which purpose is to provide a deeper understanding of the issue studied that serves as a basis for future research. Conceptual research relies on literature review which involves a systematic search and analysis of existing literature in order to identify basic concepts and theoretical starting points of the issue of sustainability in the healthcare sector, supplemented by an overview of research results in the given area. Articles in academic journals were used for conducting it.

3. Results

This conceptual study is built around existing literature and appropriate research studies that can explain the examined phenomenon. The main aim of the article is to summarize literature about the issue of sustainability in healthcare pointing out the individual pillars of sustainability and with a special emphasis on socio-cultural aspects and sustainable employability.

3.1 Sustainability in healthcare context

As mentioned, sustainability covers the economic, environmental and social impacts of an organization's operations. Environmental impacts typically refer to an organization's relation to the natural earth systems, including consumption of non-renewable resources. The social sustainability addresses a business organization's relationship to the communities and societies where it operates; it includes human rights activities, labor practices, fair operating practices, consumer support, health and safety, and community involvement and development (Boone, 2012). From a clinical perspective, considering sustainability means allocating resources - both human and material - appropriately and considering the health and wellbeing of staff which is arguably the single most important entity in the sustainable delivery of healthcare. Sustainability incorporates many core topics including quality improvement, process and systems design, and workforce planning issues across an integrated healthcare system. (Nicol, 2018). In connection with sustainability, we cannot forget the environmental impacts of the operation of medical facilities. For example a study of Andersen and colleagues in 2010 was aimed at estimation the impacts of inhalation anaesthetics on climate change and found out that global emissions of such anaesthetics have a climate change impact comparable to that of the CO₂ emitted by 1 million passenger cars. Moreover, most anaesthesia gases when released are not absorbed by patients, but they are captured by ventilation systems and ultimately expelled from the buildings and end up in the atmosphere. And there are also other non-negligible impacts, for example, CO₂ emissions from the healthcare organisations, waste produced by hospitals, drug manufacturing among others (Sustainable health systems, 2022).

Mehra and Sharma (2021) in their study focused the attention to various practices for sustainable healthcare, imperative measures of sustainable healthcare and the way of attaining sustainable healthcare. Authors based on the acknowledged sustainability practices in healthcare (grounded in appropriate theories) have developed a compendious theoretical model for sustainability in healthcare which encompasses twenty-seven sustainability practices under its triple bottom line, which have been subsequently reorganized and arranged for analysis into twelve sustainability measures. Authors' proposed conceptual model of sustainability in healthcare which is comprised of various practices, activities, and strategies was assessed by healthcare experts who advised the grouping of twenty-seven sustainability practices into twelve following measures for analysis divided into three dimensions:

1. Environmental:

- circular practices (the concept of keeping resources in use for as long as possible through their recovery and re-use following cradle to cradle approach),
- facilities design (architectural design of a hospital facility including its technology and equipment and its effect on patient safety),
- waste reduction and management (reduction to the greatest extent possible, the waste that is destined for ultimate disposal by means of re-use, recycling and other programs),
- sustainable procurement (combining social and environmental factors with financial considerations when making purchasing decisions).

2. Social:

- patient satisfaction,
- employee satisfaction,
- affordability (healthcare facility should be available (24 × 7), accessible and affordable to all),

- sustainable health (prevention of diseases and promotion of healthy lifestyles through vaccines, exercise, yoga, meditation, healthy food etc.).

3. Economic:

- green growth (the incorporation of environment friendly practices into healthcare delivery such as a green hospital),
- research & innovations (improvement programmes such as in clinical practice, nursing practice, reducing the cost of healthcare etc.),
- savings in operational costs and enhanced profits (strategies that promote cost savings, profits and research & development),
- indigenous production.

This hierarchical model (comprised of various practices, activities, and strategies) may help organisations in recognizing significant practices necessary for sustainability achievement.

3.2 Sustainable healthcare: social and cultural aspects

Social sustainability is a work field characterised by an emphasis on social aspects, e.g. equity, ethics, health, gender balance, or empowerment, within a broader sustainability context (Leal Filho et al., 2022). However, some authors (Shirazi and Keivani 2019; Chatterji 2021) believe that social sustainability is an area of knowledge that has proportionally received less attention compared with economic and environmental dimensions being discussed in academic research (in Leal Filho et al., 2022). Similarly, Djukic and Marić (2017) assume that social sustainability has had significantly less attention in public dialogue, and academic research than economic or environmental aspects although healthcare institutions are making a focal point on patients' and staffs' contentment.

In a healthcare setting, social sustainability can be represented by the ability of hospitals and healthcare systems to enhance quality of life and improve well-being in a population as well as by the ability of healthcare architecture to facilitate connections, enable access, improve health and enhance equity. Calabrese et al. (2023) believe that as for the social approach, the sustainability of health systems should be based on the ability of organisations to redesign relationships with patients, considering legitimacy, trust, and social value. The established relationship tends to emerge as a means of creating and maintaining value within organisations that aims to provide superior quality care to citizens and patients. According Djukic and Marić (2017) social sustainability of healthcare facilities in future will depend on their ability to improve quality and design towards user-oriented performance. The primordial responsibility for policy makers and designers of healthcare development is to build a facility where the feeling of human dignity could be conserved to its maximum. The design of hospitals should consider the needs and preferences of the patients and staff, to provide therapeutic and protective atmosphere for patients and to promote efficient staff performance. It is important to diminish the psychological discontent of patients, the impression of anxiety and uneasiness caused by diseases. Such type of design finally boosts the organization's clinical, economic, productivity and cultural contentment (Djukic and Marić, 2017).

Culture is an embedded mindset. The concept of culture is multi-interpretable and thus the role of culture in sustainable development varies with different interpretations of culture - from tangible and intangible human achievements to symbolic patterns, norms, and rules of human communities. Linkages between culture and sustainable development can be generally classified into two sets according to the accepted definition of culture in terms of its constituent interpretation and its functional interpretation. In the constituent interpretation (in which culture refers to a set of shared values, beliefs, and norms through which people perceive, interpret, or respond to actions and environments) the culture acts as a facilitator or barrier to development by affecting human perceptions, actions, and achievements concerning sustainability. According the second interpretation with a more functional orientation (which denotes the practice of culture through cultural production, consumption, and participation) culture plays a role as a driver and enabler of development since the cultural and creative industries that produce cultural goods and services can generate growth, income, and employment (Zheng et al. 2021).

To change a culture, it must be developed and understood by all stakeholders to include input from all of those impacted. So it is with a cultural aspects of the sustainability in the healthcare. In the healthcare systems, there is a movement of culture change called person-centered care and it does not only speak about patients or residents being served, but also those providing care or other services, families and visitors, product and service providers as well as others spending time within a health care system. We can also understand the sustainability as a culture that weaves together the fabric of an organization.

Additionally, inter-facility dialogue is necessary to creating a wider culture of sustainability in a larger geographic area. Such is the case in Maryland, United States, where health care facilities have recently formed the nation's first statewide health care sustainability leadership council (Medical Tourism Magazine).

Who knows a hospital or health care facility better than the individuals whose job it is to clean and operate it? According to the Medical Tourism Magazine the environmental services and facilities staff are the eyes and ears of an institution and know more about the efficiencies and inefficiencies than anyone else. For example, they can identify locations that are lit when unoccupied; faucets and pipes that leak or drip; excess use of toxic cleaners; entryways for pests; opportunities for recycling as well as others. Nurses, who are the end user of many products, understand the connection between environment and health and can identify opportunities for improving facility sustainability. Hospital managers including purchasing, facility, dietary, marketing, etc. are in a position to spearhead projects and best practices since often learning from peers, the literature, or at conferences so they are the right ones to support integrated sustainability practices. In addition to staff, residents and patients can contribute to the sustainability journey of healthcare as well, simple by not staying quiet about the critical topics.

According to a report in Vatornews conducted among clinicians who showed signs of burnout, up to 69% of them said they did not feel appreciated. The fact that nearly 7 out of 10 doctors feel their work is underappreciated points to the fact that health care systems should work tirelessly to be strong advocates for their own employees, to appreciate and recognize them for their selfless work, to build a favorable culture, part of which is the provision of sufficient time off for employees in the healthcare sector (Awan, 2023). The ultimate goal of developing and implementing a sustainable culture in healthcare is not only about the physical setting or operations of a facility but is also related to the positive outcomes of the populations served by the facility, and the ability to instill in all the populations to create healthy and sustainable cultures healthcare community wide (Medical Tourism Magazine).

3.3 Sustainable employability in healthcare

Sustainable employability is a growing concern for many societies since with the aging of the workforce many individuals leaving the labor market for health reasons. Achieving sustainability in healthcare, i.e., when employees are able to continue working in a satisfactory, productive and healthy manner, is a timely challenge for healthcare (Roczniewska et al., 2020). International organisations including WHO, Organisation for Economic Cooperation and Development (OECD) and World Economic Forum (WEF) have recently identified significant challenges to the long-term sustainability of healthcare systems and since: aging population, increasing rates of chronic and complex diseases, growing costs of new medical technologies and medicines, wasteful spending on low-value care, inefficiencies due to system fragmentation and limited use of data and evidence to support reform are real threats to health system performance and sustainability (Braithwaite et al., 2019). Sustainable employability can be defined as „making a valuable contribution through the work of workers, now as well as in the future, while safeguarding their welfare and health. From an organizational perspective, a sustainable workforce is absolutely necessary because it reduces the costs of turnover and absenteeism. This is especially important in healthcare services, as it supports the retention of trained specialists who are difficult to be replaced because of their specific education, skills, and expertise (Roczniewska et al., 2020). Yet, the problem is that turnover is relatively high in healthcare settings.

