CONTENTS

Preface	16
---------------	----

1. Economics

Long-Term Unemployment as a Risk Factor for the Sustainability of Business Development in Slovakia and the European Union <i>Jaroslav Korečko - Ján Vravec</i>	18
Position of Slovak Republic in Global Value Chains <i>Paulína Mihaľová - Valeriia Maljar</i>	28
The Comparison of Volume of Realized Cross-Border Mergers and Acquisitions in the European Agri-Food Sector and Banking Sector <i>Ivana Kravčáková Vozárová - Jaroslava Hečková - Alexandra Chapčáková - Martina Košíková</i>	37
The Analysis of the Youth Unemployment in the Slovak Republic <i>Mariana Dubravská</i>	47
Key Attributes Affecting the Value of European M&A Transactions <i>Miroslav Gombár - Jaroslava Hečková - Alexandra Chapčáková - Dagmara Ratnayake Kaščáková</i>	54
Change in Energy Intensity and Energy Mix of the EU's Food, Beverages, and Tobacco Industry <i>Adrienn Takácsné Papp - Klara Szucs Markovics - Ágnes Horváth</i>	62
Progress in the Digital Competitiveness of EU Economies, Challenges and Risks <i>Elena Širá - Beáta Šofranková - Dana Kiseľáková</i>	72
Assessment of Profitability and Financing of the New Section of the PPP D4 Highway <i>Tomas Kubica - Radka Fišerová - Libor Hrbáček</i>	82
The Impact of Economic Measures of EU Countries on the Development of the Recession Caused by the COVID-19 Pandemic <i>Mária Bohdalová - Liubov Hodovanska - Nico Haberer</i>	93
Determinants of External Business Environment Causing the Need for Building Corporate Agility in the Context of the Corona Crisis Impacts <i>Jarmila Klementová - Andrea Janáková Sujová</i>	102
The Impact of Geopolitical Risk on Industrial Production in Taiwan <i>Dejan Romih</i>	112
How Does Medical Insurance Contribution Affect Corporate Value? Evidence from China <i>Xuchao Li - Jiankun Lu - Jian Wang - Jiyuan Wang</i>	118
Understanding the Migration Intention of Graduates in Sri Lanka During the Crisis Recovery Period <i>Uchitha Wijesinghe - Gayan Niluke - Nuhansi Gunawardena - Shihari Oshana</i>	126
Investing in Photovoltaic Panels: A Study of Economic Development Scenarios <i>Ivan Katrenčík - Monika Zatrochová</i>	137
Application of Machine Learning Algorithms for Prediction of Unemployment Duration <i>Lucia Švábová - Diana Štefúnová - Barbora Gabříková - Marek Ďurica</i>	147

The Analysis of Characteristics of Potential Peer-to-Peer Investors in the Slovak Republic <i>Tomáš Bačinský</i>	156
One Problem, Different Consequences: Innovation and Quality Standards in the Presence of Informal Competition <i>Ján Huňady - Kamil Ščerba</i>	164
Towards a New Mentality in the Business Game – Future Generations as Major Stakeholders <i>Leonard Calin Abrudan - Mirabela Constanta Matei</i>	174
Influence of Social Capital on Economic agent’s Innovative activities <i>Nataliya S. Seliverstova - Askar N. Mustafin - Svetlana N. Kotenkova - Olga V. Grigoryeva - Rastislav Kotulič</i>	183

2. Management

An Analytical View of the Development of Human Capital from the Point of View of the Current Needs of the Labor Market <i>Jana Cocuľová - Nella Svetožárovová - Daniela Bertová</i>	190
Examining Leadership in Terms of Entrepreneurial Skills Enhancement and Bossing Elimination <i>Lucia Zbihlejová</i>	197
Risk and Crisis Management in Enterprises with the Risk of Impending Bankruptcy in the Slovak Republic <i>Mária Petruščáková</i>	205
Assessing the Attributes of Social and Emotional Managerial Competence in Terms of Gender and Age of Entrepreneurs <i>Zuzana Birknerová - Eva Benková</i>	215
Connections between Organizational Culture and the Economy of the Organization <i>Lucjan Klimsza - Václav Friedrich - Lech Nierostek - Kateřina Stanovská - Aleš Lokaj - Martin Doležal</i>	224
Burnout Syndrome: Incidence of Burnout among Employees of Family Businesses <i>Gabriela Poláková - Petra Horváthová - Terezie Krestová</i>	234
Employer Competencies Requirements for University-Educated Students: Surveys from 2020 to 2022 <i>Terezie Krestová - Lucie Bestová - David Hibler - Alice Šustková</i>	242
Gamification in Management: Enhancing Engagement, Motivation, and Performance <i>Guy Kaufmann</i>	249
Managing the Health Risks of Climate Change is Imperative for Human Health: What Does a Health Provider Need to Know? <i>Aiham Gotani</i>	257
Unlocking the Potential: A Guide to Managing Employees with Disabilities <i>Eslam Hujerat</i>	266
Examining Employee Commitment during Crises <i>Kornél Krupánszki - Vivien Pásztóová - Péter Karácsony</i>	272

Force Field Analysis and Optimization –a Key Success Factor by Managing Changes <i>Andrea Janáková Sujová - Katarína Marcineková</i>	280
The Administrative Challenge of Managing a Police Station <i>Andalow-Avraham Takala</i>	288
Trends and Digitization of Human Resources Management - New Forms and Models <i>Nella Svetozarovová - Jana Cocuľová - Daniela Bertová</i>	294
The Relationship Between Quality of Work Life and Job Satisfaction: Practical Perspectives <i>Daniela Bertová - Nella Svetozarovová - Jana Cocuľová</i>	304
Optimizing Patient Hand-off Safety in Healthcare Management: A Theoretical Exploration of Effective Strategies for Managing Healthcare Workers for Increasing Patient Hand-off Safety <i>Abed Abdel Halim Ahmed</i>	313
Reality Television Programs Impact on Management <i>Rivka David - Dvir Oshri</i>	324
Generation Z and Other Employees Chances and Needs for Mutual Benefit in Enterprises <i>Peter M. Ramharter - Martin Steiner - Emília Huttmanová</i>	331
Contexts of Hospital Management, Quality of Care Provided and Impacts of Nosocomial Diseases <i>Tomáš Groh</i>	341
Personality Traits and Interpersonal Orientation of High-level Managers - Preliminary Findings <i>Miroslava Bozogánová - Tatiana Pethö - Ondrej Ivan</i>	348
Training and Performance in the Outsourcing Industry <i>Monica Dudian - Teodora Todoran</i>	354
Exploring Perceptions of Talent Management in Relation to Generational Diversity of Employees in the Context of Sustainability in a Healthcare Facility in the Slovak Republic <i>Michaela Harničárová - Juraj Tej - Denis Tirpák - Martina Stolárová</i>	363
Formation of Approaches to Information and Intellectual Resources Management in Enterprises Innovative Activities <i>Svitlana Labunska - Volodymyr Yermachenko - Mykola Sidak</i>	372
Online Management Tools as Research Tools of Managerial Actions Aimed at Artificial Management Implementation. Results of the Research <i>Olaf Flak</i>	384
Assessment of Assertive Behavior in Managers' Communication Techniques <i>Jaroslav Gonos - Anna Tomková - Jozef Nemeč</i>	395
Innovation in Leadership: Towards CSR and the Creation of Shared Value in a Humanistic Management Perspective <i>Tonino Pencarelli - Veronika Škerháková - Viktória Ali Taha</i>	403
Factors of Success in Managerial Work: Current View of Slovak Managers <i>Dávid Miško</i>	416
Nature of Internal Communication among e-Workers, Case Study <i>Michal Beňo - Jan Kříž - Dagmar Cagaňová</i>	425

Intervening Variable in Business: Burnout in Sales Representatives <i>Vladimír Čema - Barbara Nicole Čigarská</i>	435
Human Resource Management in the Context of the Migration Physicians and Medical Students from Slovakia: A Study on the Push Factors <i>Magdaléna Tupá - Zoltán Rózsa - Viera Hulková</i>	446
Managed Family: Application of Management Principles on Family Dynamics <i>Nurit Calfon</i>	456

3. Business and Marketing

The Companies' Attitude towards the Fairtrade Social System <i>Jan Šalamoun - Ladislav Rolínek</i>	468
Willingness of Consumers to Undergo Neuromarketing Research <i>Ivana Ondrijová - Anna Tomková - Lucia Zbihlejšová - Zuzana Birknerová</i>	479
Consumer Perceptions of Neuromarketing Research in the Context of Socio-demographic Characteristics <i>Ivana Ondrijová</i>	487
The Analysis of the Connections between Neuromarketing Attributes and Business Behaviour Determinants <i>Eva Benková - Zuzana Birknerová</i>	495
Engaging with Brands Online: A Study of Consumer Online Brand Related Activities on Tik Tok as a Part of Brand E-commerce <i>Ludovít Nastišin - Róbert Štefko - Richard Fedorko</i>	502
Socio-Demographic Differences in Consumer Behavior and Purchase Intentions: The Role of Sustainability in Online Shopping <i>Lenka Štofejšová - Štefan Král - Richard Fedorko - Mária Tomášová</i>	511
Research on the Issue of Positive Effects of Artificial Intelligence on the Activity of Companies and Online Consumers Behaviour <i>Jakub Horváth - Radovan Bačík - Igor Fedorko</i>	519
The Impact of the Corona Crisis and Support Measures on Micro, Small and Medium-sized Enterprises in Slovakia <i>Marta Urbaníková - Michal Levický - Daniela Vörösová</i>	525
Innovative Forms of Marketing and their Impact on Customer Behaviour <i>Martina Kuperová - Anton Lisník</i>	536
Digital Marketing in the Current Business Ecosystem <i>Róbert Štefko - Ludovít Nastišin - Nella Svetozarovová</i>	547
Exploring the Impact of Gender on E-commerce Growth in Central European Countries <i>Mária Oleárová - Radovan Bačík</i>	554
Measuring the Communication Effect of Regional Product Brands in Slovakia <i>Janka Beresecká - Ludmila Nagyová - Martina Hudecová - Jana Hroncová-Vicianová</i>	563

Capturing Attention: Investigating the Impact of AI-Generated and Photographer-Captured Product Photos through Neuromarketing <i>Alena Kusá - Patrícia Beličková</i>	573
Exploring Information Sources in Consumer Purchase Decision-Making: An Empirical Analysis in the Slovak Market <i>Lucia Vilčeková - Katarína Gubíniiová - Peter Štarchoň</i>	580
Willing to Pay More to Support the Local Economy and Protect the Environment: How Slovak Consumers Prefer Domestic Products <i>Andrej Miklošík - Martina Chujacová - Peter Štarchoň - Nina Evans</i>	587
Media Behaviour of Generation Z: The Way to Optimise Communication Strategies on Social Networks <i>Eudmila Čábyová</i>	600
Exploring Consumer Online Grocery Shopping Behavior Dynamics: Insights from the Slovak Republic <i>Veronika Škerháková - Richard Fedorko - Tonino Pencarelli - Martin Rigelský - Viktória Ali Taha</i>	608
Will Volunteering Drive Social Entrepreneurship in Ukraine? <i>Nina Chala - Kateryna Pichyk - Olga Voropai</i>	615
Examining the Influence of User Motivation and Technology Acceptance on Behavioral Intentions in a FinTech Context <i>Ni Made Estiyanti - Domicián Máté</i>	628
Identification of Web Users through Web Content Mining: Current State and Challenges <i>Solomiia Fedushko - Natalia Kryvinska</i>	637
Analyzing the Impact of Online Resources on Pet Care <i>Yuriy Syerov - Iryna Ivanochko - Iryna Dobrianska</i>	647
Digital Technologies as a University Competitiveness Factor in the 21 st Century <i>Olena Rayevnyeva - Silvia Matúšová - Iveta Dudová - Vojtech Kollár</i>	658
Incentives for Providers of Cataract Surgery depending on the Payment Mechanisms in the Czech Republic and Slovakia <i>Peter Pažitný - Daniela Kandilaki - Kristina Randlová</i>	670

4. Finance

Economic Aspects of Bankruptcies of the Business Entities in Slovakia in the Post-Covid Period <i>Ján Vravec - Jaroslav Korečko</i>	683
Bankruptcy Risk Prediction using Artificial Intelligence: An Empirical Study of the Slovak Chemical Industry <i>Stanislav Letkovský - Marta Miškufová - Sylvia Jenčová - Petra Vašaničová</i>	693
Dividend Policies Adopted by the Banks. Their impact on the prospects of the Greek Banking System <i>Pantelis F. Kyrmizoglou</i>	701
The Role of Taxation in Moving Towards Sustainable Green Growth <i>Juraj Válek - Michal Rimeš - Jana Kušnírová</i>	705

Financial Reporting in the Public Sector in the Republic of Bulgaria under the Conditions of European Harmonization and Global Legitimacy of IPSAS <i>Daniela Feschiyan - Radka Andasarova</i>	719
Application of the Bankruptcy Models in the Teaching of Financial Subjects <i>Marta Miškuřová - Mária Jusková - Mária Matijová - Igor Petruška</i>	726
The Rolling SML-based Portfolio Strategy <i>Martin Užík - Sebastian Block</i>	734
Application of Fundamental Screening in Active Portfolio Management <i>Vladimír Valach - Samuel Funtek - Mária Bohdalová</i>	744
Innovative Tools for Financing Municipalities <i>Július Golej - Daniela Špírková</i>	755
Active versus Passive: The Case of Slovak Guaranteed Pension Funds <i>Matúš Padyšák</i>	763
Impact of Fiscal rules on Government capital expenditure: Evidence from EU countries <i>Matej Boór</i>	773
Predictive Modelling of Financial Distress of Slovak Companies Using Machine Learning Techniques <i>Marek Ďurica - Lucia Švábová - Katarína Kramárová</i>	780
Prediction of Corporate Bankruptcy – Selecting an Appropriate Prediction Method <i>Martina Mokrišová - Jarmila Horváthová - Alexander Schneider - Mária Jusková</i>	787
Prediction of Corporate Bankruptcy - Malmquist Index Approach <i>Jarmila Horváthová - Martina Mokrišová</i>	798
Financial Auditors' Perspective on Environmental, Social and Governance Non-financial Data Dissemination by Bulgarian Companies Participating in Global Value Chains <i>Daniela Ventsislavova Georgieva - Diyana Bankova</i>	808
Financial Anxiety in the Context of Income, Age and Education <i>Matúš Kubák - Jozef Nemeč - Tímea Turócziová</i>	815

5. Regional Development Management

Selected Sustainable Development Goals of Agenda 2030 in V4 countries <i>Milena Švedová - Tünde Dzuřov Vargová</i>	822
Efficiency of the Introduction of Businesses' Digitalization Elements in EU Countries – Dynamic Approach <i>Jarmila Horváthová - Martina Mokrišová - Dana Kiseľáková - Beáta Šofranková</i>	832
Analysis of the Assessment of Digital Performance and Sustainability of Economic Development within the EU-27 Countries <i>Beáta Šofranková - Dana Kiseľáková - Miroslav Gombár - Elena Širá</i>	842
Support of Investors Located in the Banská Bystrica Region through Regional Investment Aid <i>Lenka Hvolková - Vladimíra Klementová - Ladislav Klement</i>	853

History, Perspectives, Environmental and Sport Benefits of City Bicycle Road Investment in Large Cities
Eyal Whabby864

Strategic City Management in the Digital Era: Fostering Sports and Sports Tourism
for Comprehensive Urban Development

Preface

The movement in all areas of human life is accelerating globally at present. As capital and goods move more freely than ever before, the flow of labour force is rapidly increasing. On the one hand, the global economy is growing, on the other hand, trade disputes are deepening, and turbulence is arising in developing markets. There is a high rate of migration of people. Refugees are becoming job seekers, and migration brings many political as well as economic problems. Thus, at present, the management of organisations faces many challenges and opportunities, but also threats. There is a strong reason to explore all aspects and trends in economics, management, and business in relation to these and other important factors.

The presented proceedings of papers cover a wide range of current issues, insights, and new challenges in economics, management, and business.

The results of research in the mentioned main areas are presented. Attention is also paid to research in broader contexts and areas that enrich, complement, and expand knowledge.

We consider research and the transfer of one's research results into the practice of organisations as one of the significant dimensions and justifications for the current and future existence of faculties and universities. It is one of the essential driving elements of the development of universities and their faculties as well as organisations in practice. It is also the source of innovations and one of the conditions for the dynamic development of organisations as well as for societies and whole integration blocs.

Modern management develops new effective models. However, it also draws from the fountain of knowledge.

It is knowledge gained by research that appears to be a key factor in overcoming the consequences of every crisis as well as in overcoming important existing problems of enterprises and in performing theoretical, mainly current macroeconomic tasks, especially at the stage of subsequent development.

Finally, the success of a company in a strenuous effort to gain a leading position in the market is one of the main tools used to measure the quality of management. Marketing and financial health of companies, along with high competitiveness in the area of human resources and technology, satisfaction of markets by quality, and desired production based on high technology – all this is the added value provided by transferring research results into practice.

The main ambition is to contribute to the theory and experience based on current economic trends, modern management, and theoretical and practical approaches to business.

Long-Term Unemployment as a Risk Factor for the Sustainability of Business Development in Slovakia and the European Union

Jaroslav Korečko^{1,*}, and Ján Vravec¹

¹ University of Presov, Department of Finance, Accounting and Mathematical Methods,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: Long-term unemployment is a socio-economic phenomenon occurring in the economy of every EU member country. It affects different sectors of the national economy, different population groups, and selected regions of Europe and Slovakia. Regional differences in the occurrence and rate of long-term unemployment in the European Union and within Slovakia are significant and almost unchanged in the short term.

Purpose of the article: Solving the problem of long-term unemployment is a matter of the right approach of individuals, companies, governments, and European institutions. It represents one of the risky macroeconomic factors for the development of enterprises because it limits the supply of qualified labor in the labor market. The article examines the state and development of long-term unemployment in Slovakia and the EU and presents possibilities for solving this macroeconomic problem.

Methods: The article aims to examine, compare, and evaluate the state and change of long-term unemployment in Slovakia and Europe over the past years. Identify the most critical regions, analyze the causes and consequences of this phenomenon, and formulate measures to eliminate or reduce the rate of long-term unemployment. Selected indicators of descriptive statistics, average annual growth rate, and cluster analysis were used in the research and analysis.

Findings & Value added: Long-term unemployment is a phenomenon that depends on several factors. Factors can be economic, political, social, demographic, and others. The interplay of individual factors thus creates an environment where the demand for work meets the offer. It results in reduced purchasing power, which leads to reduced profits for businesses, lower budgets, and the workforce. It creates a cycle that goes on and on. An active approach to solving the unemployment issue means, involve not only public authorities but also businesses and the private sector in the support process.

Keywords: long-term unemployment, business, European Union, Slovakia

JEL classification: J60, J64

1. Introduction

Unemployment is a phenomenon current in every modern advanced economy and is constantly addressed at the political, professional, and social levels of community life. It is always a current topic of various studies, comparisons, plans, or discussions because work and regular income from it is one of the most substantial values of an individual. It affects the financial situation of households, the offer of job opportunities by companies, and shows the state problem areas in the national economy. The unemployment rate in Slovakia has been significantly different in individual regions of the country for a long time. A parallel statement also applies to the European area. The employment rate affects the population's standard of living and is closely related to the quality of life in a specific region. In almost all districts of Slovakia, the registered unemployment rate has gradually decreased over the last ten years. The exception was the pandemic era. There are regions in Slovakia and the European Union where unemployment fell over the decade faster than in others, and vice versa, where it fell minimally. The article explores the state and development of long-term unemployment in the regions of Slovakia and the European Union and presents partial chances for solving this problem.

2. Theoretical background

The unemployment rate depends on several different factors. It affects directly or indirectly all entities operating in the national economy. Individuals come to the labor market with a job offer but often have insufficient or incomplete qualifications, high demands for monetary compensation, poor work habits, or weak motivation to keep their job for the long term. The state and public administration bodies create the basic framework for working conditions in the country, burden employers and employees with taxes and levies, and contribute to the quality of the business environment, which can subsequently attract or, on the contrary, discourage investors (job creators). Employers create a demand for work, need properly qualified people ready to work, an undemanding bureaucratic apparatus for communication and fulfilling tax and levy obligations, and a healthy and fair business environment.

From an economic point of view, unemployment is an imbalance between the supply of work and the demand for it. Although unemployment has negative economic and social consequences, this phenomenon is a permanent part of the economy and is considered natural. It becomes a problem when it becomes long-term. Unemployment lasting more than 12 months can negatively affect the economic and social sphere, as well as the health and psychological state of the individual. (Krebs, 2010)

Vaska (2014) adds additional stages in the case of long-term unemployment:

- Unemployment from 24 to 36 months, the so-called very long-term unemployment. Within the European Union, Slovakia has long been one of the countries where this type of unemployment occurs.

- Unemployment for more than 36 months, the so-called extremely long-term unemployment. It includes unemployable individuals, which would not work for various reasons even with a job offer.

Unemployment is a consequence of job loss, which means an immediate change in several areas of life. A person's finances reduce, the standard of living decreases, and the dependence on financial assistance from the state will increase. (Schraggeová, 2011, Hamráčková, 2013)

Paukovič (2002) includes among the root causes of unemployment:

- regional differences in unemployment,
- low labor force mobility,
- low-paid work that becomes uninteresting and demotivating,
- high tax and levy burden, which causes a difference between the employer's costs for his employee and the employee's net income,
- poorly controlled gray economy.

Žilová (2003) mentions other causes of unemployment in her works:

- lack of jobs,
- inflexibility of the labor force,
- poorly developed information network on the labor market,
- fatalism of the long-term unemployed a
- employers' prejudices against the long-term unemployed.

According to Čaplánová and Martincová (2014), unemployment is one of the indicators of the so-called magic square that represents macroeconomic balance. Every type of economy must balance this phenomenon, which is unsolvable without state interventions. Unemployment can be characterized not only as an economic and social problem but also as a serious political problem that results in the loss of goods and services that could have been produced by the unemployed if they had worked. This loss is easy to calculate with average labor productivity.

European commission (2023) reports that almost half of the unemployed people are still long-term unemployed, that is, unemployed for more than 12 months. Long-term unemployment has implications for society, with dire social consequences for the persons concerned and a negative impact on growth and public finances. Long-term unemployment is one of the causes of persistent poverty. Therefore, addressing long-term unemployment is a key employment challenge of the Commission's jobs and growth strategy.

Economists are discussing a new theory, why employers are not interested in the long-term unemployed. They consider the so-called "skills gap" theory. This theory points out that long-term unemployed do not have the specific skills which one's employers look for. That is probably because their skills have deteriorated after being unemployed for a year or longer. In terms of demographic background and education, the long-term and short-term unemployed are very similar. They are represented in all age categories, education levels, geographic regions, and income levels. (Louie, 2014, Jurečka, 2013).

Bejaković and Mrnjavac (2018) warn that long-term unemployment can have indirect negative consequences. It concerns principally the family of the unemployed. The loss of a job could have a significant impact on the other family members. Family income decreases due to the lack of regular

earnings, which can also affect the quality of goods and services that the family can purchase. Long-term unemployment also affects the relationship between partners. Some try to solve this problem together, which may bring them closer together, but some cases lead to damage to the marriage (partnership) and subsequent separation.

3. Methods

The Slovak Central Office of Labour, Social Affairs and Family calculates the *registered unemployment rate (RU)* based on the records of job seekers, consequently from the available number of applicants and the total number of applicants.

$$RU = \frac{\text{available job seekers}}{\text{economically active population}} \times 100 (\%)$$

Since 1993, the Statistical Office of the Slovak Republic (2023) also obtains information on unemployment (*UR - unemployment rate*) through regular quarterly labor force surveys. A certain number of apartments are included in the sample every quarter. The size depends on the number of inhabitants in each district. All persons over 15 years from selected households are subject to the labor force survey.

$$UR = \frac{\text{unemployed individuals}}{\text{economically active population}} \times 100 (\%)$$

Eurostat uses both mentioned data sources monthly to create an internationally comparable unemployment rate. We obtained the input data for the analysis of long-term unemployment from databases or reports of all three mentioned institutions. For relevant comparison, we chose the rates in relative units. To calculate the average trend indicator, we used the *Average Annual Growth Rate (AAGR)*. It is determined by taking the numerical mean of specified or calculated year-on-year growth rates. The formula is following:

$$AAGR = \frac{[(\text{Growth Rate})y + (\text{Growth Rate})y + 1 + \dots + (\text{Growth Rate})y + n]}{N(1)}$$

Where:

Growth Rate (y) – Growth rate in year 1

Growth Rate (y + 1) – Growth rate in the next year

Growth Rate (y + n) – Growth rate in the year “n”

N – Total number of periods

Since practical data mining problems high-dimensional data are clustered, the resulting clusters are high-dimensional geometrical objects which are difficult to analyze and interpret. A low-dimensional graphical representation of the clusters could be much more informative than such a single value of the cluster validity one can cluster by eye and qualitatively validate conclusions drawn from clustering algorithms. (Abonyi and Balázs, 2007)

We have used two clustering methods, the hierarchical Ward's method, and the non-hierarchical K-means method. A significant part of these degrees of similarity is based on the calculation of the distance of objects. The Euclidean distance we used is defined by the formula:

$$d_{ij} = \sqrt{\sum_{k=1}^K (x_{ik} - x_{jk})^2}$$

Where x_{ik} is the value of k variable for *i-th* object and x_{jk} is the value of k variable for *j-th* object. For calculated distance is then determined the rule of linking statistical units into clusters.

4. Results and Discussion

For the analysis, we used a methodology corresponding to the standard methodology developed by the International Labor Organization (ILO). The available data are from the European Statistical Office

(Eurostat). According to ILO guidelines, Eurostat defines an unemployed person as a person aged 15-74 (for Spain and Italy 16-74) without work during the reference week, who is ready to start work within the next 2 weeks, and who was actively looking for a job during the last 4 weeks. Long-term unemployment, which exceeds a period of 12 months, is monitored by Eurostat in the same age interval.

As expected, the rate of registered long-term unemployment in individual member countries varies to a large extent. On the other hand, the development of the indicator for the monitored period 2013-2022 in the European Union is very similar. Trend graphs, and AAGR values in Table 1, prove an average annual decrease in long-term unemployment among citizens in all economies. This finding can be considered positive, but it also points to still-present differences within the individual regions of the Union.

Source: authors according to Eurostat (2023)

Ireland (AAGR=0.8183) recorded the most significant decrease in long-term unemployed over the past decade among the member states, which means an average annual decline of approximately 18 percent. Ireland followed the Czech Republic (average decrease of 16%), Poland, and Hungary. Within the V4 countries, the fall of the indicator was the slowest in Slovakia. Greece has the highest long-term unemployment rate in the Union for a long time, while Denmark, the Netherlands, and the Czech Republic have the lowest. Within the EU-27, the observed rate fell by an average of approximately 10 percent over the past ten years.

Figure 1. Change in Long-term unemployment over the last decade/over the last five years in the EU
 Source: authors according to Eurostat (2023)

In the two graphs in Figure 1., the EU member countries are in the coordinate system according to the recorded rate of long-term unemployment in 2022 (axis "x") and changes in the indicator compared to the reference year 2013 or 2018. We have chosen the interval of 10 and 5 years deliberately because it best represents the differences in the position of the countries in the graphs. The worst location in terms of the rate of long-term unemployment in 2022, but the best position in terms of the decrease of the indicator for both time intervals held Greece. Compared to 2013, the level fell by 9 percentage points, followed by Croatia (-8.6 percentage points) and Spain (-8 p.p.). Compared to 2013, long-term unemployment fell in all member states. Compared to 2018, the results in the countries' locations were significantly different. The decline was much milder, in Lithuania and Sweden there was an increase of 3, respectively 2 tenths of a percentage point.

Figure 2. Long-term unemployment in 2022 in percentage of total unemployment
 Source: authors according to Eurostat (2023)

We also examined the state and development of the share of long-term unemployment in total unemployment in member countries. At the top of the list was Slovakia by almost 67%. The positive news is the share decreased in most countries compared to 2018. The EU average was 35,2% in 2022, the median value was 33,3%. (Figure 2.)

Figure 3. Regions and districts of Slovakia most burdened by long-term unemployment (number of persons as of December 31, 2022)
 Source: authors according to Central Office of Labour, Social Affairs and Family (2023)

Among the eight regions of Slovakia, Prešov, Košice, and Banská Bystrica self-governing regions have traditionally recorded the highest number of long-term unemployed (unemployment duration of more than 12 months). If we do the math, at the end of 2022, these three regions represented approximately 73.5% of the long-term unemployed among all registered long-term unemployed job seekers within

Slovakia. (Figure 3.) Regional differences within Slovakia persist for a long time, not only in the case of long-term unemployment. However, the problem of regional inequalities does not concern only Slovakia, it is also a problem of other EU member states. Ultimately, regional differences persist even in the regions of the Union as a whole. At the end of 2022, Myjava district recorded the fewest long-term unemployed persons among all Slovak districts (115 persons). (Figure 4.)

A high level of employment in Slovakia persists for a long time, especially in the West. Therefore, many potential domestic and foreign companies (investors) concentrate their business precisely in this area of Slovakia. They find here enough qualified labor force and higher quality infrastructure. On the other sides, businesses (mainly small and medium-sized) in other parts of the country disappear more often than they are founded. Companies and sub-contractors for the automotive sector are an exception. Governments consider them still beneficial and promising.

Businesses naturally affect long-term unemployment in Slovakia, and long-term unemployment affects the existence and survival of enterprises. Loss of work habits, insufficient level of qualifications, and other problems associated with long-term unemployment cause problems for companies in staffing positions. The problem can often be so severe that employers decide to close their business or move it elsewhere.

Figure 4. Regions and districts of Slovakia less burdened by long-term unemployment (number of persons as of December 31, 2022)

Source: authors according to Central Office of Labour, Social Affairs and Family (2023)

Cluster analysis aims to reveal mutual similarities between 27 Member States based on further analysis of previous research data. Preceding quantitative and graphical analyzes indicate differences in the development of three selected indicators. Therefore, we decided to use that statistical tool to analyze multidimensional data.

Three imputed variables for the Member States were Long-term unemployment as percentage of population in the labour force in 2022, Long-term unemployment as percentage of unemployment in the same year, and the AAGR. The objective of cluster analysis was to achieve such groups of states, which would be characterized by certain homogeneity in case of selected indicators.

Figure 5. Tree diagram of member countries using Ward's clustering method
Source: authors (2023)

Hierarchical clustering methods are sequentially joining clusters, which decrease them continuously into one. The result of clustering is a tree diagram. Ward's method involves an agglomerative clustering algorithm, which looks for groups of leaves and forms branches, and limbs. In the daigram, we can identify two smaller groups of countries and two larger groups with similar characteristics. (Figure 5.) A negative finding is the placement of Slovakia among the countries with the worst results in long-term unemployment.

Conclusion

Unemployment is a phenomenon that has many known but also unpredictable causes and consequences. It depends on several factors, economic (the price of work, supply, and demand for work, the phase of the economic cycle), political (current legislation, levy burden, crisis measures), social (willingness to work, fair redistribution of pensions, perception of the value of work, society's reaction to political decisions, and others), demographic (age and educational structure of the population) and others. The intersection of these and other factors creates an environment where the demand for work meets the offer. Long-term unemployment is the result of all these factors. It is a problem that plagues several countries of the European Union, not excluding Slovakia. However, in recent years, there has been a positive development of this unemployment rate indicator within the entire community. The decrease in long-term unemployment is a good signal. Only the near future will show how individual countries can deal with this ever-present negative phenomenon. The pandemic has subsided, but many businesses employing thousands of people are struggling with the consequences of the conflict in Ukraine. Many of their operating costs have increased, and they are forced to reconsider the number of employees. The rate of registered unemployment will probably increase, but it is already extremely important that the plans and strategies adopted by governments in the current situation regard their consequences, which will also manifest themselves in the long term. It is necessary to prevent the bankruptcy of small and medium-sized enterprises, which employ an enormous population. It is essential to take measures (in Slovakia, for example, free qualification or retraining courses for the public) to re-insert the long-term unemployed into working life and thus offer new and existing companies a high-quality and qualified workforce in sufficient quantity.

The problem of persistent regional differences between individual regions in Slovakia and Europe calls for a long-term and strategic solution. The leaders of the Union, leading representatives of the

member states, and all residents of individual regions are aware of this. Balancing regional inequalities is one of the most significant prerequisites for the progress of the entire community, it requires a lot of effort, but especially transparency, efficiency, and control over the funds that flow to support less developed regions. Analogously, what applies to Europe also applies to Slovakia and its policy of supporting jobs and employment. Finally, the current economic and social situation, still affected by the coronavirus pandemic and the war in Ukraine, shows that work is one of the essential values of individuals and the entire society.

Despite the improving situation of the unemployment rate of long-term unemployed jobseekers in individual self-governing regions and districts, we must state that relatively regional differences persist. Despite the efforts of those responsible for measures to support selected regions, new ones are still emerging (increase in the number of registered unemployed due to layoffs during the pandemic; lack of professionally educated workers for selected sectors of the economy), but also ongoing problems (deficiencies in literacy or education of selected population groups; still insufficiently developed infrastructure, which prevents the creation of new jobs; but also the lack of a workforce with the required professional competence) which constantly make it difficult to more significantly fulfill the goals in the area of reducing unemployment in Slovakia.

Position of Slovak Republic in Global Value Chains

Paulína Mihal'ová^{1,}, and Valeriia Maljar¹*

¹ Comenius University Bratislava, Faculty of Management, Department of Economics and Finance, Odbojarov 10, 820 05 Bratislava, Slovakia

Abstract

Research background: It is sometimes said that the global economy can be viewed either through the economic growth and structural changes in individual countries, or through global value chains (GVC). Slovak Republic is a small economy in the center of Europe that is widely open in collaboration with other countries. Intensive involvement in international trade and global value chains is an effective way of improving Slovakia's position in the global market. However, participation in only low-value-added activities disables Slovakia from developing and future prosperity, and at the same time intensifies the country's vulnerability and dependency on its European neighbors.

Purpose of the article: Introduce up-to-date data about the emplacement of Slovak Republic in the global economy and GVC. Identify possible opportunities for Slovakia to improve its position in the global economy through the lens of modern mega trends in global supply chain management.

Methods: In the article, taking into account its nature, we mainly use descriptive and analytical methods. To illustrate the position of the Slovak Republic in the global market, we will use the value of export performance.

Findings & Value added: We will analyze and prove, that the traditional rule of expanding domestic value added to increase economic growth seems obsolete and ineffective in up-to-date GVC trends. In the article, we will consider different options for improving Slovakia's position in the global market on the assumption of the strengths and weaknesses of Slovak economy.

Keywords: globalization, global value chains, international trade, Slovak Republic, small and medium enterprises, value added

JEL classification: F41, F60

1. Introduction

Global value chains (GVC) are often considered the lead story of trade in the modern world, with an estimated 80 percent of global trade taking place through them (Agarwal et al., 2022). By GVC we understand in general fragmentation of production in many phases or processes that take place in numerous locations in different countries (Kersan-Škabić, 2019, p. 1204). The positive effects of GVC participation on income growth are likely to extend to everyone in society—if the welfare state works. GVC integration in certain regions of a country can give people the incentive to migrate within their country, which can be a powerful mechanism for reducing poverty. Higher incomes will also generate more demand for a greater number and diversity of goods and services, imported and domestic. This demand will lead to the diversification of the economy, which will increase opportunities for a broader and more diverse set of agents. GVC are also likely to make a larger variety of goods more affordable (World Bank report, 2019, p. 82). Multinational companies have contributed to the rise of global production, which made it more and more difficult to distinguish the country of origin of any product. This led finally to the development of the concept of „trade in value added“ to indicate the domestic and foreign value added in gross export (Kersan-Škabić, 2019, p. 1204).

The most well-known measure of a country's position in GVC is the participation index, which is calculated by summarising the domestic value added in foreign export (forward participation) and foreign value added in domestic export (backward participation). The higher the value on a scale of 0 to 100, the higher the country's participation in GVC. The EU member states rate differently in the GVC

* Corresponding author: havriushenko1@uniba.sk

participation index. The highest participation is in Luxembourg and Slovakia and the lowest is in Croatia. Determinants like reduction of tariffs and other trade barriers, the level of economic freedom, macroeconomic stability, a favorable business environment (level of wages, tax burden), technological development, and enlargement of the EU all influence participation within the GVC (Kersan-Škabić, 2019, p. 1204). However, as for Slovak Republic, intensive involvement in international trade and global value chains is an effective way to support the improvement of Slovakia's position in the rankings of (not just) European Union countries from an economic and social point of view. The Slovak economy is relatively open, dependent on international trade, and from the point of view of involvement in the GVC, unfortunately, the added value of Slovak production is relatively small. The country is concentrating on low-value-added activities (e.g. production and assembly), especially in the automotive sector. As we can see in Figure 1, a graph of the value added in GVC (named also the Smile curve because of its shape) shows us, that the value added depends significantly on the activity that the country provides and exports. For instance, the country that provides customer support for the global company gains a much higher level of domestic value added than the country which produces direct products.

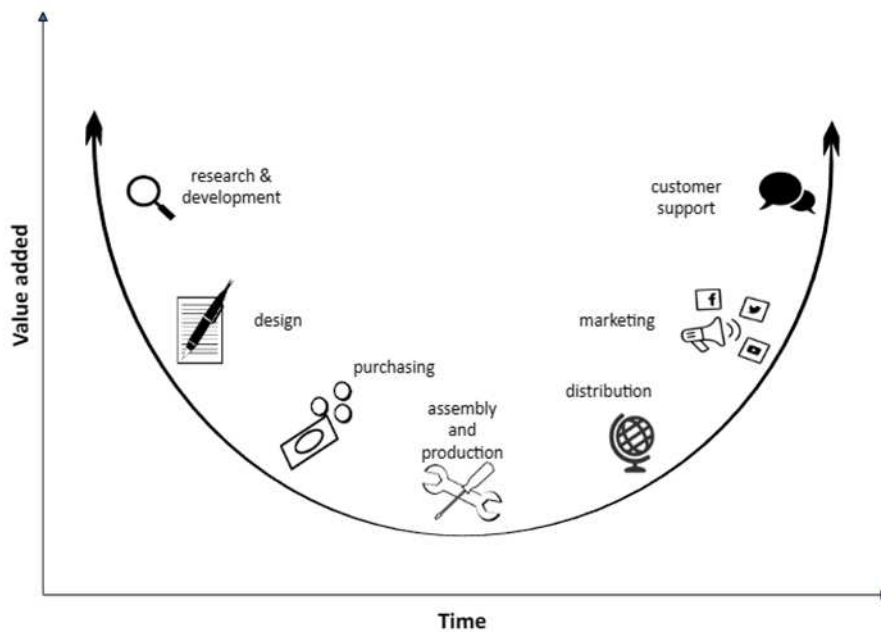

Figure 1. Value added in the GVC
Source: own processing (2023)

However, if a country is willing to raise the level of its domestic value added, there are two paths. On the one side, the country can minimize the quantity of imported intermediate inputs. Hence, it would strengthen its value added by adding its own domestically produced inputs. On the other side, there is a way to develop particular sector(s) of the economy, so that the country is competitive in sharing a „higher value“ level of GVC. We will introduce the possible paths in more detail and their (dis)advantages in the part Results.

In the study we researched and came to the conclusion, that a complex set of measures is needed, both to boost the export and improve the qualitative side of them. In our work, we suggest improving the position of Slovak Republic in the global economy by supporting small and medium enterprises in their desire to take part in GVC.

2. Methods

In the article, we mainly use analytical and descriptive methods. Apart from all, in the work we provided literary research on the issue of the involvement of the Slovak Republic in global value chains. The article relies on various domestic and foreign professional literary sources.

In our conclusions and ideas, we rely on statistical data from evaluation reports of the Slovak economy from the Organization for Economic Cooperation and Development (OECD), studies of The

World Bank as well as up-to-date articles from representatives of universities and scientific research institutions.

To illustrate the position of the Slovak Republic on the world market, we used the value of export performance. The export performance serves as an indicator of what volume of goods and services was exported during the monitored period, with the result that the export value is expressed in proportion to the nominal value of GDP in percentage. It is measured by the share of exports of products and services at the overall level of GDP. The export performance indicator can change over time, but only if there are simultaneous changes in supply and demand in foreign and domestic markets. The higher the country's export performance, the higher its competitiveness, which indicates that there is a high demand for the goods of the given economy on the foreign market. This applies especially to small economies, which, due to an insufficient sales market, cannot realize their production on the domestic market and export the majority of their production to foreign markets. (Hrinko, 2020, p.61)

3. Results

Speaking of minimizing the quantity of imported intermediate inputs, we would turn to one of the latest studies of The World Bank, where this way of improving a country's position on global trade is denied. If the economy tries to increase the domestic value added in exports by artificially supporting the inputs/intermediates by using tariffs and non-tariff measures, it will increase the cost of production and make the product less competitive in the international market, resulting in reduced demand for the product as well as workers in the exporting sector and will also affect the productivity and quality of the domestic firms as well, adversely affecting the welfare in the society.

Participation and integration into the GVC help the economies to improve their trade competitiveness, achieve higher GDP per capita growth and for example also improve female labor force participation despite falling domestic value added (DVA) in gross exports. Global technological advancement as well as falling trading costs have resulted in the fragmentation of production across borders. This reduction in trade costs helps the firms to exploit the comparative advantage of each country in the specific stage of production and hence, there is a reduction in DVA in gross exports. (World Bank Document, 2019, p.156)

As it was mentioned before, the importance of international trade for Slovakia is most evident across manufacturing sectors, where 81% of produced domestic value added is supported by foreign demand. Motor vehicle manufacturing is the most integrated Slovak economy activity in GVC, accounting for approximately 31% of value added in exports in 2018, of which 10% is domestic value added. (TiVa, p.1)

Despite the slowdown of the integration of Slovakia into GVC during the economic crisis of 2008-2009, there is an increase in foreign value added between 2016 and 2018 (see Figure 2). (TiVa, p.1) As for domestic value added, the country's DVA is relatively small with a significant part of international inputs. Below we provided a graph from Trade in Value Added, OECD database.

Figure 2. Domestic value-added content of gross exports, as a percent of gross exports, 1995 to 2018
Source: own processing based on TiVA (2021)

As we can see, between 1995 and 2018 all countries showed decreasing percentage of domestic value added. It could be caused by the development of trade and collaboration between countries, offshoring, and increasing the exports of the countries. However, Slovak Republic still faces a lower percentage of domestic value added in comparison to both EU and OECD countries. Hence, there is no doubt that for Slovakia appropriate policies to increase the qualitative side of exports are needed.

Firms in competitive economies source goods and services internationally if they are superior in quality and/or lower cost. If a country artificially induces firms to source locally, it will reduce their competitiveness and lead to less total value added and productivity. From a policy point of view then, developing countries should encourage technological advance but remain indifferent to whether inputs are sourced locally or internationally. That is a choice best left to the firm. There are policies that countries can use to encourage technological innovation, such as support for STEM (science, technology, engineering, and mathematics) education, subsidies to R&D, intellectual property rights (IPR) protection, and openness to foreign trade and investment. (World Bank Document, 2019, p.158)

As was mentioned above, neither relying only on low value-added activities nor trying to artificially raise domestic value-added will be effective for Slovakia to improve its position in GVC. Regarding the studies and examples from above, we have come up with advice for Slovakia for improving its position via the rising support of small and medium enterprises to take part in GVC.

SMEs are estimated to account for between 80-99 percent of firms in any given country as well as between 60-70 percent of global employment (WTO, 2016, p.3-5). They also have a higher rate of sales growth than large firms. This implies a substantial share of any nation's economy is supported by SMEs. (World Bank Document, 2019, p.132)

As for Slovakia, the business sector has long been characterized by a high representation of micro-enterprises (0 to 9 employees). Of the total number of active business entities in 2021, micro-enterprises aggregated up to 97.3%. Small (2.1%) and medium-sized (0,4%) companies have significantly lower representation. (Report on the state of small and medium-sized businesses in Slovakia in 2021 p.69) For a clear understanding of Slovakia's business sector structure see the table below.