For example, a prospective questionnaire study of healthcare managers in Sweden demonstrated that 40% left their jobs within a 4-year period (Skagert et al., 2012). The Pakistan study of Knowledge Management in the Healthcare says that Pakistan government admits having troubles within its healthcare sector despite the fact it is rapidly growing and the second largest economy in South Asia. Pakistan government has continuously increased the budget of healthcare over the years and presented multiple policies and strategies (National Health Policy (2001), Poverty Reduction Strategy Papers (2001–2009), Medium Term Development Framework (2005–2010), National Health Vision setting targets for 2025) in field of sustainable healthcare but still is unable to cope with the rapid growth and increase in patients on a national level, and the performance is below average (Karamat et al, 2018). Many articles present that Pakistan is considering the adoption of knowledge management to improve performance, which it is currently at infancy stage in developing countries (Karamat et al., 2019). A results obtained by survey of study from 2019 about Knowledge of Sustainable Development Goals (SDGs) and 2030 Agenda from nine Italian universities showed most of the interviewed subjects having never read nor heard about SDGs, while 26.0%, although having heard about them, reported not knowing what they were; only 36.0% of

respondents claimed having heard about them, but only one out of ten actually knew what they were. This is absolutely shocking since The Sustainable Development Goals (SDGs) were adopted already in September 2015 by nearly 200 countries participating in a historic UN Summit, calling for action each country with equal commitment and the 2030 Agenda, where the SDGs are enounced, represents a globally shared development program, involving the whole population in a common mission aimed to face climate change, to fight against inequalities and to put an end to any form of poverty. The achievement of these goals runs parallel to the guarantee of satisfaction of social needs as quality education, decent work opportunities for all, social protection as well as effective healthcare services and sustainable healthcare (Smaniotto et al., 2019). According Deloitte considerations „healthcare organizations need new thinking about the workforce and how its structured. Licensed professionals need more support from both automation and other clinicians -from nurses to pharmacists. Rising investments to address worker shortages and attrition indicate a growing recognition of challenges that providers and other industry participants face“. In order to meet the needs of the population in the immediate term and for the foreseeable future it is necessary to ensure sustainable healthcare workforce. Governments are spending considerable effort and funding to address health workforce retention issues, for example: United States plan to invest \$1.5 billion to increase the number of health workers in underserved communities by offering scholarships and loan repayments for students in healthcare who pledge to serve those communities, the Indian government is expanding medical college seats and starting special courses for rural health services,

One of the most important challenges healthcare sector is facing that threatened the sustainability of its workforce is burnout. It is major issue affecting turnover of the healthcare workforce. By its nature, burnout is prevalent among healthcare workers. The term burnout is a term for a psychological syndrome encompassing three dimensions: emotional exhaustion, depersonalization and decreased sense of personal accomplishment, according to the Revision of the International Classification of Diseases (WHO). The number of burnout healthcare workers is alarming. According to a study in Mayo Clinic Proceedings, more than 3 in 5 physicians reported at least one manifestation of burnout in 2021 (Awan, 2023). A Japanese Cross-Sectional Survey about burnout of Healthcare Workers from 2021 says that hat approximately 20–30% of resident physicians in Japan, who are considered to be more vulnerable to stress, were experiencing burnout already before the COVID-19 pandemic. Japanese healthcare delivery system, which was famous for universal health coverage was because of COVID-19 in danger of collapse, given the overwhelming number of hospitalizations and due to exponential growth in the number of cases and deaths related to the disease, the first cross-sectional study found that 50% of the front line healthcare workers who engaged in direct care for COVID-19 patients experienced burnout (Nishimura et al., 2021). According Murthy (2022) burnout manifests in individuals, but it’s fundamentally rooted in systems. However, health care worker burnout was there before Covid-19 crises. Main causes include inadequate support, escalating workloads and administrative burdens, chronic underinvestment in public health infrastructure, and moral injury from being unable to provide the care patients need. The author notes that burnout is not only about long hours, but it’s about the fundamental disconnect between health workers and the mission to serve that motivates them. It is alarming that these systemic shortfalls have pushed millions of health workers to the brink. According to surveys (American Nurses Foundation and Mayo Clinic Proceedings) around 52% of nurses and 20% of doctors are planning to leave their clinical practice. It is expected that by the end of the year (U.S. Bureau of Labor Statistics) there will be shortages of more than 1 million nurses and a gap of 3 million low-wage health workers is anticipated over the next 3 years (Mercer).

3.4 Sustainable healthcare: environmental and financial point of view

When it comes to environmental aspect of sustainability in healthcare, healthcare actually might not be the first industry that springs to mind when you consider the causes of the climate crisis. But globally, an estimated 5% of global emissions come from the healthcare industry. According to the World Health Organisation (WHO), high-income countries generate around 0.5kg of hazardous waste per hospital bed, per day. Robert Metzke, SVP and Global Head of Sustainability at Philips said, that “The healthcare sector in itself is emitting more CO2 than airlines and shipping lines and we often don’t talk about it, “If the world is to meet the targets set out in the Paris Agreement on climate change, the healthcare sector needs to transition to a more sustainable model and implemented the principles of the circular economy. This means finding new and sustainable ways to use resources and bring about the decarbonisation of the

industry. The European Union is leading the way with several initiatives following the European Green Deal and its Circular Economy Action Plan (CEAP) (Daunton, 2023).

There are a number of studies that have evaluated the performance of global-, regional and country-level healthcare systems. A comprehensive study conducted by using data from 173 countries concluded that the average efficiency of national health systems was 78.9% (Sun et al., 2017). Nobody is surprised that African countries had the lowest efficiency of 67% and countries in the west Pacific had the highest efficiency of 86% because the efficiency of national health systems depends the most on national economic status as well as on the incidence of HIV/AIDS, governance and health insurance mechanisms. The study concluded that a 1% increase in social security expense as a percentage of total health expenditure results in a 1.9% increase in national health system efficiency (Asandului et al., 2014).

There are some country-specific studies as well. A study on the Australian healthcare system concluded that healthcare services in Australia are among the best in the world. The study highlighted resource allocation and performance in patient outcome improvements as two main challenges faced by the healthcare system. Lebanon is one of the countries that has opened its borders for Syrian refugees. The influx of the refugees has put pressure on the Lebanese healthcare system. A study conducted on the Lebanese healthcare system inferred that the healthcare system performed reasonably well despite being stressed by the influx of refugees. China has made great progress in providing equal access to healthcare and health insurance but the challenges of better quality, control of non-communicable disease and efficiency in healthcare services remains a challenge. But what these states has in common within the efficiency of healthcare system is a non-negligible financial flow into sustainable healthcare (Umar et al., 2021).

Conclusion

Sustainability in healthcare seems to be the new and inevitable trend all across the world. It is obvious that the need for sustainable transformation of healthcare system becomes very urgent. The topic of sustainability itself is very wide-ranging and complex, it concerns various aspects of the functioning of organizations. Environmental issues are inseparable from other aspects of sustainability, such as social and economic. Significant changes in one dimension will inevitably affect the other dimensions. However, when dealing with the topic of sustainability of the health system, the issue of environmental sustainability is often coming to the fore and therefore one of the intentions of this paper was to point out other aspects of sustainability in the healthcare industry.

There are many ways to maintain sustainability. As the Mehra and Sharma (2021) state “it is time for the healthcare ecosystem to be re-engineered with systemic and structural changes, keeping ground realities in mind, through innovative and sustainable models of care delivery as well as business processes. It means that progress towards sustainability practices in healthcare needs to be further strengthened”. It is a big challenge to incorporate sustainability in such a big and diverse system like healthcare system. Our task at the moment is to raise awareness about this issue, which would eventually lead to the fact that the competent authorities, institutions and persons would take the necessary measures.

Since it is a conceptual study a research was conducted by observing and analyzing already published information on a given topic with the aim to interpret existing theories with the possibility of their further use in upcoming research. This conceptual study explains the investigated phenomenon and indicates the actions needed in the course of the research study based on the knowledge obtained from other ongoing researches and other researchers' point of view on the subject matter.

Management of Tax Administration and Tax Evasion as a Result of Overall Economic Behavior

Miroslav Gombár¹, Nella Svetozarovová^{1,*}, and Anna Burdová¹

¹ University of Presov, Department of Management, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: Currently, tax evasion is increasingly widespread, which is also indicated by the excessively high fines for individual tax crimes. Tax crimes do not have a positive effect on our economy, on the contrary, they have a negative effect, so the state lacks funds to develop other areas of economy. The extent of these tax crimes is quite high.

Purpose of the article: The paper focuses on the issues of tax administration management and tax evasion in the conditions of the Slovak Republic.

Methods: Our approach involves delving into the VAT tax gap's arrangement and its temporal development within the 2008-2021 period. This examination relies on secondary data accessible via the official portal of the Financial Administration of the Slovak Republic.

Findings & Value added: The results of the analysis showed that Slovak Republic recorded a historic success in the value added tax (VAT) collection for 2021, when the tax gap decreased by 4.7 percentage points year-on-year to 12.1%. The improvement of VAT collection in quantitative form brought an additional 360 million euros to the state budget. This also meant a qualitative prediction of a favorable development of tax administration management..

Keywords: tax crimes, value added tax, tax gap

JEL classification: F38, G32, H26

1. Introduction

Taxes affect our daily lives. Each tax is part of the tax system. This system evolves in tandem with a nation's economic and historical progression, resulting in a distinctive tax structure for every country. The tax recipient, known as the tax subject, holds the responsibility of fulfilling tax obligations. This role is assumed by either a natural person (whether an entrepreneur or a non-entrepreneurial citizen) or a legal entity. There are instances where the tax subject might encompass a legal representative, a tax guarantor, or even the lawful successor of a natural or legal entity. Within the framework of tax-related legal interactions, these tax subjects are most commonly denoted as taxpayers and tax payers. (Schultzová et al., 2011)

According to Lénártová (2009), who defines the taxpayer „as an anonymous consumer who pays the tax in the price of the purchased goods or services, because the tax is part of the consumer price.“ A tax payer is a tax subject who is obliged by law to remit to the public budget the tax collected from other subjects or withheld by another payer under his property responsibility. (Vančurová, Láchová, 2010) As part of the value added tax concept, we encounter the term taxable person. It is any person who does business independently, regardless of the purpose or results of this activity.

Foreign persons who are not residents of the Slovak Republic are also subject to value added tax. The objective of preventing discriminatory taxation is met through agreements aimed at sidestepping double taxation. These agreements cover various aspects, including the classification of the tax subject - whether they are a tax resident or a non-resident - and the characteristics associated with each. In essence, a tax resident can be characterized as an individual tied to the geographic jurisdiction of a state, leading to the establishment of their tax responsibilities. Tax residents assume comprehensive tax liability, obligating them to pay taxes on their earnings worldwide. (Schultzová et al., 2011)

1.1 Defining the issue of tax evasion

When viewed through the lens of criminal law, tax evasion emerges as an unconventional type of criminal transgression. It strays from the traditional model of criminal acts due to the extensive and widespread harm it generates, making it intricate to accurately pinpoint. Additionally, concerning its frequency, tax evasion distinguishes itself from other criminal offenses, exhibiting notably higher occurrence rates compared to various potentially grave breaches of administrative procedures. The enforcement of laws specifically designed to tackle tax evasion occurs in an uneven and sporadic manner. Despite these peculiarities, or possibly because of them, tax evasion occupies a space within the gap of normative analysis. In the realm of criminal law, scholars have largely skirted the exploration of tax evasion, whereas in the domain of tax law, theorists do address the subject, albeit with only partial application of the fundamental tools found in various criminal law theories. (Green, 2015)

Boháč (2011) portrays tax evasion as an instance in which taxation isn't determined and fulfilled in alignment with legal guidelines, causing a shortfall in tax revenue within the specified scope of the public budget. As a consequence, the tax amount established and remitted by the taxpayer diverges from the conceptually 'ideal' tax that would be imposed based on legal regulations, leading to a decrease (or even total absence) of the tax figured and paid.

In general, there are two basic forms of tax evasion, namely:

1. legal tax evasion or tax avoidance, which points to tax evasion in line with current legislation. Tax evasion means avoiding tax obligations by using the options offered by the law, such as the consumer who can change his behavior to pay less taxes,
2. illegal tax evasion or tax avoidance, which is actually a violation of the law as it is carried out beyond the scope of applicable legislation, and its mechanism basically has two basic forms, namely tax evasion based on complete concealment or tax evasion based on partial declaration of income for taxation. (Burák, 2016)

López (2017) states that tax evasion often occurs in developing countries. Therefore, it is necessary to comply with tax regulations in order to avoid tax evasion. Most firms avoid paying taxes by staying smaller, but larger firms can engage in costly tax evasion. Economies where revenues are too high are in a trade-off between overall efficiency and tax collection. Where tax evasion runs high, tax collection is low. Therefore, it is necessary to focus on more effective tax evasion-countering measures. Townsend (2012) explains that tax evasion is the ultimate manifestation of conventional tax-related offenses. This signifies the gravest misconduct that taxpayers can engage in, yet if it is recognized as a violation of the tax system, it results in a penalty. According to Evertsson (2016) from a globalization perspective, tax evasion is viewed as a crime with global implications. The issue isn't limited to tax evasion originating solely from business corporations. Corporate tax avoidance presents a phenomenon that impacts various regions and diverse companies simultaneously, resulting in global consequences due to companies evading their just tax liabilities within the countries of their operations. The free market structure opens avenues for tax avoidance as regions and countries aim to attract international investments by modifying their tax regulations to cater to corporations. Buehn and Schneider (2012) draw attention to the emergence of a sequence of tax evasion occurrences across 38 OECD countries between 1999 and 2010. These occurrences are rooted in the shadow economy and its estimated models. When combining indirect taxes and self-employment as propellers for tax evasion, a consistent decline in these incidents is observable across all nations during the 1999-2010 period. Over this timeframe, the average magnitude of tax evasion stands at 3.2% of the official GDP for all countries. Leading the averages is Mexico with 6.8%, closely followed by Turkey at 6.7%. In contrast, the USA and some others rank at the lowest positions with values like 0.5% or 1.3%.

Slemrod (2007) contends that no government can establish a tax system and then simply expect taxpayers to willingly follow suit. In reality, only a minority honors their tax obligations to the state, while the majority seeks ways to sidestep payment. Over time, the pool of diligent taxpayers diminishes, while the ranks of non-compliant individuals swell, emboldened by the perception that as more people evade taxes, it becomes increasingly acceptable. Consequently, it becomes imperative for each citizen to bear a legal responsibility to fulfill their tax duties, with penalties imposed on those who fail to adhere and pay. Despite the imposition of penalties, tax evasion remains widespread. Currently, tax evasion is significantly more prevalent than in the past, and this pattern is likely to persist into the future.

Stankeviciute (2018) conducted empirical research specifically centered on the challenge the European Commission faces in addressing tax evasion and fraud within the European Union. The research aimed to evaluate and quantify the collective financial harm inflicted by tax evasion on tax revenues throughout the EU. The study included a sample of 28 EU member states in 2016 (now comprising 27 member states) and covered a 12-year span from 2003 to 2014. The research employed a methodology grounded in the concept of the shadow economy to examine historical tax evasion trends. Through hypothesis testing, the research identified specific EU countries characterized by taxpayers sensitive or insensitive to EU membership, as well as their correlation with the economic conditions of those nations and the magnitude of their national tax rates. Empirical findings from this investigation substantiated the European Commission's concerns about the adverse influence of tax evasion on the EU economy. These findings subsequently established a multifaceted quantitative basis for shaping future tax policies, facilitating informed decisions aimed at mitigating tax evasion losses both within and beyond the EU.

1.2 VAT differences in the EU

The VAT tax gap can be defined as the discrepancy between the potential tax revenue that would be realized if all economic entities operated within legal bounds, and the actual tax receipts collected. Gaps in VAT predominantly arise from disparities between projected VAT obligations and the cumulative income. The surge in VAT-related tax evasion and fraud has underscored significant obligations within the EU in recent times. This encompasses tasks such as analyzing VAT gaps and subsequently computing the resulting damages. Nonetheless, VAT variations serve as more than a mere indicator of VAT fraud; they can also encompass unpaid VAT stemming from legitimate tax planning or result from financial constraints. Larger VAT differences can also manifest if tax authorities are less than efficient. On occasion, the VAT gap can be utilized as a gauge of tax collection efficiency that remains unswayed by shifts in VAT rates or economic conditions. An expanding gap can signal suboptimal tax collection or tax evasion, necessitating the vigilant focus of tax administration. As depicted in the illustration below, VAT revenues hold substantial significance as an income source for all EU member states. (Zídková, 2014)

As per estimates put forth in 2018, the VAT gap reached an approximate sum of nearly 150 billion (in eur), with organized crime groups emerging as a key contributing factor. To safeguard their economic interests, states adopt suitable measures aimed at proactively uncovering shortcomings related to the prevention of tax crime. Poland, in particular, has displayed a pronounced dedication to this endeavor, implementing several innovative measures in this sphere over recent years. Commencing from 2015, Poland has introduced measures aimed at countering various forms of fraud, thereby enhancing overall efficiency. Data provided by the government underscores the tangible impact of these initiatives, yielding measurable outcomes. A compelling illustration of progress is the reduction in VAT disparities and the subsequent enhancement of tax collection rates. The variance in VAT between 2012 and 2016 contracted by 6%, accounting for 21%. In contrast to the EU average, this rate is notably higher, surpassing the EU mean by roughly 10%. Remarkably, Poland ranked sixth among EU member states in terms of experiencing the most significant reduction during this timeframe. (Rojszczak, 2021) In comparison to 2019, the current tax-to-GDP ratio within the EU stands at 41.1%. The overall tax-to-GDP ratio, encompassing net social contributions and taxes as a percentage of GDP, reached 41.1% in the EU in 2019. This indicates a slight decrease compared to 2018's figure of 41.2%. For the eurozone, tax revenues accounted for 41.6% of GDP in 2019, showing no change from the data recorded in 2018. (Eurostat, 2020) Tax evasion predominantly takes place within environments conducive to committing such acts. (Varma, Doob, 2019) According to Torgler and Valev (2010), the subjects of tax evasion and corruption are gaining increasing recognition and significant attention in the present era. In this context, an inquiry emerges regarding whether attitudes vary based on gender—specifically, the inclination to engage in tax-related wrongdoing. It has been noted that women exhibit notably stronger aversion to tax evasion and corruption compared to men. This observation holds true across all countries in the region.

2. Methods

The study focuses on matters related to the management of tax administration and tax evasion within the context of the Slovak Republic. We offer an analytical perspective on the configuration and progression of the tax gap (VAT), specifically during the period spanning from 2008 to 2020. This analysis is based on secondary data accessible via the official portal of the Financial Administration of the Slovak Republic.

3. Structure and development of the VAT tax gap

As we mentioned above, the VAT tax gap can be defined as the discrepancy between the potential tax revenue that would be realized if all economic entities operated within legal bounds, and the actual tax receipts collected. Gaps in VAT predominantly arise from disparities between projected VAT obligations and the cumulative income. Figure 1 represents the Development of the VAT gap in the years 2000 – 2021 in Slovak Republic. As can be seen, the gap reached its peak in 2012 and gradually decreases in the following years.