Table 1. Number of active business entities in Slovakia by size category, 2021

Size of a firm (number of employees)	Absolute number	Percentage, %	Difference 2021- 2022
Micro (0-9)	618 115	97,3	37 175
Small (10-49)	13 469	2,1	-22
Middle (50-249)	2 725	0,4	-15
Large (249 and more)	655	0,1	13
SMEs together	634 309	99,9	37 138
Firms together	634 964	100	37 151

Source: Statistical Office of Slovak Republic (2023)

In countries such as France, Germany, Slovakia, and Sweden, SMEs account for only 30 to 40 percent of gross exports, well below their contribution to value creation and employment. Not only is SME participation in direct exports low compared to their economic weight, only a fraction of SMEs export at all. This is a distinct difference between large and small firms, given that the majority of large businesses are also international exporters. (World Bank Document, 2019, p.123)

Regardless of the nebulous way SMEs are defined, they are not well represented in international trade and GVC worldwide. (WTO, 2016, p.3-5) Given the positive effects GVC has been shown to bring, it is worth considering how to include more small firms in global production networks. For example, participation in GVC is associated with increased productivity, the export of more sophisticated (and frequently higher value) products, and a more diversified national export basket. Additionally, GVC has been demonstrated to be a pathway for economic development for countries (Kowalski et al., 2015, p.11).

SMEs can join global value chains by exporting intermediate goods or services directly (direct forward participation) or by supplying inputs to a local firm or multinational company – indirect exports (indirect forward participation). These forms of integration into GVC are not necessarily exclusive. Some SMEs export both directly and indirectly, highlighting the potential complementarity of these foreign market entry modes. SMEs can also participate in GVC by importing products as inputs into their own production

processes (direct backward participation) or sourcing products from local firms that use imported inputs. Forward linkages represent the seller’s perspective, or supply side, while backward linkages represent the buyer’s perspective, or sourcing side, of GVC. (World Bank Document, 2019, p.122)

According to Kordalska and Olszyk’s research, the identification of clear patterns of specialization for companies is crucial for national policy-making, because companies participating in GVCs produce a smaller range of products, which means that they focus on their core competencies. Their analysis confirms the unfavorable positions of some central and eastern European countries, such as Slovakia, in GVCs, which still do not focus on R&D activities. Kordalska and Olszyk’s results reveal that there are no links between GVC activities and R&D tasks in central and eastern European countries. On the other hand, these results are in contrast to the known positive effects of GVC activities on innovation and productivity in the production process among advanced economies. (Kordalska, Olszyk, 2021, p.10)

As Tomáš Jeck mentioned in his research for the Slovak Academy of Science, the ability of the economy to adapt to current or upcoming technological developments and changes is, among other things, determined by the level of innovation. In the term of innovation, we include for example the following factors: quality of research and development (R&D), education of the workforce, and funding intensity. When we talk about the factors of innovative development, Slovakia is below the EU average in many of them. The biggest shortfalls are the expenses of the corporate sector on R&D, only 27% of the EU average in 2016, and product or process innovations of small and medium-sized enterprises, which represented only 21% of the EU average in 2016. (Jeck, 2017, p.9)

Figure 3. Percentage of GDP invested in R&D in EU27, 2021.
Source: own processing based on Eurostat (2021)

If we look at Figure 3, we can see that Slovakia is one of the last in the area of spending on research and development (R&D) with a value of only 0.93% for the year 2021 converted to annual GDP. This was not the case only in 2021, but also in previous years, when the given value ranged from 0.64% in 2000 to 0.83% in 2019, while the EU average grew at a constant rate from 1.81% in 2000 to 2.3% in 2020. (Jeck, 2017, p.9)

One of the ways for a country to increase its R&D investments and boost new ideas and knowledge is to raise the level of GVC participation. Piermartini and Rubinova’s paper ‘*How much do global value chains boost innovation?*’ investigated how global value chains affect the diffusion of knowledge across borders. In particular, the authors looked at the impact of foreign R&D expenditure on the production of new ideas, including the number of applications for patents. The results suggest that GVC linkages can be a driver of knowledge spillovers for both developed and emerging economies. It was found that, on average, GVCs boosted innovation by 5% in the short run and this effect increases by 3.5 times in the long run. For Slovakia, being part of GVC has risen the number of patent applications by 5%. (Piermartini, Rubinova, 2021, p.18)

The research from Piermartini and Rubinova also showed that the strength of these positive externalities increases with both forward and backward linkages. Finally, absorptive capacity plays an important role and only countries with enough human capital devoted to research and development can benefit from ideas created abroad. Another channel through which GVCs may help increase the productivity of a local firm is, for example, by providing technology or know-how to produce a good of a higher standard. (Piermartini, Rubinova, 2021, p.24) Such findings can be taken as motivation for Slovak Republic to become even more interested in participating in GVC and increasing the levels of export. As was shown in the research, it can give both local firms and employees know-how, knowledge, or simply inspiration for new ideas.

It is no doubt that further research is needed, but according to Kersan-Škabić, countries with higher investment in R&D and rich with knowledge-based capital can be expected to achieve significantly more value added in industries with high knowledge intensity than those with low knowledge intensity and consequently high GVC participation. (Kersan-Škabić, p.6) Hence, we consider it essential for Slovakia to strengthen its support of SMEs also in investing in research and development activities.

3.1 Offshoring VS Reshoring

In addition to the advice discovered in the previous chapter, it is important to address the fact of the up-to-date trend of reshoring. Supply Chain 4.0 technologies may enable firms to reduce the number of stages in supply chains by reshoring routine labor-intensive activities in developing countries back to developed countries. These technologies make undertaking some production stages in high-wage countries more profitable by reducing the amount of labor required, thus weakening the incentive for firms to locate in low-wage countries and reducing the importance of low labor costs in determining comparative advantage, providing instead an advantage to integrating multiple stages of production at a single automated location. (Agarwal et al., 2022, p.10)

Slovakia is a relatively new member of the European Union. For decades the country enticed foreign direct investments from developed European countries (especially in the automotive industry) as a country with a cheap and low-qualified labor force. However, as Matej Dedinský mentioned in his article The Financial Times praised Slovakia: The end of cheap labor, nowadays it is said that this principle does not work anymore. Due to the entrance of new countries into the EU and the development of Slovak Republic, the country is not treated as one with cheap labor. Hence, we consider Slovakia should not rely on low value-added activities but concentrate on strengthening its potential in adding value to global trade. (Dedinský, 2019)

4. Discussion

Slovak Republic is a small economy in the center of Europe, that is widely open in collaboration with other countries. Openness and the small size of the economy make the country vulnerable and dependent on international trade. According to Naščáková and Baricová, "the degree of openness of the Slovak economy is still growing, and in 2019 the ratio of foreign trade turnover to gross domestic product in Slovakia was equal to 185%". (Naščáková-Baricová, 2020, p.18)

Heavy involvement in international trade and global value chains has been an effective way for promoting Slovakia's economic and social catch-up. Large foreign direct investment inflows have helped develop a competitive export-led manufacturing industry, with a strong specialization in the automotive and electronics sectors, fostering robust growth and productivity performance with good fiscal and external balance results. (Giorno, 2019, p.3)

Slovakia's participation in GVC is particularly prevalent in the manufacturing sector, especially in the transport and electronic equipment industries. It is also characterized by a high proportion of foreign inputs in exports, whereas the use of Slovak inputs in other countries' exports is low, as is also the case in other small economies. This indicates that Slovakia's role in GVC is more about assembling imported inputs than supplying parts and components to other GVC participants.

Claude Giorno in his study for OECD (Giorno, 2019) also writes about the share of foreign-added value in Slovak exports, stating that the extensive use of imported intermediate inputs in Slovakia's exports means that the share of domestic value added to its exports is low by international standards. (Figure 4)

Figure 4. Domestic value added of OECD countries in GVC, %, 2015
Source: Giorno (2019)

However, as it was mentioned in the results of the article, the idea to artificially rise domestic value added is not assumed as effective, but rising the value of exports is. So, for Slovakia, it is essential to sustain its high values of export and support pro-export policies. In the next part, we will look at the position of the Slovak Republic on the world market, observing the openness of the economy and the value of export performance.

Figure 5. Openness, export, and import of Slovakia as a share of GDP, %
Source: Hrisko (2020)

As we can see in Figure 5, it is obvious that in the 1990s the Slovak economy was not as export-oriented as it is today, while imports made up a significant part of GDP. In 2019, the degree of openness of the Slovak economy reached the level of 185.3% of the nominal value of GDP, while the share of export performance in 2019 was 93.1%. The Slovak Republic's above-standard export performance is not ensured by its own forces. More than half of Slovakia's export of goods consists of foreign-added value that was imported to the country (Hrisko, 2020, p.67).

As for the latest data, the Slovak economy recorded a drop in export performance of 7.25% between 2019 and 2020 and recorded the highest decline among the V4 countries. In 2020, the value of Slovakia's export performance reached 85.71%. According to Viera Ružeková et al., the significant orientation of Slovak exports to the EU markets becomes a major weakness of Slovakia at the time of the economic recession of the European Union, which is additionally compounded by the relatively low quality of exports, with an excessive orientation towards the export of the production of the automotive and electrotechnical industry, goods with low added value and weak diversification, which was also reflected in the decline in export performance of the Slovak Republic (Ružeková et al., 2020, p.16).

In the study „Fragile Reality of Slovak Export“ Viera Ružeková writes, that the biggest problem of Slovak export is: non-sophisticated production, losing competitive ability and advantages in the international context, as well as excessive orientation towards EU markets. Hence, the Slovak economy should concentrate not only on quantitative aspects of the exports, but mainly on the qualitative area of exports, represented by the export of sophisticated production, top technologies, and the increasing share of services in exports, as the main determinants of international competitiveness. (Ružeková et al., 2020, p.27)

Conclusion

It is sometimes said that the global economy can be viewed either through the length of growth and structural change in individual countries, developed and developing, or through GVC. According to the World Bank, Global value chains are the complex network structure of flows of goods, services, capital, and technology across national borders. (World Bank Report, 2019, p.v)

Although Slovakia's integration into world trade has produced remarkable results in recent decades, reforms are needed to improve the quality of this integration and prepare the country for future changes in the international environment. Over the years, Slovakia's integration into world trade has largely remained based on activities located in the lower part of the value chain curve (such activities include, for example, the assembly of imported intermediate products), which give the country little domestic added value.

However, we figured out that the traditional way of rising the value of domestic value added now seemed to be ineffective. So, it is necessary to improve Slovakia's position in GVC by complex and sophisticated policies, so that the country can boost its exports not only in quantitative but also in qualitative ways. As an example of such policy, the article offers supporting small and medium enterprises in their desire to take part in GVC. We chose this particular measurement due to the data that showed us relatively low participation of SMEs in the GVC worldwide. In Slovakia, the business sector has long been characterized by a high representation of micro-enterprises (0 to 9 employees). Of the total number of active business entities in 2021, micro-enterprises aggregated up to 97.3%.

Regarding the data that showed that different kinds of participation of SMEs in GVC can improve the quality of export in the country, we concluded that the policy would be effective for Slovak Republic.

Abstract

Research background: The agri-food, banking, and technology sectors have dominated intense M&A activity for several years. The agri-food sector, which is an important component of the primary sector, plays a fundamental role as agriculture helps sustain life by providing the food we need to survive, and it also makes an important contribution to the national and global economy. The banking sector in the EU plays a crucial role in promoting economic growth, ensuring financial stability, creating jobs, facilitating cross-border integration and fostering financial innovation. Providing essential services enables individuals, businesses and governments to manage their finances effectively and promote economic prosperity in the region.

Purpose of the article: The main objective of this paper is to compare the volume of realized mergers and acquisitions in the agri-food and banking sectors.

Methods: The dataset containing records of completed cross-border mergers and acquisitions in Europe is based on data from the Zephyr and Orbis databases. Since only the transactions above 1 million euros were selected for the resulting database, this analysis focuses on 12 countries in Europe, with the analyzed trend covering 18 periods (from 2004 to 2021). To test each hypothesis, the Wilcoxon matched pairs signed-rank test and the sign test, which compares differences between established sectors, were used.

Findings & Value added: From the above analysis, it can be concluded that there are statistically significant differences in the volume of realized cross-border mergers and acquisitions (M&A) between the agri-food sector and the banking sector in 2005, 2006, 2007 and 2015. No differences were found in the other observed years. Based on the descriptive statistics, we can claim that the banking sector had a significantly higher volume of mergers and acquisitions in the mentioned years.

Keywords: mergers and acquisitions, agri-food sector, banking sector, comparison, consolidation, Europe

JEL classification: F23, G34, Q17

1. Introduction

The agri-food, banking and technology sectors have dominated intense M&A activity for several years. In the case of the banking sector, which could not withstand the downturn triggered by the 2007-2008 financial crisis, banks were acquired by competitors. The consolidation of the banking sector has continued in 2019–2021, although the impact of the COVID -19 pandemic has caused the number of mergers and acquisitions in the banking sector to drop significantly. The global economy is currently in a phase of increased corporate consolidation, which has led to the emergence of truly large companies that dominate key sectors. The agri-food sector is no exception to this general trend of market domination by mega-corporations. The expression of corporate consolidation has been particularly striking along the entire food supply chain, with the size and scope of mergers and acquisitions in the sector comparable to some of the largest corporate mergers in the global economy during this period (Clapp, 2019).

* Corresponding author: ivana.kravcakova.vozarova@unipo.sk

The agri-food sector, which is an important component of the primary sector, plays a fundamentally important role. Agriculture is important because it helps sustain life by providing the food we need to survive. It also makes an important contribution to the national and global economy. According to the World Bank's 2022 report, this sector accounts for 4% of global gross domestic product (GDP), and in some of the least developed countries, it can account for more than 25% of GDP. This sector provides a large number of jobs worldwide. According to employment indicators from the Food and Agriculture Organization of the United Nations, agriculture is the second largest source of employment, accounting for 26.7% of total employment (Peng et al., 2023). The EU is the leader in agricultural production, but investment trends vary among member states. The EU is the largest agricultural producer in the world, with a total agricultural output of EUR 181.7 billion in 2018. The generally low profit margins of the sector are the main incentive for EU farmers to invest in fixed assets, increase cost efficiency and modernise production. This is also the main reason why farmers need additional working capital, as they require funding to cover current costs. Large farms invest more than small farms and rely more on external financing (EIB, 2020).

The structural change in the agricultural and food industry is characterised by consolidation processes. On the one hand, this leads to fewer large companies dominating individual stages of global value chains. On the other hand, the same companies control more and more stages of entire commodity value chains, from production to trade to processing. This means that fewer and fewer companies are exerting significant influence over the entire food system. Consolidation in the agri-food sector is taking place in both the horizontal and vertical dimensions. Horizontal concentration means that individual stages of global value chains are increasingly concentrated in the hands of a few large companies. Vertical integration, on the other hand, means that multinational companies gradually expand their activities and influence across different stages of the value chain. Horizontal concentration occurs at all stages of global value chains, e.g., in intermediate inputs, production, trade, processing, and retailing. Mergers and acquisitions are the means of choice for agri-food companies seeking to consolidate their power and influence over an increasingly large part of global value chains. Other models of collaboration among powerful companies include joint ventures, strategic alliances, and contractual agreements (PublicEye, 2023).

According to Clapp (2019), there are several drivers of corporate consolidation, some of which are industry-specific, which helps illustrate the complexity and nuances of the impact. Similarly, debates about the impacts associated with concentration are also specific to the agri-food sector. The agricultural input industry is of particular importance at this time due to recent merger activity in the sector and its importance in defining the prevailing model of agricultural production in the food system. As such, it has important significance for both economic and environmental outcomes.

Examining M&A determinants for the agri-food industry is important for three reasons. First, mergers and acquisitions in the agri-food industry tend to be among the most extensive and account for a large share of total merger and acquisition activity. Second, the agri-food industry differs from other industries by many characteristics, so the factors that explain the success or failure of mergers and acquisitions in other industries are not necessarily transferable to the agri-food industry. For example, the agri-food industry has a comparatively large number of smaller companies. The third and final reason is that mergers and acquisitions follow a wave-like pattern, meaning that there is increased merger activity during certain periods. (Muehlfeld et al., 2011; Herger et al., 2008; Oomen, 2017).

According to Oomen (2017), four concepts can influence the performance of M&As in the agri-food sector (Figure 1). The first concept is a set of influences called "other influences." The motives behind an M&A or the actors involved in an M&A may explain certain decisions or events. Therefore, it is important to consider this concept in the case studies. The second concept is the internal factors of M&A performance. The presence or absence of these determinants can have strong effects on M&A performance and should be analysed to explain the success or failure of an M&A. In light of his study, the relationship between internal factors and M&A performance is more important than the other relationships, given the available data. Therefore, the arrow in figure 1 is thicker. The third concept is the environment of the agri-food sector. Since the determinants have to be present in the agrifood sector, the characteristics of the agri-food sector are important here. For example, the importance of cooperatives might have strong implications for the performance of an M&A. Fourth, external influences might affect the performance of an M&A. For example, an M&A can be unsuccessful because of unfavorable legislation or poor economic conditions.

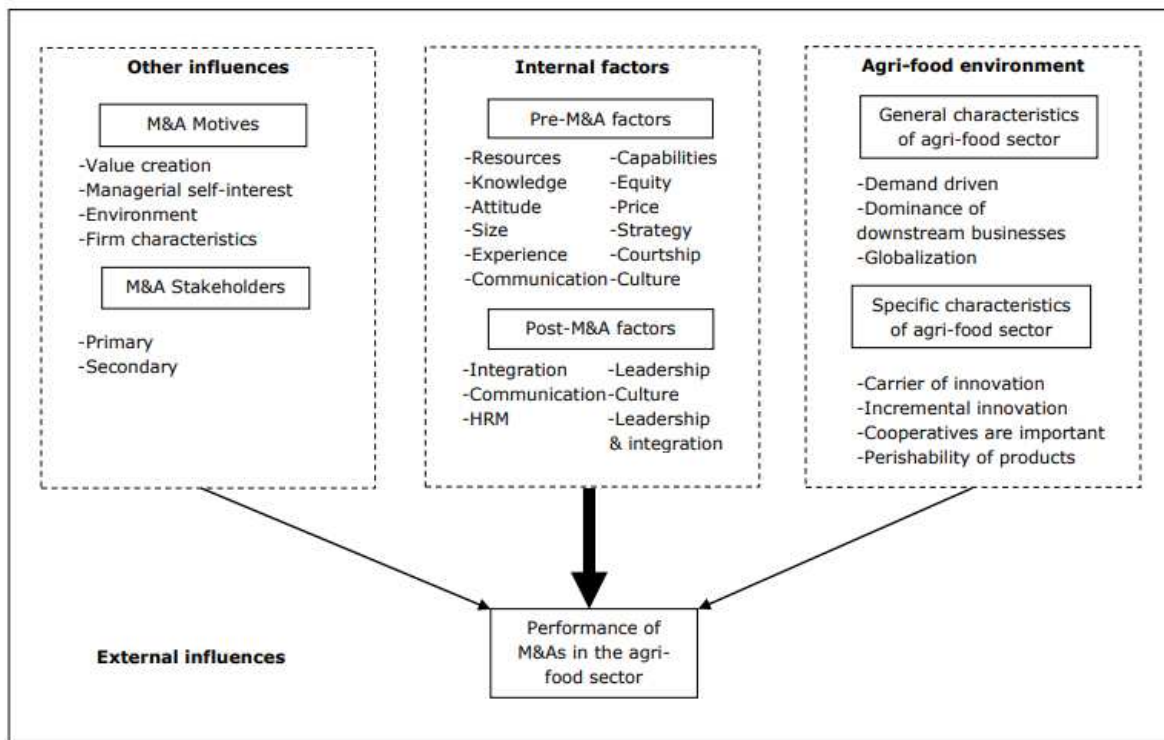

Figure 1. Concepts of impact on performance of M&A in agri-food sector
Source: Oomen (2017)

COVID-19 has had vastly differing impacts on different firms. This pandemic has motivated an improved understanding of marketing channels and selling conditions for agricultural producers to better prepare the food supply chain for future shocks and disruptions. Consumer preferences have quickly fluctuated, and grocery stores have had to adapt ready-to-eat food spaces and add precautionary equipment. Between the heightened need for food at home and the increased operational expenses, there has been an increase in costs for every segment of the supply chain (Volpe, 2020; Volpe et al., 2022). The distribution of food has changed: online and physical supermarkets, as well as take-away delivery, have grown, while the catering industry, restaurants, and on-the-go shops and their suppliers have suffered tremendously. In addition to COVID-19, consumers and their changing demands have a major impact on M&A transactions in the food sector. Consumers want transparency; they want to know where their food comes from and how it is produced. They want healthy foods with less sugar and fat. They want more convenience. Sustainability is a huge trend; consumers want food produced with less impact on the environment, less waste and more attention to animal welfare. These are the trends that investors are also looking at in deciding on transactions (Grain & Mutsaers, 2020). M&A deals in this sector are particularly sophisticated and challenging and require real industry specialists with thorough knowledge.

The banking sector in the EU plays a crucial role in promoting economic growth, ensuring financial stability, creating employment opportunities, facilitating cross-border integration, and driving financial innovation. Its provision of essential services enables individuals, businesses, and governments to effectively manage their finances and foster economic well-being within the region.

Following the global financial crisis of 2007-2009 and the subsequent European sovereign debt crisis of 2009-2012, the European banking markets underwent significant structural changes. European banks, particularly those on the periphery of the euro area, experienced substantial outflows of deposits and incurred significant losses. The financial distress, the reversal of financial integration, and the persistently low interest rate environment posed significant challenges for European banks. In fact, the number of banks in the European Union decreased by 40% between 2008 and 2020 (European Banking Federation, 2022). Consequently, there has been an increase in market concentration and a decrease in competition (De Jonghe et al., 2016; Maudos & Vives, 2019). Prior to the global financial crisis, banking concentration in major European economies was relatively moderate (Uhde & Heimeshoff, 2009), and competition was intense (Goddard et al., 2013). This was attributed to a high volume of cross-border bank mergers and acquisitions and the implementation of various reforms such as the

single banking license and the introduction of the Euro (Weill, 2013). Overall, Europe was considered to be "over banked" (Pagano et al., 2014). While a considerable body of literature has examined the implications of this environment for European banks' lending decisions (Heider et al., 2019) and their profitability, among other topics, little is known about its effects on mergers and acquisitions activity among European banks (more Kontonikas et al., 2023; Kravčáková Vozárová et al., 2022).

Brexit referendum, which resulted in the United Kingdom's decision to leave the European Union, has had significant implications for the relationship between the UK and the EU, including within the banking sector. According to Petit and Beck (2023), Brexit poses unique challenges for financial sector policymakers in the EU as the most important financial center in Europe (London) is now outside its regulatory framework. The Trade and Cooperation Agreement agreed in December 2020 between the United Kingdom and the European Union includes a very thin financial sector chapter, with eight out of 783 articles directly covering this sector. A Memorandum of Understanding to establish EU-UK structured regulatory cooperation on financial services has not been signed, and any regulatory cooperation has been paused due to the conflict over the Northern Ireland Protocol, part of the UK Withdrawal Agreement. The divergence of UK regulation from EU regulation is almost a given outcome following Brexit. The UK's rationale behind the will to actively diverge from the EU pertains to broader political choices and regulatory approaches and objectives: flexibility, common law principles-based, competitiveness, growth, and innovation. In addition to such active divergence, there can also be passive divergence, with the UK not keeping up with EU legislative changes or not following new EU regulation in the financial services sector.

2. Methods

The main objective of this paper is to compare the volume of realized mergers and acquisitions in the agri-food and banking sectors. The M&A indicator, according to which we evaluate the differences between two sectors (1- agri-food sector, 2 – banking sector), presents the volume of realized cross-border mergers and acquisitions in these sectors in the countries of Europe (in million €).

Subsequently, we established a research hypothesis for this paper:

H1: „There are statistically significant differences in the volume of realized cross-border mergers and acquisitions (M&A) between the agri-food and banking sectors in Europe.“

The dataset containing records of completed cross-border mergers and acquisitions in Europe is based on data from the Zephyr and Orbis databases. Since only the transactions above 1 million euros were selected for the resulting database, this analysis focuses on 12 countries in Europe (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Netherlands, Portugal, Spain, United Kingdom), with the analyzed trend covering 18 periods (from 2004 to 2021).

To verify individual hypotheses was used Wilcoxon Matched Pairs Signed-rank Test and Sign test to compare the differences between established sectors. Unlike the t test for paired data, the Wilcoxon signed-ranks test does not require normal distributions. Instead, it tests the hypothesis that the scores for two variables were drawn from the same distribution. The test formula is as follows (Košíková et al. 2017):

$$Z = \frac{\min(S_p, S_n) - (n(n + 1)/4)}{\sqrt{n(n + 1)(2n + 1)/24 - \sum_{j=1}^l (t_j^3 - t_j)/48}}$$

where:

N = number of cases with non-zero differences

l = number of ties

t_j = number of elements in the j-th tie, j = 1, ..., l.

Table 1 presents descriptive statistics for the volume of realized cross-border mergers and acquisitions in the agri-food sector (AFS) and banking sector (BS) in the selected period 2004–2021, where std. dev. represents the standard deviation, Q1 lower quartile, Q3 upper quartile, and MeanY means the total average value of the volume of M&A for all monitored years.

Table 1. Descriptive statistics for the volume of M&A

Source: own processing (2023)

The results of the Wilcoxon matched pairs test and the Sign test show that there are statistically significant differences in the volume of realized cross-border mergers and acquisitions between the agri-food sector and the banking sector in 2005, 2006, 2007, and 2015. Differences were not confirmed in the other monitored years. Based on the descriptive statistics in Table 1, we can claim that significantly higher volumes of M&A were in the banking sector in the mentioned years.

The countries with the largest volume of cross-border mergers and acquisitions in the banking sector for the period 2004–2021 include France, Italy, Spain, Germany, the Netherlands, and the United Kingdom. The largest number of cross-border mergers and acquisitions in the banking sector for the period 2004 – 2021 were in Italy, France, Spain, Germany, the United Kingdom, and Netherlands. During the monitored years, the given volume or number of cross-border mergers and acquisitions in the banking sector changed. Therefore, for a better idea, we present in Table 3 the average ranking of countries in individual years according to volume and number of cross-border mergers and acquisitions in the banking sector for the period 2004–2021.

Table 3. Ranking of countries according to the volume or number of cross-border M&As in the banking sector

Country	Average Rank of volume M&A	Rank of volume M&A	Average Rank of number M&A	Rank of number M&A
Austria	9.0	9	10.9	11
Belgium	8.2	7	8.6	8
Cyprus	13.8	15	12.8	15

Source: own processing (2023)

The countries with the largest volume of cross-border mergers and acquisitions in the agri-food sector for the period 2004–2021 include France, the United Kingdom, Netherlands, and Italy. The largest count of cross-border mergers and acquisitions in the agri-food sector for the period 2004–2021 was in France, Spain, the United Kingdom, Italy, and Netherlands. During the monitored years, the given volume or number of cross-border mergers and acquisitions in the monitored sector changes. Therefore, for a better idea, we present in Table 4 the average ranking of countries in individual years according to volume and count of cross-border mergers and acquisitions in this sector for the monitored period.

Table 4. Rank of countries according to the volume or number of cross-border M&As in the agri-food sector

Country	Average Rank of volume M&A	Rank of volume M&A	Average Rank of number M&A	Rank of number M&A
Austria	8.3	9	9.0	11
Belgium	7.6	7	8.5	9

4. Discussion

The production of agricultural and agri-food products and their trade are of particular importance for the European Union. Given its share of global exports and imports, the Union can rightly claim, alongside the United States, the position of the most important importer and exporter of agricultural products. Within the European processing industry, the agri-food sector is one of the most important. It is essential that European agriculture and the agri-food industry, which closely depends on it, maintain and increase their competitiveness and their market shares in their internal as well as external markets while respecting the commitments that the EU has made in its international trade relations. However, European agriculture is currently facing a much more competitive environment, mainly due to the globalization of markets (European Commission, 2013).

The global food system is increasingly dominated by a shrinking number of ever larger firms that command enormous influence over their respective markets. All along agri-food supply chains, from inputs such as seeds, chemicals, and farm equipment, to commodity trading, to food processing and retail, just a handful of very large firms tower over the scene.

What, precisely, this trend toward consolidation means for the agri-food system as a whole is not always clear. There are divergent perspectives with respect to what growing consolidation means for both economic and environmental sustainability in the food system. On one hand, a diverse set of critics have raised a number of concerns about heightened concentration in the sector. Food justice advocates and many farmer groups, for example, argue that growing corporate control over the food system, in particular the industrial agriculture model these firms promote, has contributed to heightened economic vulnerability for farmers and consumers, and has undermined the environmental sustainability of food systems. Many economists have also been concerned about growing concentration in the sector, in particular because having fewer dominant firms can threaten competition, which in turn can undermine efficiency, innovation, and social welfare. On the other hand, the firms that are key players in the sector portray their consolidation as beneficial for the food system, as they claim it promotes innovations that bring social and environmental benefits (Clapp, 2019).

Pazarkis et al. (2022) argue, that the global agri-food industry is undergoing deep reorganizations, with a plethora of mergers, acquisitions, and agreements unifying the sector. Past mergers in the field have been largely driven by technological innovation and integration, along with enhanced copyright protection. Further technological innovation and integration remain important for today's mergers, but they are not the only driving forces. Today's mergers are also largely shaped by increased financialization in the agri-food sector, which has prioritized investor claims for profits in ways that encourage corporate integration. These waves of mergers and acquisitions have revolutionized and restructured this sector several times in recent decades, and continue to bring about change and adjustment even today. The overall continuous integration of food businesses and agricultural enterprises in recent decades has not gone unnoticed. Research covering the consolidation process may not focus strictly on mergers and acquisitions in terms of the consolidation phenomenon,

but the overall structural changes that have taken place in the sub-sectors involving the food and food industries have been highlighted. There is no doubt that mergers and acquisitions have served as a means of facilitating this change. One of the main reasons for the merger is to reduce costs because a combined company can operate more efficiently than two separate companies. However, the merger of two companies could potentially lead to a reduction in competition and, an increase in the prices charged to the consumer, or a reduction in the prices paid to the producer in the event of a monopoly position.

Peng et al. (2023) investigated the influence of several agricultural factors in determining the likelihood of cross-border mergers and acquisitions in the global agriculture and food sector. They found that better agricultural resources, productivity, and the environment of the receiving (target) country are associated with a lower (higher) probability of cross-border mergers and acquisitions. Overall, they highlighted the important role these agricultural factors play in determining cross-border mergers and acquisitions, particularly in the agricultural and food sectors.

Cross-border integration is a critical aspect facilitated by the EU banking sector. Banks provide financial services across member states, enhancing cross-border trade and investment. The harmonization of regulations and the establishment of a single market have simplified cross-border banking activities, making financial services and transactions more accessible for businesses and individuals. This integration supports economic integration and bolsters competitiveness within the European Union. Cross-border M&As enable market expansion, yield synergies and efficiency gains, facilitate risk diversification, enhance financial stability, foster competition, and promote harmonization and integration. These factors collectively support economic growth, stability, and competitiveness within the EU.

According to Kontonikas et al. (2023), post-2008, banking market concentration has significantly increased in Western European countries. At the same time, interest rates reached historically low levels, with potential negative implications for bank profits from lending activities. Furthermore, the higher market concentration in the post-2008 period coincides with lower competition. These structural changes are associated with higher announcement of abnormal returns and profitability improvements for the bidding banks. The main source of this improved performance is the merger-related increases in the net interest margins, resulting in market power exploitation. Their findings highlight the importance of market structure for bank M&As performance and can contribute to the ongoing policy debate concerning the implications of competition for financial stability. The link between market structure and stability is complex, and the literature provides ambiguous and often contradictory findings (Martinez-Miera & Repullo, 2010). This strand of the literature relies on different assumptions, and, thus, higher market power can either enhance or hamper financial stability through its effects on overall bank risk. These results support the view that high concentration (low competition) improves the performance of bidding banks through market power exploitation. At the same time, it remains to be seen whether future bank M&As will be positively received by investors in the current environment of higher interest rates.

Conclusion

Mergers and acquisitions of companies have become a common part of the market economy. Increasing competition forces companies to look for opportunities that will help them, for example, improve their position and increase their market share.

According to Denčić-Mihajlov (2020), mergers and acquisitions, as transactions characterized by the consolidation of companies or assets through different types of financial transactions, are an increasingly important factor in modern economic activity. Considering the international orientation of the companies today, and the continuous process of integration in global markets, a further growth trend of M&A activity is expected in the upcoming time. The future will certainly bring new challenges for the implementation in M&A strategies, such as changing regulatory requirements, the change of needs and consumer habits, new risks that companies face in implementing the chosen strategy of growth and development.

The study compared the volume of realized M&As in the agri-food sector and the banking sector. From the above analysis, it can be concluded that there are statistically significant differences in the volume of realized cross-border mergers and acquisitions (M&A) between the agri-food sector and the banking sector in 2005, 2006, 2007, and 2015. Differences were not confirmed in the other monitored years. Based on the descriptive statistics, we can claim that significantly higher volumes of M&A were in the banking sector in the mentioned years.

The Analysis of the Youth Unemployment in the Slovak Republic

Mariana Dubravská^{1,*}

¹ University of Presov, Department of Economic and Economy, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The concept of unemployment represents an unfavorable situation both for an individual and for the entire society. The unemployment rate shows a real picture of the country's economic health. It is a very sensitive issue in today's global society. It affects both the older and the younger generation, and the inability to get a job is very frustrating for young people, and it leads to negative consequences on their psychological state and social life.

Purpose of the article: Proposed paper offers analysis of the present state of the youth unemployment in the Slovak Republic.

Methods: Unemployment analysis is performed on the basis of statistical data and indicators obtained from the Statistical office of Slovak Republic. Through statistical tests, the informative value of the results of the performed correlation analyses was identified, and thus the degree of their statistical significance was determined.

Findings & Value added: Based on the results of the performed analysis, we conclude that unemployed young people in Slovakia present a significant part of the total number of unemployed and therefore significantly influence the unemployment rate in Slovakia. Youth unemployment rate in Slovakia has decreased significantly from 2010 to 2020 (except for the year 2020).

Keywords: labour market, unemployment, youth people, Slovak republic

JEL classification: J21, J64

1. Introduction

The youth employment situation deserves immediate attention. Not only because it threatens the principle of equality and solidarity between generations, an important aspect of social justice, but any prolongation or deepening of the crisis will also increase the political and social unrest as more and more young people lose faith in the current economic change. Although unemployment harms the economic and social well-being of all those affected, the harm is more clear when it occurs at the fragile beginning of a person's working life. Therefore, it is urgent to take all possible national and international measures that will avoid the second and potentially more dangerous phase of the global crisis and to maintain faith in the current economic and social changes and their ability to ensure decent work and social justice for all (International Labour Organization 2012).

Youth unemployment is relevant to study, not only because of the increasing salience of the social problem, especially in certain countries, but also because it reveals welfare-regime country differences that the existing literature has overlooked (Cinalli, Giugni, Graziano 2013).

The youth unemployment problem is not new (. The interest in the literature begins debate in the 1980s when the representatives of the 'baby-boom' generation joined the jobs market. For Europe, unemployment was always on the interesting and important issue because EU historically registered higher values than US or Japan (Yiannaki, 2010) both for general rate of unemployment and youth unemployment rate.

Youth unemployment is a serious global problem. Youth has a special meaning for all countries of the world. Youth can be considered as an engine for achieving development goals because they are more energetic, talented, creative, open, productive and dynamic and shape future workers, entrepreneurs, consumers and producers. All these youth potentials are valuable resources for economies. To achieve

* Corresponding author: mariana.dubravska@unipo.sk

development goals, youth must be integrated into the workforce and economies. Higher youth unemployment is not only a local or developing country problem, it is a real global challenge. Therefore, it must be fought globally. (Ayhan 2016).

1.1 Unemployment as a society-wide problem

Unemployment is a ubiquitous problem that is a complex of cultural, economic interpersonal, physical, and psychological dimensions. Whereas the pernicious negative outcomes of unemployment are empirically established in the literature, there is a need to better understand the psychological experiences of unemployment so as to inform interventions that ameliorate its impact (Kossen, McIlveen 2018).

Unemployment is accepted as an important macroeconomic problems in all countries. Due to the unemployment rate being an important variable, it is a priority target in economic policies. In this direction, the issue of how to increase the employment rate and reduce the unemployment rate is included in countries' short-, medium-, and long-term economic policies of countries (Doganer 2022).

To be employed is an important condition for a person's dignified existence, it brings not only material benefit, but also gives him a sense of self-realization and social value. Employment determines the beginning and the end of people's economic activity. Employment shows generally valid values not only to those who are employed. It is the influence of identification, advice and personal example. Forcibly removing job from a person's personal life has proven negative consequences - social, economic and, of course, psychological. Without occupation, the meaning of life disappears, social contacts are limited and the integrity of the personality gradually breaks down. (Výrost, Slaměník, Solárova 2019)

Thus, employment is not only used to collect goods or to perform services, but it creates a field in which it is possible to conduct conversations, meet other people and create friendships. Group work creates a social environment in which a person is evaluated and compared with others (Buchtová, Šmajš, Boleloucký 2013).

The EU labour markets show a number of long-term imbalances and asymmetries, which are reflected in a persisting high unemployment rate. A group that is particularly affected by the high unemployment rate are young people (Potužáková, Mildeová 2015).

1.2 Youth unemployment

Persons who belong to the group of disadvantaged job seekers include, among others, especially School graduates (citizens under the age of 25 who have completed full-time vocational training less than two years ago and have not obtained their first regularly paid job - that is, a job that would last more than six consecutive months). (ÚPSVaR 2018)

Psychologists studied more than 7,000 young people born between 1980 and 1984. Their analysis revealed that emotional distress in early life (feeling anxious or depressed as a teenager) was a very strong factor in unemployment in adulthood. Teenagers living in extreme poverty were 32% more likely to be unemployed as adults. It's not exactly clear why early psychological distress is linked to lower employment later in life, but researchers say that turmoil during the school years can disrupt people's educational attainment, which in turn hurts future job opportunities. One important result of this research is that anxiety and depression, even at an early age, can take a huge professional and economic toll over a person's life (Psychological science organisation 2016).

Based on the published papers, the most studied determinants of youth unemployment are increased levels of regional economic advances, state demographics, relocation, household conditions, regional openness and export/import. Economic freedom, labour market reforms, economic growth, high proportion of part-time employment, active labour market policies, minimum wage norms, extent of bargaining scope and alignment are prominent determinants that reduce unemployment at large and improve labour market performance of youth in particular (Ralph, Arora 2022).

The problem of youth unemployment is a global issue. It is important to deeper examine the issues of youth unemployment. High unemployment means a waste of limited resources and decelerates the long run growth potential of an economy in the result of lower incomes, lower aggregate demand and GDP growth rates. (Gontkovičová, Mihalčová, Pružinský 2015)

There are micro and macroeconomic reasons for youth unemployment. Macroeconomic reasons consist of the level of production and the general rate of unemployment in the economy. Determinants of youth unemployment are sustainable growth, falling unemployment, crisis, labor costs, population growth, school-to-work transition and educational mismatch. The consequences of youth unemployment are explained in the literature as economic, social and psychological. The economic results of youth

unemployment are a decline in overall output, increasing poverty, loss of human capital, and social consequences include social unrest, crime, illegal trade, immigration, brain drain, drug and human trafficking. The psychological consequences of youth unemployment are: mental disorders, depression, suicide attempts, feelings of despair, inactivity, uselessness and exclusion from society. (Ryan 2001)

The majority of European countries spends significant resources each year on active labor market programs (ALMP) with the aim of improving the integration prospects of struggling youths. Among the most common programs used are training courses, job search assistance and monitoring, subsidized employment, and public work programs. For policy makers, it is of utmost importance to know which of these programs work and which are able to achieve the intended goals – may it be the integration into the first labor market or further education (Caliendo, Schmidl 2016).

The European Union considers long-term unemployment among youth an impediment to their full integration into society. The Commission of the European Union has, therefore, supported research into the mechanisms by which youth unemployment leads to "social exclusion" (Kieselbach 2003).

The European Union is working to reduce youth-unemployment rate in line with the main EU target of achieving a 75 % employment rate for the working-age population (. Main framework is the Europe 2020, a strategy for smart, sustainable and inclusive growth, especially Youth on the Move - it is comprehensive package of policy initiatives on education and employment for young people in Europe. Furthermore, the European Commission adopted a series measures to tackle youth unemployment. Key initiatives include: Youth Employment Package (2012), Youth Employment Initiative (2013) and also communication Working together for Europe's young people - A call to action on youth unemployment (2013).

2. Methods

The data that were used for the analysis of youth unemployment in Slovakia were obtained from statistical databases of the Statistical Office of the Slovak Republic for the period from 01.01.2010 – 31.12.2020 and from statistical databases of the European Union. These databases store statistical data and indicators in the field of economic and socio-economic development of the Slovak Republic and EU member states.

The statistical analysis consisted of performing correlation analyses, which determined the relationship of individual variables, based on established hypotheses. The relationship between the investigated variables is identified by the value of the correlation coefficient, which is denoted by the letter "r". Then the results of individual correlation analyzes have been verified with a test of statistical significance of the correlation coefficient. Verification of established hypotheses was performed on the basis of T-test and P-value. Through statistical tests, the informative value of the results of the performed correlation analyses was identified, and thus the degree of their statistical significance was determined.

3. Results

In the first half of the decade, the unemployment rate floated above 10%. The highest unemployment rate in Slovakia was in 2012 and it achieved 14.44% (see Figure 1). Since 2016, the unemployment rate has decreased, and the lowest unemployment rate in Slovakia was recorded in 2019. In 2020, the unemployment rate in Slovakia increased again to 7.57%, and this increase was caused by Covid 19 pandemic.

Figure 1. Unemployment rate in the Slovak republic in the years 2010-2020
Source: Own processing according the SOSR (2023)

The number of unemployed young people under the age of 29 in single regions of Slovakia in the years 2010-2020 is shown in the following Figure 2. It is clear that the number of unemployed young people under the age of 29 was decreasing proportionally to unemployment rate in Slovakia. At the same time, we can see that the highest number of unemployed young people under the age of 29 were recorded in the eastern Slovakia. Central Slovakia and western Slovakia recorded identical numbers of unemployed young people under the age of 29 in the searched period. The Bratislava region registered the lowest number of unemployed young people under the age of 29 as there are many job opportunities in the Bratislava region where young people can also apply after completing their studies.

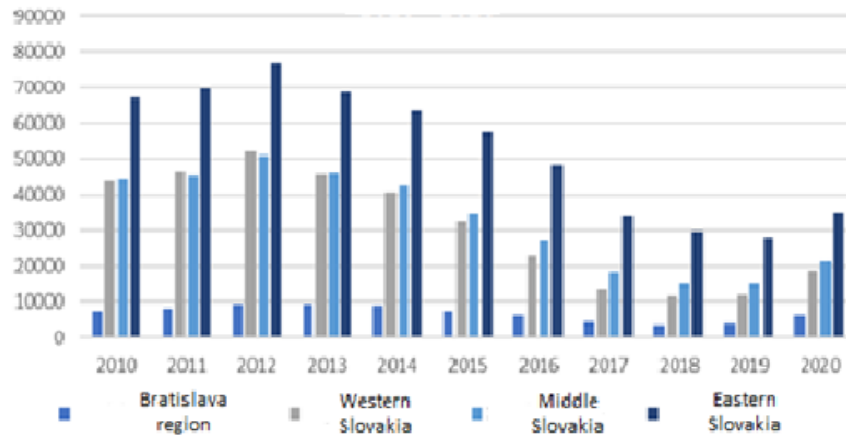

Figure 2. The number of unemployed young people under 29 years of age in single regions of the Slovak Republic in 2010 - 2020

Source: Own processing according the SOSR (2023)

In the following Figure 3, we can see the specific number of unemployed teenagers and graduates, the result is that there were about six times more unemployed graduates than unemployed young job seekers during the searched period.

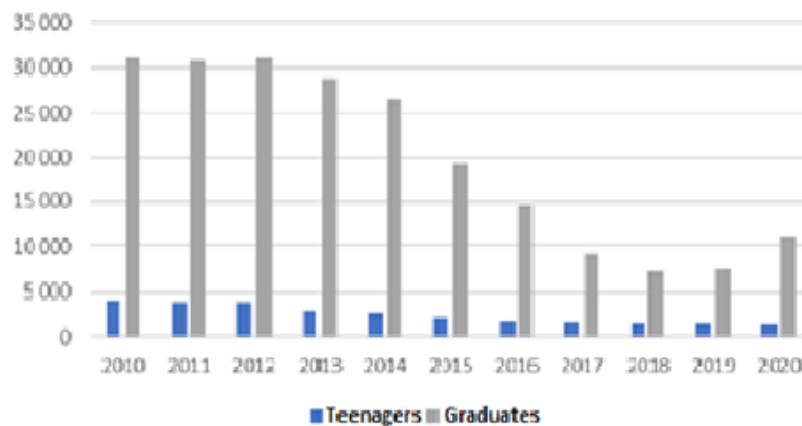

Figure 3. Share of teenagers and graduates in the total number of unemployed youth in Slovakia

Source: Own processing according the SOSR (2023)

Through the available Eurostat databases, we obtained data of the young unemployment rate of individual states of the European Union. To compare, we chose data from the Czech Republic, Poland and Hungary. We compared data in the time interval from 2012 to 2020, as the mentioned database did not contain older data regarding the youth unemployment rate in individual EU member states. In the following Figure 4, we can see the displayed youth unemployment rate of young people aged 15-24 (NEET) in the mentioned states during the searched years. The results of the comparison show that the highest youth unemployment rate during the searched period was in Slovakia. The country with the second highest youth unemployment rate was Poland, followed by Hungary, and finally, the Czech Republic achieved the lowest youth unemployment rate among the compared countries.

Figure 4. Percentage share of unemployed youth aged 15-24 in total unemployment in selected EU countries
Source: own processing according the Eurostat database (2023)

As part of the statistical analysis of the youth unemployment rate in Slovakia, hypotheses were set and then subsequently verified. The set hypotheses discussed the relationship, or the influence of individual groups of unemployed youth in Slovakia on the unemployment rate in Slovakia. Total research sample of unemployed young people in Slovakia was divided into the following four groups: young people from 15-24 years old, teenagers and graduates. Through the performed correlation analyses, a positive linear correlation dependence in all cases was identified, so we can conclude that all investigated categories of unemployed youth in Slovakia significantly influence unemployment rate in Slovakia (see Table 1).

Table 1. Correlation analyses

Correlation analyses	r-correlation coefficient	P-value
X: Number of unemployed youth aged 15-24 in 2010	0,5214	0,000
Y: Total rate of unemployment in 2010		
X: Number of unemployed youth aged 15-24 in 2020	0,6003	0,000
Y: Total rate of unemployment in 2020		
X: Number of unemployed teenagers in 2010	0,6457	0,000
Y: Total rate of unemployment in 2010		
X: Number of unemployed teenagers in 2020	0,5520	0,000
Y: Total rate of unemployment in 2020		
X: Number of unemployed graduates in 2010	0,1832	0,000
Y: Total rate of unemployment in 2010		
X: Number of unemployed graduates in 2020	0,3045	0,000
Y: Total rate of unemployment in 2020		

Source: own processing (2023)

4. Discussion

Based on the results of the performed analysis, we conclude that unemployed young people in Slovakia present a significant part of the total number of unemployed and therefore significantly influence the unemployment rate in Slovakia. Youth unemployment rate in Slovakia has decreased significantly from 2010 to 2020. During the searched period several important and effective tools has been implemented to improve the situation of youth unemployment of Slovakia, such as:

- dual education of students,
- graduate practice,
- de minimis subsidy schemes (subsidies of up to EUR 200,000.00 over three consecutive years), which were provided and are still provided by the Slovak Labor, Social Affairs and Family Offices to support the employment of young people under 29 years of age,
- subsidies from the State Budget and the European Structural and Investment Funds to support the employment of job seekers and disadvantaged job seekers.

Conclusion

Unemployment in the world and specifically in Slovakia is a serious problem, which is a very sensitive topic for all age groups, but especially for graduates and young people who do not have practical experience in the labor market. It is therefore necessary to appeal to local politicians to solve this problem without delay and look for ways and active solutions to reduce youth unemployment. Youth unemployment rate in Slovakia has decreased significantly from 2010 to 2020 (except for the year 2020). It may be caused by the fact that several important and effective tools has been implemented to improve the situation of youth unemployment of Slovakia, such as: dual education of students, graduate practice, etc. However, comparing data of youth unemployment rate with the situation in the Czech Republic, Poland and Hungary, the results of the comparison show that the highest youth unemployment rate during the searched period was in Slovakia. Slovak Republic can improve the situation by using the tools of European Commission. European Commission adopted a series measures to tackle youth unemployment. Key initiatives include: Youth Employment Package (2012), Youth Employment Initiative (2013) and also communication Working together for Europe's young people - A call to action on youth unemployment (2013).

Abstract

Research background: The research background encompasses a comprehensive review of relevant literature pertaining to market expansion and growth strategies. Specifically, it investigates the existing knowledge and research gaps regarding the determinants of achieving a set limit condition.

Purpose of the article: Mergers and acquisitions have been one of the vital forms of market expansion and growth strategy widely-utilized by firms in recent years, both within and across national boundaries. The paper focused on the analysis of the probability of achievement of the set limit condition that the value of the merger and acquisition will be capitalized at more than €1 billion.

Methods: The independent variables considered were the GDP of the source and target country, the distance between the capitals of the source and target country, the existence of a common border and language between the source and target countries, the current presence of the countries in the EU, the sector (manufacturing, services) and the year of the cross-border transaction.

Findings & Value added: The results suggest that the significant factors are mainly the GDP of the source country, the distance of the capitals, the existence of a common border, the sector, the year and, last but not least, the EU membership of the source and the target country.

Keywords: cross-border mergers and acquisitions, distance, sector, European Union, regression model

JEL classification: F15, F21, F23

1. Introduction

Mergers and acquisitions (M&As) are among the key and effective strategies for ensuring the competitiveness of companies on international markets, their long-term and sustainable growth in the current global economic environment. They consist in the joining of enterprises with the aim of combining their resources and capacities, unifying processes and procedures, streamlining their business activities, and thereby increasing profitability and their economic strength. In particular, to gain access to new markets with already existing customers, market knowledge and local knowledge that would otherwise be difficult for them to access without obtaining local resources and partners, to gain access to new resources and capacities that would otherwise be unavailable to them, to achieve synergistic effects such as productivity growth, increase the quality of management, reduce costs by concentrating resources and eliminating duplicate activities, reduce labor costs, unify research and development capacities that can be used for the growth and subsequent development of business activities, diversify portfolios and risks, ensure against the influence of fluctuations in domestic markets, etc. (more Chapčáková et al., 2022; Hečková et al., 2016).

In addition, the results of the research on the issue in question show that, from a macroeconomic point of view, cross-border M&As are an important determinant of transfers and the subsequent distribution of production from one country to another, they support technological transfer, the transfer of know-how and other capacities between different countries, which has a positive impact not only on the companies themselves, but also on the entire economies of the countries involved in these transactions (Wang et al., 2022a; Hitt et al., 2016; Hagedoorn et al., 2002). This means their positive contribution to the economic growth and competitiveness of countries as a result of helping to increase productivity, technology transfer and investment, leading to growth in economic activity, job creation, etc. (Pereira-Moliner et al., 2021) In addition to technological and managerial expertise, mergers and acquisitions can

* Corresponding author: miroslav.gombar@unipo.sk

also bring other benefits. For example, subsequent investments by enterprises in the development of infrastructure, improving the quality of education and training of the workforce in the host country, etc.

However, it is important to emphasize, that cross-border mergers and acquisitions represent highly complex processes, requiring rigorous planning and implementation, sufficient time and financial resources, and taking into account not only opportunities, but also risks, respecting local cultural and social norms and environmental aspects. These are primarily cultural differences and difficulties in integrating different cultures and values, which can lead to problems within the company and a negative impact on its performance in the future. Different financial and legal structures in different countries can lead to problems in the implementation of transactions and their failures. It should also be added that cross-border mergers and acquisitions can have a negative impact on host economies, especially when businesses gain a dominant market position and limit competition. In some cases, these transactions can lead to job losses and endanger local economic growth (more Králičková, 2020; Lapšanský, 2020).

Research on cross-border mergers and acquisitions shows that the success of these transactions depends on a complex of factors, including strategy and planning, communication, integration and management of cultural differences, and the selection of suitable partners. Cross-border mergers and acquisitions can be successful if properly planned, managed and integrated (Štefko et al., 2021; González-Torres et al., 2020; Xing et al., 2017).

Regional agreements, including advancing integration processes in Europe, have a significant positive impact on the value and number of cross-border mergers and acquisitions. The European Union has created a legal framework and policies that influence these processes and aim to support the completion and functioning of the single market, economic integration and the free movement of capital between member states. One of the main instruments is Directive of the European Parliament and the Council no. 2005/56/EC of October 26, 2005 on cross-border mergers or mergers of capital companies. Its legal basis is Articles 49 (freedom of establishment), 56 (freedom to provide services), 63 (free movement of capital) and 114 (approximation of law for the purposes of the creation and functioning of the internal market) of the Treaty on the Functioning of the European Union (OJEU, 2012). This directive established a common framework for cross-border mergers and acquisitions throughout the Union and established rules and procedures for the approval and execution of these transactions. The directive ensures the protection of the interests of shareholders, employees and creditors, and also prevents negative effects on competition. The Union has also created a range of policies and instruments that support the free movement of capital and investment between member states. For example, an integral part of the effort to achieve the integrity of the internal market and special efforts are made in the field of financial services. Integration directives and regulations contribute to market expansion and support competition by reducing the costs associated with financial integration, enable and support more efficient and smooth movement of equity capital, stimulate financial integration, reduce the cost of capital, eliminate exchange rate risk, enable the sharing of common trading platforms and integrate post-trade market infrastructure. These processes contribute to the reduction of macroeconomic uncertainty, the reduction of exchange rate volatility and the stabilization of inflation, which makes cross-border mergers and acquisitions less risky (more Škare and Porada-Rochon, 2022; Wang et al., 2022b).

The aim of the contribution is the analysis of the probability of reaching the specified limit condition, that the value of the cross-border merger and acquisition will acquire a capitalization higher than 1 billion euros, based on a sample of 19 source and 28 target countries within the European area between 1998 and 2021. The GDP of the source and target countries, the distance between the capitals of the source and target countries, and the existence of a common border and language between the source and target countries are considered as independent variables and the target country, the current presence of the countries in the EU, the sector (manufacture, services) and the year of the transaction. This paper is a continuous extension of the research presented in our previous papers Hečková et al. (2016) and Štefko et al. (2022).

2. Methods

The presented data preparation process started with the extraction of 117 561 data on the number and volume of realized cross-border mergers and acquisitions with a minimum value of one transaction in the amount of 1 million euros in 19 source countries (Austria, Belgium, Cyprus, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, Netherlands, Poland, Portugal, Spain, Sweden, Turkey, United Kingdom) and 28 target countries (Austria, Belgium, Bulgaria, Cyprus, Czech republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Turkey,

United Kingdom) of the European area and the values of the other predictors selected by us. We use a comprehensive dataset on global mergers and acquisitions from Bureau van Dijk Zephyr and Orbis database (Bureau van Dijk, 2022), spanning the period from 1998 to 2021. The dataset consists of individual cross border equity deals between the source country of the acquirer and the target country where the target firm is domiciled. The source of other statistical data used is Eurostat (European Commission, 2022). The extreme value of the capitalization volume of 204.73 million euros was excluded from the research set between the United Kingdom as a source country and Germany as a target country implemented in 2000. Subsequently, to homogenize the data, we removed the top and bottom 10% of the data from the database, so the final number of observations represents 7,511 individual values. The MS Excel and STATA 17 programs were used to process the research results.

$M\&A_{ij,s,t}$ represents the total value of cross-border assets acquired through mergers and acquisitions by source country i , in target country j , in sector s , and at time t . As part of the analysis of cross-border mergers and acquisitions ($M\&A_{ij,s,t}$), we will focus on answering the basic research question: What is the probability of achieving a higher value of cross-border mergers and acquisitions than the limit value set by us at the level of $\text{€}1 \cdot 10^9$. If the value of the implemented merger and acquisition exceeds this limit condition of the case, we assign the result 1. Otherwise, we assign the value 0. The value of the gross domestic product of the source (i) and target country (j) can be considered an important predictor that affects the volume of cross-border mergers and acquisitions in sector s and at time t ($GDP_{j,s,t}$, $GDP_{i,s,t}$). The variables of proximity of countries, specificity of their culture and relatedness of language were also included in the model. The proximity of the source and target countries is quantified by the distance of their capitals, denoted as $distance_{ij}$, the sharing of a common border is quantified by the binary variable $border_{ij}$, which takes the value 1 in the positive case and the value 0 in the negative case. The binary variable $language\ relatedness_{ij}$ takes the value 1 in the case of a matching official language and the value 0 otherwise. The other predictors in the considered model are variables that relate to the membership of the source and target countries in the European Union, namely $EU_{i,t}EU_{j,t}$ takes on the value 1 if the source country i as well as the target country j was a member of the European Union at time t , otherwise, it takes on the value 0. In the end, we will also consider the sector in which the cross-border merger and acquisition took place (1 – manufacturing sector, 2 – service sector) as variables that influence the achievement of the limit condition set by us ($M\&A_{ij,s,t} > \text{€}1 \cdot 10^9$) and the year of realization of the acquisition and merger itself (t). If necessary, we will consider the dependent variable $M\&A_{ij,s,t}$ as dichotomous (0,1) to answer the defined research question, we will choose logistic regression analysis within the study.

Logistic regression enables data analysis when the response is binary, or a frequency quantity expressed by values of 0 or 1, or ratios from the $(0,1)$ interval. Ratios represent the proportion of positive results in the case of several repeated measurements at the same value of the independent variable x . The number of measurements should be approximately the same for each ratio. Logistic regression is used in modeling the probability of the investigated response on the value of a continuous variable. The random variable is assumed to have a binomial distribution with parameter π corresponding to the probability of the outcome "1" and varying monotonically with the value of the independent variable. The resulting model is then an estimate of this parameter as a function of x . The use of logistic models is very broad and includes a number of very different disciplines. The probability depending on the variable x is modeled using the logistic model:

$$\pi(x) = \frac{\exp(\alpha + \beta x)}{1 + \exp(\alpha + \beta x)} \quad (1)$$

Or after editing

$$\log \frac{\pi(x)}{1 - \pi(x)} = \alpha + \beta x \quad (2)$$

where $\log \frac{\pi(x)}{1 - \pi(x)}$ is called *logit*, α and β are regression coefficients and the iterative method of

least squares is used to estimate them a , b . This method can be used to obtain the most reliable estimates

of the regression coefficients α and β . The logistic regression model can be expressed by a sigmoidal curve $\pi(x)$, which expresses the estimate of the probability of the observed phenomenon depending on the independent variable x . Independent variables x can also be multidimensional $\mathbf{x} = (x_1, x_2, \dots, x_m)$. The corresponding model then has a form that is analogous with linear regression in the form:

$$\pi(\mathbf{x}) = \frac{\exp(\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_m x_m)}{1 + \exp(\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_m x_m)} \quad (3)$$

3. Results

Table 1 shows that out of a total of 7,511 analyzed transactions of cross-border mergers and acquisitions ($M\&A_{ij,s,t}$) there are a total of 2,013 such cases that met the condition for acquiring the value „1“ and, on the other hand, 5,498 implementations that met the defined limit they did not fulfill the condition. The construction process of the logistic model by maximizing the logit in individual iterations shows that the maximum was reached already in the 1st iteration (8326.3135).

Table 1. Basic characteristics of the dependent variable of the logistic model

Variable	Value	Count	(Event)
$M\&A_{ij,s,t}$	1	2013	
	0	5498	
	Total	7511	

Source: own processing (2023)

In the following table 2, we present estimates of regression coefficients (estimate), i.e. their guidelines, estimates of their standard deviations, calculated levels of significance p . The regression parameter of each character, i.e. independent variable, represents an estimate of the change in the logistic regression function if there is a unit change of the characteristic in question, assuming that the other characteristics are fixed at a constant value.

Source: own processing (2023)

In table 2 it can be seen that at the level of significance $\alpha = 5\%$ significantly affects the achievement of the set limit value of cross-border mergers and acquisitions ($M\&A_{ij,s,t} > 1 \cdot 10^9$ €), i.e. reaching a value of 1, the variable GDP of the source country (GDP $_{i,s,b}$ x_1), the distance of capitals between the source and target countries (distance $_{ij}$, x_3), sharing common border between the source and target countries (border $_{ij}$, x_4), membership of the source and target country in the European Union (EU $_{i,t}$ EU $_{j,t}$, x_6), the sector and the year of the transaction itself. We also provide confirmation of these conclusions in Table 3, where we present the basic variance analysis of the considered logistic model.

4. Discussion

If we focus on the analysis of categorical independent variables, we can accept the conclusion that the fulfillment of the defined limit condition ($M\&A_{ij,s,t} > 1 \cdot 10^9$ €) has, based on the value of the odds ratio of 47.65 % those cross-border mergers and acquisitions, where the source and target countries have a common border, i.e. the variable x_4 (border $_{ij}$) takes on the value 1. In the case of another significant predictor, namely x_6 (EU $_{i,t}$ EU $_{j,t}$), the limit condition is reached by those mergers and acquisitions where both the source and target countries were members of the European Union in the same year and the probability of reaching the value of $M\&A_{ij,s,t} > 1 \cdot 10^9$ € in this case is 26.06 % higher than in cases where the source and target countries were not members of the European Union. Another interesting conclusion

is the fact that reaching the limit value is 12.35 % lower in the case of acquisitions and mergers realized in the service sector than in the manufacturing sector. The last significant variable considered namely the year of implementation of the cross-border merger or acquisition points to the fact, if we focus on the last two analyzed years, that there is a 20.47 % lower probability that realized cross-border mergers will meet the limit condition in 2021 compared to 2020. If we consider the influence of independent variables x_1 to x_3 , then we present the resulting possibilities for model cases in Figure 1.

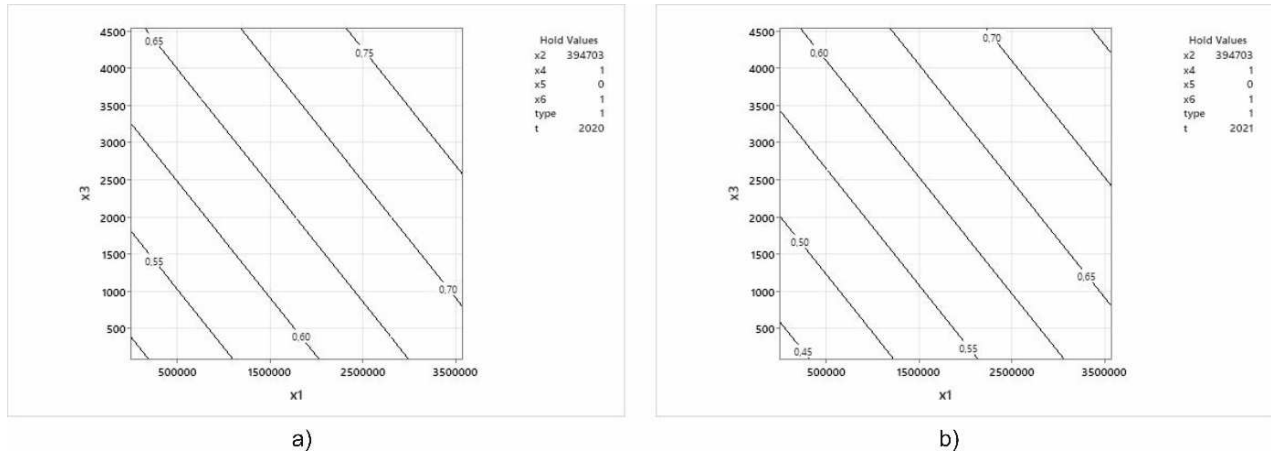

Figure 1. Probability of reaching the set limit condition for 2020 (a) and for 2021 (b)
Source: own processing (2023)

Figure 1 shows that the probability of meeting the limit condition for the value of cross-border mergers and acquisitions increases with the increase in the value of the GDP of the source country and the simultaneous growth of the distance between the capital cities between the source and target countries at a constant value of the GDP of the target country. That the distance of capitals does not play a role is confirmed by the fact that corporations realize their production within global value chains by fragmenting production operations around the world, which is a direct realization of the Concept of International fragmentation in practice (more Bair, 2005). Other constants are the mutual existence of a common border and the simultaneous presence of the source and target countries in the EU and the services sector. At the same time, we see that in 2020, under the same conditions mentioned above, the probability of meeting the limit condition is about 5% higher than in 2021. The results of our analysis for the entire research set in the examined period from 1998 to 2021 clearly confirm that European integration stimulates intra-EU cross-border M&A activity and have enhanced the attractiveness of European companies. From a theoretical point of view, it is a confirmation of a key element of regional integration in Internalization Theory and Neary's (2007) theoretical arguments, in the empirical research of the results of Coeurdacier et al. (2009), Erel et al. (2012) etc.

Conclusion

Based on the analysis of categorical independent variables, we concluded that cross-border mergers and acquisitions, where the source and target countries share a common border, have a significantly higher probability of achieving high transaction values and a set limit condition compared to transactions without a common border. Another important factor is the membership of the source and target countries in the European Union in the same year. Transactions where both countries are members of the EU show a significantly higher probability of achieving high transaction values compared to transactions where at least one of the countries is not a member of the EU. In the service sector, the probability of reaching the limit value of transactions is lower compared to transactions in the manufacturing sector. Our results indicate that the probability of reaching the limit value of transactions increases with the increase in the value of the GDP of the source country and simultaneously with the increase of the distance between the capital cities of the source and target countries, while keeping the value of the GDP of the target country constant. In view of our findings, in further research we will focus on a more detailed examination of the impact of the existence of a common border and membership in the European Union on the resulting values of cross-border transactions, the identification of other specific factors that influence these variables and the examination of the existence of conditional significant factors, including cross-sectoral comparison.

Change in Energy Intensity and Energy Mix of the EU's Food, Beverages, and Tobacco Industry

Adrienn Takácsné Papp^{1,*}, Klara Szucs Markovics¹, and Ágnes Horváth¹

¹ University of Miskolc, Institute of Business Sciences, H-3515 Miskolc-Egyetemváros, Hungary

Abstract

Research background: Besides meeting the most basic human needs, the food and beverages and tobacco industry (along with agriculture) must meet the most pressing sustainability challenges.

Purpose of the article: Our study seeks to answer the following research question: Has the EU's Food, Beverages, and Tobacco (FBT) industry started on the road to energy and climate goals between 2008 and 2020 considering changes in the energy intensity index and energy mix?

Methods: Our studies were based on aggregated data from the 27 EU countries on the one hand and data from the eight dominant member states of the FBT industry on the other hand. Dominant Member States were those countries whose cumulative share together represents 80% of the total value added in the FBT sector (EU27). Our study focuses on analyses of the food, beverages and tobacco sector's energy intensity and energy mix.

Findings & Value added: The energy intensity index improved by only 1.1 per cent at the EU level over the period under review. Based on the data of the EU27 and the TOP 8 countries, the results show a positive picture emerged about the energy mix of the FBT industry. The use of high-emitting energy sources is relatively low, which decreased everywhere from 2008 to 2020 without exception.

Keywords: food, beverages and tobacco industries, energy intensity, decarbonisation, energy mix

JEL classification: L66, Q20, Q40, Q55

1. Introduction

The food and beverages industry is one of the most critical sectors of the economy, encompassing the entire process from food production to its sale. Rapid population growth and climate change pose many problems and challenges. The increasing severity of these factors forces the agricultural sector, the food production system, and enterprises to look for an effective solution. Sustainable management of natural resources, water and energy has become essential. (Koçak & Şarkgüneşi, 2017; Bozsik et al., 2022; Gáspár et al., 2023). The EU has focused on climate protection and, simultaneously, the decarbonisation of industry for decades. Achieving the 2015 Paris Agreement, the Green Deal and Fit for 55% targets is a significant challenge for most sectors, incredibly energy-intensive sectors. Although the food and beverages industry is not one of the most energy-intensive sectors, there are about forty energy-intensive processes in food production and processing (Klemes & Perry, 2007). Energy intensity also varies considerably from product to product. Based on studies conducted between 1980 and 2015, Ladha-Sabur et al. (2019) show that "the most energy-intensive food products are powders (i.e. instant coffee and milk powder), fried goods (i.e. French fries and crisps) and bread, all involving thermal processes such freeze-drying or drying in their manufacture; in addition, hygienic and cleaning requirements are the main sources of water consumption and waste in the meat and dairy industries." (Ladha-Sabur et al., 2019)

In addition to meeting the most basic human needs, the food industry must also meet the most pressing sustainability challenges, such as protecting natural water resources, preserving soil quality, reducing carbon emissions, etc. The effects are exacerbated by the growing population requiring more and more "hungry mouths" to be fed worldwide, meaning that the food industry is under severe double pressure: on the one hand, it must increase the production of healthy food, and on the other hand, it must

* Corresponding author: adrienn.takacsne.papp@uni-miskolc.hu

reduce negative externalities and impacts on nature. In our study, among the many issues, we focus only on factors related to energy use, energy intensity and decarbonisation.

Reducing greenhouse gas emissions cannot be achieved without a green transition, which requires substantial changes in both production and consumption patterns. (Besley & Persson, 2023) Innovation plays an important role in transforming production processes, not only in the food and beverages industry, but also in related sectors. Moscona & Sastry (2023) examined innovation, climate change, and potential economic impacts in the U.S. agricultural sector.

As in any sector, the food and beverages industry prioritise energy saving, improving energy efficiency and reducing greenhouse gas emissions. To facilitate this, the GREENFOODS branch concept was created, which aims to identify and evaluate energy efficiency measures, integrate renewable energy sources into the food and beverages industry, and also include best practices to help companies in the sector. "The overall objective of the GREENFOODS project is to lead this industry to optimised energy efficiency and the integration of renewable energy sources and following reduction of fossil carbon emissions in order to ensure and foster the worldwide competitiveness, improve the security of energy supply and guarantee the sustainable production in Europe." (Glatzl et al., 2015, p. 397) In addition to energy efficiency, it is important to increase the share of energy from renewable sources in total energy consumption, while at the same time reducing the use of energy from solid fossil fuels. There are many efforts and promising practices to improve the energy efficiency of food processing and to decarbonise the food processing sector, but the transition faces many obstacles. (Clairand et al., 2020) However, appropriate political incentives may increase the acceptance of energy efficiency strategies. Moreover, the industry needs to renew traditional processes and encourage the installation of long-run, profitable intelligent technologies. (Clairand et al., 2020) In our study, we seek to answer the following research question:

RQ: Has the EU's food, beverages and tobacco industry started on the path towards energy and climate goals between 2008 and 2020 in light of changes in the energy intensity index and energy mix?

The structure of the paper is as follows: after the Introduction, Section 2 contains the literature review, Section 3 renders a brief description of the analytical framework and methodology, Section 4 presents our results, which is compared with the main conclusions of the sources of literature in Section 5, and finally, Section 6 summarizes our key findings.

2. Literature review

The global food and beverages industry uses an average of 200 EJ/year, 45% of which is related to processing and distribution (FAO, 2017) Regarding energy use, the food and beverages industry is the fifth most energy-intensive sector in the EU. A vast range of products characterises the food and beverages industry, and its products and production procedures are heterogeneous. Individual products and production processes have different energy intensities. Food production and processing involves about forty energy-intensive processes (Klemes & Perry, 2007). Ladha-Sabur et al. (2019), based on studies conducted between 1980 and 2015, show that the most energy-intensive food products are powders (i.e. instant coffee and milk powder), fried goods (i.e. French fries and crisps) and bread, all involving thermal processes such freeze-drying or drying in their manufacture. In addition, hygienic and cleaning requirements are the primary sources of water consumption and waste in the meat and dairy industries. (Ladha-Sabur et al., 2019) The literature on this topic points out that energy consumption is closely related to food productivity. (Imran & Ozcatalbas, 2021)

According to Wang, 2014, the food industry has focused on improving energy efficiency and recovering waste heat to increase the sustainability of food processing. Replacing traditional energy-intensive food processes with new technologies such as novel thermodynamic cycles and non-thermal and novel heating processes offers further opportunities to reduce energy consumption and production costs and improve the sustainability of food production. (Wang, 2014) One means of achieving the decarbonisation objectives is to increase the use of clean energy sources in the technological process. There is more significant potential for spreading renewable energy sources in the food industry, where biodiesel, biogas and biomass can also be considered for specific processes. Solar energy could also be helpful for thermal processes, such as drying. (Clairand et al., 2020) The benefits of decarbonisation in the food and beverages industry can be seen in four areas: energy and carbon savings, cost savings, environmental protection, and worker satisfaction and health. (Sovacool et al., 2021)

Kanchiralla et al. (2021) analysed the energy and CO₂ intensity of processes in the Swedish food industry via a case study. They found that 70% of the total energy goes to the production and 30% to the support processes. Heat processing (45%) and cooling (18%) are the most energy-intensive production processes. Regarding the support processes, space heating (7%) and hot water (5%) take the most energy in Sweden. The researchers also examined the energy consumption of individual food industry processes by energy carrier. Considering all food processes, 55% of energy consumption came from electricity, 27% from oil, 10% from LPG, 6% from district heating and 1% from biomass and diesel. Bajan et al. (2021) investigate the use of energy and its structures in the food production systems of the V4 countries and the EU-15 countries between 2000-2001 and 2015-2016. Their research revealed that the share of food production systems in total energy consumption has decreased in the V4 countries, while in the EU-15, this value is stabilising at around 4.4%. Among the V4 countries, the share of energy use of the food industry in total consumption was lower than the EU average in the Czech Republic and Slovakia (between 3-4% in 2015-2016), while a higher proportion can be observed in Poland and Hungary. In case of Poland, there was a marked decrease in the period under review, from nearly 11% in the period 2000-2001 to over 7% in 2015-2016. In the case of Hungary, the value ranged from 8.7% in the period 2000–2001 and fell below 8% in 2015-2016, but a lower value of 6.8% was observed in 2010-2011. As far as the energy mix of the food industry in the V4 countries is concerned, the picture is quite diversified. Poland has the highest share of energy from coal among the four countries, even above 30% at the end of the period under review (2015-2016), and the share of petroleum products, although steadily decreasing, also accounts for one-third, while the share of renewables slightly increased from 5% to 8%. The most significant increase in renewables can be observed in the Czech Republic, from 2% to 13%, and in Hungary, from 8% to 14%. In the case of Slovakia, however, the share of renewables in the food energy mix decreased from 16% to 12%. (Bajan et al., 2021)

In the tobacco industry, processing tobacco (e.g. drying, moisturizing and evaporation) requires significant energy use, thermal power (steam) and electricity are the most dominant energy sources. The negative externalities on human health and the environment caused by the tobacco industry make the need to protect the environment and reduce its carbon footprint even more pressing. Wang & Yuan, 2020 conducted a study of the Chinese tobacco industry, finding that energy intensity and energy efficiency improved significantly between 2000 and 2015 and that the government has mandated further reductions in specific energy consumption. Their literature review based on international sources found that the tobacco industry's energy efficiency is relatively high, and its energy savings rate can be a benchmark for other sectors. They highlighted that energy savings and CO₂ reduction opportunities are in scale optimization (such as improving product structures), technology development, and process optimization. In addition, optimizing energy structures at the national level and strengthening the use of clean energy are essential measures in achieving climate targets.

3. Methodology

According to NACE Rev. 2, the Food, beverages, and tobacco industry comprises the following groups: Manufacture of food products (NACE 10), Manufacture of beverages (NACE 11) and Manufacture of tobacco products (NACE 12). In this paper, we use the abbreviation FBT industry to refer to the Food, beverages and tobacco industry. In our study, we examine the energy intensity and energy mix of the EU food, beverages and tobacco industry between 2008 and 2020 to understand whether the sector is on the road toward climate goals. (RQ)

Our studies were based on aggregated data from the EU-27 on the one hand and data from the dominant member states of the FBT industry on the other. Dominant Member States are countries whose cumulative share represents 80 % of the total value added in the FBT sector (EU27). The cumulative shares, as well as the data of the TOP 8 countries based on 2019 data, are shown in Figure 1. Looking at the list of the TOP 8 countries, there were no significant changes in the 13 years studied, only minimal change of order occurred. Our analysis is based on the concentration curve based on 2019 data.

Figure 1. Cumulative share of EU Member States in value added of FBT industry
Source: Own calculation based on data from the Odyssee-Mure database

Figure 1. shows that France, Germany, Italy, and Spain are the most significant players in the EU FBT industry. These four countries account for 60% of the total value added in the FBT industry in the European Union. In addition, four other countries, Poland, the Netherlands, Ireland, and Romania contribute together with a 20% share to the cumulative share of 80%.

Our study focuses on analyses of the food and beverages sector's energy intensity and energy mix. The study relies on two data sources, Eurostat and Odyssee-Mure. The final energy consumption of the FBT industry was collected from the annual energy balance sheets (Eurostat) for the 27 EU Member States in total and by energy carrier, for the period 2008-2020. Value-added data were obtained from the Odyssee-Mure database. Energy intensity was quantified as the ratio of the final energy consumption of the branch (measured in energy units ktoe) to the value-added at constant price (measured in million euro, 2010). This indicator shows how much energy is needed to create €1 million of value added.

The energy mix of the FBT industry was mapped in detail by aggregation of energy sources based on the Energy balance methodology guide. In addition, further aggregations were made, classifying energy carriers based on their CO₂ emission factors (see in Commission Implementing Regulation (EU) 2018/2066, Annex VI, pp. 79-80.). Our classification (Table 1) is consistent with that of Arens et al. (2021).

Table 1. Classification of the energy products based on their CO₂ emission factor

High-emitting energy sources	Medium-emitting energy sources	Low- (and zero-emitting) energy sources
Solid fossil fuels, manufactured gases, peat and peat products, oil shale and oil sands, oil and petroleum products, non-renewable waste (Emission factor is above 70 tCO ₂ /TJ)	Natural gas (Emission factor is 56.1 tCO ₂ /TJ)	Renewable energy sources and biofuels, and nuclear heat (Emission factor is zero or close to zero)

Source: based on Commission Implementing Regulation (Eu) 2018/2066, Annex VI, pp. 79-80 and Arens et al. (2021) self-classification

The amount of the secondary energy sources, such as electricity and heat were allocated to high-, medium- and low-emitting energy sources based on the energy mix of the electricity and heat production of the countries.

4. Results

As mentioned above, this study seeks to answer the following research question: Has the EU's Food, Beverages, and Tobacco (FBT) industry started on the road to energy and climate goals between 2008 and 2020, considering changes in the energy intensity index and energy mix? The results are summarised in Section 4. Our analysis first covered the evolution of energy intensity in the food, beverages and tobacco industry (subsection 4.1). In addition to the energy intensity, the analysis of the energy mix can give information about the FBT industry trends on the path towards achieving energy and climate goals. The findings in connection with the energy mix are in the subsection 4.2.

4.1 Energy intensity of the food, beverages and tobacco industry

Our analysis first covered the evolution of energy intensity. A decrease in this indicator represents an improvement in energy intensity, as less energy is used to create a unit value-added, which means a positive trend. The results are shown in Figure 2. and Table 2.

Figure 2. Energy intensity index in the FBT industry, in the EU27 and TOP 8 countries in 2008 and 2019
Source: Own calculation based on Eurostat and Odyssee-Mure database

Based on the EU27 aggregate, the FBT industry's energy intensity index ranged from 0.12 to 0.13 ktoe per million euro over the 13 years under review, with slight fluctuations. In other words, 1 million EUR of value-added required of 0.12-0.13 ktoe energy consumption. From 2008 to 2019, energy intensity index improved by only 1.1 per cent at the EU level; since the value-added of the sector increased by 6.3 per cent, energy consumption increased slightly less, by 5.1 per cent. (Figure 2, Table 2)

Table 2. Change in the energy intensity index and in its main components of the FBT industry between 2008 and 2019

Country	Change in final energy consumption (%)	Change in value added of FBT industry (%)	Change in energy intensity (%)
EU27	5.1	6.3	-1.1
France	13.3	20.3	-5.8
Germany	6.5	-9.2	17.2
Italy	-15.2	16.5	-27.2
Spain	20.0	-9.3	32.3
Poland	21.1	37.8	-12.1
Netherlands	-3.9	17.6	-18.3
Ireland	30.0	40.5	-7.5
Romania	-16.4	1.1	-17.3

Source: Own calculation based on Eurostat and Odyssee-Mure database data

According to the data of the TOP 8 countries, the picture is more diverse. Ireland and Romania have the lowest energy intensity, around half the EU average. In most countries, improvements were observed in the value of the indicator. The most significant change occurred in Italy, where the sector's final energy consumption was reduced by 15.2 per cent, while value added increased by 16.5 per cent. In addition, the Netherlands and Romania reduced energy use in the sector while increasing added value. In the case of Spain and Germany, however, we are witnessing an unfavourable trend. The final energy consumption of the FBT sector increased while the sector's value added decreased. (Figure 2., Table 2.)

4.2 Energy mix

In addition to the evolution of energy intensity, the analysis of the energy mix can give information about the FBT industry trends on the path towards achieving energy and climate goals. (Figure 3)

Figure 3. FBT industry's energy mix based on 2008 and 2020 data, in the EU27 and TOP 8 countries
Source: Own calculation based on Eurostat database and energy balance data

Based on the data in Figure 3., natural gas and electricity dominate the energy consumption of the FBT sector. In 2020, natural gas accounted for 46% of total final energy use in the sector and electricity for 34%, according to EU27 aggregates. The Netherlands, Germany, Romania, and Ireland have the highest natural gas ratios. For all countries, there is a shift in the energy mix from 2008 to 2019. We have also examined the energy mix in another breakdown. The energy carriers are divided into three groups based on their CO₂ emission factor. According to this, high-, medium and low-emitting energy carriers were distinguished. The amount of electricity and heat used was divided between the groups based on the energy mix of electricity and heat production in the given country.

We examined whether there had been a shift from high-emission to medium- and low-emission energy sources in the 13 years examined (Figure 4, Table 3)

Figure 4. A high-, medium- and low emitting energy sources in the FBT industry's energy mix in the EU27 and TOP 8 countries

Source: Own calculation based on Eurostat database and energy balance data

Based on the data of the EU27 and the TOP 8 countries, a favourable picture emerges regarding the energy mix of the FBT industry (Figure 4.). The use of high-emission energy sources is relatively low (except in Poland), which decreased in each country from 2008 to 2020. Table 3 provides information on the extent and direction of change.

Table 3. Change in the share of high-, medium- and low-emitting energy sources between 2008 and 2019 in the FBT industry's energy mix in the EU27 and TOP 8 countries

Country	Change in share of high-emitting energy sources	Change in share of medium-emitting energy sources	Change in share of low-emitting energy sources
EU27	-13.8%	5.8%	8.0%
France	-9.9%	2.7%	7.1%
Germany	-12.6%	8.8%	3.8%
Italy	-21.6%	7.3%	14.3%
Spain	-19.1%	8.9%	10.2%
Poland	-17.0%	13.4%	3.5%
Netherlands	-6.7%	1.2%	5.5%
Ireland	-28.2%	25.9%	2.3%
Romania	-18.7%	8.2%	10.5%

Source: Own calculation based on Eurostat database and energy balance data

According to Table 3, the TOP 8 countries and the EU27 show a decrease in the share of high-emitting energy carriers in the FBT industry's energy mix, with decreases of around 20 percentage points or more in several countries. This trend is even more favourable in countries where most of the shift has been towards low-emission energy sources. Given that electricity consumption represented a significant proportion (up to 30-40 per cent) of the FBT industry's energy mix, the energy mix of electricity and heat generation were examined in each country. (Our calculations do not consider that countries can also cover their electricity needs from imports, which may distort the results). (Figure 5). The energy mix of electricity and heat production in the countries shows a highly diverse picture.

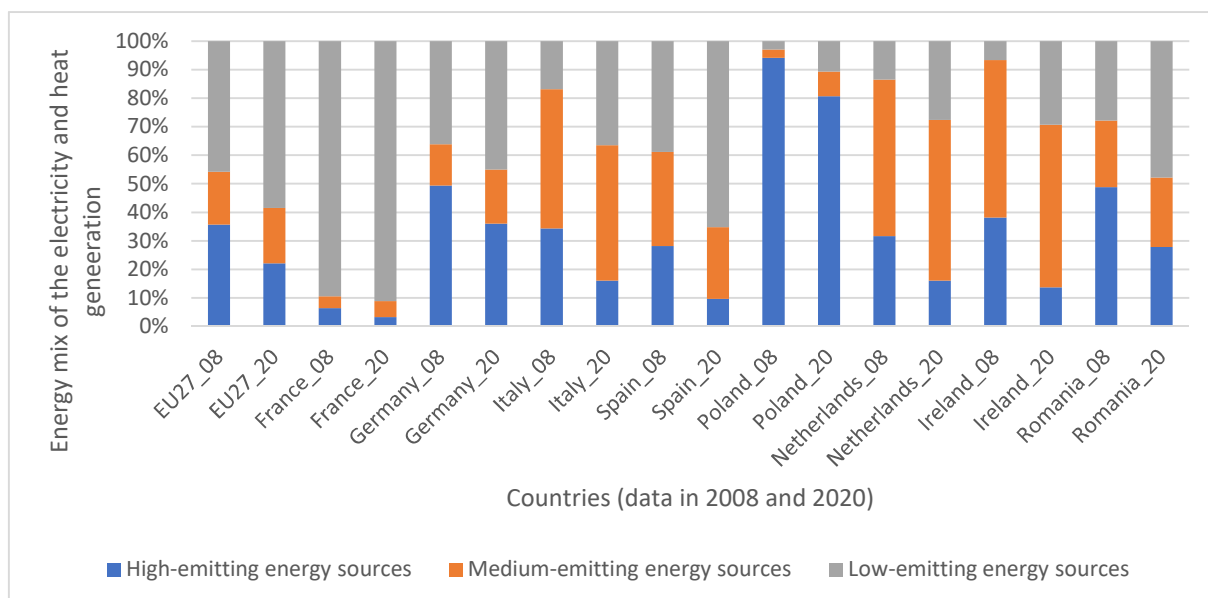

Figure 5. A high-, medium- and low emitting energy sources in the energy mix of electricity and heat generation in the EU27 and the TOP 8 country

Source: Own calculation based on Eurostat database and energy balance data

The energy mix of electricity and heat generation moved favourably from 2008 to 2020 in all countries studied. Poland has the worst energy mix, where even in 2020, the share of high-CO2-emitting energy carriers was 80 per cent. The best situation can be seen in the energy mix of France, where the share of low-emitting energy sources is over 90%. However, it is important to shade the picture by demonstrate the structure of low-emitting energy sources (LES) (Table 4). For example, a very favourable

LES rate in France is dominated by nuclear energy and a relatively low share of renewable energy sources. While for example, a more modest share of LES in Italy is purely driven by renewable energies.