Figure 1. Development of the VAT gap in the years 2000 – 2021 in Slovak Republic
Source: opendata.financnasprava.sk (2023)

The structure of the tax gap on value added tax. The tax gap in VAT is compartmentalized into two segments—unidentified VAT and the withdrawal gap. Unidentified VAT constitutes a portion of the gap wherein taxpayers either deliberately or inadvertently fail to acknowledge, and simultaneously, it goes unnoticed by the Financial Administration (FSSR) during control assessments. It's calculated as the variance between potential and stipulated tax. The tax collection gap, on the other hand, represents the discrepancy between the stipulated tax and the tangible tax payments. This encompasses any additional tax liabilities determined post a tax audit but left unpaid. Figure 2 represents the structure of the VAT gap in the years 2008 – 2020 in Slovak Republic.

Source: opendata.financnasprava.sk (2023)

Between 2009 and 2015, the tax gap was very high, which testifies to the ineffectiveness of the management of the tax administration. In the following years, we observe a decline. During 2018, the VAT tax gap in the Slovak Republic stood at 21.3% of the potential VAT. In contrast to its peak in 2012, the VAT gap experienced a reduction of over one third. In nominal figures, the disparity between potential and realized VAT revenue for the past year accounted for 2.3 billion euros (equivalent to 2.6% of GDP). Delving deeper, a sector-specific assessment reveals an estimate of the tax gap across various industries. This analysis highlights that sectors like agriculture, industry, wholesale and retail trade, accommodation and catering services, professional services, and other services pose higher risk levels (MF SR 2019).

In the year 2021, Slovak Republic made substantial strides in enhancing the collection of value-added tax (VAT), as indicated by a year-on-year reduction of 4.7 percentage points in the tax gap, resulting in a value of 12.1%. This positive shift in VAT collection contributed an additional 360 million euros to the state budget. In comparison to 2011, the efficiency of VAT collection increased by approximately 23 percentage points from the previous 65%, and in contrast to 2020, it rose by 4.7 percentage points.

The Financial Administration of the Slovak Republic has set an ambitious goal of narrowing down the tax gap to the level of other EU member states by 2024, which hovers around ten percent. The drive to enhance value-added tax (VAT) collection is motivated by several factors. This improvement was achieved without altering existing legislation.

In recent years, the Financial Administration has introduced a project to connect all cash registers online to the Financial Administration portal - the so-called eKasa. Online connection of the cash register for financial management is mandatory. The adoption of eKasa and the heightened adoption of online payments and internet-based purchases also contributed significantly to bolstered oversight and, consequently, tax collection. The shift from cash to electronic transactions has been incredibly advantageous. In an era of cashless transactions, each transaction leaves a trace, and it would be unreasonable to disregard sales made through card payments.

4. Discussion

Value added tax (VAT) stands as the primary revenue source for the state budget and the second most crucial source for the public administration budget. The operational framework of VAT is notably vulnerable to instances of tax evasion. This susceptibility, coupled with the substantial influx of both domestic and international transactions, positions VAT among the tax categories carrying the highest risk. The methodology presented is built upon the initial computation of the tax gap for VAT in the Slovak Republic, conducted in 2012. Subsequent to this, minor revisions were introduced to the methodology, and in collaboration with the International Monetary Fund in 2014, a more intricate calculation of the sector-specific gap was incorporated into the portfolio of tax gap estimations. The primary objective of this material is to outline the currently employed methodology for assessing the comprehensive as well as sector-specific VAT gap in the Slovak Republic.

The estimation of the VAT tax gap employs two distinct methodologies. In both instances, the top-down approach is employed, grounded in macroeconomic aggregates. The initial approach, rooted in final consumption, is utilized to gauge the entire tax gap. Its notable advantage resides in its relatively straightforward estimation process, along with the capacity for regular updates and the simplicity of input data. However, conversely, the model lacks the capability to provide in-depth insights into the intricate composition of the tax gap. In contrast, the second approach simulates the interplay between supplier and customer relationships across sectors, encompassing the fundamental application of VAT principles. This approach's strength lies in its ability to furnish a breakdown of the tax gap's composition (sectoral

decomposition), yet it is accompanied by the need for comprehensive input data and substantial delays in procuring the essential supply and use input tables.

Throughout its evolution, the tax structure of the Slovak Republic underwent diverse modifications that contributed to aligning it with global economies. Despite this alignment with global economies, individual tax systems remain distinct in each country. These disparities stem from political factors, legislative norms, administrative protocols, and the like. However, conversely, there exists a common thread that runs through all tax systems. This shared element revolves around the pursuit of enhancing tax collection. The challenge of tax evasion is intricately intertwined with the tax framework itself. The matter of tax evasion predominantly centers around the realm of taxation. Beyond financial and tax law, the realm of tax evasion also intersects with criminal and constitutional law. It's this interconnectedness that has rendered tax evasion an enduring subject of discussion, with ongoing deliberations concerning its origins and potential remedies.

They represent a phenomenon that is of interest not only to the public, but also to various scientists and state authorities, as tax evasion undermines the fiscal stability of the state. The various available studies address not only issues related to the structure of the tax gap, but also the quantification of tax evasion.

When it comes to tax evasion, Slovak Republic, as a member of the European Union, falls within the category of countries where, based on estimates, tax evasion surpasses the 2-billion-euro threshold annually. In preceding periods, this figure has sometimes exceeded 3 billion euros per annum. Looking at the time span from 1990 to 2020, the aggregate value of tax evasion in Slovak Republic tallies up to an approximate 60 billion euros each year. The emergence of these occurrences of tax evasion is predominantly intertwined with the nation's high tax and levy burden, in conjunction with the prevailing distrust among taxpayers towards the government. Considering these statistics, one can infer that taxpayers have been complicit in a substantial volume of tax fraud, leading to instances of tax evasion that have culminated in Slovak Republic suffering substantial financial losses, ultimately impacting its public finances.

In terms of the tax gap's magnitude, it holds statistical significance due to a notable reduction in this phenomenon over recent years. The tax gap embodies the variance in VAT collection between the amount the state could reasonably accrue as value-added tax in line with the law and the actual sum directed to the state treasury, which results in the exploitation of excessive deductions. The fiscal administration lacks the capacity to capture revenue losses resulting from undocumented and unpaid tax obligations. Within the European Union, member states should strive to mitigate the tax gap. The tax ratio serves as a gauge of a state's prowess in tax collection. A higher tax ratio corresponds to greater success in tax collection. When the effective tax ratio rises, the tax gap contracts, and vice versa. Slovak Republic 's tax gap remains among the highest in the European Union, with the country forfeiting billions of euros annually in VAT collection.

The tax gap might also encounter adverse effects due to the pandemic, which could potentially lead to its escalation. The pandemic has the potential to exacerbate this situation both locally and globally, given that the state budget is influenced, primarily relying on value-added tax as its key revenue source, followed by income from the public administration budget. Furthermore, the pandemic has disrupted public finances, thereby necessitating Slovak Republic to explore diverse avenues for enhancing tax collection efficiency and mitigating tax evasion.

Improving the collection of Value Added Tax (VAT) receivables is a critical task for the state treasury of the Slovak Republic as well, as it directly impacts the government's ability to fund essential public services such as healthcare, education, and infrastructure. One of the first steps in enhancing VAT collection is a digital transformation. Improvement of the existing software that enables real-time monitoring of VAT collections would provide a valuable tool for flagging any irregularities for immediate investigation.

Legislative reforms also play a pivotal role. Strengthening the penalties for VAT evasion or avoidance could serve as a significant deterrent against malpractice. Additionally, streamlining VAT rates for different goods and services could simplify the tax system, making it easier for businesses to comply and reducing the administrative burden on tax authorities. Enforcement strategies could further bolster VAT collection efforts. Frequent audits, particularly targeting sectors or businesses with a history of VAT evasion, would add another layer of oversight. Specialized task forces within the tax authority could be developed to handle complex cases that require focused expertise. Education and awareness are just as essential. Comprehensive education campaigns could enlighten businesses and the general populace on the

importance of VAT to national development. Tax officials could benefit from specialized training programs in new technologies and methodologies for identifying tax evasion schemes, enhancing their ability to enforce the law effectively. International partnerships with tax authorities in other EU countries could serve as a forum for sharing best practices and information on transnational companies that operate in multiple jurisdictions. Furthermore, adopting a customer-centric approach could make compliance easier and more attractive for businesses. Simplified reporting mechanisms, including easy-to-use online forms, can reduce the hassle associated with filing VAT returns. For businesses facing genuine hardships, offering flexible payment options could facilitate compliance without the threat of shutting down operations.

By adopting these multifaceted approaches in a coherent and systematic manner, the Slovak Republic stands to significantly improve the efficiency and effectiveness of its VAT collection processes, thereby positively contributing to the state treasury.

Conclusion

Slovak Republic, as a member of the European Union, falls into the category of states where tax evasion, according to estimations, surpasses the threshold of 2 billion euros annually. In preceding periods, this figure occasionally exceeded 3 billion euros per year. If we narrow our focus to the timeframe spanning from 1990 to 2020, tax evasion in Slovak Republic aggregates to approximately 60 billion euros annually. These instances of tax evasion are primarily attributed to the nation's elevated tax and levy burden, alongside the prevailing skepticism among taxpayers towards the government. Considering these statistics, it becomes evident that taxpayers have been involved in a significant volume of tax misconduct, culminating in instances of tax evasion. This trend has led to substantial financial losses for Slovak Republic, thereby exacerbating the deficits within the nation's public finances. In relation to the perspective of the investigated issue, it is necessary to realize that in recent years, efforts to suppress tax evasion and illegal economic activity led to the promotion of the idea of eliminating cash (Cohen et al., 2020), as cash (perceived as "anonymous money"), can play the role of a facilitator of such activities. The socio-economic system is currently very dynamic; the trend of dominance of cashless payment systems and convergence to cryptocurrencies, bitcoins, etc. is evident (Gandal et al., 2018; Korauš et al., 2021). All this, in addition to the positives, also has its negatives, which causes heated debate among experts (Rogoff, 2017; Araujo, Camargo 2015). Cohen et al. (2020) even point to the un-wanted consequences of eliminating cash. In their study they construct a simple general equilibrium model in order to demonstrate how elimination of cash-paying can lead to a misallocation of resources in a naturally segmented economy.