Table 4. Change in the share of high-, medium- and low-emitting energy sources between 2008 and 2019 in the FBT industry's energy mix in the EU27 and TOP 8 countries

Country	France	Germany	Italy	Spain	Poland	Netherlands	Ireland	Romania
Share of RES in electricity and heat generation of the country (%)	12.3	28.5	36.3	29.3	10.7	22.3	28.9	21.0
Share of RES and Nuclear heat (share of LES) in electricity and heat generation of the country (%)	90.5	44.7	36.3	64.6	10.7	27.0	28.9	47.6

5. Discussion

In Chapter 4, we review whether the findings for the 2008 to 2020 period examined in this study are consistent with the observations in the literature on the situation, decarbonisation opportunities and efforts made by the energy-intensive sectors. In the following, we compare our results with the main findings in the sources of literature.

Our research results align with the results of Bajan et al. (2021), who concluded that the share of food production systems in total energy consumption has decreased in the V4 countries. However, they have already gained a more diversified picture regarding the energy mix. (Bajan et al., 2021). Looking at the energy intensity, we concluded that from 2008 to 2019, the value of the energy intensity index improved by 1.1 per cent at the EU level.

However, the data of the eight countries that play the most significant role in creation of value-added in the FBT industry showed a more diverse picture. In most countries, improvements were observed, but unfavourable trends emerged in Spain and Germany. According to researchers studying the V4 (Bajan et al., 2021), Poland has the highest share of energy from coal among the four countries in terms of the energy mix, which has been confirmed by our research (even in 2020, the share of high-CO₂ emitting energy carriers was 80 per cent in this country). Kanchiralla et al. (2021) analysed the energy and CO₂ intensity of processes in the Swedish food industry via a case study. Among other things, energy carriers examined each food industry process's energy consumption. According to their results, 55% of energy use in the Swedish FBT industry came from electricity (Kanchiralla et al., 2021), well above the EU average (34% in 2020 in the EU-27). According to their research, the share of renewables was also meagre among Swedish companies, which is also in line with our research results, although trends are becoming more and more optimistic: the use of high-emission energy carriers in the EU is relatively low, which decreased from 2008 to 2020 in all countries surveyed, without exception.

According to Sovacool et al. (2021), energy and carbon savings are not the only benefits of decarbonising the food and beverages industry, but cost savings, environmental protection, and worker satisfaction and health can also occur, which will set further research directions for researchers dealing with the topic, including us.

Conclusion

Food industry (together with agriculture) must meet the most basic human needs, it has about forty energy-intensive processes. Over the past two decades, improvements in energy efficiency in the sector have begun, with positive effects in several areas. In this study, we sought to answer how the food and beverages industry's energy intensity index and energy mix changed between 2008 and 2020. Our analysis first covered the evolution of energy intensity. The energy intensity index improved by only 1.1 per cent at the EU level over the period under review. As regards the energy mix, some degree of realignment has been observed in all countries. Based on the data of the EU27 and the TOP 8 countries, a positive picture emerged in connection with the energy mix of the FBT industry. The use of high-emission energy sources is relatively low, which decreased everywhere from 2008 to 2020 without exception. Overall, the EU's Food, beverages and tobacco industry has started on the road towards the energy and climate goals set by the EU.

Our research also had limitations. As Xu & Flapper (2011) point out, the methodology of research on energy use and energy intensity, the specific content of the applied indicators, and the processes covered by the research are primarily unknown in detail, because of which, for example, the values of energy intensity can also be volatile. This makes it difficult to compare the individual research results precisely.

Abstract

Research background: In the context of the current changes brought about by the 6-K wave, the area of developing countries' digital competitiveness is very important. Several indices are used to measure and compare this area. One of them is the Digital Economy and Society Index (DESI). It is a composite index that summarises relevant indicators on Europe's digital performance and tracks the evolution of EU Member States, across five main dimensions: Connectivity, Human Capital, Use of Internet, Integration of Digital Technology, Digital Public Services.

Purpose of the article: The main aim of the paper is to investigate the progress in the technological readiness of digitalisation/digitization in terms of DESI in all EU countries and compared to the results, show the position of Slovakia across EU. The analysed period is set to 2017-2022. According to main aim, there was set the research questions: Does the internet coverage of the country affect its position in the DESI index? Who are digital leaders?

Methods: To solve this questions, identify the leaders countries and investigate Slovakia's gap in digital competitiveness, we used the methods of analysis and synthesis, correlation, and other methods of descriptive statistics. For complex calculations, we used the Statistica software.

Findings & Value added: At the conclusions, the leaders of EU countries in the field of digital competitiveness were identified. For Slovakia, there were set challenges and risks according to leaders' countries, which must be considered to improve the current situation in the mentioned area.

Keywords: digital competitiveness, DESI index, European Union

JEL classification: O33, O40

1. Introduction

The enormous impact of the Internet of things and digitization is present across the globe. Unrelenting technological progress and increasing technological pace have become essential features in all countries. The application of ICT has changed the way businesses (Pisár et al., 2022), people, and global innovation work. On the other hand, with the advent of new technologies, several challenges and risks are created that complicate the problems for policy makers. A strong emphasis is placed on governments and their roles, for which it is important to find a balance between the protection of the country's fundamental interests and the ability to ensure national competitiveness. It is nothing new that the digitization process enables countries to maintain global competitiveness, increase GDP, create jobs, or stimulate investments. ICTs therefore play a key role in connecting people, increasing investment and productivity, strengthening competitiveness (Stankovič et al., 2021).

Innovations in the field of digital technologies have become an integral part of business processes and organizations. The primary task of digitization is to facilitate and improve companies' business, increasing efficiency and effectiveness. Newly created business models in the era of digitization produce new business directions and techniques to create a better position on the market. Moving in business without new digital technologies is unthinkable and competing on the market is very difficult to the point of being impossible. It is technological progress that builds the recognition of companies on the market, influences

* Corresponding author: elena.sira@unipo.sk

innovation, with which competitiveness is closely linked (Vašaničová, & Gira, 2018). The transformation of digitization into all business sectors results in tough battles in the competitive global market. Being digitally competitive is very important for access to knowledge, easy transfer of new knowledge, technology, and capital (Martinčević, 2021).

In the economy, the digital revolution begins on a large scale at the end of the 20th century, when the Internet was put into economic use (Olczyk, & Kuc-Czarnecka, 2022). In the last two decades, the effects of ICT on economic growth have been a very frequent topic among economists (e.g., Stanley, Doucouliagos, & Steel (2018), Bilan et al. (2019), Nasab, & Aghaei (2009)). Many economists, such as Niebel (2018), Bilan et al. (2019) have been inclined in recent years to the opinion that the effect of increasing ICT is not always automatic but depends on implementation in different sectors. Therefore, it is better and more accurate to focus your attention partially on individual sectors and study the impact of ICT on education, health system, human development, profitability of companies, job creation, quality of life, etc. If we focus our attention on the creation of jobs, properly used technological innovations have a positive effect on the creation of new jobs. Therefore, government institutions strive for the best possible technological environment, which leads to the development of companies and the creation of jobs, thereby strengthening economic stability, which has a positive effect on economic development. (Aksentijević, Ježić, & Zaninović, 2021).

Today, the global economy is greatly influenced by the digital economy. Traditional economic aspects such as agriculture, are engaging and implementing more and more digitization in their activities, especially in developed countries (Niebel, 2018). As part of this set trend, governments and international companies are competing for the best possible position in the digital economic spectrum. The European Union aims to become a global leader in the digital economy by developing its unique single digital market strategy (Laitsou, Kargas, & Varoutas, 2020). "Digital economy and digital competitiveness are among the most frequently used terms referring to the perspectives of socio-economic development of contemporary society". In a broader sense, the digital economy describes the development of technological society and discusses the wide use of ICT in all spheres of human activity. Information and communication technologies help people solve common tasks more efficiently. They have an impact not only on individuals, but also on society, because they create new fields of possibilities for companies for the availability of their products and services. The main advantages of ICT in companies include increased efficiency and effectiveness of business processes, creation and transfer of knowledge, development of employee skills or a more accurate understanding of the user experience (Stanković et al., 2021).

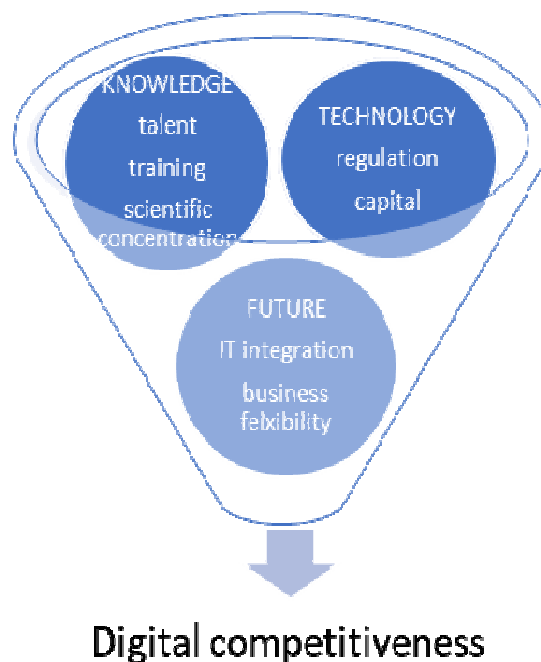

Figure 1. Digital competitiveness

Source: processed according to Martinčević (2021)

Even though the digital economy has received enormous attention in the last 15-20 years, it is a very complex phenomenon. "Measuring techniques and traditional tools of economic development cannot easily capture what is really happening in a digital world whose channels can be lost when a financial transaction occurs". A complication in the assessment of digital development and digital competitiveness of the economy is that they cannot be achieved only by using statistical data. This is what led economists to work together to create various indexes to compare and evaluate national digital economies (Laitsou, Kargas, & Varoutas, 2020). Stankovič et al. (2021) discuss the following best-known methodologies for quantification:

- Digital Economy and Society Index (*DESI*).
- The Network Readiness Index (*NRI*) is used to measure the propensity of countries to use the opportunities offered by ICT. This index also measures the performance of economies in using ICT to support competitiveness, innovation and well.
- The Digital Economy Country Assessment Program (*DECA*), it is a multidimensional model that analyses the readiness to use and the impact of digital transformation on national social and economic progress. It also evaluates the level of development of the digital economy in order to analyse shortcomings and opportunities for future growth.
- ICT Development Index (*IDI*), monitors and compares ICT development across countries over a certain time horizon.
- The e-Government Development Index (*EGDI*), which was developed to examine the development of e-Government in UN member states.

1.1 DESI index

We agree with the authors Bánhidi, Dobos, & Nemeslaki (2020), who discuss the fact, that the European Union has had a universal scoring system since 2014. This is the Digital Economy and Society Index (DESI). This index is intended to measure the readiness and progress of digital transformation (Russo, 2020), (Jenčová, 2021). The practicality of this index is in capturing the trend of the constantly advancing socio-economic digital transformation. The main advantage is the measurability in all EU countries (Bruno et. al., 2023). A comprehensive picture of the digital ecosystem is created and comparisons between Member States are enabled. The period between data collection and its subsequent publication is very long, which often leads to outdated and out-of-date assessments. Regardless of the problems and complications that have arisen, the DESI index is still a robust system that is considered the best in mapping the progress of digitization in Europe.

The use of the DESI index and its interpretation in the context of macroeconomic development is broad (Šofranková et. al., 2022). As Olczyk, & Kuc-Czarnecka, (2022) points out, some studies use DESI to examine the digital development of a given economy and then make recommendations about areas of the digital dimension that should be improved. Other studies use DESI to analyse economic growth, e.g., Stavitsky et al. (2019) confirmed a positive correlation, while Vyshnevskiy et al. (2020) found that the level of digitization of the EU economy as measured by DESI does not have a decisive effect on the growth rate.

The Commission have already adjusted DESI to align it with the four cardinal points set out in the Commission proposal for a Decision 'Path to the Digital Decade' which is being negotiated by the co-legislators. It sets EU level targets to be attained by 2030 to deliver a comprehensive and sustainable digital transformation across all sectors of the economy. The DESI scores and rankings of previous years are re-calculated for all countries to reflect changes in the underlying data and the choice of indicators. Several improvements have been made in the DESI indicators for the DESI 2022 reports. Under Human capital, the digital skills indicators have been modernised to better reflect the required digital competences of people. Under Connectivity, the Fibre to the premises coverage indicator has been added, which allows a more comprehensive analysis of gigabit connectivity. And under Digital public services, there is break in series for most of the indicators thanks to an improved methodology (European Commission, 2023).

Each year, the reports include country profiles helping Member States identify areas for priority action and thematic chapters providing an EU-level analysis in the key digital policy areas. Now, in 2022, DESI includes four dimensions (Table 1) with equal importance. As an example, the DESI score for country C was calculated using the formula (European Commission, 2023):

$$DESI(C) = Human_capital(C) * 0.25 + Connectivity(C) * 0.25 + Integration_of_Digital_Technology(C) * 0.25 + Digital_Public_Services(C) * 0.25$$

Table 1. Structure of DESI 2022

DESI dimension	DESI sub-dimension
1 Human capital	Internet user skills, Advanced skills and development
2 Connectivity	Fixed broadband take-up, Fixed broadband coverage, Mobile broadband, Broadband prices
3 Integration of digital technology	Digital intensity, Digital technologies for business, e-commerce
4 Digital public services	e-Government

Source: own processing according to European Commission (2023)

2. Methods

The main aim of the paper is to investigate the progress in the technological readiness of digitalisation/digitization in terms of DESI in all EU countries and compared to the results, show the position of Slovakia across EU. In the case of Slovakia, we want to identify the current position in the field of digitization and point out the position within the EU countries.

From the many indices monitoring the progress of countries in digitization, we chose the DESI index. This is mainly because our sample consists of EU countries and this index is built precisely to assess progress in EU countries. The analysed period is set to 2017-2022. The sub-goals are:

- To analyse internet coverage in EU,
- To analyse the development of DESI during the period 2017-2022,
- To analyse the sub-dimensions of DESI,
- To identify the progress in DESI sub-dimensions during the time,
- To identify the position of Slovakia in DESI.

According to main aim, there was set the research questions:

RQ1 - Does the internet coverage of the country affect its position in the DESI index?

RQ2 - Who are digital leaders?

Different methods were used to find answers to the research questions, especially according to the nature of the analysed problem. To solve these questions and investigate Slovakia's gap in digital competitiveness, we used the methods of analysis and synthesis, correlation, and other methods of descriptive statistics. For evaluation of the hypothesis, we used the Statistica 13 software.

3. Results and discussion

Firstly, we analysed the broadband internet coverage with more than 100 megabits per second as % of households. The last year due to lack of sources, was 2021. In each country, this internet coverage has increased over the years. In Malta and Luxembourg, this amount was about 100 %. Another country, where the broadband internet coverage in the last analysed year was about 90 % were Belgium, Denmark, Netherlands, Spain, Portugal, and surprisingly Bulgaria. Bulgaria was a surprise, because in other analyses it ranks last among countries. And the second reason for the surprise in the case of Bulgaria is the fact that in 2017 broadband coverage was just over 30%. This country is among the biggest "jumpers", that is, during the years 2017 - 2021, it achieved progress of almost 300%.

The progress in 2017 – 2021 can be seen in Figure 2. The darker the colour, the better the country's broadband internet coverage.

Figure 2. Broadband internet coverage - % of households with more than 100 megabits per second (Mbps)
Source: own processing

Using the data from broadband internet coverage and sub-dimensions of DESI, we try to answer the research question. **RQ1** - Does the internet coverage of the country affect its position in the DESI index? To answer it, we used Correlations. At a significance level of 5%, we correlated with the results shown in Figure 3 and Table 2.

Figure 3. Correlation results
Source: own processing

Table 2. Correlation results

	hum_cap	con	I_Dig_Tech	Dig_Pub_Ser
Int_cov	0.067898	0.527578	0.186945	0.351714

Source: own processing

Notes: *Int_cov* – Broadband internet coverage,
Con – Connectivity,
Dig_Pub_Ser – Digital public services

hum_cap – Human capital,
I_dig_tech – Integration of digital technology,

From the calculated correlations, the highest correlation was between broadband internet coverage and connectivity sub-dimension, in amount of 0.527578. This means, that there is moderately strong direct linear dependence. Low correlation values were detected between broadband internet coverage and other sub-dimensions. There was weak direct linear dependence, while the lowest value and therefore almost no dependence was between broadband internet coverage and human capital (0.067898).

The development of countries' performance in the DESI index during the years has a growing tendency. For each EU country, the values of this index increased from year to year. Some countries have made more progress, some less. Compared to 2017, Denmark, Finland, the Netherlands, Ireland, and Italy adjusted their position most significantly. The smallest progress was in Romania and Latvia. In the case of Slovakia, there is always growth in DESI values throughout the monitored period. The biggest year-on-year growth was achieved in the last two analyzed years. In the Figure 4 we can see the first and last analysed years made by line and other years by columns.

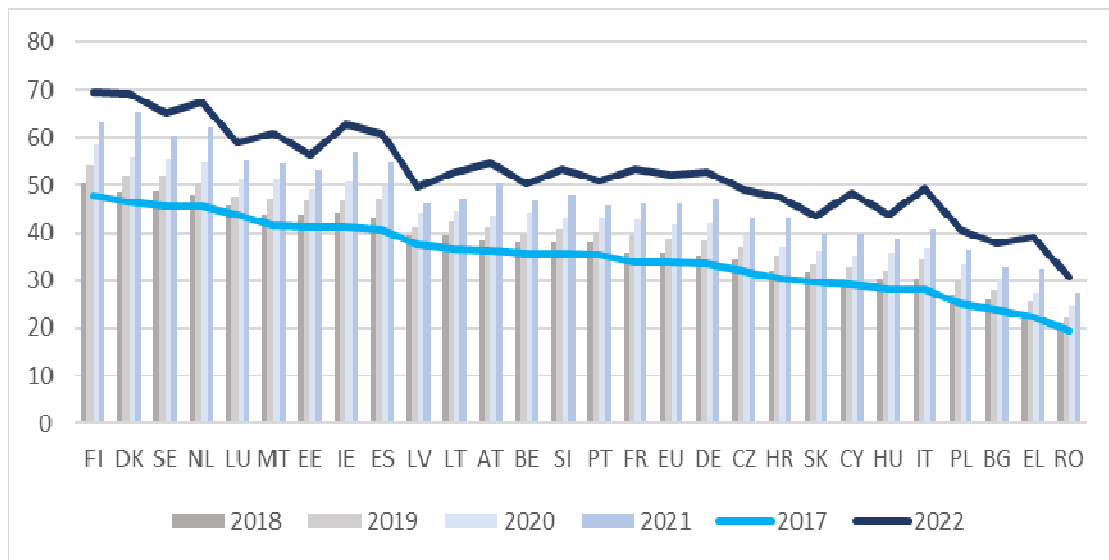

Figure 4. Development of total DESI index
Source: own processing

To answer the research question 2, „Who are digital leaders?“, we calculate the mathematical difference and shows the results in Figure 5. The darker the colour of the country, the more progress the country has made. We also consider the achieved values of the DESI index in the analysed period and based on these facts we subsequently identified digital leaders across the EU. The Finland, Denmark and Netherlands are the digital leaders according to our research.

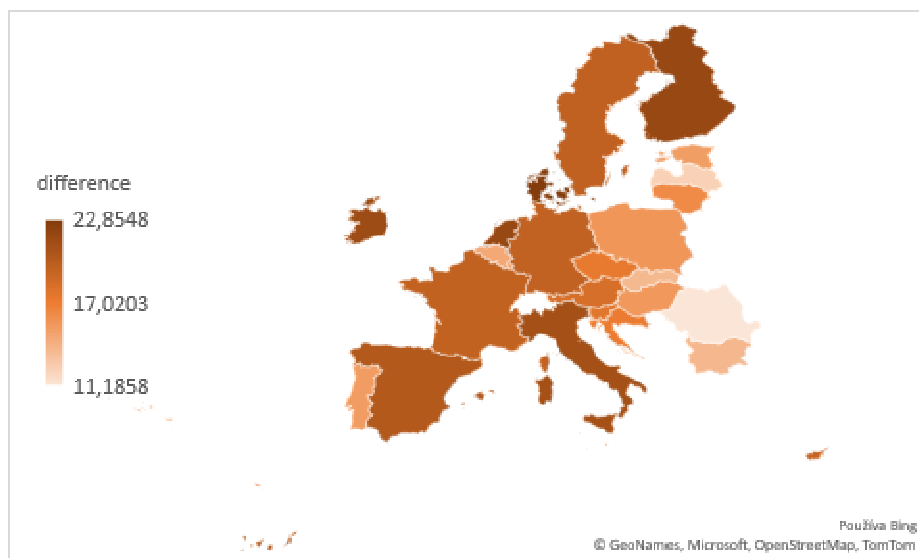

Figure 5. Difference in total DESI across EU
Source: own processing

Since the results in 4 sub-dimensions enter the DESI index, we also analysed those with development during the monitored years. Figure 6 shows the development in sub-dimensions in the first and last year, i.e., in 2017 and 2022. The chart shows a significant progress of countries, even in terms of individual sub-dimensions. The biggest progress was in the Connectivity sub-dimension.

Figure 6. DESI development in sub-dimensions

Source: own processing

For a closer look at how individual sub-dimensions of DESI looked in 2022, Figure 7 serves. We can see how the ratio between individual sub-dimensions changed in individual countries. Croatia had the most balanced distribution between sub-dimensions. The highest values were achieved mostly by all countries in the Digital public services sub-dimension. However, such a situation wasn't in Germany, Italy, Cyprus, Hungary, Greece, and Romania, where there was a more or less significant dominance in the Connectivity sub-dimension.

Figure 7. Sub-dimensions of DESI in 2022

Source: own processing

For evaluation of Slovakia's position, it is necessary to compare it. To evaluate the strengths and weaknesses, it is good to compare us with the best. We compare the performance in sub-dimensions in the year 2022. We compare Slovakia's position with the best country, also with the EU average and, finally, with the weakest. This is because at the weakest country we can see how far we are from the lowest values. It is also clear that we are far from the best EU countries, but an achievable goal for Slovakia can also be achieving values higher than the EU average. That would be desirable in our case.

As we can see from the Figure 8, the position of Slovakia compared to selected countries, isn't very well. We are almost at the level of the EU average only in the Human capital sub-dimension. In the other subdimensions, we are more behind the average, even behind the best country overall. Our weakest sub-dimension is Integration of digital technology. So, if we want to keep up with other EU countries, we need to improve in this area.

Figure 8. The position of Slovakia across sub-dimensions in 2022
Source: own processing

Conclusion

Almost every sphere is currently somehow connected with technology and digitization. A country that develops and supports this area with its policy is competitive in the context of other countries, not only in the given region, but also globally, as it is a very important area today. And not only in the context of the performance of the country, but also in the context of the development of industry and other sectors of the country, as well as the improvement and simplification of the daily life of its inhabitants.

This paper evaluated the performance of the EU countries within the DESI index. It is one of the many indices that evaluate the digital performance of the country. We identified the leader countries in this area, and, of course, the relationship between broadband internet coverage and sub-dimensions of DESI. These two areas were the subject of our research questions. As for the relationship between broadband internet coverage and sub-dimensions of DESI, moderately strong direct linear dependence was identified only in the case of sub-dimension Connectivity. In the field of digital leaders' countries, after considering several circumstances, we have identified Finland, Denmark, and the Netherlands as leaders. When evaluating the achieved level of the countries in the DESI indexes, we considered progress in the period 2017-2022, and the results achieved not only in the overall ranking, but also in the division into sub-dimensions.

Finally, we also evaluated Slovakia's position in the context of the best country and the EU average. Here we must state that the position of Slovakia compared to selected countries, isn't very well. The weakest place in Slovakia is the sub-dimension Integration of digital technology. This area is focused on the use and utilization of various forms of digital technologies in SMEs. Weak results are in the use of

software packages in enterprises, enterprises analysing data, SMEs selling online and turnover. Until the business sector improves in these areas, we cannot even expect a radical improvement in Slovakia's position within the DESI index.

Like any other research, our investigation has certain limitations. By using other indices, we could in the future better compare the results not only across countries, but also across other approaches and indicators that make up this area. It would also be beneficial for further research, to expand the sample of countries and go into research outside the EU countries as well. Perhaps it would be beneficial if we had a different perspective on the research area.

Assessment of Profitability and Financing of the New Section of the PPP D4 Highway

Tomas Kubica^{1,*}, *Radka Fišerová*¹, and *Libor Hrbáček*¹

¹ VSB - TUO, Faculty of mining and geology, Department of Economics and Control Systems, 17. listopadu 2172/15, 708 00 Ostrava-Poruba, Czech Republic

Abstract

Research background: The intention of the EC is the economic sustainability of the projects. The Czech Republic does not track the total amount of road transport losses, therefore we do not even know its proportional part for each project, so we cannot evaluate the economic sustainability of projects in a relevant way.

Purpose of the article: Assessment of the profitability of the PPPD4 project. Addition of unpublished data (IRR, FV, annual installment amount). Calculation of total road transport losses in the Czech Republic.

Methods: Determination of CF value by iterating between baseline CF and NPV. Determining the discount also by iteration. Calculating ROI. Model calculation of PPPD4 revenue with high traffic density of the D4 motorway and toll prices in Spain.

Findings & Value added: Price conversion from NPV to FV, calculation of the annual installment that The Czech Republic will pay for PPPD4. The calculations performed revealed an IRR value of 5.35%. The ROI has become negative, which leads to the conclusion that the PPP project is not profitable as an investment. If PPPD4 were an unsubsidized commercial project, the toll prices would have to be 2.5 times more expensive than the toll prices in Spain for the revenues to equal the costs. The originality of this article lies in the inclusion of a proportional part of the target costs associated with transport in the calculation of the profitability of the PPPD4 project and thereby making the calculation of the efficiency of the investment more precise.

Keywords: transport infrastructure, internal rate of return, profitability, PPP D4, the state budget

JEL classification: O3

1. Introduction

Financing the construction of transport infrastructure is one of the highest non-mandatory expenditures in The Czech Republic. In 2021, the total transport capital expenditure amounted to CZK 82.33 billion, which is "43.9% of all capital expenditure of the state budget 2021" (The Ministry of Transport of The Czech Republic, 2022).

Over the past 10 years, the state budget has had a significant deficit 8 times. The total balance over the past 10 years exceeded one trillion crowns (-1080 billion CZK). This fact will undoubtedly put pressure on state finances. Especially if we take into account the still unsolved phenomena's of the ageing population, the effort to fight climate change, and to achieve, due to the green transition, an economy with zero greenhouse gas emissions. Not to forget the added costs of the Covid-19 pandemic, also the energy crisis, as well as the costs associated with the war in Ukraine and its economic consequences.

It is not the task of the authors to evaluate or define some societal challenges, but it is clear that ambitious plans will require considerable financial resources.

If we accept the thesis that we should treat public things with the care, the question arises whether the construction of the transport infrastructure is in line with this thesis.

The current transport concept of The Czech Republic is defined by the "Public Transport Concept 2020-2025 with a view to 2030". In the document, the Ministry of Transport advocates the so-called Swiss model of co-financing public services in transport (The Ministry of Transport, 2021).

* Corresponding author: kubica@czechway.eu

There is no doubt that investment in transport infrastructure is a project of public benefit. Therefore, the CBA (Cost-Benefit Analysis) method is used to assess the project. However, PPP projects (private and public sector partnerships) make it possible to look at the construction and operation of the transport infrastructure from a different perspective. From the point of view of a private entity, this is a standard investment project, and therefore its assessment should be carried out using standard methods, for example, using the determination of net present value (NPV) or internal rate of return (IRR). From this perspective, 2021 can be considered a turning point, as on 15th February 2021 the Minister of Transport signed a concession agreement with the representatives of VINCI Concessions and Meridiam. According to this contract, together with the construction of the new 32 kilometers of highway between Příbram and Písek, the concessionaire will operate and maintain the perfect condition of another 16 kilometers of the D4 highway and the I/20 road, which will be renewed and retrofitted with, among other things, highway technology and safety equipment (The Ministry of Transport, 2021).

Transport infrastructure is the subject of a number of research projects, but the authors did not find a single professional work that would quantify the total economic loss of transport from the states position, or at least divide the resources invested in transport routes from its own resources (from sales or other income) and from foreign resources (from state and other subsidies).

According to Penyalver D. et al. (2019) *"The efficiency of major transport projects in terms of resources should be always a critical factor in decision-making"*, in his work he also states that in addition to the results from the CBA, other political considerations are involved in the decision-making. In their contribution, the authors Bujna et al. (2012) *"explains the terms of profitability and effectiveness"*. Lielgaidina et al. (2012) developed *"The study focuses on the sustainable approach of using natural resources for the construction and maintenance of roads with respect to the environment, economy and society"*. Horcher et al. (2021) in their paper on the economics of public transport states: *"Efficient resource allocation is critical"*. Why is it important to know the total traffic loss? Verburg (2019) writes in his work: *"The sense of purpose that an attractive ecological and economically viable vision of the future inspires, acts as a powerful motivating force for those who share the vision"*.

According to Wolfson (2015) *"is economic theory as such – as a descriptive and refutable science"*. In accordance with this statement, the authors believe, if the given state does not have a quantified proportion of the total losses from transport, it cannot relevantly assess the economic efficiency of partial transport investment constructions or evaluate the economic direction of transport. Carrying out the overall balance (profit/loss) of the entire transport of a given state and calculating the economic efficiency of investments in transport routes with the inclusion of proportional losses (of the state) from the entire transport appears to be a neglected area. Therefore, the authors decided to at least partially fill this oversight with this paper.

The authors are aware that individual transport structures are unique in their own way. Consequently, they decided to use the highway construction as a model serving the authors' intention to assess whether the project in question is profitable from the state's point of view.

The article, therefore, sets the following goals: (1) Calculate the annual instalments that The Czech Republic will pay to the winning consortium; (2) Evaluate the profitability of the PPP D4 project from the point of view of The Czech Republic.

The objectives stated above imply two research questions that the authors asked themselves: (1) What must the toll price be to pay the annual instalment of the accessibility price? What is the Future Value (FV) in each year of the project if we know the NPV? (2) Can the financing of this transport route be profitable?

The authors' work was based on the following hypotheses:

H1: Driving one km of the new section of the D4 highway, calculated per vehicle, costs more than CZK 6.295 (the highest toll rate in The Czech Republic for using the highway).

H2: Financing the construction and operation of the given section D4 by the PPP project under the given conditions is unprofitable.

2. Methods and data

The Ministry of Transport of The Czech Republic has published only the current value of the PPP D4 project in NPV (hereinafter the project), which amounts to CZK 17.8 billion. The stated value of the project was valid at the time of signing the contract. The concluded contract assumes that after the construction of the new 32 km D4 highway section and the renewal of 16 km of the existing D4 section,

the given section with a total length of 48 km will be operated and maintained by the concessionaire for a period of 24 years and four months.

For an overview and comprehension, we have summarised the individual sub-tasks of the project in Table 1, see Table 1.

Table 1. Subtasks of the project

Summary of subtasks of the project			
Task n.	Partial task	Time calculation	Note
1	Construction 32 km	3 years and 8 months	44 months
2	Management and maintenance 32 km	20 years and 8 months	248 months
3	Retrofitting of a 16 km section	24 years and 4 months	292 months
4	Management and maintenance of a 16 km section	24 years and 4 months	

Source: own processing (2023)

In order for the authors to be able to answer the research questions, to comment in a qualified manner on the hypotheses and fulfil the goals of the article that they have set, it is not enough only to know the current value of the project. Knowledge of the CF value in the individual years of operation of the subject of the contract also appears to be key (or project lifetime).

The initial task will be to determine the value of CF in individual years, during which the value of NPV will be equal to 0. The complexity of the task is increased by the fact that the contract with the concessionaire is not concluded for complete years, but for the previously mentioned period of 24 years and four months (Kubica, 2023).

The starting point for determining the CF value will be the Formula for calculating NPV [Fact sheet] (Investopedia and Cambridge Dictionary). Own processing (Kubica, 2023):

$$NPV = \sum_0^T \frac{CF}{(1+DIS)^T} \quad (1)$$

where: NPV - net present value; CF – cash flow; DIS – discount rate; T – number of years since investment (power/exponent)

Since the development of prices in 2021, or 2022 shows that the influence of inflation cannot be neglected, we modify the initial formula (1) into the following form:

$$NPV = \sum_0^T BCF \left(\frac{1+INF}{1+DIS} \right)^T \quad (2)$$

where: NPV – Net Present Value; BCF – basic CF (Present Value CF at the time of project acquisition); INF – Inflation; DIS – Discount Rate; T – number of years since investment (power/exponent)

The CF value is then determined by iterating between the basic CF and the NPV, a chain of CF values divided into years according to the length of the project period, at which the NPV value becomes 0, is examined (Kubica, 2023).

To determine the future value [Fact sheet] (Cambridge Dictionary) of the project and its division into individual years, we will use the formula for calculating the future value for several cash flows (3) [Fact sheet] (Saylor Academy). Own processing. (Kubica, 2023):

$$FV = \sum_0^T PV(1 + INF)^T \quad (3)$$

Where: FV – Future Value; PV – Present Value (in a given year is equal to BCF - basic CF);
INF – Inflation; T – number of years since investment (power/exponent)

The total future value of the project and its division into individual years determines the actual amount of instalments that The Czech Republic will pay each year for all provided project services. By dividing the instalment between the retrofitting of the old 16 km section and the construction of the new 32 km section, we use the expenses for the 32 km section.

Another key input for determining NPV, CF, or FV is the discount rate. The discount rate is normally calculated using the 'Adjusted Present Value' (APV) method, the 'Cash Flow to Equity' (CFE) method and

the 'Weighted Average Cost of Capital' (WACC) method. Unfortunately, none of these methods can be used in our case, because the necessary data for calculations are blacked out in the contract between the Ministry of Transport and the contractor (Kubica, 2023).

The starting point for determining the value of the discount rate is the information published on the professional server zdopravy.cz, which states in its article on the project: "*Financial closure was made with an availability payment of 17.83 billion crowns, which in nominal terms amounts to 34.61 billion over the entire duration of the contract.*" The server further states in the article that: "*the interest rate is, in the case of a PPP project on D4, fixed for the entire duration of the concession contract*" (The Ministry of Transport).

Again, with the help of an iterative calculation, the amount of the discount rate is determined, at which the parameters of the contract related to the project in question will be observed (Kubica, 2023).

The discount rate of the investment is equal to the internal rate of return (IRR) in the case that the net present value of the investment is equal to 0. The discount is therefore again determined by iteration using the method of numerical modelling according to the formula (Kubica, 2023).

$$0 = \sum_{t=0}^n \frac{CF_t}{(1 + IRR)^t} \quad (4)$$

Since this is not a standard project, it is necessary to adjust the profitability calculation and we will work with income and expenses instead of sales and costs. Return on Investment is then calculated using formula (5):

$$ROI = \frac{(incomes - expenses)}{expenses} * 100 [\%] \quad (5)$$

Expenses are calculated in FV, according to formula (3). Since the incomes from transport are not consistent in The Czech Republic, the determination of incomes for the 32 km section of the D4 highway, as well as the determination of toll prices, is calculated in a model way. In The Czech Republic, passenger cars do not pay tolls, the collection of tolls is replaced by the payment of "highway stamps" for a significant number of vehicles. This "highway stamp" covers an unlimited number of km driven, so it is not possible to transfer these incomes to our model section (Kubica, 2023).

For the above reason, the toll prices of the 37 km section of the AP-71 highway: León – Astorga in Spain, which will subsequently be converted to 32 km, were chosen as a model. The economy of Spain, per capita in purchasing power parity, corresponds to the economy of The Czech Republic, and the highway section that was chosen has a similar length and character to the model section of D4. For the auxiliary calculation (with Spanish prices), it is not decisive what toll model was chosen, because in the end the amount of the toll will be determined to create parity with the amount of the annual instalment that The Czech Republic will pay for accessibility, also converted to a 32 km section.

The calculation of income for the ROI will be carried out with the actual measured intensity and the composition of traffic on the given D4 section. The results will be compared with prices and revenues from tolls in The Czech Republic, also based on the modelling of the number of measured vehicles driven.

Given that the authors hypothesize the unprofitability of the project, logically it is necessary to check the possibilities of cross-financing from other sources arising from transport.

3. Results

From the Discount Iteration (Kubica, 2023), FV CF and PV CF, it can be seen that in the case of the contracted price for the project expressed as an NPV value of CZK 17.8 billion and an FV of CZK 34.6 billion, the discount rate determined by the iterative method (IRR) is 5.35 % (Kubica, 2023). The share of the total expenditures of PPPD4 attributed to expenditures for project administration and maintenance is calculated according to similar current expenditures of the ŘSD (road administrator) (Kubica, 2023). Out of a total of CZK 34.608 billion, CZK 3.852 billion will go to administration and maintenance. For the first annual instalment, The Czech Republic will pay CZK 1.053.94 million. The distribution of total project expenses is shown in Table 2. Detailed tables with calculations can be viewed online (Kubica, 2023).

Table 2 shows that (30,3+2,6) CZK 32.9 billion will be allocated to the new 32 km section, which is 94.97% (87.55%+7.42%) of the total costs of the project. When recalculating the total amount of the first instalment of the payment for accessibility in the amount of CZK 1,053.94 million, CZK 1,001 million

will fall from this portion to the 32 km section. CZK 1.7 billion, which is 5.03%, remains for the retrofitting and management of existing sections of the project.

Table 2. Total distribution of PPP project expenditure D4

Total distribution of PPP D4 project expenditure		
	[mil. CZK]	[%]
Expenditure for the construction of 32 km of the new highway D4	30298	87.55
Expenditure for administration and maintenance of 32 km (2568 mil. CZK)	3852	7.42
Expenditure for administration and maintenance of 16 km (1284 mil. CZK)		3.71
Expenditure for retrofitting 16 km of the old highway D4	458	1.32
Total expenditure for PPP D4 (CF)	34608	100

Source: own processing, data: The Ministry of Transport of The Czech Republic.

The Directorate of Roads and Highways operates a beta version of the Automatic Traffic Counting System – ASD (Ředitelství silnic a dálnic, 2020). From the result of the measurement using the counting device, which is located on 78.40 km of the existing D4 highway, carried out for the period from 1/1/2021 to 31/12/2021, 3 200 320 vehicles passed, which means an average of 8 768 vehicles per day.

Although the study of the traffic intensity found that the traffic intensity changes at each intersection. In our model example we work with the same traffic intensity in the entire highway section.

Table 3 shows the recalculated average toll prices in The Czech Republic as well as the recalculated toll prices in Spain. From the intensity and composition of vehicles, we will perform the calculation directly for the model 32 km section of the D4 highway, see table 4.

Table 3. Toll prices in Spain and average toll prices in The Czech Republic

Tolls - rates of The Spain		Tolls - rates of The Czech Republic		
Group (maximum permitted weight)	Average toll rate for a given group	Group (maximum permitted weight)	Interval of toll rates for a given group	Average toll rate for a given group
(0 t - 3,5t)	3,64	(0 t - 3,5t)	0	0
(3,5 t - 7,5 t)	4,92	(3,5 t - 7,5 t)	0,042 - 0,116	0,70
<7,5 t - 12 t)		<7,5 t - 12 t)	0,861 - 2,408	
≥12 t)	5.96	≥12 t)	2,253 - 6,295	3,93

EUR = 25,645 CZK

Source: own processing (2023), data: (Road and Motorway Directorate CZE and ESP)

Given that the toll rates in The Czech Republic reflect the emission class, which cannot be determined from the composition of the vehicles, the average toll price is determined as an arithmetic average. The Spanish toll rates are converted by the average annual exchange rate of 2020 and adapted to the 32 km model section.

From the Table 4 below, it is clear that with Czech prices, we will collect 39.88 million CZK per year for the 32 km section. For comparison, if we used Spanish prices, we would have collected CZK 400.73 million.

When comparing the ROI calculation with toll incomes in the amount of CZK 39.88 million per year (table 4) calculated with Czech prices vs. ROI with toll incomes calculated with toll prices in Spain to the amount of CZK 400.73 per year (Table 4) and with annual expenses for the 32 km new section to the amount of CZK 1001 million, we get the following results. ROI from tolls with Czech prices is -96%. Since the toll provides only one part of the income, it is necessary to treat this result as such. As a result, only 4% of the expenditure for the availability of the 32 km section will be paid from the toll revenue.

Much more interesting is the result of the model example with Spanish toll prices, where the ROI came out to be -60%. If we were to collect tolls on the 32km section of the Highway D4 project according to the Spanish price list and with the current intensity and composition of traffic on Highway D4, the project would create a loss of 60%, i.e. it would be unprofitable.

By dividing the service price for the 32 km section (CZK 1,001 million) by the total collection of tolls with Spanish prices (CZK 400.73 million), we obtain a multiple of how many times the current prices must be higher in order to be able to cover the repayment for availability. The prices would have to be

2.5x higher than the current prices in the model example, which gives us the answer to the second research question. In order to pay the instalment for availability, we would have to collect 9.09 CZK from passenger cars, 12.29 CZK from trucks and 14.89 CZK from trucks for each kilometre driven.

Table 4. Comparison of tolls for the 32 km PPP D4 section (Spanish and Czech prices)

Composition and intensity of traffic D4 (at 78.4 km)			Tolls - rates of the Czech Republic			Tolls - rates of the Spain		
	vehicle per year	vehicle per day	average toll rate [CZK/km]	toll vehicle/km [mil. CZK]	toll vehicle/32 km [mil. CZK]	toll [CZK/km]	toll vehicle/km [mil. CZK]	toll vehicle/32 km [mil. CZK]

		8768			1001

Source: own processing (2023)

From table 5 above, it explains that the investment of the PPPD4 project, if financed only from tolls, would be profitable with the above prices, which are valid for the same composition and intensity of vehicles. These prices are 2.5 times higher than the prices in Spain and it is not realistic for them to be paid by the user. Also, it should be added that the expenses of 1001 in the model example are increased every year, so the prices correspond to profitability only for the first year, they would have to be increased proportionally every year.

Road transport is not a legal entity, and therefore the revenues are revenues from the state budget, insurance companies and other entities, or from subsidies from various budgets. Funds are redistributed and some of them are not returned to transport, so Table 6 cannot be viewed as a profit and loss statement, but only as an overview of revenues and costs thematically linked to road transport.

Losses from traffic accidents cannot be excluded, which mainly include the costs of HZS, the police, courts, health and social expenses, such as disability pensions and the other costs of people injured in accidents, as well as material damages, etc. A comparison of revenues and costs from road transport, which do not depend on subsidies, results in a loss of CZK 8.5 billion.

Of the 27.8 billion CZK collected for liability insurance for damage from the operation of motor vehicles, in 2020, 13.1 billion CZK was for the payment of material damages from traffic accidents, and 14.7 billion CZK from collections were the costs and profit of insurance companies. Of the total 23.9 billion CZK of accident insurance in 2020, 12.6 billion CZK was used to cover claims and 11.3 billion CZK went to the costs and profits of insurance companies.

Table 6. Overview of revenues and costs thematically connected with road transport

CZK billion	Measurable income	CZK billion	Measurable expenses
5.8	fees for using highways and expressways	81.4	losses from traffic accidents
11.5	toll (collection 2020)	0.4	Road tax administration (1/15 of the tax)
5.9	road tax	0.8	Toll collection costs
77.9	consumption tax (only mineral oils converted to road transport, 2020)	23.4	Total expenditure on repairs and maintenance of road infrastructure
27.8	motor vehicle liability insurance (2020)	0.6	SFDI activity costs
23.9	accident insurance (2020)	1.6	Costs of purchasing buses - part covered by subsidy
152.8	Revenues without subsidies - subtotal	43.4	Investment construction (2020) covered by subsidies
43.4	Subsidy for investment costs	9.7	Costs for purchasing part of tickets for passengers - regular bus transport without public transport (2020)
29.7	Coverage of remaining accident costs from social, health insurance and the state budget (note: this is not income from transport)		
1.6	Subsidy for the purchase of buses		
9.7	Subsidies for public passenger transport - Regular bus transport without public transport (2020)		
84.4	Subsidy proceeds		
237.3	Total revenues	161.3	Total expenses

4. Discussion

The weak side of dividing the ratio of the total price of the project into the price for construction, management, maintenance and retrofitting, consists of deriving the prices of management and maintenance and retrofitting from already implemented projects, especially ŘSD, which may differ from the prices offered by the concessionaire. Given that the expenses for administration, maintenance and retrofitting are marginal compared to the price of the construction of a new 32 km section of highway, any deviation from the actual costs of administration, maintenance and retrofitting is also marginal.

The partial result is the total price at the end of the project, which is shown in table 2 as Future Value and was calculated at CZK 34.6 billion. This is the price that The Czech Republic will pay for the concessionaire's project in annual instalments over 24 years and four months. The last column in Table 2 is a control calculation, where each relevant annual instalment corresponds to the net present (residual) value in the given year, i.e. the value calculated on the date of signing the contract.

In order for income to be equal to expenses, a car driver would have to pay CZK 291 and a truck driver CZK 476 to drive on the model 32 km section D4, which is unfeasible from a commercial point of view. It is worth noting the fact that the project is profitable only if the prices are 2.5 times higher than the prices in Spain. For the overall assessment of the effectiveness of the project, 2.5 times higher prices in combination with the absolute price for driving the given section are economically unacceptable, despite the fact that the density and structure of traffic, the nature and number of objects of the two assessed highways may differ. The fact that the toll income is not enough to cover the project's expenses means that the project is also cross-financed from other sources.

The analysis of income and expenses from Table 6 is a very complicated task because in fact tax revenues are income of the state budget and not directly from road transport. For example, the SFDI budget received CZK 8.4 billion (The Ministry of Transport) from consumption tax collection, while the share of road transport in the collection of this tax amounted to CZK 77.9 billion, i.e. the difference of this amount remained in the state budget. In the same year, SFDI received a subsidy of CZK 37.3 billion from the state budget. The transport financing system does not make it possible to find out in a simple way what percentage of this transport is financed by subsidies, because part of the subsidies is provided by the state,

part by municipalities and subsidies from The EU. Some subsidies (e.g. for vehicle fleets) are drawn directly by commercial companies. This ignorance creates a paradigm that transport in The Czech Republic is financially healthy.

The authors compiled Table 6 in order to find out what part of the road transport costs is financed from revenues that are not thematically connected with transport and what part must therefore be subsidized from other sources. The results proves whether transport will generate enough resources to finance the PPP D4 project, or whether its financing will once again be a claim on the state budget.

From the balance of unsubsidized incomes from road transport in the amount of CZK 152.8 billion and expenses in the amount of CZK 161.3 billion, it shows that road transport created a loss of CZK 8.5 billion in 2020. The disputable point of this assessment is the non-inclusion of part of the revenues, specifically CZK 29.7 billion, which cover the relevant part of the costs of the loss of traffic accidents. This part of the costs is covered by social and health insurance as well as the budgets of the Police of The Czech Republic and the HZS. According to the authors, these costs are not covered by revenue from transport, and their inclusion would unjustifiably favour road transport when making comparisons with other types of transport. Even if we recognized these revenues, road transport was in surplus by CZK 21.2 billion in 2020.

If the financing of transport is perceived by the Government of The Czech Republic as a whole and the financing of the PPP D4 project is part of this whole, it is important to take into account the result of financing all types of transport. Road and rail transport account for 98% (The Ministry of Transport) of all transport services implemented in The Czech Republic, therefore the authors evaluated the revenues and costs of rail transport as well, respectively and of both dominant modes of transport as a whole.

Railway transport revenues, which cover operating costs, are made up of only 25% of sales (CZK 8.5 billion) and 75%, CZK 34 billion of costs must be subsidized. In railway transport, investment costs for construction in the amount of CZK 29.6 billion were 100% covered by subsidies. Part of the subsidy of CZK 15.5 billion was received from SFDI (state transport infrastructure fund). So, in effect, this organization received a subsidy in order to provide a subsidy. In 2020, railway transport needed CZK 72.1 billion to cover overhead and investment costs from subsidies. Subsidies were also provided in rail transport for fares, purchase of seats, etc., these are not included in this amount (The Ministry of transport and railway administration).

Even the potential profit of CZK 21.2 billion for road transport cannot offset the huge loss of rail transport. It is clear from the above that the PPP D4 project cannot be financed from the revenues of road and rail transport, because these modes of transport are collectively unprofitable in The Czech Republic.

Unprofitable transport management actually means that transport does not generate enough funds for investment. The PPP D4 project must be subsidized by the state budget.

The authors also assessed the substantive side of the project. If the realization of construction and subsequent maintenance through a PPP partner would be cheaper than when realized through ŘSD, then the savings generated are a benefit of the project. The authors cannot explicitly state this benefit, so one can only speculate. If the present value of the total benefit over the lifetime of the project exceeded the project's expenses, then the project would be profitable. However, this profitability does not change the fact that the project does not generate sufficient income from operation to cover the expenses incurred for construction and subsequent operation.

Table 6 also does not include fees that cannot be precisely quantified. Costs for health problems and global warming (CO₂), costs of congestion in road transport, costs of energy dependence in transport, costs of financing illicit activities from oil, costs of running the Ministry of Transportation, the Transport Research Centre and other institutions, as well as costs of moral damages from traffic accidents. For example more than 40,000 people have died on the roads in the past 40 years. people and more than 1 million road users have been injured (Kubica, 2017).

Although the findings are only supported by model calculations, the authors are confident that the conclusion is convincing. There is no doubt that the current way of financing transport will not be possible without the allocation of additional state income for transport, which is already a political decision.

As resources are limited, the question arises of the sustainability of the current paradigm and whether it would not be beneficial for the state and its citizens to change the current paradigm.

An apparently less significant change should occur in the overall approach to transport and strive to reduce demands for transport as such. An example is shared transport, which can significantly contribute to reducing the number of vehicles on the roads. Greater emphasis on the use of local resources can

contribute to the elimination of freight transport. Rational decision-making on the construction of new transport infrastructure can eliminate increasing maintenance expenses. For reasons of greater transparency, it is desirable to include all road transport under one legal entity owned by the state and to conduct annual financial results, which will make it clear what part of the costs is covered by subsidies.

The current state of transport, especially its extensive nature, contributes to oil exporters. Unfortunately, we have not learned from the past and we still remain in the role of the hostages. It is common knowledge that oil exporters, OPEC and associated producers artificially regulate supply in order to increase oil prices.

In order to get rid of this energy dependence, it is necessary to strive in innovative efforts to develop a new transport system. It is obvious that its development should be a European solution. If The EU were to find a solution and develop a new, profitable mode of transport, we could shift part of the transport performance from road transport. We would thereby reduce traffic congestion, due to the lower traffic density, also the accident rate and with it the cost of traffic accidents. The biggest bonus of this would be the fact that by reducing some of the transportation performance, we would reduce the demand for oil and put pressure on oil exporters who would be forced to compete. We would not tolerating the predatory business practices in oil pricing to protect consumers. With a new transport solution, we would create a new economic stimulus that The EU will need to resolve the consequences of the economic crisis.

Paradigm change is always difficult and often stressful. However, the current geopolitical situation encourages a reframing of existing schemes in many areas. Every crisis carries with it an opportunity for change. Therefore, Europe has a chance for change and it is only in the hands and heads of its inhabitants and their political representation whether they take this chance or waste it.

Conclusion

Both hypotheses formulated at the beginning of the article were confirmed. Financing the construction and operation of the given section D4 by the PPP project is unprofitable and ineffective under the given conditions. Driving one kilometer of the new section of the D4 highway costs more than today's highest toll rates, i.e. 6.295 CZK/km.

The project would be profitable if the toll rates were 9.09 CZK/km for passenger vehicles and motorcycles, 12.29 CZK/km for vans and 14.89 CZK/km for trucks. These rates are 2.5 times more expensive than the toll on the AP-71: León - Astorga, in Spain.

It is apparent from the above that cross-financing of the project is necessary. From the analysis of the total revenues and costs of road and rail transport in 2020, presented in Table 6 and also in the discussion on page 18, it follows that the revenues from these dominant modes of transport would not be able to cover the investment expenditure of the project in that year, since both modes of transport together created a loss in any given year. If the balance was similar in 2022, it would mean that the project would not be financed from transport revenues, but would have to be subsidized by the state budget.

There is no doubt that it is the correct target of the government to ensure a quality public service, but we must perceive all the connections and especially the consequences that subsidizing transport financing causes. Funds spent on subsidies must naturally be lost somewhere. It is not only correct to ask a question for the reason for what the dependence of transport on public means. It is important to scientifically investigate the causes of this addiction and try to find solutions to alleviate or prevent it. It is also necessary to examine the different impacts of the principle of dependence on financially strong states and states with lower performance in the national economy.

Precisely because The EU and The Czech Republic support the principle of the dependence of transport on funds from public sources, it is important to remember that any support for unbalanced management indicates a suboptimal allocation of resources. The approved principle, i.e. according to the theory of well-being, in The Czech Republic, society on the axis of well-being is heading towards poverty and ultimately hinders the increase in the standard of living.

The fact that the authors did not find scientific articles on the topic of transport profitability indicates a high level of paradigm in society. Society considers transport subsidies as something natural, and inevitable, and does not feel the need to look for ways to prevent waste. A neglected path is a serious, pan-European, scientific investigation of the development of a completely new, profitable type of transport, to which we would shift part of the current transport performance, from overloaded road transport and high-loss rail transport.

The Impact of Economic Measures of EU Countries on the Development of the Recession Caused by the COVID-19 Pandemic

Mária Bohdalová^{1,*}, Liubov Hodovanska¹, and Nico Haberer¹

¹ Comenius University Bratislava, Department of Quantitative Methods, Faculty of Management, Odbojarov 10, 820 05 Bratislava, Slovakia

Abstract

Research background: The COVID-19 crisis has revealed specific problems and, at the same time, opened up new opportunities and areas for growth. By studying a crisis, society can gain new experiences and accumulate information to help prioritise changes that can ensure economic well-being and security.

Purpose of the article: The paper contributes to the study of the crisis caused by the disease COVID-19 in Europe. The paper aims to evaluate the behaviour of 27 European Union member states to identify atypical features of the classical business cycle theory.

Methods: The impact of implementing lockdown measures against the pandemic on the economy of EU countries was evaluated. We tested whether the level of digitalisation has a statistically significant impact on economic activity during COVID-19. The DESI index was used as a factor that can strategically impact countries' economic activity. We have evaluated the situation in the analysed countries using descriptive statistics and the Fixed Effect model.

Findings & value added: According to our data, the recession has different durations for EU countries, ranging from 1 to 2 quarters. Before the pandemic spread, some adverse shocks affected economic activity in seven countries. Our analysis confirms a V-shaped recovery from recession in most EU countries. According to the regression model results, there is a positive relationship between the indicators, which is statistically significant even after adjusting for standard errors.

1. Introduction

The COVID-19 crisis has become an unprecedented global event. The decline in economic activity in an extremely short period reached a depth not seen since the Great Depression. The recession caused by the COVID-19 pandemic was unprecedented both in terms of its scale and origin. This was due to the speed of its spread across different sectors, the decline in economic activity, and the nature of the shock itself. When the first signs of a possible lockdown appeared, some questions arose in academic and business communities. The discussion focused on such critical issues as the probable duration of the recession, the depth of the decline, permanent losses, the stability of the recovery, possible scenarios for the shape of recovery, and more. This discussion provoked the beginning of research on the shocks, forecasting the development of the crisis and possible scenarios for recovery.

If we are talking about recovery scenarios, one of the first questions that economists discussed was about the shape of the recovery that can be. The shape of the recovery refers to the intuitive geometric characteristic of the key indicator of economic activity development. De Backer et al. (2021, p.2) proposed a schematic representation of recession in the V, U and L shapes. These scenarios answer the following questions: whether the economy will recover to its previous level, what form the recovery will take, and how long it will run. Defining only a shape as a type is not enough. Each shape may have different characteristics. Therefore, the question also arises about the intensity of the shock.

Carlsson-Szlezak et al. (2020) note that the "path" may differ in the recovery slope and the contraction depth for a V-shaped scenario. For a U-shaped crisis, the questions are how long it will take to recover to the previous level, the depth of the decline, and even if the growth slope will be restored. The level will

* Corresponding author: maria.bohdalova@fm.uniba.sk

probably not be the same as before the recession. An example of such a scenario is the global financial crisis 2008 in the United States, which is characterised by a U-shaped pattern. While GDP growth recovered its slope, it did not return to its previous level (Carlsson-Szlezak et al., 2020). In other words, the new growth trend runs parallel to the previous secular trend but at a lower level, and the economy is in permanent losses. Eichengreen et al.(2021) also mention one more shape, specifically the W-shape. The question of whether the shape of the recovery from the COVID-19 recession will transform from V or U-shaped to W-shaped arose because of the possibility of a second or even third wave of the pandemic and, as a result, the possibility of a new lockdown. It can be said that while the economy has an excellent chance of recovering to its previous level, the recovery may be followed by another wave of decline.

The uncertainty that accompanied the whole year 2020 was reflected in forecasts and estimates of economic indicators. The European Central Bank (ECB) Survey of Professional Forecasters (SPF) for the 3rd quarter of 2020 also shows significant pessimism and uncertainty. De Backer et al. (2021, p.1) argue that the range of expected GDP growth for 2021 (2% to 10%) published by the ECB is unprecedented and indicates the problem's complexity. The lowest estimate of 2% GDP growth in 2021 for the euro area means an L-shaped, worst-case scenario. The highest forecast of 10%, respectively, indicates a V-shape and a quick recovery. De Backer et al. (2021, p.2) investigated this topic for the euro area. According to their forecast of real GDP, it is unlikely that the recovery will have a full V-shape for any of the countries. However, short-term forecasts are relatively optimistic and indicate an average between V and U. However, long-term forecasts are determined by U and L shapes, followed by significant losses (De Backer et al., 2021).

At the beginning of the pandemic, Carlsson-Szlezak et al. (2020) provided examples of two factors that could have influenced the formation of a U-shaped scenario. First, controversial central bank policies were a severe problem for that period. Second, a large-scale "freeze" of the real economy was a new case with unpredictable consequences.

Economists tend to believe that the main driver of the COVID-19 crisis was forced savings and labour hoarding due to the lockdown. During the crisis, industries that were ill-adapted to poor performance suffered the most, while industries that had experience working online before the crisis suffered much less.

Bai et al. (2021) studied the impact of information technology adaptation on economic stability during the pandemic. The authors provide the first verified results and argue for the work-from-home (WFH) feasibility of labour as a practice that increases the resilience of companies to economic shocks.

Gal et al. (2019), in a working paper by the Organization for Economic Co-operation and Development (OECD), assess whether policies that support the adoption of digital technologies will increase the productivity of companies. The paper was published before the pandemic and provides evidence that adopting digital technologies in industries, combined with quality training and enabling conditions for gaining the necessary skills, increases firm productivity and positively impacts the industry. This study was conducted for 22 industries and identifies manufacturing and routine activities as those for which the effect is most significant.

Doerr et al. (2021) examine the impact of the World Digital Competitiveness Ranking of countries on the economic performance of enterprises during the COVID-19 crisis. As the main insight of this study, the authors highlight that a one standard deviation increase in a country's technology rating leads to a 4% increase in the average firm's revenue. In the case of the pandemic, companies that are more adapted to e-commerce, logistics, and the provision of services using digital technologies have adapted faster and even turned this into a strategic advantage.

In the process of setting the aims of this paper, we decided to focus on the issue of the consequences of the COVID-19 crisis for EU countries.

The paper aims to provide an analytical view of the GDP Index, which, in our case, is the main object of study as the level of economic activity. We pay attention to the level of digitalisation DESI for EU countries, as this factor was mentioned in the review of relevant literature as one that can provide a strategic advantage during the COVID-19 crisis. We use the Stringency Index provided by The Oxford COVID-19 Government Response Tracker (OxCGRT) to reconstruct the measures taken by European governments to overcome the COVID-19 pandemic.

The paper is organised as follows. The next section describes the data and methods used. Section 3 introduces our results. Section 4 offers a discussion of our results. Section Conclusion concludes our findings. The analyses presented in this article are taken from (Hodovanska, 2023), where we also find analyses of other economic indicators.

2. Methods and Data

The main object of the paper is an indicator of the country's economic activity, namely GDP measured in chain-linked volumes. We use the year 2015 as a reference year. The sample includes 27 countries of the European Union. The study is covered in the period from 2017 to 2021, with a quarterly frequency (from the 4th quarter of 2017 to the 4th quarter of 2021, which is 17 time points). We use a balanced panel dataset with a total number of observations $N \times T$, which in our case is 459 observations. The primary data source we use in our research is the European Union Statistical Office – Eurostat database. These are mainly quarterly data in chain-linked volumes, with 2015 as the reference year. The data are seasonally and calendar-adjusted. The exception is the Digital Economy and Society Index (*DESI*), which is available with an annual frequency and is measured by weighted scores corresponding to the digital efficiency of European countries across five criteria: Connectivity, Human Capital, Use of the Internet, Integration of Digital Technology, and Digital Public Services. Annual Index values are interpolated into quarterly values.

We use the data from The Oxford COVID-19 Government Response Tracker (OxCGRT) as an indicator of the stringency (*Stringency*) of measures taken by governments in response to the spread of the COVID-19 pandemic (Hale et al., 2021). The Stringency Index reflects the degree of restrictions in 9 areas: school closures, workplace closures, public events restrictions, restrictions on gatherings, closure of public transport, stay-at-home requirements, restrictions on movement between cities/regions, international travel controls, public information campaigns (Phillips et al., 2022). As countries have reduced restrictions for the part of the population that has fulfilled the vaccination requirements, the Index reflects these differences. It is available in four versions (for the unvaccinated and vaccinated population, the average, and a weighted average based on the share of vaccinated people) (Roser, 2021). Restrictions are measured on a scale from 0 to 100. The higher value means the stricter the restrictions. The data for the Stringency Index were originally in daily frequency, so we used the quarterly average to convert the daily data to quarterly.

According to researchers Gal *et al.* (2019), Brynjolfsson *et al.* (2020), and Doerr *et al.* (2021) appeal to the positive impact of digitalisation on the economic performance of the US and individual companies, in particular during the crisis, we decide to test whether the level of digitalisation has a positive impact on the *GDP* in EU countries. We are also interested in the degree of change in the *GDP* Index under the influence of restrictions. Therefore, we propose a Fixed Effects Model at the country-quarter level from Q4 2017 to Q4 2021 in the form:

$$GDP_{i,t} = \beta_1 Stringency_{i,t} + \beta_2 DESI_{i,t} + u_{i,t}, \quad t = 1, \dots, 17; \quad i = 1, \dots, 27 \quad (1)$$

Stringency and DESI are the historical values of the appropriate indices for the i -th country in time t , and the model residuals are denoted as $u_{i,t}$.

3. Results

A slowdown in economic activity was already observed in Croatia and Greece during the 3rd quarter of 2019. Also, starting in the 4th quarter of 2019, the GDP Index began to decline in 5 other countries: Finland, Austria, France, Italy, and Denmark. Most countries enter a phase of economic recession beginning in 1st quarter of 2020, specifically at the onset of the recession, the leading cause of which is the shock caused by the anti-pandemic restrictions. The exceptions were countries such as Estonia, Ireland, Lithuania, Poland, and Romania. These countries entered a recession in the 2nd quarter of 2020. And up to this point, they continued to increase the value of the GDP Index.

We date the bottom of the recession by the second quarter of 2020. The recession in EU countries mainly lasts for two quarters, but in the case of five countries, it is one quarter. From the 3rd quarter of 2020, the countries (in this case, synchronised) enter the recovery phase. Luxembourg and Ireland are recovering the fastest. In the 3rd quarter of 2020, these countries reached the level before the economic downturn and continued the growth trend. A similar trend of rapid recovery was demonstrated in Estonia, for which the period of decline lasted the first quarter, while it took the second quarter to recover. Lithuania, Croatia, and Denmark fully restored their pre-crisis economic activity levels in 1st quarter of 2021 despite having different recovery scenarios. Denmark recovered by about 92% in the 1st quarter. Croatia gradually restores the lost value over three quarters, and after economic activity reaches the previous level, the growth rate slows significantly. With the start of the recovery phase, Lithuania's GDP Index regained about 50% of its lost value in 3rd quarter 2020 and fully recovered over the next two quarters.

Most countries recovered the economic activity lost during the recession in the 2nd and 3rd quarters of 2021 (8 and 7 countries, respectively). France also managed to recover from a prolonged period of decline

by the end of 2021, recovering by 80% in 3rd quarter of 2020 but slowing dramatically in 4th quarter of 2020. By the end of 2021, 6 countries (Spain, Germany, Czech, Portugal, Slovakia, and Italy) had not recovered their pre-crisis GDP Index level.

We recorded the most significant drop in the GDP index for the entire period under review in all countries during the second quarter of 2020. Moreover, Spain (-18.722), Malta and Hungary (-17.242 and -17.034, respectively), Croatia and Portugal (-16.554 and -16.286, respectively) showed the most significant decline in 2nd quarter of 2020 compared to the previous quarter. The smallest decline in 2nd quarter of 2020 was observed in Bulgaria (-5.331), Luxembourg (-6.101), and Lithuania (-6.334). Meanwhile, for Luxembourg, the recovery of its GDP Index level lasted one quarter, and for Lithuania, two quarters. The recovery lasted four quarters for Bulgaria despite a relatively small decline during the recession.

Throughout the entire time series, 11 countries went through a period of recovery without recurrent downturns. Despite the different pace (from 2 to 5 quarters), all 11 countries (Bulgaria, Denmark, Estonia, Greece, Croatia, Cyprus, Lithuania, Hungary, Poland, Romania, and Sweden) can have a V-shaped recovery.

Countries that experienced one downturn are Belgium, the Czech Republic, Finland, Germany, France, Italy, Malta, the Netherlands, Portugal, Slovakia, and Slovenia. This economic contraction falls mainly on the 4th quarter of 2020 or the 1st quarter of 2021, which may result from the second wave of the lockdown. It should be noted that 5 out of 6 countries that did not restore the pre-crisis value of the GDP Index by the end of 2021 experienced a repeated economic decline in one quarter. This decline is between -0.546 and -2.703. The decline is less significant for the rest of the countries and ranges from -0.018 to -0.548.

Despite the rapid recovery from the recession, Ireland and Luxembourg experienced two more economic activity downturns during the period we are analysing. While this decline is not deep enough to affect the overall pattern for Luxembourg, it causes a second recession for Ireland. Thus, we observe a W-shaped recovery for Ireland.

The recovery scenario is somewhat different for Austria, which reached a pre-crisis level of economic activity in 3rd quarter of 2021. Nevertheless, Austria is the only country that has experienced a downturn in three out of six episodes during the recovery. By the recession's trough, Austria had lost 15.176 points, while the recurrent downturns during the recovery had a further 4.481 points. Although compared to the recession of the first quarters of 2020, the recessions of the 4th quarter of 2020 and 1st quarter of 2021 are almost five times smaller, we can describe the shape of Austria's recovery as W-shaped, even though it is not as pronounced as the shape of Ireland's.

The EU countries experienced two waves of increased restrictions during 2020 and 2021. However, while the first wave had the same timeline for all countries, countries differed in the duration and intensity of restrictions in the second wave. The first wave began in the first quarter of 2020 and lasted until the middle of the year, significantly reducing restrictions in the 3rd quarter. Governments introduced the second wave in the 4th quarter of 2020, which generally peaks in the 1st quarter of 2021. Thus, governments are taking a preventative step for the cold season. The quarantine softening comes during the warmer seasons, which are economically important for countries with vital agricultural and tourism sectors. However, a significant reduction of restrictions starts only from mid-2021, which overlaps with the increasing vaccination coverage. Vaccination starts in the EU in the 4th quarter of 2020 for nineteen countries and in the 1st quarter of 2021 for eight countries.

The degree of restrictions imposed in the 1st quarter of 2020 ranges from 15.47 to 57.72 points. Consequently, the countries that immediately implemented higher restrictions (from 43.33 to 57.34 points) moved more smoothly to tightening in the next quarter (on average +17.77 points). For countries with low restrictions (from 15.47 to 33.02) in the first quarter of 2020, the transition to the next quarter adds an average of +42.7 points to the restriction policy. As a result, the values for the 1st and 2nd quarters are cumulated, and the range of values for all countries shrinks. However, the difference between the maximum and minimum at the peak of the first wave differs by 25.28 points, with Latvia showing the lowest value of restrictiveness (56.87 points) and Ireland the highest (82.15 points).

Regarding the second wave, its duration is generally longer, mainly four quarters, compared to 2 quarters of the first wave. The exception is Denmark, with a duration of 3 quarters. We observe differences in the wave shape for the two groups of countries, which is a consequence of the more substantial stability of restrictions for some countries. Another peculiarity is that the second wave in the Czech Republic (58.86 compared to 73.69 points) and Slovenia (61.9 compared to 74.35 points) significantly differed from the first wave. Italy demonstrated the same level of restrictions for the peaks of both waves (77.27 and 77.31 points).

Further, we have analysed whether the growth rate of the DESI Index changed during the crisis, the leading cause of which was distancing and lockdown. We will briefly comment on the most significant changes in the ranking of countries according to the DESI Index. Over the five years from 2017 to 2021, the European countries accelerated the DESI Index growth rate. On average, for EU countries over five years, the growth rate is the highest in 2021. From 2017 to 2019, the DESI Index grew by an average of +2.4% per year, while the growth in 2020 was +3% weighted points and in 2021 +4.4% weighted points. In 2021, the DESI Index for European countries increased by 12.2% of weighted points compared to 2017. Even though in 2020 there was a slowdown in the growth rate compared to 2019, the upward trend continues.

Meanwhile, in 2021, the growth rate accelerates by more than 40% compared to the previous year. In 2018, the growth rate of the DESI Index ranged from +1.1% to +3.1%. The lowest growth is demonstrated by Greece and Cyprus, which occupy 26th and 22nd places in the ranking at the end of 2018. In 2019, the growth boundaries shifted by 0.5%, and the growth rate range varied from +1.6% (Latvia) to +3.7% (Italy and Finland, respectively). In the first year of the pandemic, the range variates from +1.8% (Bulgaria) to +4.3% (Finland), with an average growth rate declining compared to the previous year. Then, in 2021, all countries accelerated the Index's growth rate, ranging from +2% (Latvia) to +9.3% (Denmark).

Thus, it can be stated that the upward trend was already present in the pre-crisis period, but it was prolonged and did not significantly impact the situation in the coming years. For example, at their average growth rate in 2018 and 2019, the countries in the rankings below the European level as of 2017 would need up to 4 years on average to at least reach the 2017 European value of the DESI Index. In an identical situation, but with the average growth rate of 2020 and 2021, it would take just over two years. By the end of 2021, Denmark's most significant increase in the DESI Index is observed (+9.3% in 2021), which allows Denmark to become the leader in the ranking in 2021, overtaking Finland, which was in first place during the previous four years. Germany has significantly improved its Index score since 2020, rising five places in the ranking during 2021. Ireland and Austria improved their rankings by three places in 2021, with an increase of +6.3% and +6.9%, respectively. For the rest of the countries, there are no significant changes in the ranking or unexpectedly significant increases in the DESI Index.

According to the summary statistics presented in Table 1, the average *GDP* Index of the countries is 111.9, with a standard deviation of 9 units. We observed that the *GDP* Index reached the lowest standard deviation with the tightest range of values (from 86 to 158.2 points). The highest standard deviation corresponds to the *Stringency* Index (15.45), averaging 52.98 points. The average Value of the *DESI* Index reaches 40.29 points with a standard deviation equal to 9.19. For our dataset, the difference between the mean and median for the variables varies from 0.01 (*Stringency* Index) to 1.5 (*GDP* Index). Moreover, the first and third quartiles (Q_1 and Q_2) and median values are presented.

Table 1. Summary statistics

Panel: Country-level variables								
Variable	Obs. (n)	Mean	Std. Dev.	Min	Max	Q_1	Median	Q_3
<i>GDP Index</i>	459	111.90	9.00	86.00	158.20	106.80	110.40	116.20
<i>DESI Index</i>	459	40.29	9.19	19.40	65.30	33.81	40.22	46.65
<i>Stringency Index</i>	216	52.98	15.45	15.47	86.16	41.75	52.97	65.04

Source: Own processing (2023)

The results of the Fixed Effects Model (1) are presented in Table 2. In the case of the model (1), the residuals are not symmetrical. The median is almost zero, and the difference between the maximum and minimum values of the residuals in absolute terms is 3.7. Because the minimum and maximum values of the residuals are pretty significant (-14.28 and 17.98, respectively), it should be clarified that some of the predicted values for the *GDP* Index will differ significantly from the actual values.

This model omits Intercept. The coefficients for the independent variables, according to the *p*-value, are statistically significant at the 1% significance level. Thus, the coefficients of the variables *Stringency* and *DESI* are statistically significant. The estimated coefficients are intuitive and consistent with the information obtained from the literature review. According to the model's coefficients, a ten-point increase in the *DESI* is associated with a 13.2-point increase in the *GDP* Index *ceteris paribus*.

Table 2. Summary for Fixed Effects Model

Coefficients	Estimate	Std.Error	t value	p-value	
<i>Stringency</i>	-0.1429***	0.0098	-14.58	<2e-16	
<i>DESI</i>	1.3218***	0.0746	17.72	<2e-16	
Residual standard error: 3.855 on 430 degrees of freedom					
Multiple R-squared (full model): 0.8278 Adj. R-squared: 0.8166					
Multiple R-squared (proj model): 0.4242 Adj. R-squared: 0.3867					
F-statistic (full model): 73.85 on 28 and 430 DF, <i>p</i> -value: < 2.2e-16					
F-statistic (project model): 158.4 on 2 and 430 DF, <i>p</i> -value: < 2.2e-17					
Residuals:	Min	Q ₁	Median	Q ₃	Max
	-14.2768	-1.838	0.2833	1.9756	17.9761

Source: Own processing (2023)

*** means significant at a 1% confidence level

According to the coefficient of the *Stringency* Index, a ten-point increase in the *Stringency* Index will cause a drop in the *GDP* Index by 1.4 points *ceteris paribus*. If we consider that in the first quarter of 2020, EU countries, on average, implemented restrictions with a score of 36 points, then according to this level of restrictions, the *GDP* Index will fall by 5.04 points *ceteris paribus* on average per country.

The standard errors are no more than 7% of the slopes for both variables. However, according to the results of the tests for the presence of heteroscedasticity in the regression model and serial correlation of the residuals, we need to estimate cluster-robust standard errors. We reject the zero hypothesis (H_0) of the Breusch-Pagan Test and accept the alternate hypothesis of this test (H_1), according to which the residuals in the regression model are distributed with different variances. Similarly, based on the results of the Breusch-Godfrey test, we reject the zero hypothesis (H_0) and accept the alternative hypothesis (H_1), which states that there exists autocorrelation in some order.

Due to the heteroscedasticity and autocorrelated residuals of the Fixed Effect model (see Table 2), we have found the model with edited standard errors. The results are presented in Table 3. Even though the standard errors of the estimated coefficients have increased significantly, these coefficients are still statistically significant. According to the *F* statistic, the model is statistically significant at the 1% level. The residual standard error is equal to 3.855 for both models. We can conclude that both regression models predict the *GDP* Index with an average error of about 3.855. We also want to highlight what the prefixes mean for the *F*-statistic and the Coefficient of Determination (*R*-squared) - complete and projected model. A full model includes dummy variables for each country. Their values for the dummy variables of each country are given in Table 3. The statistics for the Projected model correspond to the within-estimator model (without country-specific constants). For us, the statistics for the entire model are more important. According to the *R*-squared of the entire model, the variation of the dependent variable *GDP* Index is covered by 82.78% by our model.

Table 3. Summary for Fixed Effects Model 1 with Clustered SE

Coefficients	Estimate	Std.Error	t value	p-value

4. Discussion

When assessing the critical indicator of economic activity, it is worth noting that a particular economic shock has a negative impact even before the pandemic and restrictions began. However, this shock affects only a small number of countries. These are seven countries where the decline in economic activity begins 1-2 quarters earlier and does not significantly impact economic activity. Despite the primarily pessimistic forecasts regarding recovery scenarios, EU countries have generally overcome the effects of the crisis under the V-shaped scenario. 21 out of 27 countries fully restored their pre-crisis *GDP* Index levels by the end of 2021.

Nevertheless, the recovery duration is also an issue, as, despite the rapid growth in the first quarter of 2020, the recovery phase lasts 4 to 5 quarters for most countries, while recessions last 1 to 2 quarters. The *GDP* Index experienced 1 to 3 repeated declines for 16 of 27 countries, while economic expectations are generally positive. However, in such an unstable situation as the pandemic, it is difficult to judge the significance of the expectations because decisions and amendments to the policy of restrictions change without proper prior communication and timing in conditions when different sectors of the economy depend on the policies of other countries and factors which impossible to influence. It is also reflected in the re-implementation of restrictive measures in Q4 2020 and Q1 2021, which does not negatively affect economic expectations, while more than half of the countries experienced a repeated decline in *GDP* in these quarters.

In such circumstances, however, the strategic advantage is the ability to adapt the economy to new conditions, which, together with the willingness to adopt new technologies, can positively affect economic activity. For this purpose, the level of adoption of digital technologies and the ability of companies to implement and maintain them play an important role. Our findings are confirmed by several studies both in the pre-crisis period and that directly describe the effect of increasing the level of digitisation on the economic performance of companies during the COVID-19 crisis. Countries that have recovered their *GDP* level in the first two quarters after the bottom of the recession are in the top 10 of the *DESI* ranking as of 2019. Also, according to the regression model results, a one-point increase in the *DESI* Index corresponds to a 1.3-point increase in the *GDP* value of the Index. However, it should be considered that this is only a characteristic of how the *GDP* Index changes over time on average for a country when the *DESI* increases by one point. It is interesting that in 2020, we did not observe a significant positive jump in the *DESI* Index. For ten countries, the growth rate is declining, while the rest do not show the significant change that we would expect. A significant increase compared to previous years is observed starting in 2021. Even though the growth rate of the *DESI* Index increased by the end of 2021, it is not significantly higher for most countries. On average, EU countries' growth rate in 2021 increased by only 1.5 points compared to 2019. Most countries have not picked up the trend towards the adoption of digital technologies and support for the development of digital infrastructure to the extent that it could be a game-changer for stabilising economic activity in the EU. For example, on average, the *DESI* Index for EU countries increased by 1 point per quarter, with its highest rate in 2021.

Conclusion

The paper analysed the development of the recession in EU countries caused by COVID-19. We paid attention to the level of digitalisation *DESI* for EU countries, as this factor was mentioned in the review of relevant literature as one that can provide a strategic advantage during the COVID-19 crisis. Moreover, we have used the Stringency Index to reconstruct the measures taken by European governments to overcome the COVID-19 pandemic.

The purpose of the descriptive analysis was to assess the fundamental changes that occurred with the indicators during different stages of the business cycle and describe the specifics of these changes in comparison with the traditional behaviour of the indicators, as well as to compare the forecasts of the early stages of the COVID-19 crisis with the actual situation as it looks in the post-crisis period. Finally, we investigate the policy of restrictions and the impact of the level of digitalisation on the *GDP* Index using a panel data regression model.

We started with a descriptive analysis of the *GDP* Index. We assessed the changes that occurred from quarter to quarter and determined the starting point of the recession, its duration, and the depth of the decline in economic activity. In our analysis of the *GDP* Index, we identified the form of recovery and its numerical characteristics. According to our data, the recession has a different duration for EU countries, ranging from 1 to 2 quarters. There was a particular negative shock that affected economic activity in seven countries before the spread of the pandemic. The magnitude of the *GDP* Index decline during the

entire period of contraction (from Q4 to Q1, depending on the country) ranges from -6.334 (Lithuania) to -24.819 (Spain) points. 11 countries went through a period of recovery without further declines. Despite the different paces (from 2 to 5 quarters), for all 11 countries, the shape of the recovery can be considered V-shaped. For Ireland and Austria, the recovery was W-shaped. However, the scenarios differed in the pattern. Six countries did not restore their pre-crisis GDP index levels by the end of 2021. For the rest of the countries, the shape of the recovery could resemble a V-shape. However, during the recovery period, the countries experienced repeated episodes of decline from 1 to 2 times, which slowed the recovery and affected the shape.

The opinions of scientists were strongly divided. Among the optimistic forecasts was a V-shaped rapid recovery, as the crisis caused restrictive measures that physically impeded consumption, and when the restrictions were lifted, consumption would return to the previous level. However, these forecasts do not consider the situation's instability and the long period of overcoming the pandemic, accompanied by several waves of infection and consequent restrictions. According to the reconstruction of EU restrictions, after the first wave lasted two quarters, the second wave lasted from 3 to 4 quarters. Furthermore, governments have not provided sufficient support for adopting digital technologies that could stimulate the economy while avoiding the risks of increased morbidity resulting from direct incentives to the most affected markets. Businesses are left alone to deal with complex changes at a critical moment because governments act very slowly when it is necessary to implement changes quickly. The government's reflection on the importance of developing the level of digitisation comes with a delay and takes the form of strategies for the next nine years. According to the descriptive analysis, the growth of the DESI Index slowed down on average in 2020. Only 12 countries in 2021 show a significant increase in the DESI Index compared to previous periods. During the crisis, countries with higher digital infrastructure, human capital, and experience implementing changes have better conditions. Governments did not pay enough attention to digital capability development when fighting the pandemic wildfire. We use Fixed Effect Estimation to analyse the relationship between countries' digitalisation levels and changes in the GDP Index. According to the regression model results, there is a positive relationship between the indicators, which is statistically significant even after adjusting for standard errors.

Additionally, we conducted tests to check the data structure and identify abnormal behaviour of the indicators. It should be added that a clear outlier in our dataset is Ireland, for which the pattern of GDP differs significantly from what we observe for other countries.

We would also like to draw attention to the fact that the study of the impact of restrictive measures on various sectors of the economy is complicated by insufficient data. Broader generalisable analyses for EU countries will require significant efforts to collect data directly from governments. While collecting data for this paper, we also encountered missing data, significantly limiting the research.

Determinants of External Business Environment Causing the Need for Building Corporate Agility in the Context of the Corona Crisis Impacts

Jarmila Klementová¹, and Andrea Janáková Sujová^{1,*}

¹ Technical University in Zvolen, Department of Economics, Management and Business, Faculty of Wood Sciences and Technology, T.G.Masaryka 24, 960 01 Zvolen, Slovakia

Abstract

Research background: The coronavirus pandemic in 2020 brought significant impacts on the economy of countries in addition to health consequences for the population. The most economically affected countries were countries with a worse pandemic situation, with long-lasting anti-pandemic measures, including the Slovak Republic. As a result of the measures taken to prevent the spread of the disease, many companies in Slovakia had to reduce or completely suspend their business activities.

Purpose of the article: The aim of the paper is to evaluate the adverse impact of the pandemic on the economy of small and medium-sized enterprises in the Slovak Republic through factors determining the decline in economic activity of business entities and selected economic indicators. The impact of the pandemic on the SME economy was the most significant impact on the performance of the Slovak economy. This was the reason for focusing this article on SMEs.

Methods: The secondary empirical research was performed. The research was based on the analysis of secondary data from statistical databases and official reports of Slovak government institutions. Methods of descriptive statistics and economic analysis were applied by processing data and findings formulation.

Findings & Value added: The result of the analysis is the identification of factors of the external environment of Slovak companies provoking the need for change and building corporate agility in the context of the impacts of the corona crisis. The increase in output and value added in SMEs in Slovakia already in the first quarter of 2021 indicate the ability of SMEs in the Slovak Republic to adapt to change.

Keywords: corona crisis, small and medium enterprises, external determinants, enterprise agility

JEL classification: E20, O12

1. Introduction

The year 2020 was exceptional in terms of the development of exogenous factors that changed the development of the Slovak and global economy in an extraordinary way. The COVID-19 pandemic was unquestionably a central factor in the economic environment in 2020 and 2021. The decline in economic activity did not occur only in Slovakia, but was also symptomatic of other countries. In the European Union as a whole, economic performance declined mainly due to the downturn in major EU economies (Fuentes & Moder, 2021).

The non-cyclical crisis caused by the COVID-19 uncontrollable spreading showed that its kind of crisis cannot be predicted (Iacob et al., 2021). The economic recession caused by the COVID-19 pandemic had a more significant impact on businesses than the 2008 crisis. As a result of the various measures taken to prevent the spread of the disease, many companies had to reduce or completely suspend their business activities, causing considerable problems for the economies of the affected countries. The pandemic limited the possibility for large masses of people to continue their professional activities due to the measures of physical distancing, which affected production capacity and ultimately the aggregate supply of the economy (Oncioiu et al., 2021). Direct effects of the corona crisis in reduced income, job losses, customer preferences, low demand, cash flow problems, obstacles to the free flow of capital, labour and trade were observed in most of countries (Balasoiu, 2021; Abd Aziz et al., 2022; Turnea et al., 2020)

* Corresponding author: andrea.sujova@tuzvo.sk

In the Slovak economy, the GDP contraction in 2020 was 4.4%. Also in 2021, the Slovak economy was affected by the COVID-19 pandemic, but less significantly than in 2020. In addition to the ongoing pandemic, the Slovak economy was also hampered by supply chain problems, shortages of commodities (including energy), and rising commodity prices. According to data from the Slovak Statistical Office, Slovakia's GDP growth in 2021 was 3.0% and GDP growth slowed to 1.7% in 2022 (SBA, 2022). The negative impact of the pandemic was also in the increase of the gross government debt, which reached 58.9% of GDP in 2020 and exceeded the threshold allowed in the EU, rising to 61.8% of GDP in 2021. Similarly to Slovakia, at the time of the pandemic, other countries started to adopt comparable measures, resulting in (temporary) disruption of global supply and demand chains with an impact on foreign trade. Consumer price developments in 2021 were characterised by rising dynamics. At the beginning of the year, inflation was still at 1%, while in the last quarter of 2021 it had already exceeded 5%. The annual inflation rate increased to 3.2% in 2020 compared to 2021. The increase in the price level was decisively influenced by fuel prices, but also by food prices (NBS, 2022).

The slump in the Slovak economy was related to a decline in domestic demand. Final household consumption fell by 1.1%. Public final consumption stagnated after the previous growth. Investment activity also experienced a negative development in 2020. Gross capital formation fell by 12% year-on-year. Total exports of goods and services also declined by 7.5% compared to 2019. The decline in the performance of the Slovak economy was also reflected in the labour market. In the months of April and May 2020, there has already been a year-on-year decline in employment in almost the entire spectrum of sectors. (Bečka, 2020)

Small and medium-sized enterprises are among the most vulnerable categories of enterprises in times of crisis. The effects of the coronary crisis on the economy of SMEs have been studied and analysed in countries across the world in publications by authors such as Birbirenko et al. (2020), Langworthy et al. (2021), Gashi et al. (2021), Clampit et al. (2021), Abuhussein et al. (2023). Limited access to liquidity, lack of strong state support, poorly prepared and motivated human resources, low digitalization are the weaknesses of SMEs are the main obstacles to resilience in this crisis (Iancu et al., 2022). Among other factors influencing the ability of SMEs to survive and master corona crisis are employee and customer satisfaction in the changing situations. (Khan et al., 2022; Fasth et al., 2022; Thekkoote, 2023). The importance of strategic flexibility, innovation-oriented strategies, implementation of agile behaviour and dynamic capabilities, applying creativity to adapt to new conditions was highlighted as the matter for the survival in emerging economies (Chomicki & Mierzejewska, 2020; Thukral, 2021; Yaya et al., 2022; Chen et al., 2023), According to Zahoor et al. (2022), the agile adaptation and new opportunity utilization were the primary means of dealing with the disruptions the COVID-19 pandemic brought about in SMEs of Finland.

In the long term, the position of small and medium-sized enterprises (SMEs) in the national economy of the Slovak Republic is significant, especially in terms of their contribution to total employment, added value and support for economic development. The importance of SMEs can also be observed in the structure of economically active business entities. Small and medium-sized enterprises account for 99.9% of the total number of business entities in the Slovak economy. They account for almost two thirds of employment in the business economy and contribute more than half of the total value added.