Conceptualization of Intercultural Competence as Part of Managerial Education

Lucia Dančišinová^{1,*}, and Irina Kozárová¹

¹ University of Presov, Department of Intercultural Communication,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: Academic discourse offers various definitions and models of intercultural competence. The heterogeneousness of intercultural competence conceptualization can be seen as its drawback as empirical research has to be theoretically based. In the Czech and Slovak contexts, the element of intercultural education is an integral part of management and economics study programmes. Knowledge of the specifics of one's own and foreign cultures together with cultural tolerance and knowledge of foreign languages is considered an important prerequisite for the successful employment of future managers in practice. Therefore, it is important to know what the elements constituting intercultural competence are.

Purpose of the article: The aim of the paper is to review, analyse, and summarize the most recent concepts of intercultural competence in order to excerpt its most prominent characteristics and elements.

Methods: Analytical-synthetic and comparative methods are applied to achieve the set aim.

Findings & Value added: The paper presents the overview of the main elements of intercultural competence in cognitive, affective, and behavioural dimensions to find possible discrepancies in current interpretation in academic literature. The paper represents an opportunity to identify and synthesize current research in the field including the Czech and Slovak academic discourse.

Keywords: intercultural competence, conceptualization, intercultural competence models, cognitive, affective, behavioural

JEL classification: Z1, Z13

1. Introduction

Demographic, economic, political, and technological changes create a world dominated by cultural differences in a global environment (Osler, 2020; Thesing et al., 2021; Negedu & Ojomah, 2021). There is a growing need to understand the importance that culture plays in communication and to learn how to function effectively in this environment (Lustig & Koester, 2010). Although the emergence of intercultural communication as a process dates back to the origins of human civilization (Průcha, 2010), its more systematic scientific exploration began in the mid-20th century and is associated with interdisciplinary collaboration between linguists (such as G. Trager and R. Birdwithstell) and anthropologists (such as E. T. Hall). Around the same time, in 1959, Robert White identified the human trait, which was named "competence" and from the 1970s, the so-called competency approach to selecting candidates for jobs began to be applied (Kubeš et al., 2004). The first competency assessment programme was developed in the 1970s to distinguish successful managers from unsuccessful ones (Kubeš et al., 2004, p. 20).

From the 1970s to the 1990s, several descriptions of competences (ranging from generic to specific) and more than 200 competence models have been developed (Kubeš et al. 2004, p. 21). The concept of intercultural competence was also developed in this period. At present many authors (Wang, 2020; Yurtsever & Özel, 2021; Kalaja & Pitkänen-Huhta, 2020; Pondelíková, 2022) focus in their research on the development of models of intercultural competence. The paper presents an overview of the main elements of intercultural competence in cognitive, affective, and behavioural dimensions to find possible discrepancies in current interpretation in academic literature. The aim of the paper is to review and

* Corresponding author: lucia.dancisinova@unipo.sk

summarize the most recent concepts of intercultural competence in order to excerpt its most prominent characteristics.

1.1 Terminological Peculiarities of Intercultural Competence

There are several aspects to be addressed before proceeding to the models' analysis. There is no homogeneous approach to the concept of intercultural competence. It is also caused by various terminological differences, such as: *inter-*, *multi-* (Hladík, 2010; Kostková, 2013), *trans-* or *cross-cultural* (Stone, 2006), *competence* vs. *competency* (Hladík, 2010; Kostková, 2012), or *competence* vs. *effectiveness* (Stone, 2006).

There is a problematic use of the prefix with *cultural* in the context of the study of effective communication in intercultural setting. Hladík (2010, p. 27) points out that in academic literature, both *inter-* and *multi-cultural* terms are used, while he understands them as interchangeable. Though, he admits that terminological heterogeneousness complicates the discussion. Kostková (2013) describes this distinction as being geographically based when the term *intercultural* is preferred in the countries of the European Union and the term *multicultural* is more used in the US, Canada, or Great Britain. Kostková (2013, p. 31) differentiates the terms and claims that the prefix *inter-* implies process and *multi-* implies state. Moreover, Stone (2006, p. 338-339) adds that the terms *transcultural* and *cross-cultural* are also used, but claims that in practice, these terms are "often used loosely and sometimes interchangeably. Choosing one or the other appears to be either a matter of local preference or a result of conventions specific to particular academic or vocational contexts." Similarly, Deardorff (2006, p. 247) observed "more than six different terms ... including cross-cultural competence, global competence, intercultural competence, and global citizenship" in her research of intercultural competence among administrators of higher education institutions.

Furthermore, Hladík (2010, p. 28) and Kostková (2012, p. 22-25) claim that the use of the words *competence* and *competency* in English can be also problematic. Hladík (2010, p. 28) identifies as a source of ambiguity the English distinction which is not reflected in the Czech language. Similarly, Kostková (2012, p. 22-25) claims that the concept of *competence* is used with relative variety in professional academic discourse identifying two sources of ambiguity, one is based on the differences in terminology in both, the professional literature and various fields of its application, and the second one in the English use of the concepts *competence* in the holistic meaning, and the analytical meaning of *competency*. Kostková (2012, p. 42-43) cites as examples DeSaussure's distinction of *langue* as a system of language and *parole* as a specific discourse or Chomsky's competence as a grammatical *competence* vs *performance* as a language use. In both cases, the distinction is based on the abstract vs. specific use of language, i.e. an abstract system of language vs. its specific performance in an individual's speech or discourse. In the Czech and Slovak environments, the term competence/competency also can have two different meanings.

Kubeš et al. (2004, p. 14-15) identify two meanings in foreign languages:

1. an authorization or right to do some activity – given to a person externally; this meaning is dominant in German and French;
2. an ability to carry out an activity, being qualified – the internal quality of an individual; this meaning is preferred in English, and it is this meaning that is used with managers and their abilities.

Kubeš et al. (2004, p. 19) also identify three categories of approaches to defining *competence*:

1. competences as perceivable behaviour;
2. personal characteristics as basis of behaviour;
3. individual abilities possible to turn into a performance.

In the context of terminological heterogeneousness connected with the word *competence*, Stone (2006, p. 340) chooses to talk about intercultural effectiveness where the related literature uses the term intercultural competence. Stone (2006, p. 340-341) argues that the term *competence* has been used in many different contexts and is usually connected with lower skills and abilities.

In the study, the term *intercultural competence* is used following the tradition of Deardorff (2006) who has done significant research in this area. *Intercultural competence* is also understood here as interchangeable with *intercultural effectiveness* as both aim at effective performance in intercultural setting.

1.2 Selected Intercultural Competence Definitions and Models

As Deardorff (2006, p. 258) claims, „the definition of intercultural competence continues to evolve...“ Nevertheless, there are several definitions which are up-to-date and suitable in the context of this study. Deardorff (2004 as cited in Deardorff, 2006, p. 247) postulates such a definition when she understands intercultural competence as "the ability to communicate effectively and appropriately in intercultural situations based on one's intercultural knowledge, skills, and attitudes." Deardorff's definition is currently cited by many authors (Cajander et al., 2012; Kohli Bagwe & Haskollar, 2020; Hackett et al., 2023; Hladík, 2010) as being the most comprehensive and widely accepted in the field.

In the Slovak context, Zelenková (2014, p. 14-16) defines intercultural competence as¹: "the ability to communicate and act in intercultural situations in such a way that the participants in the interaction are understood without compromising their integrity, which is manifested in the cognitive domain (manifested by a certain amount of knowledge), the affective domain (manifested by understanding, comprehension of other cultural patterns and a certain amount of empathy) and the action domain (manifested by acting and behaving in a way that takes into account cultural differences and the specificities of the different cultures)." In the Czech academic discourse, Průcha (2010, pp. 46-47) in his definition of intercultural competence focuses on its perception in the psychological and pedagogical sense: "Intercultural competence is the ability of an individual to realise effective communication and cooperation with members of other cultures using the acquired knowledge about the specificities of national/ethnic cultures and the relevant skills."

When it comes to modelling of intercultural competence, Hladík (2010, p. 29-30) talks about two approaches: prescriptive and descriptive. In prescriptive models, elements are conceptualized as typical or ideal and are general and easily applicable. The disadvantage of a prescriptive model is its normative character and the fact that it is not based on empirical data. Descriptive models, on the other hand, are based on descriptions of existing elements of intercultural competence (Hladík, 2010, p. 29-30). Kubeš et al. (2004, p. 63) identify three approaches to competence model design, i.e. prescriptive, combined, and tailored, the selection of which depends on key aims and strategies, or external factors of the selecting company.

Hladík (2010, p. 34) states that there are many models of competence which differ in elements and their mutual interaction. The most recent models of intercultural competence summarizing the development of research in the field which were selected for the purpose of this study:

- Stone's (2006) Model of Intercultural Effectiveness;
- Deardorff's (Deardorff, 2004 as cited in Deardorff, 2006, p. 254) Pyramid Model of Intercultural Competence;
- Deardorff's (Deardorff, 2004 as cited in Deardorff, 2006, p. 256) Process Model of Intercultural Competence;
- Hladík's (2010) Hierarchical Model of multicultural competences inspired by Průcha (2006).

These models can be considered prescriptive, though Deardorff's models are based on empirical data but need empirical validation (Hladík, 2010, p. 30).

Stone's (2006, p. 342-345) model of intercultural effectiveness (ICE) is based on an existing literature review. As such, it can be considered prescriptive and not based on the results of empirical research. He identified the following elements of ICE:

- emotional intelligence,
- knowledge,
- motivation,
- openness,
- resilience,
- reflectiveness,
- sensitivity, and
- skills.

These elements can be divided into three interrelated areas:

1. knowledge as prior learning;
2. skills as observable behaviour;
3. attributes specifically related to ICE, such as emotional intelligence, motivation, etc.

¹ Translated by the corresponding author.

Deardorff (2006) in her extensive research of intercultural competence asked the institutional administrators in higher education and prominent scholars in the field to define and assess the intercultural competence of students in higher education institutions. She found out that both, administrators and scholars preferred broader definitions of intercultural competence and not in connection with its specific components (Deardorff, 2006, p. 253-257). Both groups agreed upon twenty-two essential elements of intercultural competence including, for instance:

- understanding others' worldviews;
- cultural self-awareness and capacity for self-assessment;
- skills to listen and observe;
- flexibility;
- skills to analyse, interpret, and relate;
- mindfulness;
- respect of other cultures;
- cross-cultural empathy, etc. (Deardorff, 2006, p. 249-250).

Based on her previous research, Deardorff (2006) offers two models which are dynamic and incorporate the idea of intercultural competence degrees. Both models begin with attitudes and move towards interpersonal and interactional levels as internal and external outcomes constitute the degree of intercultural competence. In her Pyramid Model of Intercultural Competence (Deardorff, 2004 as cited in Deardorff, 2006, p. 254), "degree of intercultural competence depends on acquired degree of underlying elements." In her Process Model of Intercultural Competence (Deardorff, 2004 as cited in Deardorff, 2006, p. 256), "degree of intercultural competence depends on degree of attitudes, knowledge/comprehension, and skills achieved." The main advantages of these models are their recognition of the continuous development of intercultural competence with attitude as the most critical element.

In the context of Czech and Slovak intercultural education, there is a significant influence of Průcha's (2006) ideas of multicultural education. Hladík's (2010, p. 35) Hierarchical Model of multicultural competences was inspired by Průcha's (2006, p. 17) views on multicultural competence as being based on a formula: "multicultural education = learn to know → understand → respect (other cultures, ethnicities, nations) → coexist and cooperate"². Hladík (2010, p. 34-35) understands it as implying hierarchy caused by the linking. He adds the three most frequent elements of multicultural competence and offers a hierarchical model the basis of which is knowledge creating the foundation for attitudes. Knowledge is at the same level as cognition and leads to attitudes. Understanding and tolerance are parallel to attitudes. The model aims at cooperation. Hladík (2010, p. 34-35) admits that the relationships among the elements of multicultural competences are not scientifically explained which is also the usual drawback of other models.

2. Methods

The paper presents a comparative analysis of selected models. Analytical-synthetic and comparative methods are applied to achieve the set aim of identification and summarization of the main concepts of intercultural competence and its most prominent characteristics. The results will be graphically processed into a table of identified elements (Table 1).

3. Results

All the definitions and models focus on knowledge, attitudes and external/visible outcomes which can lead to internal changes necessary for effective communication and mutual understanding in intercultural setting. All the models include elements of knowledge, skills as observable/behavioural outcomes, and also attitude as internal motivation. These elements of intercultural competence can be classified as cognitive, affective, and behavioural aspects. The difference among the selected models is in the mutual relations among these elements. Pyramid Model of Intercultural Competence (Deardorff, 2004 as cited in Deardorff, 2006, p. 254) and the Hierarchical Model (Hladík, 2010) are layered, starting with attitudes as their bases. The Model of Intercultural Effectiveness (Stone, 2006) and Process Model of Intercultural Competence (Deardorff, 2004 as cited in Deardorff, 2006, p. 256) focus more on interrelations or interactional relations as a process.

² Translated by the corresponding author.

what the elements constituting intercultural competence are. Therefore, a comparison of the most recent models was offered. Knowledge, attitudes, and behaviour were recurring elements. These can be categorized into cognitive, affective, and behavioural aspects. The differences could be spotted in the hierarchization or its absence. The results of the study are applicable in the managerial education context.

Abstract

Research background: In our article, we discuss the professional terminology of selected Slavic languages - Slovak, Polish, Czech and Serbian. The paper focuses on borrowed language elements from English in economic texts. We examined and compared the degree of their domestication in the target Slavic languages.

Purpose of the article: The article compares economic terminology in related Slavic languages, focusing on intercultural communication. Effective cross-cultural management requires awareness of partner cultures and adept use of professional vocabulary, including Anglicisms. The study emphasizes integrating native equivalents with Anglicisms for effective communication.

Methods: Our study employs three domestication criteria for Anglicisms: 1. Original form in Slavic languages, 2. Adapted spelling, and 3. Native language equivalents. We utilize scientific methods: data compilation, lexicographic databases, comparative analysis, data coding, quantitative measurement, interpretative analysis, and cross-cultural insights.

Findings & Value added: Analyzing 100 selected anglicisms in economic texts, we found Czech has the most Anglicisms in original form (80), Serbian has the most anglicisms with adapted spelling (Latin: 48, Cyrillic: 61), and Serbian also shows the highest domestication rate (48 in both scripts). Our study sheds light on Anglicism adaptation in Slavic languages, benefiting cross-cultural business interactions. Managers understanding Anglicism dynamics can communicate more effectively with diverse stakeholders.

1. Introduction

Lopez Zurita (2022, p. 72) means that “the expansion and globalization of marketing and technology make lexical creation and the use of anglicisms inherent characteristics, more evident when both fields are combined in digital marketing.” The position of English in contemporary (not only) Slavic languages is undoubtedly dominant. The influence of English is related to globalisation, the contact of several cultures (and thus languages), business travel, the desire to establish oneself not only on the domestic but also on the foreign market. In the past, each of the languages under study was influenced by other languages primarily through liturgical texts. Also according to Bobáková (2009), the influence of English on other languages is striking. The author cites as a reason e.g. opening of borders.

* Corresponding author: zuzana.slobodova@unipo.sk

Currently, according to Jesenská (2014), English is mainly spread vicariously through the economic environment; it is the language of international and transnational trade. According to the author, there is no language within Europe that does not come into contact with other languages; languages are not isolated and it is virtually impossible to avoid any cultural, social or commercial contact, be it cultural, social, commercial, etc.

Another important factor in the penetration of English expressions into other languages is the number of foreign companies operating in 'our' territory. Linked to this is also the vocabulary of the English language, which was and is rich in new terms for which the target language (in our case, the Slavic languages under study) has no adequate equivalent.

In our paper we focus on the comparison of dynamic processes within the selected Slavic languages - Slovak, Czech, Polish and Serbian from the aspect of intercultural communication.

1.1 Intercultural communication

Intercultural communication is the process of exchanging information and ideas between individuals from different cultures. It is a complex process that requires an understanding of cultural differences, language proficiency, and communication styles (Gudykunst & Kim, 2003). Effective intercultural communication is essential for building relationships, resolving conflicts, and achieving goals in diverse settings.

One critical aspect of intercultural communication is nonverbal communication. Nonverbal cues, such as facial expressions, gestures, and body language, can vary greatly across cultures and can significantly impact the meaning of a message (Gudykunst & Kim, 2003).

Another important thing to consider is the proximity of languages. The closer the languages, the higher the mutual intelligibility. Some Slavic cultures, such as Bosnia and Herzegovina, share similar communication styles and have mutually intelligible languages such as Serbian, Bosnian, and Croatian (Kordić, 2017). The proximity of these languages makes intercultural communication very simple.

Language proficiency is another important factor in intercultural communication. Individuals who are not proficient in a language may struggle to understand and express themselves effectively, leading to miscommunications and misunderstandings (Gudykunst & Kim, 2003). It is essential to recognize the limitations of language proficiency and to use appropriate strategies such as simplifying language, using visual aids, and using translation services if necessary.

Cultural values and beliefs also play a significant role in intercultural communication. For example, the value placed on collectivism versus individualism can impact communication styles and expectations (Hoffmanová & Kuchařová, 2020). Similarly, cultural differences in power distance, uncertainty avoidance, and masculinity/femininity can also affect communication styles (Hofstede, 2001). In the context of Bosnia and Herzegovina, collectivism is a prevalent cultural value, and communication is often more indirect, with an emphasis on maintaining harmony and avoiding conflict (Hoffmanová & Kuchařová, 2020).

1.2 Manager communication skills

English as a lingua franca (EFL) can be understood as “any use of English among speakers of different first languages for whom English is the communicative medium of choice and often the only option” (Seidlhofer, 2011, p. 7). Due to the processes of globalization and major technological advances, English has become the lingua franca for a wide range of purposes, including international trade, communication and business. Both in private and in professional lives, people are increasingly engaged in international and multicultural environment (Charvatova, 2018, p. 631). According to Eginli (2016, p. 33), intercultural communicative competence implies the development of language fluency, understanding of culture, knowledge, attitudes and skills. Nowadays, the majority of international communication among business professionals (e.g. managers, CEOs, CFOs) is expected to be held in English, therefore in order to improve communication skills, managers not only need to perform various tasks in English (e.g. negotiations, giving presentations, telephoning) but they also need to acquire the knowledge of new vocabulary. However, as it was mentioned in the introduction, when English comes into contact with another language, the target language may borrow or adapt some words. According to Cierplich (2019, p. 109) English has become lingua franca of the business communication; she also uses the term *professiolect*, i.e. a type of language used in a particular group of professionals. In Polish such a phenomenon is referred to as *korpomowa*, i.e. the type of Polish language used in big international companies with many anglicisms and pseudoanglicisms adapted according to the Polish grammar and

spelling rules. Therefore, the process of intercultural communication is very dynamic – new anglicisms enter various languages and their usage becomes natural and common, which will be described in the next part of the article.

Knowledge of English is a must for any professional in the world. Therefore, it is systematically taught at primary, secondary and tertiary levels of schools. While at primary and secondary schools, pupils learn mainly general English, at the tertiary level, students usually continue with English for specific purposes (ESP). A more general term, referring to any language (not only English) of specific purposes is LSP (language for specific purposes).