The impact of the pandemic on the SME economy is therefore the most significant impact on the performance of the Slovak economy. This was the reason for focusing this article on SMEs. The aim of the paper is to evaluate the adverse impact of the pandemic on the economy of small and medium-sized enterprises in the Slovak Republic through factors determining the decline in economic activity of business entities and selected economic indicators.

2. Methods

A review of a large number of scientific papers focusing on the impact of the COVID19 pandemic on SMEs in countries around the world showed the importance of addressing this topic and was the inspiration for the objectives and methodology of the paper.

The method used in the paper was secondary empirical research based on the analysis of data from statistical databases and official reports of Slovak government institutions in the years 2020 and 2021. Main sources of data were the Slovak Business Agency, OECD reports, Eurostat data, Slovak National Bank reports and reports of the National Council of the Slovak Republic.

Methods of descriptive statistics and economic analysis were used. Trends in absolute and relative frequency during the period 2017 – 2021 were applied to describe the development in Slovak SMEs

sector. Indicators of the development of economic indicators and their indices of change were applied to show the impact of pandemic period on the economic results of Slovak SMEs. In the paper the following economic indicators of SMEs in Slovakia in the period 2019 – 2021 were analysed: number of employees, gross production, added value, and profit before taxation.

On the basis of the comparison of economic results with anti-pandemic measures in the Slovak Republic connections were deduced, factors determining the decline in economic activity of business entities were identified, and conclusions were drawn.

3. Results

3.1 Anti-pandemic measures of the Slovak government and support for SMEs

In 2020, a number of important pieces of legislation were adopted to address the economic, social and economic emergency situation that arose in the Slovak Republic due to the outbreak of the COVID-19 pandemic. Among the most important measures with an impact on SMEs is the entry into force of Act No 198/2020 Coll. A package of 115 measures to improve the business environment and reduce the administrative burden has been incorporated into the text of the Act. Other measures include: the introduction of tenant protection and temporary protection for entrepreneurs; the provision of financial assistance to ensure the liquidity of SMEs; the regulation of the provision of rent subsidies; the provision of subsidies to support small and medium-sized enterprises; the suspension of trades for less than 6 months; the regulation of the so-called 'home-office'; as well as other provisions of emergency measures in connection with the COVID-19 pandemic in the financial sector, and others. (SBA, 2020)

The anti-pandemic measures adopted in the Slovak Republic can be divided into two groups based on the time of adoption, namely measures adopted during the first wave of the pandemic and measures adopted during the second wave of the pandemic. Most of the anti-pandemic measures taken were of a nationwide nature. However, some of the measures taken also targeted businesses operating in specific areas where the risk of disease spread was higher.

The first anti-pandemic measure during the first wave of the pandemic, which came into force on 10.3.2020, was a ban on gatherings associated with the organisation of public, mass, cultural and social events, which naturally affected businesses with a high concentration of people (theatres, cinemas, shops, sports and cultural events). Following the worsening epidemiological situation, a state of emergency and a state of emergency has been declared as of 12.3.2020. The state of emergency ended on 13.06.2020 after the first wave of the pandemic, but the state of emergency is still in place. Another important nationwide measure, which came into force on 25.3.2020, was a ban on "going out and about in public without covering the upper respiratory tract. The disinfection measures increased the costs for businesses, which included additional costs for the procurement of disinfectants. Domestic businesses were also largely affected by the change in the border regime. In addition to the closure of border crossings, increased attention was paid to persons crossing the border after March 16, 2020 (SBA, 2021c).

In addition to area-wide measures, specific anti-pandemic measures have been taken for a limited group of businesses operating in sectors with a higher risk of disease spread: accommodation and catering, other services, trade and transport. The relaxation of area-wide measures occurred only in the 3rd quarter of 2020.

The second wave of the pandemic began to spread massively in Slovakia in September 2020. As during the first wave, both nationwide and specific anti-pandemic measures were taken during the second wave of the pandemic, partially or completely restricting the operations of enterprises operating in the most affected sectors. The nationwide lockdown began at 5 a.m. on Saturday, December 19, 2020, and was coupled with a curfew. At the end of January 2021, businesses in which this was possible were advised to introduce a home office, which became mandatory on 01.03.2021. In February 2021, the so-called COVID-automatic became applicable in Slovakia. Restrictions were of different extent in different regions of the Slovak Republic depending on the increase in the number of persons infected with coronavirus (NR SR, 2021).

3.2 Business areas at risk and impact of quarantine measures

One of the worst affected and most at-risk sectors in the first wave of the pandemic was accommodation and catering, which was already experiencing restrictions or a complete ban on operations as early as March 2020. Thus, accommodation and catering was among the sectors first affected by the

restrictions associated with the coronavirus pandemic and, conversely, was the last to be affected by the relaxation. However, other sectors - particularly those using long-term employee accommodation services - were also affected by the restriction or ban on the operation of accommodation and catering establishments. During the first wave of the pandemic, businesses in the accommodation and catering sector were caught off guard by the obligation to close their establishments within a day. Although catering establishments were closed for only one month and accommodation establishments for about two months, by the start of the second wave of the pandemic, entrepreneurs were only able to partially compensate for the quantified losses (NBS, 2022).

Another sector that was heavily affected by the pandemic was the other services sector, where we can include, for example, education, health and social assistance, which covers a wide range of activities - from health care provided by trained health professionals in hospitals and other facilities, to home care, to social work activities without the involvement of health care professionals. Within the other services sector, culture, entertainment and recreation (live performances, museum activities, gambling activities, sports and recreational activities) and personal service activities such as hairdressing, beauty and other personal care services also form a significant group. (SBA, 2020)

The more than two-month closure of businesses in the other services sector has complicated operations, particularly in those establishments that cater to a large number of customers, such as swimming pools and cultural events. The possibility of low numbers of customers was unprofitable for these businesses, which is why they did not reopen until a longer period of time had elapsed. However, the rapid onset of the second wave of the pandemic caused the rapid closure of businesses again, which automatically had an impact on the businesses' revenues.

In addition to the sectors mentioned above, trade - and retail outlets in particular - were also affected by the major restrictions and closures. During the first wave of the pandemic, almost all retail outlets were closed. Those businesses that were allowed to remain open had to meet stringent hygiene conditions to prevent the spread of the coronavirus. The limitation of the number of people in the establishment, as well as the rising costs of improving hygiene levels, reduced the bottom line of businesses, which saw their operating costs rise and their revenues fall.

The last sector directly affected by the ban and restrictions was the transport sector. The border regime is linked to this and other sectors. Travel restrictions and border closures during the first wave of the pandemic almost completely halted international passenger transport and significantly reduced international freight transport, which in turn had an impact on all sectors of the Slovak Republic that rely on the import and export of goods. Industrial production in particular has been affected.

According to the SK NACE classification, a total of 53 243 small and medium-sized enterprises in Slovakia are active in the sectors most affected by the quarantine measures. These entities, which have been forced to close their establishments, account for 8.9% of the total number of active small and medium-sized enterprises. Micro-enterprises employing fewer than 10 employees dominate the total number of SMEs most at risk. They account for 96.2% of the total. Small enterprises (10-49 employees) represent 3.4% and medium-sized enterprises (50-249 employees) 0.4%. In the structure of endangered SMEs by legal form, sole traders predominate. Sole traders account for almost two thirds (59.7%) of the total number of SMEs at risk. More than one third (37.4%) is represented by enterprises (legal entities) and 2.9% by freelancers. The quarantine measures necessitated the closure of establishments operated by SMEs mainly in the retail, accommodation and catering, transport and commercial and other services sectors. Table 1 shows the number of SMEs most at risk.

Table 1. Structure of most vulnerable SMEs by sector (SK NACE)

Sector of SMEs at risk	Number of SMEs most at risk
Retail	4,187
Accommodation and catering	19,419
Transport	7,884
Business services	1,478
Other services	20,275

Source: SBA, 2020

In the retail sector, retailers of furniture (720 SMEs), computers (691) and second-hand goods (598) had to reduce their business. In the accommodation and catering sector, the most threatened are

entrepreneurs providing catering (6 962 SMEs), other specialised catering establishments (4 371) and hospitality (3 885). Existential problems in the transport sector are mainly experienced by entrepreneurs providing other passenger land transport (3 485 SMEs) and taxi services (2 193). Business service entrepreneurs such as travel agencies (623 SMEs) and travel agencies (507) also have to cope with a difficult situation. Most of the SMEs that have had to reduce their business due to the quarantine measures are in other services (37.0%). The main activities of these entrepreneurs are, for example, the provision of hairdressing and beauty services (11,195 SMEs), physical well-being services (3,267), or entertainment and leisure activities (1,489) (SBA, 2021a).

3.3 Impact of the pandemic on the economy of SMEs in the Slovak Republic

The number of small and medium-sized enterprises is one of the key quantitative indicators characterising the state of the SME sector. The development of the number of SMEs created was very dynamic during the period analysed, but it can be stated that the number of business entities created falling into the SME size category during and after the two waves of the pandemic (unlike micro-enterprises) did not reach the pre-pandemic values. The absolute majority of business start-ups are micro or small enterprises. In 2020, 83 173 business entities (all SMEs) were created. Compared to 2019, the number of business entities created decreased by 2.01%. From the evolution of the number of business entities dissolved during 2020, it can be noted that entrepreneurs did not cease their business activities immediately after the outbreak of the pandemic. The unclear epidemiological situation and the deteriorating performance of businesses caused the end of the most affected businesses only in the 3rd and 4th quarter of 2020. In 2020, 47,648 business entities closed down - 8,449 (or 15.06%) fewer than in 2019. The number of business entities closing down increased to 51,724 in 2021. The lower number of business entities closing down was also due to the adoption of corona support measures, the use of which was conditional on maintaining business activity. The number of business closures decreased most significantly in the liberal professions (by 32.1%). More than four-fifths of the total number of disappeared entities were sole proprietorships (82.1%) (SBA, 2021a).

Due to the higher number of established business entities than closed ones, a net increase of 14.9% was registered in Slovakia in 2021. This is the highest level of net gain in the past 10 years. In a year-on-year comparison, the number of SMEs increased by 37 138 entities (Eurostat, 2021). The evolution of the number of SMEs in the Slovak Republic in the period 2017-2021 is shown in the graph in Figure 1.

In line with the long-term development tendencies observed in the sectoral structure of SMEs, the most significant representation in 2020 was also of entities operating in the service sector (47.4%). A slight increase in representation has been observed in recent years in the construction sector, which accounted for 18.1% of all entities in the SME size category in 2020. 16.9% of SMEs were active in trade, 13.6% in industry and 4.0% in agriculture. Disrupted buyer-supplier chains during 2020 (especially during the first wave) and declining demand also negatively affected our pro-export oriented SMEs (SBA, 2020).

Figure 1. Development of the SME population in the period 2017-21
Source: own processing according to data of SBA (2022)

Employment

Micro-enterprises (including FO-entrepreneurs) have long been the most important contributors to SME employment. In 2021, their share was 46.1%. Small and medium-sized enterprises have a significantly lower share (14.1% each) (SBA, 2022). Table 2 provides an overview of the evolution of the number of persons employed in SMEs from 2017 to 2021, with the percentage change in employment.

Table 2. Number of persons employed in SMEs and trend in the change in employment share

Years	Number of employees in SMEs in the Slovak Republic	Change in employment
2017	1,387,848	+1.40%
2018	1,407,324	+1.40%
2019	1,430,804	+1.70%
2020	1,400,859	-2.10%
2021	1,389,960	-0.80%

Source: SBA, 2022

Employment in the corporate sector decreased by 1.0% (by 18.3 thousand persons) to 1,870.6 thousand persons. In 2021, the share of persons employed in the profit-oriented corporate sector in the total number of employed persons in the national economy of the Slovak Republic decreased to 79.4%. Entrepreneurs operating in the accommodation and restaurant services sector in particular had problems retaining their employees. Employers operating in these sectors faced the problem of redundancies, with employment falling by 9.2% and 7.2% respectively. Only two industries, information and communication activities and selected market services, experienced an increase in firm employment in 2021 (SBA, 2022).

Gross production

In 2020, non-financial SMEs produced products and services with a total volume of EUR 62 889 million, which represents 45.31% of the total gross output of non-financial corporations in the Slovak Republic in that year. The volume of gross output of SMEs thus decreased by EUR 3 196 million (or 4,84 %) year-on-year in 2020 due to the pandemic. Despite the fact that the gross output of small and medium-sized enterprises decreased significantly in Q2 2020, micro-enterprises paradoxically produced more goods and services in the same period (Q2 2020) than in Q1. In the second half of the year, the gross output of non-financial corporations started to increase gradually. SMEs failed to match the output of 2019 even at the end of 2020. The increase in the output of the orpti of 2019 occurred only in Q1 2021. Changes in the output of SMEs SR are shown in Table 3.

Table 3. Year-on-year comparison of gross output of SMEs in the Slovak Republic in the period 1Q 2019 - 1Q 2021

Size	1Q 20 / 1Q 19	2Q 20 / 2Q 19	3Q 20 / 3Q 19	4Q 20 / 4Q 19	1Q 21 / 1Q 20
Micro	↑ 1.47 %	↓ 5.27 %	↓ 3.51 %	↑ 2.47 %	↑ 1.90 %
Small	↓ 0.44 %	↓ 11.99 %	↓ 2.81 %	↓ 5.45 %	↑ 2.97 %
Medium	↓ 1.48 %	↓ 15.23 %	↓ 7.37 %	↓ 4.69 %	↑ 0.14 %
TOTAL	↓ 3.93 %	↓ 20.09 %	↓ 1.19 %	↑ 1.28 %	↑ 4.39 %

Source: SBA, 2021c

Added value

Non-financial business entities belonging to the size category of micro, small and medium-sized enterprises generated an added value of EUR 24,096 million in 2020, which represents 53.63% of the total added value of non-financial corporations in the Slovak Republic in the respective year. Thus, compared to 2019, due to the pandemic, the value added of SMEs decreased by EUR 973 million (or 3.88%). The second wave of the pandemic had a greater impact on the value added of micro-entrepreneurs, which did not reach the value of the pre-pandemic period even in Q1 2021. In relative terms, the most pronounced declines in value added were recorded by accommodation and food services, transport, industry and construction. In contrast to gross output, the value added of non-financial enterprises recorded a year-on-year increase in values in Q3 2020 in as many as 7 sectors. Table 4 shows the changes in the value added of SMEs in the Slovak Republic.

Table 4. Year-on-year comparison of value added of SMEs in the Slovak Republic in the period 1Q 2019 - 1Q 2021

Size	1Q 20 / 1Q 19	2Q 20 / 2Q 19	3Q 20 / 3Q 19	4Q 20 / 4Q 19	1Q 21 / 1Q 20
Micro	↓ 0.18 %	↓ 7.18 %	↓ 0.52 %	↓ 4.54 %	↑ 0.69 %
Small	↓ 0.42 %	↓ 11.35 %	↓ 9.68 %	↓ 8.28 %	↑ 3.64 %
Medium	↓ 0.53 %	↓ 10.12 %	↑ 0.82 %	↑ 3.94 %	↑ 4.70 %
TOTAL	↑ 0.79 %	↓ 13.22 %	↑ 3.75 %	↑ 2.56 %	↑ 2.85 %

Source: SBA, 2021c

Profit

Profit is a measure of the success or failure of the transformation process - i.e. it measures the effect created in the transformation process and is summarised by a qualitative indicator of corporate performance. Non-financial SMEs reported a total profit of EUR 4 790 million in 2020, which represents 53.09% of the profit generated by all non-financial companies in the Slovak Republic in total in 2020. Thus, compared to 2019, which was not affected by the pandemic, non-financial SMEs reported a lower profit of EUR 640 million (or 11.78%). Microenterprises made higher profits in the first half of 2020 than in the second half. Paradoxically, they reported the highest profits during the first wave of the pandemic - in Q2 2020. The impact of the second wave of the pandemic was more pronounced for micro and small businesses, which is also related to their sectoral structure. The volume of profits made by micro and small enterprises in Q1 2021 did not exceed the volume of profits made before the pandemics, and decreased in comparison with 2020, with small enterprises declining the most, by 47%. Table 5 shows the changes in the profits of SMEs SR.

Table 5. Year-on-year comparison of profits of SMEs in the Slovak Republic in the period 1Q 2019 - 1Q 2021

Size	1Q 20 / 1Q 19	2Q 20 / 2Q 19	3Q 20 / 3Q 19	4Q 20 / 4Q 19	1Q 21 / 1Q 20
Micro	↓ 2.15 %	↓ 12.45 %	↑ 1.92 %	↓ 56.03 %	↓ 19.26 %
Small	↑ 5.34 %	↓ 7.38 %	↓ 14.72 %	↑ 12.82 %	↓ 47.08 %
Medium	↓ 37.62 %	↓ 17.32 %	↓ 20.12 %	↑ 63.26 %	↑ 102.76 %
TOTAL	↓ 11.31 %	↓ 30.07 %	↑ 17.85 %	↓ 18.98 %	↑ 16.18 %

4. Discussion

Already in the period before the pandemic, at the end of 2019, there was a decline in global demand, which was exacerbated by the pandemic measures in place. In the case of the Slovak Republic, there was a decline in industrial production, further extensive restrictions in the service sector and other sectors, and the overall situation led to a reduction in consumption, followed by a decline in production, which was ultimately reflected in a decline in GDP in 2020. Sharp declines in demand and production due to blockades and supply chain disruptions led to a historic contraction in activity in Q2 2020. Factories remained operational and were helped by strong export demand and inventory replenishment. Overall, the pandemic effect in 2020 was milder than the euro area average and smaller than initially expected. Due to the restrictions, more than 3,000 trades were also suspended in early 2020 (Bečka, 2020).

After a slowdown in the first quarter, economic growth picked up in the second quarter of 2021, helped by easing measures and a gradual recovery in economic activity, especially in the services sector. The fiscal support will be partly offset by the use of grants from the EU's Recovery and Resilience Facility, which could amount to EUR 6.3 billion over 2021-2026 (OECD, 2020).

The negative impact of the coronary crisis on the Slovak economy in 2020 was also reflected in the development of the economic performance of the small and medium-sized enterprise sector. In 2020, the growth trend of all important economic indicators of SMEs was interrupted. The impact of the pandemic was also felt in the area of innovative activity of enterprises. SMEs in particular have been reassessing their planned innovation activities or have suspended them altogether. (SBA, 2021b)

Even in 2021, businesses did not have sufficient scope for a significant improvement in investment activity. This is because a stronger take-off in investment activity was hampered by input shortages (especially in industrial production; as a supply shock), but also by rapidly rising input prices, primarily due to the impact of the opening up of the economy and the easing of anti-pandemic measures. A

significant part of the services sector was closed (due to the COVID-19 pandemic). Consumption was more goods-oriented, which caused a stronger growth in global demand for consumer goods, affecting the availability of some components and materials (SBA, 2021c).

In the long term, the sectoral structure of SMEs is characterised by an increasing representation of the service sector, accompanied by a decline in the trade sector. The representation of agriculture and industry has remained unchanged in recent years. The construction sector has shown a slight increase in recent years. The sectoral structure is highly differentiated in terms of size categories of enterprises. SMEs with a higher number of employees are characterised by a higher representation of industry. Micro and small enterprises, on the other hand, have a higher share of construction and services. In contrast to the year in which the corona crisis broke out (2020), SMEs in 2021 were already better able to cope with the negative impacts of the pandemic, which was reflected in the increased number of active SMEs in Slovakia.

The quarantine measures significantly affect small and medium-sized enterprises (SMEs), which, due to the economic downturn, have problems with cash flow and maintaining employment. During the 2020 and 2021 pandemics, retention of employees was particularly difficult for accommodation and restaurant service businesses. The construction and industrial sectors were among the other sectors with significant employment declines. The only sector of the economy in which labour demand grew was the information and communication services sector. As a result of the measures taken, owners of retail establishments were also forced to partially or completely reduce their activities, which caused a significant drop in sales in the retail sector, which fell more during 2020 than in 2009.

Based on the results presented, it can be concluded that profit is the indicator most affected by the impact of the pandemic. Similarly to gross output and value added, SMEs' profit experienced the most significant decline in the first half of 2020 - specifically in Q2, when the first wave of the pandemic was raging. In Q4 2020, with the escalation of the second wave of the pandemic, the bottom line of non-financial enterprises deteriorated again, especially for micro enterprises. Compared to the same period of the previous year, only small and medium-sized enterprises reported higher profits in Q4 2020.

The growth in economic performance has not been confined to Slovakia, but has also been characteristic of other EU countries. Among the V4 countries, the Hungarian economy performed best, growing by 7.1%. Poland's gross domestic product increased by 5%. The Czech Republic (growth of 3.3%) and Slovakia (growth of 3.0%) were well behind Poland. In the European Union as a whole, performance increased by more than 5%, mainly due to the growth of major European Union economies such as France, Spain and Italy. The performance of the Slovak economy in 2021 was almost the lowest in the EU. Thus, the Slovak economy's performance in 2021 lagged behind not only the V4 countries, but also most EU countries (Eutostat, 2021).

Conclusion

The emergency situation associated with COVID-19 raises specific needs for structural changes in both enterprises and institutions. In the context of the pandemic, it also appears that the country's technological readiness and the associated digital transformation, may be key in this regard in the near term. On the other hand, the deteriorating investment climate may lead to a slowdown in the necessary structural changes. One of the most vulnerable and most affected groups of businesses are SMEs, which have in some cases been existentially impacted by the anti-pandemic measures. The impact of the coronavirus has also been reflected in the economic performance of the SME sector. Lack of demand, low liquidity and not inconsiderable fixed costs have been a burden for many of them as a result of the coronary crisis.

The coronacrisis has shown that the need to learn and adapt is essential for survival. The increase in the number of SMEs in the Slovak Republic, the increase in output and value added in SMEs in the Slovak Republic already in the first quarter of 2021 indicate the ability of SMEs in the Slovak Republic to adapt to change. The agility of enterprises as the need to adapt to new conditions, to react quickly and flexibly, or to focus on creating value for the customer are in demand in various sectors. While a small organisation is often naturally agile, larger medium and large enterprises need to increase their agility with increasing uncertainty, ambiguity and variability of problems and the environment.

The Impact of Geopolitical Risk on Industrial Production in Taiwan

Dejan Romih^{1,*}

¹ University of Maribor, Faculty of Economics and Business,
Department of International Economics and Business, Razlagova ulica 14, 2000 Maribor, Slovenia

Abstract

Research background: The Russo-Ukrainian war and the risk of a Sino-Taiwanese war make it necessary to examine the impact of a positive shock to the geopolitical risk index on the economy. Indeed, the evidence from the United States shows that a positive shock to the geopolitical risk index has a negative impact on economic activity. It is therefore important to measure and monitor geopolitical risk.

Purpose of the article: The purpose of the article is to examine the impact of a positive shock to the geopolitical risk index on the industrial production index for Taiwan, a semiconductor manufacturer.

Methods: I use two vector autoregressive models and monthly data from 2003 to 2023 to examine the relationship between the above indices.

Findings and added value: I find that a positive shock to the geopolitical risk index causes a decline in the industrial production index for Taiwan, which is consistent with the literature on the impact of geopolitical risk on the economy. The article has important implications. First, it is necessary to monitor geopolitical risk. Second, it is necessary to control geopolitical risk. And finally, it is necessary to increase the resilience of the industry and its supply chains to geopolitical risk.

Keywords: geopolitical risk, industrial production, Taiwan

JEL classification: E32, F51

1. Introduction

The escalation of the Russo-Ukrainian war in February 2022 and the risk of a Sino-Taiwanese war have changed the geopolitical situation in the world. The geopolitical tensions in the Taiwan Strait have led to concerns about the supply of semiconductors (Semiconductor Industry Association, 2023). It is therefore important to examine the impact of geopolitical risk on industrial production.

In this study, I focus on Taiwan, an island country in East Asia known for its semiconductor industry (Semiconductor Industry Association, 2023, pp. 20–21). I examine the relationship between the geopolitical risk index developed by Caldara and Iacovielli (2022) and the industrial production index for Taiwan. The geopolitical risk index depends on the number of articles in ten newspapers (Chicago Tribune, Financial Times, Los Angeles Times, The Daily Telegraph, The Globe and Mail, The Guardian, The New York Times, The Wall Street Journal, The Washington Post, USA Today) about geopolitical tensions. In addition to the geopolitical risk index, I also use its two sub-indices: the geopolitical acts index and the geopolitical threats index.

The geopolitical risk index enables policymakers to monitor and control geopolitical risks. This is important because evidence shows that geopolitical risk has a negative impact on the economy, and much of this evidence applies to the United States (see, for example, Alam et al., 2023; Caldara & Iacoviello, 2022; Fiorillo et al., 2023; Gkillas et al., 2018; He, 2023; Nguyen & Thuy, 2023; Yang & Yang, 2021).

Caldara and Iacovielli (2022) found that a positive shock to the geopolitical risk index causes a long-term increase in the geopolitical risk index, a short-term increase in the CBOE Volatility Index (VIX), a long-term decline in real private fixed investment per capita, a long-term decline in nonfarm payrolls in private sector per capita, a short-term decline in the West Texas Intermediate oil price, and a short-term decline in the 2-year Treasury note yield at constant maturity. They also found that a positive shock to the geopolitical acts index has a negative impact on the economy. This is also true for a positive shock to the geopolitical threats index. The evidence for the United States shows that geopolitical risk has a negative

* Corresponding author: dejan.romih@um.si

impact on the stock market. For example, He (2023) found that a positive shock to the geopolitical risk index causes a short-term decline in the sentiment index developed by Baker and Wurgler (2006). This is consistent with the findings of Caldara and Iacoviello (2022).

The rest of this article is divided into four sections. In Section 2, I describe the methods I used in this study. In Section 3, I present the results of this study and in Section 4, I discuss the results.

2. Methods

In this study, I use two VAR models. First, I use a VAR model with five variables and five lags. The order of the variables is as follows: the natural logarithm of the geopolitical risk index (\ln_gri), the natural logarithm of the TAIEX (\ln_taidx), the interest rate for Taiwan (ir), the natural logarithm of the unemployment rate for Taiwan (\ln_ur) and the natural logarithm of the industrial production index for Taiwan (\ln_ipi). I chose the number of lags based on the Akaike information criterion and the final prediction error. I use monthly data from July 2003 to March 2023.

Second, I use a VAR model with six variables and two lags. The order of the variables is as follows: the natural logarithm of geopolitical acts (\ln_gai), the natural logarithm of geopolitical threats (\ln_gti), the natural logarithm of the TAIEX (\ln_taidx), the interest rate for Taiwan (ir), the natural logarithm of the unemployment rate for Taiwan (\ln_ur) and the natural logarithm of the industrial production index for Taiwan (\ln_ipi). I chose the number of lags based on the Akaike information criterion, the final prediction error and the Hannan and Quinn information criterion. Variable descriptions and sources can be found in Table 1.

Table 1. Variable descriptions and sources

Variable	Description	Source
\ln_gri	Geopolitical risk index, index	Caldara & Iacoviello (2022), https://www.matteoiacoviello.com/gpr.htm
\ln_gai	Geopolitical acts index, index	Caldara & Iacoviello (2022), https://www.matteoiacoviello.com/gpr.htm
\ln_gti	Geopolitical threats index, index	Caldara & Iacoviello (2022), https://www.matteoiacoviello.com/gpr.htm
\ln_taidx	TAIEX, index	Taiwan Stock Exchange Corporation, https://www.twse.com.tw/en/
ir	Discount rate, %	Central Bank of the Republic of China, https://www.cbc.gov.tw/en/
\ln_ur	Unemployment rate, %, seasonally adjusted	Directorat-General of Budget, Accounting and Statistics, https://eng.dgbas.gov.tw/
\ln_ipi	Industrial production index, index, seasonally adjusted	Directorat-General of Budget, Accounting and Statistics, https://eng.dgbas.gov.tw/

3. Results

In this section, I examine the impact of a positive shock to the geopolitical risk index on the industrial production index for Taiwan. I also examine the impact of a positive shock to the geopolitical acts index and the geopolitical threats index on the industrial production index for Taiwan. As I mentioned in the previous section, I use two VAR models. Both satisfy the stability condition as all eigenvalues lie within the unit circle. The descriptive statistics can be found in Table 2.

Table 2. Descriptive statistics

Variable	Number of observations	Mean	Standard deviation	Minimum	Maximum	Skewness	Kurtosis
\ln_gri	237	4.56	0.23	4.10	5.79	1.13	5.87
\ln_gai	237	4.48	0.36	3.35	5.54	0.05	3.52
\ln_gti	237	4.58	4.58	3.97	6.02	1.27	6.37
\ln_taidx	237	22.90	0.31	22.17	23.63	0.45	3.01
ir	237	1.75	0.59	1.13	3.63	1.53	4.85
\ln_ur	237	1.42	0.12	1.28	1.80	1.55	4.86
\ln_ipi	237	4.51	0.23	3.95	4.95	-0.20	2.20

Source: Own calculations

Figure 1 shows the movement of the geopolitical risk index, the geopolitical actions index and the geopolitical threats index from July 2003 to March 2023.

Figure 1. Geopolitical risk index and its sub-indices

Notes: The horizontal axis of the graph is in months. 2002-01 stands for January 2002.

Source: Caldara & Iacoviello (2022), <https://www.matteoiacoviello.com/gpr.htm>

During the observed period, the geopolitical risk index peaked at 325.44 in March 2022 (see Figure 1), indicating that it reached its highest point shortly after the escalation of the Russo-Ukrainian war in February 2022. This is not surprising, as the escalation had a negative impact on geopolitics in the region and the world. Both sub-indices also peaked in March 2022: the geopolitical acts index at 253.42 and the geopolitical threats index at 413.42. This means that escalation of war is an important factor in geopolitical risk.

In the rest of this section, I present the results of the analysis of the impulse–response functions. First, I focus on the impact of the geopolitical risk index on the industrial production index for Taiwan.

Figure 2. The orthogonalised impulse–response functions in the case of a positive shock to \ln_gri .

Notes: The horizontal axis of each graph is in units of time and the vertical axis of each graph is in units of the variable. Each graph shows the impact of an innovation over a 60-month period. The confidence level for confidence intervals is 95.

Source: Own calculations

Figure 2 shows that a positive shock to \ln_gri has a negative impact on \ln_ipi that is statistically significant between the second and the twenty-seventh month after the shock. In other words, a one-time increase in the geopolitical risk index causes a long-term decline in the industrial production index for Taiwan. Figure 2 also shows that a positive shock to \ln_gri also has a negative impact on \ln_taiex that is

statistically significant between the first and the twenty-seventh month after the shock. This means that a one-time increase in the geopolitical risk index causes a long-term decline in the stock market index for Taiwan.

Moreover, Figure 2 shows, that a positive shock to \ln_gri has no impact on ir and \ln_ur , which is not consistent with my expectations. I expected the positive shock to \ln_gri to have a negative impact on ir and a positive impact on \ln_ur .

Second, I focus on the impact of the geopolitical actions index on the variable of interest.

Figure 3. The orthogonalised impulse–response functions in the case of a positive shock to \ln_gai

Notes: See notes in Figure 2.

Source: Own calculations

Figure 3 shows that a positive shock to \ln_gai has a negative impact on \ln_ipi that is statistically significant between the second and the thirty-fourth month after the shock, which is seven months longer than in the previous case. Figure 3 also shows that a positive shock to \ln_gai also has a negative impact on \ln_taiex that is statistically significant between the third and the twenty-ninth month after the shock, which is longer than in the previous case. Figure 3 also shows that a positive shock to \ln_gai has a positive impact on both \ln_gai and \ln_gti .

Finally, I focus on the impact of the geopolitical threats index on the industrial production index for Taiwan.

Figure 4. The orthogonalised impulse–response functions in the case of a positive shock to \ln_gti

Notes: See notes in Figure 2.

Source: Own calculations

Figure 4 shows that a positive shock to *ln_gti* has no impact on other variables except *ln_gti*. This means that threats are not as harmful as acts.

4. Discussion

In this study, I show that an unexpected increase in the geopolitical risk index causes a decline in the industrial production index for Taiwan. This result shows how important it is for industries to manage geopolitical risk by diversifying their production geographically. This applies to both domestic and foreign industrials. Since Taiwan is a major manufacturer of semiconductors (Semiconductor Industry Association, 2023, pp. 20–21), this is particularly important for manufacturers of electronics. The reality is that a potential Sino-Taiwanese conflict could lead to disruptions in the supply of semiconductors, which would have a negative impact on industrial production in the world (Gao et al., 2023; Zhang & Zhu, 2023). Therefore, it is important for China and Taiwan to defuse tensions in the South China Sea.

Conclusion

The geopolitical situation in the Taiwan Strait and in the world is very difficult, partly because of the consolidation of geopolitical power (Kim & Cho, 2022; Lee, 2022). The geopolitical tensions between China and Taiwan on the one hand, and between China and the United States on the other, have led to concerns about peace and prosperity in the region.

This study contributes to the literature on the impact of geopolitical risk on the economy. Using data for Taiwan, I found that a positive shock to the geopolitical risk index causes a decline in the industrial production index and the stock market index, which is in line with my expectations. This is also true for a positive shock to the geopolitical acts index, but not for a positive shock to the geopolitical threats index. Surprisingly, I found that a positive shock to the geopolitical risk index has no impact on the policy rate and the unemployment rate, which is also true for a positive shock to the geopolitical acts index and a positive shock to the geopolitical threats index.

These findings have important implications. First, there is a need to monitor geopolitical risk. The geopolitical risk index enables policymakers to monitor geopolitical risk in the world in general and in selected countries in particular. Second, there is a need to control geopolitical risk. This applies to both domestic and foreign industrial companies. Finally, there is a need to increase the resilience of industry and its supply chains to geopolitical risk.

How Does Medical Insurance Contribution Affect Corporate Value? Evidence from China

Xuchao Li¹, Jiankun Lu^{2,*}, Jian Wang¹, and Jiyuan Wang³

¹ School of Economics and Management, Wuhan University, Wuhan, PRC

² Corresponding author. Email: lujiankun@zufe.edu.cn. School of Public Finance and Taxation, Zhejiang University of Finance and Economics, Hangzhou, PRC

³ School of Insurance, Central University of Finance and Economics; China Institute for Actuarial Science, Central University of Finance and Economics, Beijing, PRC

Abstract

Research background: Theoretically, there is an apparent trade-off between potential costs incurred and benefits gained from investing in employees' health insurance. Despite the importance of this issue, the extent to which medical insurance affects firms' value and the mechanisms through which insurance provision plays a role have not been studied systematically.

Purpose of the article: This paper studies the impact of firms' medical insurance contributions for employees on corporate value.

Methods: This study uses the reform of nationwide social insurance collection as an instrumental variable (IV) and employs a two-stage-least-square (2SLS) estimation procedure to identify the causal effects.

Findings & Value added: Results show that the increases in firms' contributions to employees' medical insurance funds have a positive impact on firms' market-to-book ratio. These effects can be explained by enhanced labor productivity, firm efficiency, and innovation. Heterogeneity analysis suggests that the effects are more pronounced for firms in high R&D industries, areas with high pollution, or areas with better medical and labor supplies. It contributes new insights to the existing literature on firm risk management, especially human capital risk management. And most existing studies focus on the provision of pension and retirement benefits, while we focus on the medical insurance contribution behavior of firms.

Keywords: medical insurance contribution, corporate value, employee health risks

JEL classification: I18, D21, G32

1. Introduction

Medical insurance is central to modern healthcare systems and improves population health over time. Existing research has mainly focused on the impacts of medical insurance on the improvement of household welfare (Barcellos and Jacobson, 2015), while few studies have examined how medical insurance contributions affect firms' performance and value. Understanding the effect on firms' performance and value can shed light on firms' incentives and responses to provide insurance for employees. In some countries, such as the Netherlands and Germany, there are mandatory health insurance schemes for all citizens (see, e.g., Van de Ven et al., 2008; Busse et al., 2017), while in others, such as the United States and China, there is a partial provision of employer-sponsored health insurance schemes (see, e.g., Farber and Levy, 2000; Liu et al., 2002). Providing medical insurance is an efficient way to shift human capital risks, especially health risks, outside firms. Intuitively, providing medical insurance has two potential effects on firms. The first is that providing insurance adds to firms' labor costs. If firms have to contribute to their employees' health insurance, their contribution can be regarded as an additional cost along with employees' wages and other fringe benefits. For example, Fairlie et al. (2011) show that employer-based health insurance increases labor costs and negatively affects business creation, especially for those employees who cannot be covered by insurance through their spouses. Molina-Vera (2021) examines the impact of an expansion of workers' health insurance on the employment of beneficiaries and shows that workers are more likely to become formal employees, with a consequent potential increase in

* Corresponding author: lujiankun@zufe.edu.cn

labor costs to employers. The second effect of providing medical insurance is that it improves employees' health conditions and productivity, something that is often overlooked. For example, studies such as Sun et al. (2020) show that improved health conditions and productivity can ultimately boost firms' innovation and performance. Theoretically, there is an apparent tradeoff between potential costs incurred and benefits gained from investing in employees' health insurance. Despite the importance of this issue, the extent to which medical insurance affects firms' value and the mechanisms through which insurance provision plays a role have not been studied systematically.

This study estimates the effect of firms' medical insurance provision on corporate value, using data from all A-share nonfinancial companies in China from 2007 to 2017. To address the potential endogeneity problem arising from firms' unobserved heterogeneous responses to medical insurance contribution, this study uses the reform of nationwide social insurance collection as an instrumental variable (IV) and employs a two-stage-least-square (2SLS) estimation procedure to identify the causal effects. Prior to the reform, firms often evade premium contributions because the collection process by social insurance agencies was imperfectly executed. The reform enforces firms to increase their medical insurance contribution rates to a statutory level by transferring the social insurance collection power from social insurance agencies to tax authorities. This top-down reform is initiated by the central government and gets implemented at different times in different regions. We thus exploit the exogenous regional variations in the timings of the reform across regions to identify the causal impact of medical insurance contribution on corporate value. The results show that, first, social insurance reform increases firms' medical insurance contribution rates by 1 percentage point on average. This first-stage results survive from a battery of tests for identification assumptions of the IV. Moreover, among several potential explanations why firms under-contribute premiums before the reform, we perform additional analyses and recognize that free-rider problem in the market might be the prominent one. Second, a 1 percentage point increase in medical insurance contribution increases firms' market-to-book ratio by 14.3 percentage points, which is around 5.35 percentage points of the sample mean. This positive effect can be explained by the improvement in labor productivity and firm innovation and efficiency. Specifically, a 1 percentage point increase in medical insurance contribution leads to increases of 2.4 (2.7 after partialling out the industrial average) and 6.3 percentage points in employees' wages and productivity, respectively; it also leads to increases of 2.7 and 4.3 percentage points in firm efficiency and total factor productivity (TFP), respectively.

2. Institutional Background

Although insurance contributions are mandatory for firms and employees, the collection process has been imperfectly enforced, and evasion is quite common. Consequently, the firms' actual contribution rates are often lower than the legislated rate of 8%. The efficiency of the collection processes depends on the authority in charge. There are three models of collection across the regions. The first is dominated by local social security agencies. In this model, the agencies review the medical insurance contributions submitted by firms and calculate and approve the finalized amount, which they are also responsible for collecting. The second model is dominated jointly by local social security agencies and tax authorities. In this model, the agencies first review the medical insurance contributions submitted by firms, and then calculate and approve the finalized amount. Finally, the tax authorities collect the exact amount approved by the social security agencies. The second model is more efficient than the first because tax authorities are better able to enforce firms to pay the contribution and prevent evasion than social security agencies. In the third model, the tax authorities alone review, calculate, approve, and collect the contributions that have to be paid by firms. This model is the most effective because tax authorities have access to information on the number of employees, wages, and taxes precorded in the system and can verify the information provided by firms. Moreover, tax authorities have a better capability to collect premiums than social security agencies.

Given that the third model is the most effective, as of 1998, the Chinese government initiated a reform of the social insurance collection system with the aim of moving away from the first two models and giving tax authorities full power to review, approve, and collect firms' social insurance contributions. In reality, it usually takes a long time for a region to adopt the third model. So far, most cities/provinces have only switched from the first model to the second since 1998. In 2018, only four provinces/cities adopted the third model, and most provinces were transitioning from the second to the third. For example, Yunnan, Chongqing, Jiangsu, Anhui, Hubei, Zhejiang, and Inner Mongolia switched from the first model to the second in 1998. Guangdong, Gansu, Shaanxi, Liaoning, Heilongjiang, and Hainan started the

transition in 2000; Qinghai, Fujian, and Hunan started in 2001; Xiamen (capital of Fujian) in 2003; Ningxia in 2008; Guangdong in 2009; Dalian (a major city in Liaoning) in 2010; Ningbo (a major city in Zhejiang) in 2013; and Henan in 2017.

Figure 1 demonstrates the average contribution rates across years relative to the period of reform. Year zero is the year when the policy is introduced, and the other numbers on the x-axis indicate the number of years relative to the period of reform. We can observe an increasing trend in average contribution rates after the reform year.

3. Data and Empirical Strategy

We draw the firm-level data from the China Stock Market & Accounting Research (CSMAR) Database, including all A-share nonfinancial listed companies in China. The sample period 2007–2017 covers the period of social insurance collection reform. In the data set, information about medical insurance contributions is recorded from 2007, which we therefore take as the sample starting date. Since medical insurance contributions are measured in annual incremental amounts by taking the difference in total contributions between two consecutive years, the effective sample of firms ranges from 2008 to 2017. In general, this sample consists of satisfying proportions of firm-year observations exposed to the reform (treatment group) and firm-year observations unexposed to the reform (control group). The policy implementation data is drawn from PKULAW and official policy documents from local governments. Province-level data, such as regional economic development and the demographics employed in this paper, are taken from the *China Statistical Yearbook*. Healthcare-related variables are taken from the *China Health Statistical Yearbook*. Air pollution data are collected from the *China National Environmental Monitoring Centre*. After excluding the subsample of financial firms and observations with a nontrivial number of missing values and winsorizing the sample at the top 1% for continuous variables, the final sample consists of 14,055 firm-year observations. In later regression analysis with fixed effects, we leave out singleton observations within any fixed-effects groups, which leaves us 14,042 effective observations.

Table 1 shows the descriptive statistics of medical insurance contributions. The actual contribution rate of medical insurance has a mean of 5.202% and a median of 4.77%, which is below the statutory contribution rate of 6%.

Note: Corporate value is measured by a firm's market-to-book ratio. Medical insurance (MI) contribution is measured by the ratio of average medical insurance contribution in average compensation (pre-tax wage and other benefits) for a firm in the preceding year. Labor productivity is measured by the average output per employee. Log avg. wage means the natural logarithm of a firm's average wage. Log ind.-demeaned wage means the natural logarithm of a firm's average wage after flattening the industrial average. R&D efficiency is measured by the number of patents divided by R&D investment. The TFP is the residual after regressing the natural logarithm of firms' business income on the natural logarithm of the number of employees as labor input, the natural logarithm of fixed assets as capital input, and the natural logarithm of capital expenditure as investment. Firm size is measured by the natural logarithm of total assets. The asset-liability ratio is measured by total corporate liabilities divided by total assets. Tangibility is measured by taking the ratio of the net value of total fixed assets to the value of total assets. Ownership equals one if a firm is state-owned, and zero otherwise. Separation measures the difference between control and cash flow rights. Board size is the number of directors. The proportion of independent directors is the number of directors who are not employed by the firm. Dummy variable duality indicates whether the chairman of the company also serves as the chairman of the board. It equals one if the chairman is also the CEO, and zero otherwise. Other social insurance contribution rate is measured by the average contribution rate of other social insurance programs such as social security, unemployment, maternity and disability insurance.