When we teach a course of LSP, the scope of the specific content has to correspond to the aims of the course and to the language level and age of the students. Integrating specific content into the curriculum can have a very motivating effect.

In courses of business English, university students usually work with authentic texts. They develop mainly their knowledge of the specific vocabulary, but also the formal style of English which is typical of ESP.

Managerial communication skills are one of the key elements of managers' success and that is why it is a frequent topic of research. Researchers approach the issue from many different perspectives. Focus on the usage of languages is only one of them. In other works, authors investigate the relationship between communication within an organization and its impact on employees' well-being (Proctor, 2014), communication and performance, communication and organizational commitment (Bambacas, 2008, Ng, 2006), communication and work satisfaction, verbal and nonverbal communication of managers (Feyz, 2020) etc.

According to Feyz, Kiakojouri, Farrokhseresht and Aghaahmady (2020, p. 61) "are communication skills one of the key elements of managers' success and a process in which individuals share information, thoughts and feelings through the exchange of verbal and nonverbal messages."

Effective communication is critical to the success of managers in organizations. In order to effectively communicate, managers must be able to convey information clearly, listen actively, and adapt their communication style to the needs of their audience (Guffey & Loewy, 2016). The ability to communicate effectively has been shown to be positively related to job performance, job satisfaction, and overall organizational effectiveness (Al-Hussami, Darawad & Saleh, 2018).

One important aspect of effective communication is the ability to listen actively. Active listening involves paying close attention to what the speaker is saying, asking clarifying questions, and providing feedback to ensure that the message has been accurately received (Guffey & Loewy, 2016). This is particularly important in situations where the message being conveyed is complex or sensitive.

Another important aspect of effective communication is the ability to adapt one's communication style to the needs of the audience. This involves being able to understand the preferences and communication styles of others and adjusting one's own communication style accordingly (Guffey & Loewy, 2016). For example, some people may prefer direct and straightforward communication, while others may prefer a more indirect and diplomatic approach.

Research has shown that effective communication skills are positively related to job performance (Al-Hussami, Darawad, & Saleh, 2018). Managers who are able to communicate effectively are better able to convey their expectations to employees, provide feedback, and resolve conflicts. Effective communication also leads to increased job satisfaction among employees, as they feel more informed and better able to contribute to the organization (Al-Hussami, Darawad, & Saleh, 2018).

Effective communication is, therefore, a critical skill for managers in organizations. Active listening and the ability to adapt one's communication style to the needs of the audience are important components of effective communication. Managers who possess these skills are better able to convey their expectations, provide feedback, and resolve conflicts, leading to improved job performance and organizational effectiveness.

1.3 Anglicisms

All the target languages studied - Slovak, Czech, Polish and Serbian - belong to the group of Slavic languages, which are divided into East Slavic languages (Russian, Ukrainian, Belarusian), the West Slavic languages include Slovak, Czech and Polish (which also includes Lusatian Serbian and the extinct languages: Polabian and Northern Slovene) and the southern group of Slavic languages includes Serbian (along with Bulgarian, Macedonian, Croatian and Slovene). The work from which we drew information about the analysis languages, *Úvod do štúdia jazykov* (Introduction to the Study of Languages, 1984), was

published before the division of Yugoslavia and thus before the division of the Serbo-Croatian language into Serbian and Croatian. For our work, the designation of the Slavic language under study as „Serbian” is relevant, so we refer to the current designation. On the other hand, contemporary linguist J. Dudášová (2014) lists Serbian and Croatian as two separate languages. The author states that the written Serbo-Croatian language never represented a unified system throughout history. On the contrary - there have always been two variants - Serbian and Croatian. In contrast, English belongs to the Germanic languages, namely the West Germanic group (together with German, Dutch, Flemish and Frisian) (Ondruš, 1984).

As society evolves, so does language, which evolves in response to changing social events and conditions. Vocabulary is a dynamic system - some words „leave” its periphery (archaisms, historicisms), others enter it. Words that are used in the language for the first time are called neologisms. Words that occur in at least three languages are called internationalisms (Jesenská, 2014).

The adoption of words of foreign origin is a consequence of mutual linguistic contacts, their economic, political and cultural situation. The adoption of words occurs when there is a need to name new realities, when the language has no linguistic means of its own to name this new reality. In language contacts, direct or mediated acquisition of language units occurs. Language contacts are characterized by *Encyklopédia jazykovedy* (the *Encyclopedia of Linguistics*) (1993) as a situation in which two or more languages that are close to each other territorially or socially interact. In a broader sense, language contacts arise mainly in the acquisition of foreign words from other languages.

In this context, we can speak of the internationalisation of natural language. The process of internationalization is promoted by globalization tendencies, especially in the fields of economy, tourism, politics, etc. *Encyklopédia jazykovedy* (the *Encyclopedia of Linguistics*) (1993) characterizes internationalization as the most typical interlingual category, which has an impact on all linguistic levels of all languages. It most significantly affects the lexical plane - both through the adoption of names and through the emergence of new word-formation patterns, etc.

If we focus our attention on the words (i.e. meaningful units, lexemes) of a certain language, we deal with lexicology. The total list of all the lexemes of a language is called lexicon. Also, the authors of the *Oxford Concise Dictionary of Linguistics* (2005) define lexicon as a complete set of meaningful units in a language. There are several ways how the lexicon of a language is enriched. If a language takes lexemes from another language, the new items are usually called loan words or borrowings. Words which came to other languages from English are called anglicisms.

Borrowing words from other languages is a natural part of a language development. There are areas where language loans are particularly frequent. These are areas of human activity, which develop extremely fast, such as technologies, medicine, business and management etc. There is often no time for making and introducing equivalents in the given language and therefore, borrowing English words is often the only possibility.

Sometimes, several synonyms (anglicisms together with words in the home language) exist simultaneously. The preference of usage of one or another may be stylistic or purely personal. Sometimes, usage of an anglicism instead of a word in the home language may be perceived as an expression of social prestige.

1.4 Serbian digraphia

Digraphia refers to the practice of using two distinct writing systems in a language. The Serbian language is one of the few European languages that employ both the Cyrillic and Latin scripts, with their use depending on the context, personal preference, and historical background. Modern Serbian language is, thus, an exemplary case of active digraphia. (Ivković, 2013). The use of the Cyrillic script in Serbian can be traced back to the 9th century when it was introduced to the Slavic-speaking population of the Balkans by the brothers Cyril and Methodius (Pavlović, 2013). Over time, Cyrillic became the dominant script in Serbia. However, in the 19th century, with the rise of nationalism and the influence of the West, Latin script began to gain popularity. In 1868, Serbian linguist Vuk Karadžić proposed a reform of the Serbian language that included the adoption of the Latin script (Greenberg, 1998).

Today, both scripts are officially recognized and are used in different contexts. The Cyrillic script is employed in official documents, books, and newspapers, while the Latin script is more common in informal settings, such as texting, social media, and advertising (Vasiljević, 2015). Code-switching is another interesting aspect of digraphia in Serbian, which refers to the use of both scripts within the same text or conversation. For example, a person may use the Cyrillic script to write a formal email but switch to the Latin script to write a text message to a friend (Pavlović, 2013).

The phenomenon of digraphia in Serbian has also attracted the attention of scholars in various disciplines, including sociolinguistics, language planning, and cultural studies. Greenberg (1998) explored the relationship between digraphia and national identity in Serbia, while Pavlović (2013) conducted a corpus-based analysis of code-switching between the Cyrillic and Latin scripts.

2. Methods

If the target language does not have an adequate alternative to the foreign word, it will accept it into its vocabulary. Foreign words enter the vocabulary of another language first with their original spelling. After prolonged use, the foreign words become established, which is reflected in a change of spelling, e.g. management.

Jesenská (2014, p. 25) considers Anglicisms to be „direct borrowings from English, foreign words mediated by English, and hybrid words containing an English element.” When selecting Anglicisms for the database, we also considered words that were adopted from other languages and entered the investigated Slavic languages through English, e.g. the lexemes *benefit*, *franchising*, *leasing*, *tender* which entered English through French; or *marketing* - entered English from Latin; the word *management* entered the English vocabulary through Italian.

There are several ways of classifying Anglicisms - according to the form of contact and the way of pronunciation in the adopted language. In our work we have chosen the criterion of the degree of domestication of an English lexeme. From this point of view we distinguish the following (according to Jesenská, 2014):

(a) domesticated Anglicisms - they have existed in the linguistic consciousness of users for a long time and are not perceived as a foreign element; they have adapted to the orthographic and orthoepic form of our language,

b) post-gentrified Anglicisms - words that have been present in the language for 20 - 30 years. These Anglicisms already have a native orthographic form, but some users ignore this fact, e.g. *leasing/leasing*,

c) foreign words that have only recently entered our language - professional terms that retain their English orthography (in this case we can speak of internationalisms, e.g. *roaming*).

These three stages of domestication are referred to by Ološtiak (In Jesenská, 2014) as „1. integration, 2. adaptation, and 3. interference.”

In our analysis, we took note of the degree of domestication in the (written) language and chose the following categories:

1. anglicisms in their original spelling, e.g. *blog – blog*,

2. anglicisms with adapted spellings, e.g. *catalog – katalóg*,

3. words that have replaced the original Anglicism with an equivalent from the home language, e.g. *key buyer – klíčový zákazník*.

When selecting lexemes for the database, we chose a random selection of representative terms from the field of economics, taking into account the linguistic equipment of the authors. We performed the comparative analysis on a sample of 100 expressions excerpted from professional texts.

When looking for a Slovak equivalent, we proceeded as follows: first of all, we verified the occurrence of the Anglicism in the online dictionaries of Slovenská akadémia vied (the Slovak Academy of Sciences - slovník.juls.savba.sk). There we verified the spelling equivalent. In case we did not find the Anglicism, we searched for the occurrence of the lexeme in Slovenský národný korpus (the Slovak National Corpus) and the online dictionary *glosbe*, which contains a number of phrases, sentences, continuous texts and also in freely accessible professional economic texts.

When searching for Polish equivalents, we verified the existence of the lexeme in the Polish National Corpus (Narodowy Korpus Języka Polskiego - www.nkjp.pl).

When searching for Serbian counterparts, our first step was to examine the incidence of the Anglicisms within the digital dictionaries provided by the Serbian Academy of Sciences and Arts (sanu.ac.rs). If an Anglicism was not listed, we turned to the Serbian National Corpus, as well as the same online *glosbe* dictionary we used for the Slovak language.

3. Results

Among all the Anglicisms we have analysed, we have selected representative phrases to illustrate all three degrees of domestication. Here is the list of analyzed words: *back office*, *banner*, *benefit*, *benchmarking*, *blog*, *bossing*, *brainstorming*, *brand*, *briefing*, *budget*, *business*, *business intelligence*, *business plan*, *buzz marketing*, *call centre*, *cash*, *cash and carry*, *cash before delivery*, *cash flow*,

cashback, catalog, click and collect, client, cold call, consumer, CRM, crowdfunding, CSR, database marketing, deadline, dealer, design, digital marketing, dumping, e-government, e-request, e-shop, e-signature, email marketing, event, franchise, front office, fundraising, goodwill, green deal, green marketing, green washing, headhunter, high end, home office, HR, image, impact, interview, key buyer, leader, leadership, leasing, live, logo, low end, management, manager, marketing, marketing concept, marketing controlling, marketing mix, meeting, micromanagement, on line, outsourcing, podcast, portfolio, poster, PR, profit, promotion, public affairs, public relations, ranking, relationship marketing, social network, soft skills, spam, sponsoring, spot, stake holder, story, SWOT, team, teambuilding, telescript, tender, up-selling, viral marketing, webinar, webdesign, workshop.

Results for Slovak:

We also included in the analysis the double occurrence - the original spelling or the modified or new Slovak equivalent. Of the 100 English lexemes analysed, we recorded the largest group of words at the first stage of domestication - 54 words (including 12 double occurrences), a smaller group at the second stage of domestication - 32 words (including 5 double occurrences), and the smallest group of words at the third stage of domestication: 27 words (including 12 double forms).

Results for Serbian:

The number of Serbian words in their corresponding levels of domestication is as follows:

Latin first stage: 16 lexemes including double occurrences,

Cyrillic first stage: 0 lexemes,

Latin second stage: 48 lexemes including double occurrences,

Cyrillic second stage: 61 lexemes, including double occurrences,

Latin third stage: 48 lexemes including double occurrences,

Cyrillic third stage: 48 lexemes including double occurrences.

Results for Polish:

The number of Polish lexemes on the following stages of domestication:

First stage (Anglicisms in the original spelling) - 70 lexemes, including 17 double occurrences (i.e. lexemes with original spelling which are also used in Polish with adapted spelling or which have Polish equivalents);

Second stage (Anglicisms with adapted spelling) – 22 lexemes, including 5 double occurrences (i.e. lexemes with original spelling)

Third stage (Polish equivalents) – 27 lexemes, including 12 double occurrences (i.e. lexemes which are also used in Polish with original or modified spelling).

Results for Czech:

Here is an overview of the number of Czech lexemes on the following stages of domestication:

First stage (Anglicisms in the original spelling) - 80 lexemes, including 17 double occurrences (i.e. lexemes with original spelling which are also used in Czech with adapted spelling or which have Czech equivalents);

Second stage (Anglicisms with adapted spelling) – 21 lexemes, including 4 double occurrences (i.e. lexemes with original spelling)

Third stage (Czech equivalents) – 17 lexemes, including 13 double occurrences (i.e. lexemes which are also used in Czech with original or modified spelling).

4. Discussion

In some cases, we happened to find parallel Anglicisms in the texts in the original wording next to the **Slovak** equivalent, e.g. interview - interview, rozhovor. We counted each expression (both the original occurrence in the Slovak language and the Slovak equivalent) separately.

To the first group we also included e.g. the lexeme green washing, which in Slovak has the form greenwashing (i.e. only the graphic modification in the target language, not the pronunciation).

For the lexeme fundraising we did not find a stable word equivalent alongside the original word, so we included it in the first group. The following meanings were found in the texts: zhromažďovanie ekonomických zdrojov, zhromažďovanie a získavanie príspevkov a finančných zdrojov, získavanie zdrojov... (gathering economic resources, gathering and soliciting contributions and financial resources, raising resources...). Here we revealed the still unfinished process of domestication of the foreign word.

In three cases we did not find any Anglicisms or **Polish** equivalents of the following lexemes: cold call, green deal, telescript, which indicates that process of domestication has not been finished yet. These lexemes have been added to the first category (Anglicism with original spelling).

On several occasions, we discovered co-existing Anglicisms alongside their **Serbian** counterparts in their original form in the text. For instance, poster - poster, plakat. However, Serbian is unique in this group because of the dygraphia we mentioned previously. The same Anglicism - poster - can also be written as “постер”. This time, the pronunciation is the same, but because of a completely different script, we cannot count it as a fully domesticated word. This means that Serbian has a rare property where a single Anglicism can have different levels of domestication as per our definition, depending on the script one uses to write the word.

In other cases, the level of domestication is the same in both scripts. Take for example the Anglicism live - lajv/лајв, živo/живо. In both scripts, Latin and Cyrillic, both the adapted English and the native Serbian words have their variants.

People who are interested in loans in the **Czech language** have several dictionaries and other publications at their disposal (Kraus 2005, Martinová 1998, 2004). However, as this area of language develops quickly, no printed dictionary can cover all the currently used anglicisms in the Czech language. Therefore, to verify the correct form of each anglicism, we consulted the online Czech National Corpus (www.korpus.cz). This is an electronic collection of authentic texts (written or spoken) easily searchable for various language phenomena and to display them in their natural context.

Conclusion

In our article we compiled a database of 100 representative Anglicisms from economic texts in each of the four target languages: Slovak, Polish, Czech, and Serbian. These Anglicisms were chosen based on their relevance to the field and the linguistic expertise of the authors. We utilized online lexicographic databases, linguistic corpora, and language resources specific to each target language. These sources included national language academies, language corpora, and online dictionaries. This allowed us to verify the existence of Anglicisms, their spellings, and potential native equivalents.

The study provides a comprehensive insight into the incorporation and domestication of Anglicisms taken from various economic texts of selected Slavic languages, namely Slovak, Polish, Czech, and Serbian. Our research identified distinct levels of borrowing and adaptation from English, with a clear delineation found between Anglicisms maintained in their original form, those with adapted spelling, and words that have been replaced by native language equivalents.

After collecting and categorizing the data, we conducted an interpretative analysis to draw meaningful conclusions from the observed patterns. We interpreted the findings in light of cultural, historical, and linguistic factors that influence the domestication of Anglicisms in each language.

We found that the highest prevalence of Anglicisms in their original form was found in the Czech language, whilst Serbian language showcased the most Anglicisms with adapted spelling. Conversely, the lowest rate of domestication was observed in the Serbian language, as well, where native equivalents were used more frequently instead of original Anglicisms. This is of no particular surprise given cultural differences, historical background as well as geographical proximity.

These findings underscore the importance of understanding the dynamic evolution of professional terminology in different languages, particularly in the context of economic discourse and managerial communication. Intercultural communication, and the ability to navigate language nuances and cultural specificities, emerges as a critical skill in modern managerial communication.

Understanding the degree of Anglicism domestication in different languages, therefore, has practical implications. It helps managers to leverage an appropriate professional vocabulary in a foreign language, enabling them to communicate effectively across cultural boundaries.

This study also promotes the effective use of Anglicisms and their native equivalents, reaffirming that where a suitable native equivalent exists, it should ideally be employed to facilitate cross-cultural understanding.

Our findings contribute to a better understanding of the dynamic interplay between languages in professional lexis, with significant implications for intercultural communication in the field of economics. Future research could expand upon this work by exploring Anglicism domestication in other professional fields and languages.

The paper underscores the importance of effective communication skills for managers. By studying the incorporation of Anglicisms, managers gain valuable knowledge about the usage of professional vocabulary in both native and foreign languages. This knowledge empowers them to communicate proficiently with international counterparts, thereby enhancing their credibility, rapport-building, and negotiation prowess.

In the realm of marketing, understanding the degree of Anglicism domestication can influence branding and advertising strategies. Businesses operating in Slavic markets can use this knowledge to make informed decisions about whether to use Anglicisms or their native equivalents in marketing campaigns. A nuanced approach to language adaptation can help companies resonate more effectively with their target audiences and build stronger brand connections.

The paper's findings contribute to the realm of cross-cultural management. In an increasingly globalized business landscape, managers are tasked with overseeing teams and projects spanning multiple countries and languages. By comprehending the varying levels of Anglicism integration in different Slavic languages, managers can foster more inclusive and cohesive team dynamics, ensuring effective communication and collaboration.

The paper contributes to academic literature by offering a comprehensive analysis of Anglicism domestication in specific Slavic languages. Researchers, linguists, and academics in the fields of linguistics, communication studies, and cultural studies can use this work as a foundation for further research into the dynamics of language adaptation, cross-cultural communication, and linguistic trends in professional fields.

The combination of these research methods allowed the authors to comprehensively analyze the phenomenon of Anglicism incorporation and domestication within the context of business, management, and marketing in the selected Slavic languages. The study's robust methodology contributes to a nuanced understanding of linguistic borrowing, cultural influences, and intercultural communication dynamics in the professional domain.