Source: Own elaborating based on original data from CSMAR Database, Li et al. (2023)

This study estimates the impact of medical insurance contribution on corporate value through the following empirical specification:

$$y_{frt} = \alpha_0 + \alpha_1 MI_{frt} + \mathbf{X}_{frt}\boldsymbol{\gamma} + \boldsymbol{\delta}_f + \boldsymbol{\phi}_t + \varepsilon_{frt}, \quad (1)$$

where subscription f represents the firm, r represents the region in which the company is located, and t represents the year. The dependent variables, denoted as y_{frt} , include corporate value and four mechanism variables. The core explanatory variable MI_{frt} is the medical insurance contribution measured by the average medical insurance contribution rate of firms. The vector of covariates \mathbf{X}_{frt} includes several time-varying control variables measured at the firm level, such as the firm's financial situation and governance structure, and some regional-level variables to control for the potential data-generating process of the reform. These control variables include economic indicators, such as GDP per capita and GDP growth rate; public financing indicators, such as fiscal deficit and the proportion of social security expenditure to overall fiscal expenditure; and population structure, such as the dependency ratio. Firm fixed effects ($\boldsymbol{\delta}_f$) are introduced to capture time-invariant and unobservable heterogeneities at the firm level, and regional unobserved characteristics are also nested in the firm-level fixed effects. Year fixed effects ($\boldsymbol{\phi}_t$) are introduced to control for common time trends at the regional level. In later analysis, we also introduce industry-by-year fixed effects to control for potential heterogeneities in industrial development over time.

We are interested in parameter α_1 as it shows the effect of interest. However, we cannot treat it as a causal effect since there could be a reverse causality problem. For instance, firms with higher value might invest more in employees' health insurance than other firms. To solve this problem, we employ the social insurance collection reform as an IV to identify α_1 . The first-stage regression is as follows:

$$MI_{frt} = \beta_0 + \beta_1 DID_{rt} + \mathbf{Z}_{frt}\boldsymbol{\rho} + \boldsymbol{\omega}_f + \boldsymbol{\theta}_t + u_{frt}, \quad (2)$$

where we employ a difference-in-differences design using the reform. The term DID_{rt} represents the staggered regional-level social insurance collection reforms. It equals one if region r in which firm f is located has experienced the reform since year t , and zero otherwise. The same firm-level and province-level variables are controlled for in addition to firm fixed effects and year fixed effects. The standard errors ε_{frt}

and u_{firt} are clustered at the region level to account for correlations among firms within the same province (Abadie et al., 2022). Essentially, the 2SLS estimate of parameter α_1 is a so-called local average treatment effect (LATE), which measures the impact of medical insurance contributions on corporate value for those firms that have indeed increased their contributions because of the reform (compliers).

4. Main Results

4.1 Baseline

We estimate Equations (1) and (2) using a 2SLS estimation procedure. Table 2 shows the results of the first-stage regression. The dependent variable in the first-stage regression is the actual contribution of medical insurance (MI). The regression coefficients indicate the marginal effects of the reform on the actual contribution rates of medical insurance. The first column in Table 2 includes only firm fixed effects and year fixed effects, aiming to control for time-invariant firm characteristics and common development trends. Columns (2) and (3) further include additional control variables on financial situations and corporate governance structure, respectively. Column (4) includes the region-level variables to control for the data-generating process of the reform and time-varying regional economic development and fiscal characteristics. Column (5) further includes industry-by-year fixed effects to control for industry characteristics that change over time. The effects are similar in all columns of Table 2, and the size of the effect of exposure to reform on firms' medical insurance contributions ranges between 1.034 and 1.099. The results indicate that, on average, the reform increases firms' medical insurance contributions by more than 1 percentage point, which is approximately 19.88% of the sample mean (using the estimate in Column (5) of Table 2).

Table 2. The effect of reform on corporate medical insurance contribution

Table 3 exhibits the effects of firm medical insurance contributions on corporate value. Columns (1)-(4) show the OLS estimates and Columns (5) and (6) demonstrate the 2SLS estimates, corresponding to the first-stage results in Columns (4) and (5) of Table 2, respectively. The dependent variable in the second-stage regression is corporate value. The endogenous variable is the actual corporate medical insurance (MI) contribution. Column (1) controls for only firm and year fixed effects, while Columns (2)-(3) gradually control corporate financial indicators, corporate governance structure indicators, and province-level economic variables. Column (4) further controls for industry-by-year fixed effects.

Table 3. The impact of medical insurance contribution on corporate value

Source: Own elaborating, Li et al. (2023)

Results in Columns (1)-(4) show that the estimated effect of corporate medical insurance

contributions is approximately 0.05, and all estimates are statistically significant at the 1% level. OLS estimates indicate that a 1 percentage point increase in corporate medical insurance contributions increases corporate value by 0.055 (Column (4) of Table 3), which is about 2.06% of the sample mean. Columns (5) and (6) exhibit the 2SLS estimates whose first-stage results are in Columns (4) and (5) in Table 2. The value of the F-statistic is more than 40, which plausibly suggests that the relevance assumption of the IV is satisfied. Columns (5) and (6) show that the effects of medical insurance contributions are 11.7% and 14.3%, respectively, which are twice as large as the OLS results. The difference implies that the OLS estimates are downward biased compared to the 2SLS estimates. This bias may come from reverse causality, in that those firms with higher values tend to contribute more to employees' medical insurance. Column (6) indicates that a 1 percentage point increase in medical insurance contributions increases corporate value by 14.3 percentage points, which is approximately 5.35% of the sample mean.

4.2 Mechanisms

We consider two: labor productivity and firm innovation and efficiency. First, unlike social security, which benefits employees after retirement, medical insurance benefits employees during their working lives. Maintaining employees' health conditions by providing sufficient medical insurance coverage has a positive impact on employees' productivity, which can then translate into higher corporate value. Second, improved health conditions for employees can also improve firms' innovation activities and efficiency.

We take three measures for labor productivity: (1) the average output per employee; (2) the natural logarithm of a firm's average wage; (3) the natural logarithm of a firm's average wage after partialling out the industrial average. Table 4 reports the results. Average output per employee is measured by the ratio of sales revenue to the number of employees, which is a direct measure of labor productivity. Column (1) of Table 4 shows that a 1 percentage point increase in firm medical insurance contributions increases labor productivity by 6.3 percentage points.

Alternatively, we employ the wage level of employees to measure labor productivity, since wage is an informative measure for employees' productivity. Moreover, employees' deteriorating health conditions can be reflected in wages. Healthy employees receive higher wages compared to unhealthy individuals. We first consider the natural logarithm of firms' average wages. Column (2) of Table 4 shows the results. The effect of medical insurance contributions on log wages is approximately 2.4 percentage points, and is statistically significant. A potential issue with this labor productivity measure is that firms' average wages depend heavily on industry characteristics, which can potentially influence medical insurance contributions and corporate value simultaneously. Therefore, we consider an alternative modified measure of labor productivity. We eliminate industry differences by partialling out the industry average wage from the firm average wage. We run the same exercise and report an estimated effect of 2.7 percentage points in column (3), which is similar to the estimate in column (2).

A potential threat to the interpretation of labor productivity effect is that, even if the calculation of the MI variable is not directly affected by the number of employees, firms' firing decisions could affect marginal productivity. To rule out this possibility, we conduct a robustness check by examining the effect of the reform on the number of employees. The result in Column (6) of Table 4 indicates that the number of employees is impacted insignificantly by the reform. This suggests that firms do not make more layoffs in response to the policy. One potential reason is that it is more costly to fire employees than to provide them with adequate medical insurance. For example, in China, labor law states that firing an employee will cost the employer a multiple of monthly wages, depending on how long the employee has worked. All these results confirm that an increase in medical insurance contributions due to the reform improves the labor productivity of firms.

Table 4. Mechanisms

	(1)	(2)	(3)	(4)	(5)	(6)
	Labor	Log	Avg.	Log	Ind.-Demeaned	TFP
	Productivity	Wage	Wage	Ind.-Demeaned	TFP	R&D

Source: Own elaborating, Li et al. (2023)

Columns (4) and (5) of Table 4 demonstrate the results of the innovation and efficiency measures, which are also employed by existing studies such as Giannetti et al. (2015). Column (4) of Table 4 shows the estimated effect of medical insurance contribution on TFP is 0.043, implying that every 1 percentage point increase in the corporate medical insurance increases TFP by 4.3%. Column (5) reports the results using R&D efficiency (number of patents per employee) as the dependent variable. The results show that a 1 percentage point increase in firm medical insurance contributions leads to a 2.7 percentage point increase in R&D efficiency, which confirms that R&D efficiency is a channel through which increasing employee medical insurance can enhance firm value.

5. Discussions

First, this study contributes new insights to the existing literature on firm risk management, especially human capital risk management. Related studies (e.g., Dalton et al., 2019; Sun et al., 2020) focus on the management of human capital risks to board members, while our study highlights the importance of managing human capital risks to employees. Second, our study focuses not only on the cost aspect of corporate medical insurance contributions but also on their potential benefits. The positive effect we have estimated implies that firms receive a higher market valuation by contributing to employees' medical insurance. Therefore, firms have the incentive to sustain their contribution to employees' medical insurance, contrary to the traditional wisdom that the provision of health insurance for employees is simply a cost (e.g., Fairlie et al., 2011). Third, most existing studies ignore the medical insurance contribution behavior of firms (e.g., Servaes et al., 2013; Desai and Dharmapala, 2009). Unlike pension and retirement schemes, from which employees benefit only after retirement, medical insurance improves their health conditions throughout their working life. Employees' health status and work performance depend on firms' health insurance contribution behaviors; therefore, firms need to take this effect into account to achieve their corporate goals. Finally, we recognize that free-rider problem might be a prominent reason in explaining why firms tend to under-contribute premiums, even though contributing medical insurance is beneficial for them. The results provide field evidence to support policy-making decisions and potential solutions to overcome market failure.

6. Conclusions and Policy Recommendation

This paper studies the impact of firms' medical insurance contributions on corporate value, measured by firms' market-to-book ratios. We draw data on all A-share listed nonfinancial companies in China from 2007 to 2017. To identify and estimate the causal effect, we exploit a nationwide social insurance collection reform as an instrument and a 2SLS estimation procedure. We first find that the reform indeed increases firms' medical insurance contributions, which in turn increases corporate value for firms that have conformed to the reform. Analysis of potential mechanisms shows that this positive effect can be explained by the increase in employees' productivity, firm innovation, and efficiency due to firms' increased investment in medical insurance.

This paper argues that reducing the level of medical insurance contributions would do more harm than good for firms, especially for those firms in polluted areas, highly R&D-intensive industries, or regions with better healthcare and labor supplies. To some extent, our conclusion supports Desai and Dharmapala (2009), who studied the impact of corporate tax avoidance on firm value. Maintaining a statutory level of medical insurance contribution enhances employees' labor productivity, innovation, and

firm efficiency, and all these positive effects translate into an increase in corporate value. Therefore, reducing social insurance contributions cannot be a one-size-fits-all policy, and different social insurances should be treated differently. Our paper suggests that medical insurance contributions should be held at a fair level.

Abstract

Research background: Sri Lanka was under the limelight of the world last year due to the political and economic crisis which resulted in a civil movement that ousted an executive president with a two-thirds majority power in the parliament. The crisis caused significant harm to the nation with negative effects in the short run as well as in the long run. One such long-term adverse effect is the severe brain drain that the country currently experiences.

Purpose of the article: Through this study, researchers attempted to understand the factors contributing to intensifying the recent graduates' intention to migrate using a quantitative approach. Through the lenses of the push and pull factors model of migration, researchers attempt to understand which factors have made a dominant contribution during the recovery period.

Methods The survey method was used to collect data from 232 respondents using self-guided structured questionnaires which were analyzed using SPSS 20. The sample consisted of recent Sri Lankan graduates who were selected using the convenience sampling technique.

Findings & Value added: The regression analysis revealed that in the presence of all studied factors in the push and pull factors model of migration, social push, political push, and economic pull factors significantly affect the migration intention of fresh graduates in Sri Lanka. However, the study revealed that the impact made by economic push, social pull, and political pull factors is insignificant.

Keywords: migration, crisis, graduates, Sri Lanka, push-pull model

JEL classification: 0150, R23

1. Introduction

History provides ample evidence of human migration prompted by expectations of better opportunities in life created by favorable social, economic, and political circumstances in regions of immigration (Kandemir, 2012). Hence, throughout the history of mankind, human beings have been moving from place to place seeking opportunities to improve their standard of living (Mishchuk & Grishnova, 2015). Extant literature defines migration as a movement that involves a change of residence for a substantial duration, which in a way facilitates the migrants to achieve their desired life (Sinha, 2005). Hence, the willingness to migrate has proven to be an outcome of migrants' expectations of favorable social, economic, and political circumstances in their surroundings (Iravani, 2011).

At present, the research site -Sri Lanka, is in the process of recovering from a severe economic and political crisis, which has led the people into complexities in achieving their desired social life expectations (Kaur, 2022; Koop, 2022). The mismanagement of domestic fiscal policy and inaccurate decisions made by the ousted political regime in its recent political history have depleted the quality of life of its citizens, which has motivated the youth to seek opportunities for migration (George et al., 2022; Sharma & Anawade, 2022).

Emigration has been an evident phenomenon in the history of Sri Lanka since the late 1970s owing to significant changes adopted in accordance with the introduced open economic policy in 1977. Hence,

* Corresponding author: uchitha@mgt.ruh.ac.lk

emigration has never been a major topic of discussion in Sri Lanka until the recent few years as the major proportion of Sri Lankan migrants earlier comprised unskilled labor to the Gulf countries (Collyer et al., 2009). Further, even the emigration statistics from the late 1970s until 2019 presented only a consistent gradual improvement. However, by the end of the calendar year 2019, the total number of migrants from Sri Lanka was about 203,087, which can be observed as a significant increment in comparison to the 5716 emigrations recorded as the average number of emigrations recorded per annum since 1986 to 2019. Further, 311,056 legal emigrations were recorded in 2022 which was a 153% growth compared to the emigrations recorded in 2019 before imposing covid 19 international travel restrictions (SLBFE, 2022).

Apart from the severity of the matter depicted by the drastic rise in the total number of emigrations, the SLBFE statistics also highlight the change in the manpower of emigrations. The report accentuates a significant rise in professional and skilled labor migration compared to previous years (SLBFE, 2022). This development is of significant importance in the purview of brain drain and subsequent national policy preparation as the emigration of skilled labor and professionals is considered to be a severe concern in comparison to the emigration of unskilled labor (Ramanayake & Wijetunga, 2018)

Recent studies conducted in the research site affirm the growing tendency for graduates in Sri Lanka to migrate (Dharmadasa et al., 2019; Weerasinghe & Kumar, 2014). This phenomenon can be defined as the brain drain, which is a transfer of human capital from less developed economies to more developed nations (Williams & Baláz, 2005). Brain drain, or human capital flight, is regarded as an economic cost to a nation that affects virtually all aspects of a country's operations (Dodani & Laporte, 2005; Irvani, 2011). Accentuating the importance of the phenomena, this study focuses on understanding the causes prompting the migration intention of recent graduates in Sri Lanka even during the recovery period of a multidimensional crisis in which the country currently is in.

Scholars have been contemplating the factors that have caused such significant emigrations from developing countries similar to Sri Lanka. To understand this phenomenon in the current study, the researchers are building their hypothesis based on the "Push and Pull Factors Model" (Ravenstein, 1885). The aforementioned model attempts to study how economic, societal, and political factors cause human migration (Zanabazar et al., 2021). Hence, through the lenses of the 'push and pull factors model', researchers attempt to understand the causes contributing to the decision by recent graduates in Sri Lanka to migrate.

2. Literature Review

2.1. Migration and Brain drain

The movement of individuals from their birth or residing country to settle permanently in another country could be identified as migration (Urbanski, 2022). During the history of humankind, millions of people have moved to other countries yearly in hopes of becoming citizens. Migration has been there since the beginning and can be considered as the calculated decision arrived at by individuals to enjoy opportunities that they would not otherwise receive in their home countries. (Urbanski, 2022; Llull, 2018). Many of the recent studies in the domain of migration have highlighted that a significant number of students are considering traveling abroad and leaving their country across the world in order to thrive in their careers and personal lives expecting monetary and nonmonetary returns (Cattaneo et al., 2019; Tuckman, 1970). Apart from seeking career and personal development, literature discloses that favorable social and political conditions prevail in the migrating country together with the discontent with negative practices of the same aspects back in the home country as dominant factors for students to lean into studying abroad. (Nghia, 2019).

As much as we focus on understanding the factors driving fresh graduates' intention to migrate, the migration of those individuals for further studies or career opportunities is not without any consequences. This international migration of skilled workers also known as the 'brain drain' shorthand developing countries of their human capital which is considered to be a scarce resource and a critical aspect (Docquier et al., 2007). The crucial areas of a nation such as social, economic, and political dimensions of development may be affected because of skilled labor migration. Many recent studies have discovered that a significant number of highly skilled workforce in developed nations come from poorer, isolated, and underdeveloped or developing economies. Eventually, the performances of the developing nations' economies will deplete, which may cause negative economic consequences to the source regions. (Ekanayake & Amirthalingam, 2022; Kone & Özden, 2017). Similarly, the brain drains cause rising societal issues as well. Due to the skilled labor migration the quality of services that are being provided to

migrant's origin society will deplete further as the inadequacy of manpower will occur in the health, educational, and business sector (Adeyemi et al., 2018; Lien & Wang, 2005).

These skilled workers migration is often seen as more disastrous than unskilled migration because it can lead to a loss of human capital which was developed by the developing nations through extensive education and training (Khadria, 2002). The extant literature argues that this can have a negative impact on the developing country's economic growth and development as it undermines a developing country's productive capacity (Lowell & Findlay, 2001). Hence the emigration taking place in large volumes in developing countries poses considerable concerns about the return on the investment made in developing the workforce.

Skilled laborers are often more productive and contribute significantly to the economy where their migration slows the GDP growth and adversely affects those who remain, as a consequence of increment in poverty and inequality (Lowell & Findlay, 2001). The decline in skilled labor will lead to a decline in the technological potential of developing countries and cause a number of social problems since working in another country separately from their own family can lead to psychological losses from both ends (Hamidov, 2022). The impact of skilled workers' migration can vary significantly based on individual circumstances, host country policies, and the economic needs of the source and host nations. Hence, a subtle approach is necessary to understand the full implications of skilled workers' migration (Clemens & Pritchett, 2019).

Scholars are of the opinion that international migration is fundamentally steered by structural economic, political, and social factors such as labor market demand, income inequalities, and conflicts in the home country among many other factors which we can categorize as push and pull factors. (De Haas, 2019). While international migration is an occurrence across the world 'brain drain' is a notable concern in developing countries, in other words, third world countries, where a competent and educated group of the population leave the home country in search of a better future and broader opportunities created by favorable social, political, and economic conditions (Roudgar, 2015). In light of this existing knowledge, the current study attempts to understand the factors that contribute to graduates' intention to migrate during a recovery period of a crisis.

2.2. Theory on Push and Pull Factors of Migration

The push-pull factor theory was originally proposed by Ernest Ravenstein in 1885. The theory was formulated based on Ravenstein's observations of migration trends within Europe. His research revealed that rural-to-urban migration and migration from economically disadvantaged regions to those with higher economic prospects were recurring patterns that he identified through his observations (Ravenstein, 1885). The push-pull factor theory serves as a versatile framework for comprehending various migration patterns, encompassing international, internal, and refugee migrations. It provides valuable insights into the multifaceted motivations that drive people to relocate (Castles, 2014).

The push-pull factor theory is a prominent migration theory that offers insights into the underlying reasons behind human decisions to migrate between different destinations (Urbanski, 2022). The migration theory on push and pull factors portrays that individuals are compelled to leave their home countries either due to negative or "push" factors such as poverty, unemployment, political instability or war in their home country or favorable developments in foreign destinations (referred to as "pull" factors) such as economic opportunities, political stability, and family connections (Stanojoska & Petrevski, 2012). "Push factors are conditions that propel people to leave the origin country, while pull factors are conditions that entice people to enter a destination country" (Simpson, 2022, p. 2). The association between migration and social, economic, or political factors is a complex phenomenon that has been the subject of much research. (Urbanski, 2022). Some scholars argue that social factors, such as family ties and cultural norms, are the most important determinants of migration. Others argue that economic factors, such as poverty and unemployment are more important (Carling & Schewel, 2017). Still others argue that political factors, such as war and political instability are the most important among others.

The push-pull factor theory is a dynamic theory that recognizes a broader scope of causes behind the intention to migrate which could change over time, over diverse communities and contexts (Mazzarol & Soutar, 2002). For example, a country that is experiencing political instability may initially be a push factor for migration (Parkins, 2010). However, even if the political situation stabilizes, better employment opportunities in other nations would operate as a pull factor for migrants who are seeking economic opportunities (Nikou & Luukkonen, 2023). Assigning relative importance to push and pull factors is challenging, however, it is important to consider both types of factors when analyzing the migration patterns

of fresh graduates. For example, a fresh graduate may be motivated to move by a combination of economic push factors such as limited job opportunities in their home country, and social pull factors such as the presence of family or friends in the destination country while certain other factors remain not as significant as former (Mazzarol & Soutar, 2002). Hence, such a model with a broader scope would enable this study to assess the combined effect made by these multiple factors on the intention of fresh graduates to migrate.

Recent studies conducted in Sri Lanka in the domain of migration have revealed that social factors such as family ties and cultural norms (Ekanayake & Amirthalingam, 2019), economic factors such as high employment rate in other nations and low wages in the home country (Ekanayake & Amirthalingam, 2019; de Silva et al., 2010) together with limited opportunities for professional development and political instability in Sri Lanka have propelled many to migrate (de Silva et al., 2010; Mazzarol & Soutar, 2002; Weeraratne, 2022). In order to gain a comprehensive understanding of fresh graduates' migration intention, it is imperative to acknowledge the interplay between these push and pull factors. Typically, both types of factors play a role in the decision to migrate (Mazzarol & Soutar, 2002). Hence, this study focuses on understanding which factors are more dominant in contributing to the migration intention of fresh graduates in Sri Lanka.

3. Methods

3.1 Data Collection and Analysis

Data were collected from 232 graduates who recently completed their first degree from any university in Sri Lanka (State or Private) in any stream of studies. The sample was collected through non non-probability convenience sampling technique using both online questionnaires and printed questionnaires which were self-guided and structured. The questionnaire consisted of two main sections. The initial section consisted of collecting demographic data and section two was dedicated to collecting data for the six independent variables and the dependent variable. Table 3.1 provided below presents the operationalization of the independent and dependent variables tested with 5-point Likert scales. The data collected were later analyzed with SPSS 25 software.

Table 3.1 Operationalization of variables

Construct	Items	Source
Economic Push Factors	<ol style="list-style-type: none"> 1. Income distribution among citizens in Sri Lanka is unfair. 2. It is difficult to find suitable jobs for graduates in Sri Lanka. 3. Salaries paid for jobs in Sri Lanka are inadequate. 	Urbanski, 2022
Social Push Factors.	<ol style="list-style-type: none"> 1. Social discrimination in Sri Lanka is high. 2. Social welfare facilities in Sri Lanka are inadequate. 3. Social security in Sri Lanka is unsatisfactory. 4. Satisfying basic health needs in Sri Lanka is challenging. 5. The Education system in Sri Lanka is poor. 	
Political Push Factors.	<ol style="list-style-type: none"> 1. Political corruption in Sri Lanka is high. 2. Conflicts among major political parties in Sri Lanka are high. 3. The administrative system in Sri Lanka is poor. 4. Human rights violation in Sri Lanka are high. 5. Accountability and Transparency in decision making in Sri Lanka are satisfactory. 	
Economic Pull Factors.	<ol style="list-style-type: none"> 1. I migrate expecting higher wages in the migrated country. 2. I migrate to improve my living standard. 3. I migrate for career development in the migrated country. 4. I migrate due to high job opportunities in the migrated country. 5. I migrate expecting enhanced welfare standards in the migrated country. 6. I migrate expecting favourable work conditions in the migrated country. 	

Social Pull Factors.	<ol style="list-style-type: none"> 1. I migrate to be free from discrimination in the migrated country. 2. I migrate expecting better medicine and healthcare in the migrated country. 3. I migrate expecting enhanced social welfare facilities in the migrated country. 	
Political Pull Factors	<ol style="list-style-type: none"> 1. I migrate expecting political security in the migrated country. 2. I migrate expecting political freedom in the migrated country. 3. I migrate expecting democracy in the migrated country. 4. I migrate expecting political stability in the migrated country. 5. I migrate expecting value for human civil rights in the migrated country. 	
Intention to Migrate	<ol style="list-style-type: none"> 1. I am considering migrating from Sri Lanka to my desired country. 2. The likelihood of me migrating to the desired country is high. 3. I am determined to migrate to the desired country. 	Hou & Shiau, 2020

3.2. Conceptual Framework

The conceptual Framework developed for the study is presented in figure 3.1 provided below. The proposed conceptual framework and the hypotheses developed attempt to study the impact of the three push factors and 03 pull factors selected as independent variables on the dependent variable – intention to migrate.

Figure 3.1. Conceptual Framework

Source: Wijesinghe et al (2023)

Hypotheses;

- H1: Economic Push Factors significantly affect fresh graduates' intention to migrate.
- H2: Social Push Factors significantly affect fresh graduates' intention to migrate.
- H3: Political Push Factors significantly affect fresh graduates' intention to migrate.
- H4: Economic Pull Factors significantly affect fresh graduates' intention to migrate.
- H5: Social Pull Factors significantly affect fresh graduates' intention to migrate.
- H6: Political Pull Factors significantly affect fresh graduates' intention to migrate.

4. Results

4.1. Validity and Reliability

With the objective of testing the suitability of data to be used in the subsequent analysis, researchers initially tested the validity and reliability of the scales used. Table 4.1 provided below are the outcomes of

the statistical calculations performed using the outer loadings for each item in the construct extracted through a factor analysis. The Kaiser-Meyer-Olkin measure or the KMO value of .919 for the factor analysis established sampling adequacy or the suitability of the data to conduct the factor analysis while the Bartlett's Test of Sphericity was significant at .000 which further supported the fitness of data to conduct the factor analysis.

Table 4.1 Validity and Reliability

	Cronbach Alpha	AVE	Composite Reliability	PHE	PHS	PHP	PLE	PLS	PLP
PHE	0.821	0.5662	0.7965	0.7525					
PHS	0.806	0.5674	0.8651	.477**	0.7532				
PHP	0.925	0.6032	0.8834	.543**	.513**	0.7767			
PLE	0.919	0.8066	0.8744	.507**	.431**	.570**	0.8981		
PLS	0.833	0.5341	0.7734	.366**	.437**	.410**	.581**	0.7308	
PLP	0.944	0.6281	0.8939	.436**	.440**	.568**	.612**	.606**	0.7925
IM	0.925	0.6040	0.8207	.473**	.485**	.576**	.637**	.480**	.538**

Source: Wijesinghe et al (2023)

As provided in the table above, the scales used in the study presented statistical evidence to hold both convergent and discriminant validity. The values of the Average Variance Extracted (AVE) of each construct used which were above 0.5 establish the convergent validity (Fornell and Larcker, 1981). Discriminant validity or the constructs' empirical uniqueness from other constructs (Hair et al. 2017) has been established as presented in the above table, which involves a comparison among the square roots of the AVE against the inter-construct correlations. Based on the values provided above, it could be concluded that the constructs used in the study possess discriminant validity as the *square root values* of AVE extracted (*values presented in bold numbers*) for each construct is higher than inter construct correlation value (Fornell and Larcker, 1981). The Cronbach alpha values and the values of composite reliability presented in the table above establishes the internal consistency of the data collected. Literature recommends scales with Cronbach alpha and composite reliability values greater than 0.7 as scales with internal consistency (Hair et al. 2017; Norman & Streiner, 1994).

4.2. Demographic statistics and intention to migrate

The study involved data collected from 232 respondents of which 106 (45.7%) were male respondents while 126 (54.3%) were female respondents. Out of the total participants, the majority of them belonged to the age group of 22-25 years (62.9%) which was followed by 41 respondents with in the age group 18-21 years (17.7%). Number of respondents representing the age groups 26-29 years and above 30 years were 36 (15.5%) and 9 (3.8%) respectively.

Analyzing the monthly income of the respondents, the sample comprised 62 respondents (26.7%) who earned a monthly income that was above LKR 50,000 and less than LKR 100,000. This largest composition was followed by 45 respondents (19.4%) who earned an income of less than LKR 50,000 per month. The third largest composition of the sample in terms of monthly income was 32 respondents (13.8%) who earned an income above LKR 250,000 per month. Out of the 232 respondents, 142 respondents have graduated from state universities while 90 of the sample have graduated from private universities.

The study findings revealed Australia as the most preferred destination of migration of Sri Lankan graduates. Out of the 232 respondents, 82 (65.3%) expressed Australia to be their most preferred destination which was followed by 54 (23.3%) respondents who prefer Europe. 16% of the sample or 37 out of the 232 declared Canada as their most preferred destination of migration while 26 (11.2%) preferred New Zealand. Among the popular migrating destinations of Sri Lankans, the United States ranks 5th with 10.3% of the sample preference.

The severity of the brain draining in Sri Lanka which is about to occur is reflected by the 44% of the respondents' non-willingness to return to Sri Lanka if migrated for any cause. Only 56% of the population is willing to return back once their task is accomplished after migrating. An important outcome generated through the analysis was the absence of any statistically significant difference in the intention to migrate

between graduates from state universities and private universities. The mean values of the intention to migrate by state university graduates and private university graduates were 4.1831 and 4.1741 respectively. The Levene's test was insignificant at .938 with a t value of .078.

4.3. Regression Analysis: Exploring the factors driving migration

The study conducted mainly aimed to understand which factors are causing fresh graduates to migrate from Sri Lanka. Accordingly, a regression analysis was performed with 06 independent variables (i.e., economic push factors, social push factors, political push factors, economic pull factors, social pull factors, and political pull factors) to test the relative impact on the dependent variable, intention to migrate. As per the model summary of the analysis, the adjusted R square value of .494 denoted the ability of the selected independent variables to explain 49% of the variance in the intention to migrate. Further, the fitness of the model used was supported by the significant p-value of the ANOVA table as provided below.

Table 4.4 Regression Model Summary

Model Summary						
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate		
1	.712 ^a	.507	.494	.61337		
a. Predictors: (Constant), Economic Push Factors, Social Push Factors, Political Push Factors, Economic Pull Factors, Social Pull Factors, Political Pull Factors						
ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	87.089	6	14.515	38.580	.000 ^b
	Residual	84.650	225	.376		
	Total	171.739	231			
a. Dependent Variable: Intention to Migrate						
b. Predictors: (Constant), Economic Push Factors, Social Push Factors, Political Push Factors, Economic Pull Factors, Social Pull Factors, Political Pull Factors						

Source: Wijesinghe et al (2023)

Table 4.5 Table of coefficients

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.238	.268		.887	.376
	Economic Push Factors	.066	.061	.064	1.076	.283
	Social Push Factors	.141	.059	.139	2.366	.019
	Political Push Factors	.193	.064	.199	3.027	.003
	Economic Pull Factors	.389	.078	.340	5.005	.000
	Social Pull Factors	.064	.067	.061	.961	.338
	Political Pull Factors	.088	.066	.090	1.324	.187
a. Dependent Variable: Intention to Migrate						

Source: Wijesinghe et al (2023)

As provided in the table above, the regression analysis establishes that, out of the six (06) factors studied, only three (03) factors are causing a significant impact. Accordingly, apart from social push factors, political push factors, and economic pull factors, none of the other factors are causing a significant impact as the significance value is greater than 0.05 (95% confidence level). Among the three factors

identified, economic pull factors present more impact compared to other factors as the standardized beta coefficient of economic pull factors (.340) is greater than .139 and .199 beta coefficients of social push factors and political push factors. Accordingly, it could be concluded that the driving forces behind the migration intention of Sri Lankan fresh graduates are favorable economic drivers in their preferred overseas destination and unfavorable social aspects and political conditions in Sri Lanka.

5. Discussion

The main aim of this study was to explore the factors that drive the intention of fresh graduates to migrate from Sri Lanka. The study was guided by the push and pull model of migration which considered economic, social, and political factors as driving push and pull factors of migration. Conceptually push factors of migration refer to those life situations that cause dissatisfaction with one's present locale while pull factors refer to those appealing attributes that exist in distant places (Dorigo and Tobler, 1983). The current study was conducted to understand which among the selected factors impact on the migration intention of recent graduates in Sri Lanka during a unique development in world history. According to the findings, it was evident that, not all factors tested significantly affect the intention of Sri Lankan fresh graduates to migrate, instead some of those.

As per the findings of the study, the most dominant factor causing fresh graduates to migrate from Sri Lanka is the favourable economic conditions expected in overseas destinations. Accordingly, the expectation of earning higher wages, improving the standard of living and exploring the abundance of quality jobs in overseas nations dominantly affect the intention to migrate. However, an interesting outcome which is noteworthy is the insignificant impact made by economic push factors to migrate ($t=1.076$, $p=0.283$). Conversely, in many of the studies that were conducted to understand the causes behind brain drain, unfavorable economic conditions in the migrants' own locale were found to be significant (Kabbash et al. 2021; Kanayo, 2019). The observation is especially important considering the economic crisis that the country is progressing through. Even though an opinion has been established in the society upholding that, the inability to secure employment opportunities that provide satisfactory income to fresh graduates is the driving force behind labour migration in Sri Lanka, the outcomes of the regression analysis contradicted this perspective as in the presence of other factors, economic push factors are causing relatively an insignificant impact.

This phenomenon of relative insignificant role played by economic push factors to migrate in comparison to economic pull factors has been observed in extant literature. The regression analysis of Urbanski (2022), a similar study conducted in Poland and Romania concluded that economic pull factors operate as the main determinants of human migration to Poland and Romania while the role played by economic push factors to migrate was insignificant. Further in many similar studies (Simpson, 2022; Mayda, 2010), especially the studies which were conducted in low-income earning developing countries, researchers concluded that seeking better working conditions and salaries was the main cause behind labour migration from developing nations (Abdelaziz et al., 2018).

Based on the outcomes of the study, the researcher interprets the crisis prevailing in Sri Lanka which drives the brain drain to be social and political in nature. Critical social aspects such as social discrimination, availability of social welfare facilities of medical services and education together with social security for citizens are at an unsatisfactory level as such factors have significantly caused fresh graduates from Sri Lanka to consider migrating. Dail (1988) resulted in similar findings which concluded that social factors such as social discrimination and low standards of education pushes citizens of developing countries to developed countries.

Similar to the unfavourable social situation in the country, the political crisis has also caused to fuel up the intention of youth to migrate. The study revealed that the combined effect made by the political corruption, conflicts between major political parties, poor governance and administration system has significantly driven ($t=3.072$ $p=0.03$) the intention of Sri Lankan youth to migrate. Even though the unfavourable negative developments in the country encourage people to migrate, favourable social conditions and political conditions are not sought after significant factors in intended destination of visit. In other words, the role played by these favourable social factors and political factors in desired destinations of migration do not significantly affect the intention to migrate. These findings challenge certain studies such as Dail (1988) which held that favorable factors in developed countries significantly affect. In a nutshell, based on the research findings, it could be concluded that hypotheses 02, 03, and 04 are supported while hypotheses 01, 05, and 06 are not supported.

Conclusion

Based on the research findings, it could be concluded that fresh graduates of Sri Lanka are considering the option of migration with the hope of better employment opportunities and salary levels. However, it is important to understand that, dissatisfaction with employment opportunities and perceived less earnings from employment are not significant causes behind migration intention. Hence, in economic perspective, the migration intention is supported more by the expectations of a better life than the lower standards experienced in Sri Lanka. Conversely to the outcome of the economic factors, push factors are dominant in social and political perspectives. This establishes that, rather than the economic crisis in terms of employment, income distribution or employment earnings; the crisis in Sri Lanka is rather social and political in nature. However, the expectations of favorable social and political circumstances in the migrating country do not significantly affect the migration intention.

While the push-pull factor theory provides valuable insights into migration, it is not without limitations. It is a static theory that overlooks the dynamic nature of migration. Moreover, it does not account for the agency individuals exercise in their migration decisions. Additionally, assigning relative importance to push and pull factors proves challenging (Stanojoska & Petrevski, 2012). The push-pull factor theory offers a nuanced understanding of migration dynamics, yet it is essential to recognize its limitations. A comprehensive comprehension of migration necessitates the incorporation of other variables such as networks, policy impact, and individual decision-making processes (Castles & Ozkul, 2014).

Investing in Photovoltaic Panels: A Study of Economic Development Scenarios

Ivan Katrenčík^{1,*}, and Monika Zatrochová¹

¹ Slovak University of Technology in Bratislava, Institute of Management,
Vazovova 5, 812 43 Bratislava, Slovakia

Abstract

Research background: The background of the research is based on a project carried out at the Institute of Management of STU, which dealt with the issue of microgrids and renewable resources.

Purpose of the article: Investments in renewable resources bring with them not only an ecological aspect, but also an economic one, which is often motivating. Today, we live in uncertainty and the probability of a financial and economic crisis is high. The purpose of this paper is to identify the impact of major economic variables such as inflation, energy price growth, interest rates and grants on investment in photovoltaic systems from a business perspective.

Methods: A mathematical model was created to simulate economic variables, which was able to assess data on energy consumption and production on an hourly basis. Consumption data were obtained from typical consumption diagrams provided by energy distribution companies, production data from the PVGIS tool. The impact of economic variables on selected investment evaluation methods such as net present value, internal rate of return, simple payback period and discounted payback period was analysed.

Findings & Value added: Using a simulation using several economic scenarios, we found that inflation has an ambiguous impact according to the selected investment evaluation methods, real discount rate slightly negative effect, escalation rate of electricity prices significantly positive effect, debt parameters negative effect and non-refundable financing significantly positive effect.

Keywords: photovoltaic system, renewable energy, investment evaluation, economic scenarios

JEL classification: Q42, Q29, Q55, O13

1. Introduction

Investing in photovoltaic panels offers several compelling advantages. First and foremost, solar energy is a renewable resource that is abundantly available and free of cost. Unlike fossil fuels, which are finite and contribute to environmental degradation, sunlight is an inexhaustible source of clean energy. By harnessing solar power, individuals and organizations can significantly reduce their carbon footprint and contribute to a more sustainable energy system (Ramshani, Khojandi, Li, & Omitaomu, 2020).

From a financial perspective, investing in photovoltaic panels can offer attractive returns over the long term (Chiaroni et al., 2014). The cost of solar panels has been steadily declining, making them a more affordable option for both residential and commercial installations (Mah et al., 2018). Furthermore, many countries and regions provide various incentives and government-backed schemes, such as tax credits, feed-in tariffs, and grants, to encourage the adoption of solar energy (D'Adamo, Gastaldi, & Morone, 2020). These incentives can significantly improve the financial viability of solar panel investments and accelerate the payback period.

Moreover, solar panels have a long lifespan and require minimal maintenance. With advances in technology and manufacturing processes, photovoltaic panels are becoming more durable, efficient, and resistant to environmental factors (Jiang et al., 2021). This longevity and reliability make solar panel investments appealing for individuals and organizations seeking stable and predictable returns.

Investing in photovoltaic panels can also serve as a hedge against rising electricity costs. As the demand for electricity continues to grow, traditional energy prices are expected to rise. Installing solar

* Corresponding author: ivan.katrencik@stuba.sk

panels allows individuals and organizations to generate their own electricity and reduce their dependence on the grid, thus mitigating the impact of future price increases (Reis, Almeida, Silva, & Brito, 2019).

It is worth noting that investing in photovoltaic panels involves certain considerations. Factors such as sunlight availability, installation costs, and regulatory frameworks in your region can impact the feasibility and profitability of solar panel investments. Therefore, it is crucial to conduct thorough research, assess the potential for solar energy in your area, and consult with experts or solar energy companies before making any investment decisions (Wu, Wang, Ji, Song, & Ke, 2019).

The main objective of this paper is to use selected economic indicators such as inflation, energy prices, interest rates, grants for photovoltaic systems to evaluate their impact on the return on investment from the point of view of businesses.

2. Methods

The data we used in the simulation were mainly drawn from publicly available sources. Data on typical consumption diagrams were downloaded from the official website of the Energy distributor for the western Slovakia ("Hodnoty - Západoslovenská Distribučná, a. s.," n.d.). The consumption type diagram is a sequence of values of the average hourly consumption of electricity per year, based on which the amount of electricity consumption by electricity consumers with type C metering is determined. They serve as a substitute method to determine the daily consumption diagram, which is necessary to account for deviations. This method is used for sampling points without continuous measurement. Subsequently, calculations were used to obtain the hourly consumption of electricity. TDD1, which is for entrepreneurs and single-tariff products, was used as a typical consumption diagram in the simulation.

We obtained data on weather conditions and solar gain from the European Commission tool – PVGIS (Photovoltaic Geographical Information System) ("JRC Photovoltaic Geographical Information System (PVGIS) - European Commission," n.d.). We obtained data on photovoltaic equipment on market research and a solution proposal from several suppliers for a specific installation. The installation should have been carried out on the roof of the company operating in western Slovakia. Subsequently, we created a simulation application in the Microsoft Excel calculation processor on which we implemented the simulation, the data of which are presented in the results of this publication. From financial parameters, we calculated the net present value (NPV), the payback period, the discounted payback period and the internal rate of return (IRR). The calculations used in these methods are widely known (Zatrochova & Katrencik, 2023).

A solar power plant is significantly dependent on the weather. Not every year is the same, and therefore the profit from the solar power plant varies from year to year. In our work, we considered weather conditions for 16 years (2005-2020), from which we used average values in the simulation.

In our work, we are considering the installation of a photovoltaic system under a company operating in Slovak conditions. This is a model example, and the very structure and focus of the company in this case is not essential. The legislative rules applicable in the territory of Slovakia are essential, especially in the areas of taxes, the functioning of the distribution system and subsidies.

3. Results

In this section, it is necessary to introduce in detail the parameters of the simulation and the limiting conditions that were considered. Subsequently, the results of individual simulation scenarios based on the changes in input parameters will be presented.

3.1 Design of the Photovoltaic System

In the simulation of photovoltaic systems, the geographic location of the installation itself plays an important role. In our simulation, we consider the location of western Slovakia with the following parameters:

- Lat: 48.230, Lon: 17.375,
- Elevation: 137 m,
- PVGIS ver. 5.2,
- solar radiation database: PVGIS-SARAH 2.

As part of price surveys and offers from several suppliers of photovoltaic systems, we obtained a proposal for a photovoltaic system. The premise for the design of the installation was data on the average annual consumption of the company and the spatial availability of the installation. We estimate the

company's annual consumption at 70 MWh and the installation on the roof of the building. By default, the roof of buildings is usually unused, and the installation of photovoltaic systems can serve as a suitable use of free space.

The total power of the photovoltaic installation was considered to be 59 kWp and consisted of the following components:

- crystalline silocon panels with a power of 455 Wp in the number of 130 pcs,
- 60 000 W inverter,
- aluminium frame,
- communication module,
- electrical switchboards AC and DC
- fuses and wiring,
- installation,
- grid interconnection, engineering and permitting.

The PVGIS tool makes it possible to calculate the solar gain of such an installation on an hourly basis based on the selection of a specific location, selection of PV technology, installed power and information about the azimuth and tilt of the panels. This is a freely available online tool of the European Commission, which is often used in practice for such calculations.

Figure 1 shows the monthly energy output of the PV system in the first year at the simulated location.

Figure 1. Monthly energy output of the simulated PV system in the first year
Source: own processing using PVGIS (2023)

The performance of a photovoltaic device is dependent to a large extent on the weather. The weather is not the same every year and therefore in the simulation we considered the average performance, which we calculated as a simple average for 16 years (2005-2020). According to typical consumption diagram, estimated yearly consumption of electricity, maximum reserve capacity, and number of phases, we were able to calculate hourly consumption of electricity during the year (Janicek, Ponican, & Sadlon, 2019). This was later used to calculate the electricity delivered from the PV system and consumed by the company and the electricity that was generated by the electricity PV system and sold to the supplier (excess). The profit used in the calculation of the investment return was composed of the price of electricity produced by the system and consumed by the company and the price of electricity sold by the company. In the calculations of electricity generated by the PV system we considered the losses of various reasons (shading, soiling, losses on the AC/DC side of the systems, and so on). We estimate these losses at 10%. The annual degradation rate of the electricity generated by the PV system was set at 0,55%.

Figure 2 shows that the main excess of electricity generated occurs in the warmer months of the year (April to September). The smaller the granularity of the data, the more accurate the results. In our work, we used hourly production and consumption data, which we consider to be sufficiently accurate. Of course, if we were to think about seconds, the results would be slightly more accurate, but the complexity of the

calculations would increase by an order of magnitude. The value of the electricity that the company produces with the PV system and consumes is higher than the value of the electricity that the company sells.

Figure 2. Electricity consumed and generated by the PV system in the first year
Source: own processing

Estimated installation costs can be found in Table 1. Total Direct Capital costs consisted of modules, inverter frame and installation costs. We calculate contingency at 5% of Total Direct Capital Costs. The interconnection and permit were calculated at 1 400 €. The system needs maintenance and we estimate the yearly maintenance cost 2 500 € per year with the yearly escalation rate at 0,5 % per year.

Table 1. Estimated costs of PV system

Costs	in EUR without VAT
Modules (130 units)	27 000,00
Inverter (1 unit)	3 700,00
Other Material and Frame	33 000,00
Installation Labor	16 000,00
Contingency (5% of Direct Capital Costs)	3 985,00
Total Direct Capital Cost	83 685,00
Grid interconnection, engineering and permitting	1 400,00
Total Indirect Capital Cost	1 400,00
Total Installed Cost	85 085,00
Operation and Maintenance Cost per Year	2 500,00

Source: own processing

Cash flow, which is entered into the investment calculations, consisted of net profit after tax. In addition to the installation costs shown in Table 1, the costs of obtaining foreign capital and interest were also considered in the simulation. The income tax rate was 21% and the depreciation of the equipment was considered for 12 years in an even way (8.33% of the total installed costs per year). The salvage value of the PV system after the lifetime was estimated at 10%.

In various scenarios, only one parameter will change. The input parameters were the same for the entire analyzed period. The default values of the input parameters will be:

- inflation – 2,5 %,
- lifetime of PV system – 25 years,
- real discount rate – 3,0 %,
- electricity rates: fixed monthly charge 3 €, rate for buying electricity 0,5 €/kWh (electricity generated by the PV system and consumed in the company) and rate for selling electricity

0,057 €/kWh (excess of electricity generated by the PV system). The yearly escalation rate was set at 1 %/year.

The typical lifetime of PV systems is 25 years. The analysis period in our research was set according to the standard lifetime of the photovoltaic systems. We considered long-term inflation as the average value of inflation in the Eurozone for the period 1985-2021 according to World Bank data - 2.5% (“World Bank Open Data,” n.d.). The real discount rate used in calculation of nominal discount rate that was used in Net Present Value (NPV) was set at 3.0 %. We set the real discount rate at this value after careful consideration. The value was derived from the Weighted Average Cost of Capital (WACC) for PV systems estimated for Slovakia by a survey and impact analysis published by AURES 2 (European research project on auction designs for renewable energy support – Auctions for Renewable Energy Support) in March 2021 (Roth et al., 2021). The electricity rates were established according to the official price list of the largest electricity supplier operating in the selected region.

3.2 Investment Simulation Without Debt

In the first simulation, we considered that the company made the investment from its own resources without the need for additional financing. The input parameters that we changed in the simulation were:

- inflation,
- real discount rate,
- electricity rates.

Figure 3 shows the changes in financial parameters when the inflation was increasing. Because the nominal discount rate was rising along with inflation, NPV had an increasingly lower value. On the other hand, the IRR was rising with inflation. This happened because due to the higher inflation the profit of the company was rising (inflation raised energy prices and the company saved more costs by producing its own energy). The discount payback period uses a nominal discount rate and therefore was rising as well. Ultimately, the results of the financial parameters show conflicting recommendations. According to NPV and discounted payback period, inflation growth has a negative effect on financial parameters of investment in PV systems and according to IRR and simple payback period has a positive effect.

Figure 3. Financial parameters of investment in PV system according to the changes of inflation
Source: own processing

When we changed the real discount rate, the payback periods and IRR stayed the same. NPV was decreasing and discounted payback period was increasing. Increasing the real discount rate has

a negative impact on the calculated financial parameters of the investment. Data can be seen in Figure 4.

Figure 4. Financial parameters of investment in PV system according to changes of inflation
Source: own processing

Next, we changed the annual escalation rate of the purchase price of electricity. The default value was 1 %/year and we calculated financial parameters for 3%, 6% and 12% per year. As can be seen in Figure 5, the increase in the purchase price of electricity has a significant positive effect on the financial parameters. NPV increased dramatically, IRR increased and payback periods decreased. All parameters showed a positive trend.

Figure 5. Financial parameters of investment in PV system according to the changes in the purchase price of electricity
Source: own processing

When we changed the annual escalation rate of the selling price, the effect on financial parameters was also positive but not as positive as when we changed the annual escalation rate of the purchase price of electricity. That is due to the lesser amount of electricity that is sold and also due to the smaller selling price (compared to the purchase price).

Figure 6. Financial parameters of investment in PV system according to the changes in the selling price of electricity

Source: own processing

3.3 Investment Simulation with Debt

In this part of the work, we examine how the amount of foreign capital needed to acquire a PV system and the amount of interest rate will affect the investment. We will start from the default parameters described in the chapter above and we will gradually change the loan parameters. The default parameters for the interest rate were set at 3,57% p.a. We obtained these data from the statistics of the National Bank of Slovakia as average interest rates on new bank loans for non-financial institutions with a maturity of more than 5 years (“Priemerné úrokové miery z úverov bánk,” n.d.). The default value of maturity of the loan was set at 5 years.

Figure 7 shows the changes of financial parameters of investment evaluation in PV systems according to the changes in the % of loan of total invested capital. The data shows clear negative effect on financial parameters.

Figure 7. Financial parameters of investment in the PV system according to the changes in % of loan

Source: own processing

Changing the interest rate of the loan has a slightly negative effect on the financial parameters of the investment. When the percentage of debt was higher, the effect of the interest rate was also higher. Data are presented in Table 2.

Table 2. Financial parameters of investment evaluation according to changes in interest rate of the debt

Debt percent	10%				20%				30%			
	3,6%	5,0%	7,0%	9,0%	3,6%	5,0%	7,0%	9,0%	3,6%	5,0%	7,0%	9,0%
Interest rate	3,6%	5,0%	7,0%	9,0%	3,6%	5,0%	7,0%	9,0%	3,6%	5,0%	7,0%	9,0%
Payback Period	4,0	4,1	4,1	4,1	4,3	4,4	4,4	4,4	4,7	4,7	4,8	4,9
Discounted Payback Period	4,4	4,4	4,5	4,5	4,8	4,8	4,9	4,9	5,2	5,2	5,3	5,4
Net Present Value	209 759 €	209 499 €	209 129 €	208 751 €	203 402 €	202 883 €	202 143 €	201 387 €	197 045 €	196 267 €	195 157 €	194 023 €

Source: own processing

3.4 Investment Simulation with the Grant

Currently, we can observe a significant trend in the support of green technology and green energy by the state (Fang, 2023). The European Union has a green strategy (European Green Deal) and has a plan to have at least a 42,5% share of renewable energy in gross final consumption by 2030. In addition, OECD and the BRICS countries have implemented policies to limit global warming (Escoffier, Hache, Mignon & Paris, 2021). It is therefore appropriate to consider that businesses can obtain various forms of support and subsidies/grants for investments in renewable energy sources. In our simulation we calculated with the non-refundable grant, which will decrease the amount of money needed to cover the investment costs for the business.

Obtaining a grant has a significant impact on the evaluated financial parameters. The data are presented in Figure 8. Payback periods decreased significantly and the IRR increased significantly. This form of support from the state can significantly motivate businesses to make such an investment and help fulfill the EU's strategic goals in this area.

4. Discussion

In various scenarios of the development of economic parameters, we presented the impact of economic parameters on the economic performance of the investment on selected financial indicators. An increase in inflation according to selected financial parameters is an ambiguous outcome. According to NPV and the discounted payback period, the impact is negative, and according to IRR and simple payback period, it is positive. Increasing the real discount rate has a slightly negative effect on the

investment - IRR and payback period did not change, while NPV and discounted payback period changed negatively. Increasing the purchase price of electricity has a strong positive effect, and increasing the selling price of energy has a slightly positive effect.

When looking at the investment in the PV system using foreign resources, the change in the percentage of foreign resources in the total financing was significantly negative. As the level of indebtedness increased, the assessed financial parameters worsened. Increasing the interest rate of the loan had a slightly negative effect on the evaluated financial parameters, while the degree of negative effect also increased with increasing percentage of debt.

If the company received non-returnable funds, for example in the form of a grant, the financial parameters of the investment would improve with the increasing amount of the grant.

Conclusion

If we look at the investment in the PV system as a whole, the financial parameters of this investment are good. Of the monitored economic variables, only the deterioration of financing conditions clearly has a negative impact on investment. Inflation was evaluated by the monitored financial parameters of the investment as ambiguous. Financial support in the form of a non-refundable loan or grant was identified as a significantly positive economic variable.

In conclusion, investing in photovoltaic panels offers a compelling opportunity to contribute to a sustainable energy future while earning financial returns. With the declining costs of solar panels, government incentives, and environmental benefits associated with solar energy, this form of investment has gained popularity in recent years. By harnessing the power of the sun, individuals and organizations can not only reduce their carbon footprint but also enjoy the long-term financial benefits of clean and renewable energy.

Many studies rely on historical data that might not accurately reflect future performance. The quality and consistency of data can vary, leading to potential inaccuracies in predicting investment returns. Investment returns are highly dependent on location-specific factors like solar irradiance, climate, local policies, and grid dynamics. Many studies might not adequately address these regional variations. Also, the rapid pace of technological advancements in solar technology can render research outdated quickly. New technologies can influence the performance and costs of PV systems, affecting return calculations.

Future research can focus on developing more sophisticated models that integrate various influencing factors, such as technological advancements, climate variability, electricity price projections, and policy changes, could enhance return predictions. With the growing importance of energy storage and grid integration, future research could investigate how combining PV systems with energy storage impacts overall investment returns. Comparative studies could assess investment returns of PV systems against other renewable energy technologies or traditional investment options, providing a broader context for decision-making.

In summary, the limitations in current research on investment returns in photovoltaic systems point toward the need for more comprehensive, dynamic, and region-specific analyses that consider a wide range of influencing factors. Future research should aim to provide more accurate and adaptable models for investors considering solar PV investments.

Abstract

Research background: Unemployment affects individuals' financial stability and well-being while also posing challenges to social cohesion, economic growth, and overall societal development. Therefore, using machine learning models for predicting every jobseeker's unemployment duration has great potential, mainly in identifying individuals threatened by long-term unemployment.

Purpose of the article: This paper presents two machine learning models for predicting the duration of unemployment with high accuracy and precision, where the focus is not only on the predictions themselves but also on identifying important factors that influence the duration of unemployment of the jobseekers.

Methods: In the paper, we used real data on registrations of citizens in Slovakia in the database of jobseekers. We used jobseekers' characteristics and variables describing their previous unemployment history as the input variables. Two machine learning algorithms, classification and regression tree (CART) and neural networks (NN), are employed for prediction modelling.

Findings & Value added: The developed models exhibit strong performance in predicting unemployment duration. Both models have an accuracy of over 77% and, furthermore, excel in identifying the most problematic group of jobseekers with potential unemployment durations exceeding 12 months, with a prediction accuracy of almost 92%. The study also highlights the key predictors of unemployment duration. This information allows for the identification of high-risk jobseekers threatened by long-term unemployment and can assist policymakers, job placement agencies, and individuals in making informed decisions and implementing targeted interventions to mitigate the risk of long-term unemployment.

Keywords: unemployment, prediction models, neural networks, classification and regression tree

JEL classification: E24, J64, C5

1. Introduction

Unemployment duration has far-reaching implications for individuals and societies, encompassing various socio-economic factors. It is a multifaceted issue that not only affects individuals' financial stability and well-being but also poses challenges to social cohesion, economic growth, and overall societal development. Consequently, predicting unemployment duration plays an important role in understanding and addressing this complex phenomenon.

Traditionally, predicting unemployment duration has relied on simplistic approaches, such as categorising individuals into binary groups based on short-term or long-term unemployment. However, this oversimplification fails to capture the nuanced dynamics and potential risk factors associated with unemployment duration. To overcome these limitations, recent research has turned to advanced machine learning techniques and comprehensive analysis of jobseeker characteristics to develop more robust and accurate prediction models. By using machine learning algorithms and considering a wide range of input variables, including demographic factors, educational background, and the course of an individual's previous unemployment, it is possible to find patterns and associations among the unemployment duration

* Corresponding author: lucia.svabova@uniza.sk

and mentioned input variables. Models predicting the duration of a jobseeker's unemployment have the potential to provide actionable insights, identify the individuals with a risk of facing long-term unemployment, aid policymakers, job placement agencies, and individuals in making informed decisions, implementing targeted interventions, and allocating resources effectively to mitigate the risks associated with long-term unemployment.

Given the significance of understanding and predicting unemployment duration, this study contributes to the existing body of literature by employing advanced machine learning methods and comprehensive data analysis techniques. The objective is to develop models with high accuracy of predicting the duration of unemployment, considering four possible unemployment durations, with a main focus on the high-risk group of unemployment duration over 12 months. Moreover, the objective is also to identify the most critical factors dependent with unemployment duration. By doing so, this research aims to provide valuable insights and practical tools for addressing the challenges posed by unemployment duration and fostering more effective interventions and support systems.

The rest of the paper is structured as follows. The Literature review section highlights some interesting studies in the field of predicting unemployment using machine learning algorithms. Next, the Methodology and Data section describes the methods used in the study and the database used for creating the models. The Results section presents the two models created for predicting unemployment duration and identifies the most important predictors within them. The Discussion section analyses the results of this study and compares them with the findings of similar studies published so far. Finally, the Conclusion section summarises the main points.

1.1 Literature review

Prediction of unemployment using machine learning algorithms is a topic that has been analysed by numerous authors worldwide. Some studies have focused on predicting the unemployment rate in selected countries, while another group aimed at predicting an individual's unemployment status. An example of a study from the first mentioned group is Kouziokas (2017), where artificial neural networks were employed to create models for predicting unemployment. The models considered several economic factors, and the results demonstrated high prediction accuracy. In a consecutive study by Kouziokas (2019), artificial neural networks were also used to predict unemployment in the UK, achieving high prediction accuracy. The author emphasises that such predictions can be valuable in implementing proactive measures to prevent an increase in unemployment. Mutascu and Hegerty (2023) focused on predicting unemployment in a sample of 23 advanced and developed countries from 1998 to 2016 using artificial neural networks. Their predictions demonstrated high precision. Katris (2020) predicted unemployment rates in several countries using time series models (FARIMA and GARCH) and machine learning models (support vector regression, neural networks, and multivariate regression). Xu et al. (2013) presented a data mining framework that utilised search engine query data to predict unemployment rates. The tools employed by the authors for predicting the unemployment trend include, among others, neural networks and support vector regression.

Within the group of studies aimed at predicting individuals' unemployment, Viljanen and Pahikkala (2020) focused their study on predicting the probabilities of transitioning into unemployment, leaving unemployment and remaining unemployed. The authors employed a Markov chain model with person-specific transition rates, which were fitted using three linear models (simple linear, mixed effects, and machine learning models) based on unemployment history—Adeliyi et al. (2022) analysed factors influencing female unemployment in Nigeria. The authors developed a prediction model using random forest and compared it with seven other prediction models created through various machine learning methods. According to commonly used evaluation metrics, the random forest model outperformed the other selected models. Zhao (2020) employed machine learning models such as logistic regression, random forest and XGBoost to develop a highly accurate model for predicting the potential risks of long-term unemployment using data from European public authorities for employment services. Chodorow-Reich and Coglianesi (2021) proposed a three-stage approach based on the simulation of factor flows with the aim of predicting the distribution of the duration of unemployment.

2. Methods and data

In this study, we employed two machine learning algorithms, namely neural network (NN) and classification and regression tree (CART), to predict the duration of unemployment. Neural network models can find hidden complex patterns and nonlinear relationships within the data and usually achieve high prediction accuracy and precision (Frnda et al., 2019).

The neural network model used in this study was a multilayer perceptron network. This network consists of an input layer, one or more hidden layers, and an output layer. Each layer consists of a set of artificial neurons (nodes) connected through weighted connections. The model uses a forward process to transform the input data from the input layers to the output layer, which generates predictions (Frnda et al., 2022). Due to the complexity of this model's structure, it is considered a black box, as it is impossible to describe all the connections among the neurons in the network, implying that the final model is then uninterpretable. Nevertheless, we can assess its prediction performance for all groups given by the target variable values and determine the importance of predictors used in the model.

In contrast, the Classification and Regression Tree (CART) approach has the advantage of being interpretable while also being capable of capturing nonlinear relationships between inputs and outcome. The CART algorithm operates by partitioning the data into two subsets based on the values of predictor variables. In each step, the algorithm identifies the best predictor variable and corresponding split point that optimally divides the data. The objective is to maximise the homogeneity within each resulting subset concerning the target variable (in this case, unemployment duration) and maximise the heterogeneity between the two subsets. The splitting process is repeated for each subset until stop criteria, such as a minimum number of cases in a parent and child node or maximum tree depth, are met. Subsequently, the tree is usually pruned to avoid the problem of overfitting. Pruning means removing nodes or branches from the tree that have not significantly contributed to the model's prediction accuracy (Durica et al., 2019; Gabrikova & Svabova, 2022).

The resulting CART model takes the form of a decision if-then tree structure, with each parent node representing a split based on a specified value of the input variable and each leaf node representing a prediction of the unemployment duration. The model predicts the duration of unemployment as the mode of the target variable within the leaf node.

We used a dataset described in the following paragraph to train both models. The dataset was randomly divided into training and testing samples, where the training set was used for models training, and the testing set was subsequently used for evaluating the models' performance on data not used in their learning process (Gajdosikova et al., 2023; Larose & Larose, 2017). The training set was balanced by boosting in terms of the number of cases in subgroups given by the categories of unemployment duration. This involved multiplying the less numerous groups to achieve a comparable number of cases to the most numerous group (Ripley, 2008).

The performance of both models was evaluated using various metrics such as sensitivity, specificity, precision, accuracy and F-measure (Chowdary et al., 2014; Manning et al., 2008). These metrics provided insights into the models' accuracy and allowed comparisons between the two prediction models. All of the mentioned metrics were calculated from the confusion matrix (Jagannathan et al., 2021), which describes the numbers of jobseekers correctly and incorrectly classified into one of the groups of unemployment duration. Since the target variable has four possible values, it was necessary to recalculate the number of cases in the confusion matrix using micro- or macro-averages. In this study, we used macro-averaging of the confusion matrices, wherein in individual confusion matrix was constructed for each category of the target variable (i.e. of unemployment duration). The evaluation metrics were calculated for each matrix and these were then averaged (Luo & Uzuner, 2014).

All calculations were performed using the IBM SPSS Modeler 18.3 data mining software. One advantage of using this software is its capability to utilise the created prediction models for future predictions solely by using new data.

2.1 Data used in the study

In this study, we used the database of jobseekers obtained from the Central Office of Labour, Social Affairs and Family (COLSAF) of the Slovak Republic (SR). This database includes all registrations of unemployed individuals in the database of jobseekers. Registration in this database is compulsory in Slovakia to access benefits for the unemployed, such as state-paid insurance, unemployment allowance, or the possibility of participation in intervention programs of the active labour market policy. The database contains various data on the jobseekers, including their age (at the date of registration), the highest level of education, gender, nationality, number of children etc. Furthermore, using anonymised identification numbers of the jobseekers, we were able to add variables describing their previous unemployment experiences. All the input variables used in the study are listed in Table 1. Additionally, the outcome variable used in this study is listed in the last row of the table.

Table 1. Variables used in the study

Variable name	Variable description	Possible values
gender	jobseeker's gender	male, female
nationality	jobseeker's nationality	Slovak, Hungarian, Czech, Roma, unknown or other nationality
marital status	jobseeker's marital status	single, married, divorced, widow, unknown
permanent residence	jobseeker's permanent residence	Eastern Slovakia, Western Slovakia, Central Slovakia, Bratislava region
education	jobseeker's highest completed education	non-finished primary, primary, lower secondary vocational, secondary vocational, complete secondary, general secondary, higher vocational, university 1st grade, university 2nd grade, university 3rd grade, unknown
disadvantage: school-leaver	disadvantaged jobseeker	no, yes
disadvantage: over 50 years	disadvantaged jobseeker	no, yes
disadvantage: long-term unemployed	disadvantaged jobseeker	no, yes
disadvantage: health	disadvantaged jobseeker	no, yes
disadvantage: no paid job	disadvantaged jobseeker	no, yes
disadvantage: low education	disadvantaged jobseeker	no, yes
disadvantage: organisational reasons	disadvantaged jobseeker	no, yes
disadvantage: others	disadvantaged jobseeker	no, yes
children	number of children	0, 1, 2, 3, 4 and more
intervention	intervened jobseeker	no, yes
previous registrations	number of all previous registrations	0, 1, 2, 3, 4, 5 and more
previous non-interventions	number of previous registrations without intervention	0, 1, 2, 3 or more
previous interventions	number of previous registrations with intervention	0, 1, 2, 3, 4 and more
age	jobseeker's age at the date of registration	min 15.0; max 78.0; average 34.9
cumulative	cumulative number of days of all previous registrations before the period under review	min 0; max 33,722; average 1155
work experience before registration	number of days from the last occupation to the current registration	min 0; max 15,805; average 415
average unemployment	the average number of days spent in unemployment per year from 15 years of age	min 0; max 365; average 45
unemployment duration	duration of the current registration in months (categorised)	up to 3, 3 – 6, 6 – 12, more than 12

Source: authors (2023)

The database consists of a total of 524,304 registrations of jobseekers in the COLSAF database, covering the period from 04/2010 to 06/2019. This time frame is determined by the data availability from COLSAF SR. As mentioned above, the target (outcome) variable in this study is the *unemployment duration*, which refers to the length of unemployment at a particular jobseeker registration in the database. We categorised the registration durations into four categories, as mentioned in Table 1. Based on these categories, the data contains the following numbers of registrations.

We would like to emphasise that each case in the dataset does not represent an individual jobseeker but rather a jobseeker's registration in the database. That means each jobseeker could have one or more registrations during the period under review, and their unemployment history is also considered using the variables mentioned in Table 1.

Table 2. Distribution of target variable

Category of unemployment duration	Proportion of registrations in %	Number of cases
up to 3 months	23.85	250,069
3 – 6 months	21.34	223,743
6 – 12 months	26.10	273,701
more than 12 months	28.71	301,011

Source: authors (2023)

3. Results

Figure 1 depicts the CART model for predicting the unemployment duration of jobseekers. In each terminal node of the tree, the modal category of unemployment duration is predicted. Therefore, if a jobseeker falls into a terminal node based on the fulfilment of the dividing conditions, the predicted unemployment duration will correspond to one of the four categories.

Figure 1. CART model
Source: own processing (2023)

In order of importance, the most important predictors for the unemployment duration were the number of previous registrations, the number of previous registrations *without* and *with interventions*, *cumulative days of previous unemployment*, *intervention* at the current registration, *age*, and *average unemployment* per year.

The confusion matrix in Table 3 presents the number of cases from the testing sample that the model correctly and incorrectly classified into the respective categories of unemployment duration.

Table 3. Classification table of the CART model

unemployment duration	up to 3 months	3 - 6 months	6 - 12 months	more than 12 months	correct [%]
up to 3 months	86,484	10,519	25,631	2,391	69.2
3 - 6 months	54,710	25,734	29,698	1,890	23.0
6 - 12 months	64,445	8,266	60,991	2,974	44.6
more than 12 months	11,136	2,691	22,551	114,202	75.8
sum	216,775	47,210	138,871	121,457	54.8

Source: authors (2023)

The NN model used the following input variables as the most important predictors: *average unemployment*, *disadvantage long-term unemployed*, *previous registrations*, *cumulative*, *previous interventions*, *intervention*, *work experience before registration*, *previous non-interventions* and *age*. The order of predictor importance is depicted in Figure 2. Other variables were also included in the NN model but are not displayed in the figure for better readability.

Figure 2. Predictors' importance in the NN model

Source: author (2023)

NN model achieved the following correct and incorrect predictions of unemployment duration in individual categories, as shown in Table 4.

Table 4. Classification table of the neural network model

unemployment duration	up to 3 months	3 - 6 months	6 - 12 months	more than 12 months	correct [%]
up to 3 months	75,822	5,957	39,745	3,499	60.6
3 - 6 months	44,407	21,090	43,537	2,998	18.8
6 - 12 months	46,482	3,280	81,706	5,208	59.8
more than 12 months	8,994	1,430	22,362	117,787	78.2
sum	175,705	31,757	187,350	129,492	56.5

Source: authors (2023)

The performance of both models was evaluated and compared using evaluation metrics; their values are presented in Table 5. The metrics are listed for each category of unemployment duration, allowing for an assessment of the model's performance in predicting each specific category of unemployment duration. Finally, the macro-average of the partial confusion matrices was employed to calculate the evaluation metrics for the overall model.

Table 5. Evaluation measures of both models

Model	Unemployment duration	sensitivity	precision	accuracy
CART	up to 3 months	69.17	39.90	39.90
	3 - 6 months	22.97	54.51	79.44
	6 - 12 months	44.62	43.92	70.71
	more than 12 months	75.84	94.03	91.68
	macro-average	53.15	58.09	77.41
NN	up to 3 months	60.65	43.15	43.15
	3 - 6 months	18.82	66.41	80.62
	6 - 12 months	59.78	43.61	69.37
	more than 12 months	78.23	90.96	91.51
	macro-average	54.37	61.03	78.27

Source: authors (2023)

Both models demonstrate their best performance in identifying the most high-risk group of potentially long-term unemployed individuals threatened by an unemployment duration of more than 12 months. The sensitivity of identification in this category exceeds 75 % for both models, with precision over 90 % and accuracy exceeding 91 %. Moreover, both models achieved high sensitivity in accurately identifying the least problematic group of jobseekers unemployed for up to 3 months, with a sensitivity of over 60 %. However, the most challenging category to predict is the registrations lasting from 3 to 6 months, with a sensitivity of only around 20 %. This result is lower than that of a naive model with random category predictions.

Overall, both models demonstrate strong predictive performance in the testing set, with an average accuracy exceeding 77 %.

4. Discussion

We can conclude that both models agreed on the most important variables influencing unemployment duration. In this sense, both models include the *number of previous registrations*, *number of previous registration without and with interventions*, *cumulative days of previous unemployment*, *intervention at a current registration*, *age*, and *average unemployment per year* as the most important predictors for the duration of unemployment. These findings suggest that the jobseeker's history of previous unemployment plays a significant role in determining their unemployment duration.

If we compare our results with those of similar studies, we can conclude that the performance of the prediction models based on machine learning techniques for predicting unemployment is at a very high level. For example, we can mention the study conducted by Adeliyi et al. (2022), where the authors employed eight different machine learning models to predict unemployment among women in Nigeria, with a special focus on identifying the factors that most influence women's unemployment. The models were developed using data from nearly 42,000 female study participants aged 15 to 49. Similar to our study, input variables such as the highest level of education, region, age etc., were employed. The models achieved prediction accuracies ranging from 68 % (naive Bayes) to almost 87 % (random forest) with similar precision levels. In this regard, we consider our models to be slightly more precise. However, the main difference is that the mentioned study aimed to predict whether a woman is likely to be unemployed or not, while our study focused solely on individuals who were already registered as unemployed jobseekers, with an emphasis on predicting the duration of their unemployment.

In this study, the agreement between the two models in individual predictions of unemployment duration was over 66 %. A similar performance of the prediction models was achieved in the study by Viljanen and Pahikkala (2020). The authors employed the linear model, the linear mixed effects model and the linear machine learning model. Compared to our study, these authors focused on predicting the risk of unemployment exit, entry and prevalence. Their training set consisted of 10,000 persons from 2013 to 2016, and the models achieved performance ranging from 0.67 to 0.80. The authors emphasise that predicting the exact timing of transitions from and into unemployment is difficult, with a models'

performance of 0.67 and 0.69. However, the overall unemployment prevalence can be predicted by the machine learning model with a high precision of 0.80. These precisions are similar to those presented in this study.

Conclusion

The use of machine learning models has garnered significant attention in recent years, and it has great potential to be used also in predicting unemployment. Among the machine learning methods, CART and neural networks are powerful tools because of their ability to capture complex hidden relationships. Both these methods demonstrated their high prediction accuracy. While both models have shown promise, the choice between CART and neural networks depends on the specific context, data availability, and the desired balance between interpretability (CART) and performance (NN).

The developed models demonstrated significant potential for practical applications in identifying the key factors influencing unemployment duration and categorising individuals into groups based on their possible duration of unemployment. These models are particularly valuable in identifying the most at-risk and vulnerable group of long-term unemployed individuals. The usability of the models in practice is not only attributed to their pretty high predictive power but also the creation of the models as a data-mining task. This allows for the deployment of the models, monitoring their performance and precision in practice and, if necessary, adjusting the model and its coefficients to adapt to changing conditions in the labour market or to the changed distribution of the population of jobseekers.

However, it is important to admit that this study and its results have several limitations. One of these limitations is the low sensitivity in identifying a specific category of unemployment duration. Even though this category may not be considered the most problematic, improving the performance of both models in correctly identifying this category of unemployed individuals would further enhance their overall performance.

Another limitation to consider is the fact that the models were created using data from a period before the COVID-19 pandemic. Therefore, there is a possibility that the coefficients of the models may need to be re-estimated in case it is found that the population of jobseekers will have changed characteristics or behaviour as a result of the pandemic crisis. However, the data-mining approach employed in predicting unemployment duration allows for the flexibility to address such updates of the models.

A possible future research direction could involve exploring the application of advanced ensemble techniques to address the issue of predicting unemployment duration, incorporating additional available data sources. Furthermore, drawing inspiration from similar studies, if suitable data is available, it would be beneficial to predict not only the duration of unemployment for individuals already unemployed but also to predict the likelihood of being unemployed.

Abstract

Research background: Peer-to-Peer (P2P) lending has been the subject of many articles recently. The idea provides a relatively uncontrolled non-regulated platform for crowd lending, the possibility to obtain loans directly from other individuals – investors. They behave according to the cultural and economic factors of their country of residence. Several authors also deal with investors' trust in P2P platforms, perceived risk of investment, and rationality of decision making.

Purpose of the article: The aim of this article is to define the characteristics of potential P2P investors, the biggest differences in willingness to invest between groups of potential investors and the aspects that significantly influence the willingness to invest.

Methods: In order to achieve goals, a survey with 479 respondents was conducted, and the answers were processed via statistical methods of non-parametrical Mann-Whitney U-test, Pearson and Spearman correlation, OLS model and multiple linear regression models.

Findings & Value added: The results suggest that the biggest impact on willingness to invest in P2P platforms lies in the level of education and perceived importance of high revenue, possible choice of borrower and no bank involved. No statistically significant influence of gender, discretionary income, or previous investing experience on the willingness to invest, was found. The findings in this article can help educational institutions raising awareness of P2P lending and the marketing department of P2P lending platforms target potential investors with higher accuracy, who, on the other hand, will be able to make more informed decisions.

Keywords: P2P lending, investors, willingness to invest, perceived pros and cons

JEL classification: E00, E02

1. Introduction

The topic of peer-to-peer (P2P) lending has been frequently researched during last years by several authors using secondary data provided by P2P platforms, namely Wang (2011), Emekter et al. (2015), Jin & Zhu (2015), Miller (2015), Serrano-Cinca (2015), Guo et al. (2016), and Lyócsa & Vašaničová (2022). Other authors research the view of investors and potential investors, for example Zhang et al. (2020) find out using vector autoregressive that investor sentiment can predict the stability of P2P lending platforms. Kim (2020) studies the determinants of Chinese investors leaving the P2P market and their investment patterns. Yan et al. (2018) examine how to persuade investors to develop initial trust in P2P platforms. In Malaysia, Khan (2022) also studies the trust of investors in P2P lending platforms and finds out that investors' income and age are positively related to this trust. The rationality of decision-making of investors is the subject of the paper of authors Chen et al. (2017). The relationship between successful borrowing times, successful loans and default loans is identified by Wang et al. (2019). Hu et al. (2019) study investors' ability to properly identify default risk when investing in P2P lending. The main goal of this paper is to describe typical attributes of potential investors in P2P lending and to identify predictors that affect their willingness to invest in P2P lending. The secondary objective is to find out whether there are significant differences in the willingness to invest in P2P lending between groups of different discretionary income, gender, level of education and former investing experience.

2. Methods

As a part of the research, a questionnaire was formed and a survey with 479 participants aged 16 – 88 was conducted in the beginning of 2023. All calculations were performed using Gretl software. The sample of respondents was composed of potential investors in P2P lending in Slovakia. The following variables were defined:

- *Gender, Age, Educ* are demographic variables of gender (0 – man, 1 – woman), age and highest achieved education (1 – primary; 2 – secondary school; university: 3 – stage one, bachelor study; 4 – stage two, master / engineer study; 5 – stage three – PhD. study),
- *IncCat, DiscInc, PerImpRet, Invest, NrPlat, WillInvP2P* are economic and financial variables of **Income Category** (0 – no income, 1 – from 646 € to 971 €, 2 – less than 1295 €, 3 – less than 1620 €, 4 – less than 1944 €, 5 – less than 291 €, 6 – more than 2590 €), **Discretionary Income** (0 – less than 0 €, 1 – less than 50 €, 2 – less than 100 €, 3 – less than 150 €, 4 – less than 200 €, 5 – less than 250 €, 6 – less than 300€, 7 – greater than or equal to 300 €), **Perceived Importance of Return** on investment (0 – least important, 10 – very important), **Investing** experience (0 – no, 1 – yes), **Number of Platforms** for P2P lending known and **Willingness to Invest in P2P** lending (0 – no, 10 – very willing),
- *ProsChoiceAmount, ProsDiver, ProsChoiceBorr, ProsPassInc, ProsAnon, ProsNoBank, ProsHighRev, ConRisk, ConReclaim, ConTax, ConCrash* are variables of the perceived importance of the **Pros** and **Cons** of investing in P2P lending (0 – not important, 10 – very important), in particular the freedom of **Choice of Amount** to be invested, the possibility to **Diversify** portfolio, the freedom of **Choice of Borrower**, investment perceived as a **Passive Income**, **Anonymity**, **No Bank** involvement, **Higher Revenues**, high **Risk** of investment, possible problems when **Reclaiming** an investment, **Taxation** of income and possible **Crash** of the P2P platform,
- *InflPurp, InflGen, InflAge, InflApp, InflEth, InflEduc, InflEc* are variables of the perceived **Influence** of borrowers' attributes on the investment decision, specifically the **Purpose** of the investment (borrowers project), **Gender**, **Age**, **Appearance**, **Ethnicity** / nationality, level of **Education** and **Economic** status.

The frequencies of the categorical and ordinal variables are shown in Table 1.

Table 1. Frequency table

	0	1	2	3	4	5	6	7
<i>Gender</i>	161	318
<i>Educ</i>	.	19	362	44	52	2	.	.
<i>IncCat</i>	148	126	74	32	16	12	13	.
<i>DiscInc</i>	55	67	38	44	39	43	39	139
<i>Invest</i>	248	231

Source: author's own calculations

Typical potential investor is a woman with finished secondary school of lower income category, relatively high discretionary income, and no former experience with investing. When using weighted values (multiplied by *WillInvP2P* percentage), the highest average willingness to invest in P2P lending can be seen among women, people who finished primary school, with lower income than 646 €, monthly discretionary income less than 50 €, without former investing experience and knowing no P2P lending platforms. The potential investor most willing to invest in P2P lending considers the most important pros – high revenue (2.11) and choice of borrower (1.92) – and cons – risk of platform crash (2.249) – and is mostly influenced by (interested in) economic status (1.938) of borrower and the purpose of his investment, resp. project (1.903). Descriptive statistics of other variables are presented in Table 2.

Table 2. Descriptive statistics

	Mean	Median	Min	Max	Std. Dev.	IQ range	Miss. obs.

Source: author's own calculations

In this paper following research questions were conducted:

- *Q1*: Is there any relationship between discretionary income and willingness to invest in P2P lending?
- *Q2*: Is there any difference between men and women in willingness to invest in P2P lending?
- *Q3*: Does the level of education influence the willingness to invest in P2P lending?
- *Q4*: Does former investing experience affect willingness to invest in P2P lending?
- *Q5*: What are the most influential predictors of willingness to invest in P2P lending?

3. Results

Research question *Q1* is answered using OLS model with results in Table 3:

Table 3. OLS model for Q1 (n=464)

	Coefficient	Std. Error	t-ratio	p-value	Mean dep. var.	3.4806	S.D. dep. var.	2.4476
<i>const</i>	3.6409	0.2085	17.46	< 0.0001	Sum sq. resid.	2768.787	S.E. of regression	2.4481
<i>DispInc</i>	-0.0401	0.0438	-0.9169	0.3597	R-squared	0.0018	Adjusted R-squared	-0.0003

Source: author's own calculations

Results suggest that the less discretionary income one has, the slightly more willing one is to invest in P2P lending. The regression coefficient is, however, insignificant ($p = 0.36$) and the coefficient of determination R^2 is close to 0. We can therefore assume that there is **no significant relationship** between the discretionary income and willingness to invest in P2P lending.

Gender differences in willingness to invest in P2P lending in *Q2* are tested using Mann Whitney U-test. The variable *WillInvP2P* does not follow normal distribution ($p = 0.002$). The results of the test can be seen in Table 4 below.

Table 4. Mann Whitney U-test for Q2

	n	w	U	z		one-tailed p-value		
<i>Gender = 0</i>	161	38363	25876	0.194	P (Z > z₁)	0.577	two-tailed p-value	0.847
<i>Gender = 1</i>	318	76597	25322	-0.194	P (Z > z₂)	0.423		

Source: author's own calculations

As a result, the *p*-value (0.847) is greater than 0.05, therefore there is **no significant difference** in willingness to invest in P2P lending between men and women. We cannot say that the willingness to invest in P2P lending is influenced by gender.

The level of highest achieved education (*Educ*) and its influence on the willingness to invest in P2P lending (*WillInvP2P*) is the subject of research question **Q3**. The relationship between the variables (potential influence) is tested using nonparametric Spearman correlation with the following results:

Spearman's rank correlation coefficient (rho) = 0.04818691, Under the null hypothesis of no correlation: t(477) = 1.05364, with two-tailed p-value 0.2926

The alternative hypothesis of a significant correlation is rejected ($0.2926 > 0.05$), thus according to data the level of education does not correlate with the willingness to invest in P2P lending, suggesting that the variable *WillInvP2P* is **not influenced** by variable *Educ*. This is confirmed by the univariate regression with the dependent variable *WillInvP2P*, dummy variables *Educ1-Educ4* and insignificant regression coefficients with the following *p*-values:

Educ1 p-value 0.212, Educ2 p-value 0.129, Educ3 p-value 0.279, Educ4 p-value 0.179

Possible effects of former investing experience on willingness to invest in P2P lending (**Q4**) are tested using Pearson correlation.

corr(WillInvP2P, Invest) = 0.05860192,
Under the null hypothesis of no correlation:
t(477) = 1.28209, with two-tailed p-value 0.2004

No significant correlation between the variables *WillInvP2P* and *Invest* was identified ($p = 0.2 > 0.05$), therefore we can assume that there is no significant relationship between former investing experience and willingness to invest in P2P lending; respectively, former experience in investing **does not** statistically significantly **affect** willingness to invest in P2P lending.

The final research question **Q5** is answered via series of multiple linear regression models. Insignificant variables from research questions **Q1-Q4** were also used in the models, because of possible significant impact in conjunction with other observed variables. The models describe the dependence of the dependent variable *WillInvP2P* on other variables and are formulated as follows:

$$WillInvP2P_i = \beta_0 + \beta_1 Gender_i + \beta_2 Age_i + \beta_3 Educ_i + \beta_4 IncCat_i + \beta_5 DiscInc_i + \beta_6 PerImpRet_i + \beta_7 Invest_i + \beta_8 NrPlat_i + \beta_9 ProsChoiceAmount_i + \beta_{10} ProsDiver_i + \beta_{11} ProsChoiceBorr_i + \beta_{12} ProsPassInc_i + \beta_{13} ProsAnon_i + \beta_{14} ProsNoBank_i + \beta_{15} ProsHighRev_i + \beta_{16} ConRisk_i + \beta_{17} ConReclaim_i + \beta_{18} ConTax_i + \beta_{19} ConCrash_i + \beta_{20} InflPurp_i + \beta_{21} InflGen_i + \beta_{22} InflAge_i + \beta_{23} InflApp_i + \beta_{24} InflEth_i + \beta_{25} InflEduc_i + \beta_{26} InflEc_i + u_i, i = 1, 2, \dots, n.$$

Created models M_i with regression coefficients β_i and adjusted coefficient of determination (*Adj. R²*) can be seen in Table 5.

Source: author's own calculations

No problem with either multicollinearity or heteroskedasticity was identified. Among the models M_1 - M_4 , model M_4 best describes the influence of the predictors on the variable *WillInvP2P*. Its adjusted R^2 ($Adj. R^2$) is 0.177. 21.5 % of the variability observed in the dependent variable *WillInvP2P* is explained by the regression model M_4 ($R^2 = 0.215$). Model M_3 and M_4 both have more than half of the significant predictors. The most significant regression coefficients are (in order) β_0 , β_2 , β_3 , β_{15} , β_{17} , β_{21} , β_{24} , β_8 , β_{23} , β_{20} , β_{14} and β_{11} . We can observe a positive influence of the variables *Educ*, *NrPlat*, *ProsNoBank*, *ProsHighRev*, *InflPurp*, *InflGen*, *InflEth* and a negative influence of the variables *Age*, *ProsChoiceBorr*, *ConReclaim*, *InflApp* on the dependent variable *WillInvP2P*. Therefore, according to results, the willingness to invest in P2P lending is mainly **positively influenced** by

- the level of education of the potential investor (*Educ*),
- the degree of perceived importance of the high earning potential of such an investment (*ProsHighRev*),
- the number of known P2P lending platforms (*NrPlat*),
- likelihood of being influenced by the gender of the borrower (*InflGen*),
- perceived importance of involving no bank in investment in P2P lending (*ProsNoBank*),
- likelihood of being influenced by borrower's ethnicity/nationality (*InflEth*),
- the probability of being influenced by the purpose of the investment – the borrower's project (*InflPurp*).

On the other hand, **negative impact** on the willingness to invest in P2P lending can be observed on

- the perceived importance of risk, the probability of loan not being repaid – default (*ConReclaim*),
- the likelihood of being influenced by the borrower's appearance – platform dependent (*InflApp*),
- perceived importance of being able to choose the borrower – investment (*ProsChoiceBorr*),
- the age of the potential investor (*Age*).

In addition to M_1 - M_4 , other suitable models are suggested in Table 6.

Table 6. Multiple linear regression models M5-M8 for Q5

Source: author's own calculations

The problem with heteroskedasticity in model M_7 was corrected using robust standard errors HC3. The most suitable model appears to be M_5 with $Adj. R^2$ of 0.1782 explaining the amount of variability observed in the variable $WillInvP2P$ (R^2) comparable to model M_4 . After model M_5 , we can observe decline in models' reliability when reducing number of independent variables. All models M_5 - M_8 , confirm the positivity and negativity of the influence of the predictors described above.

4. Discussion

In this paper the following research questions were conducted and answered using statistical tests and models: $Q1$ – Is there any relationship between discretionary income and willingness to invest in P2P lending? $Q2$ – Is there any difference between men and women in willingness to invest in P2P lending? $Q3$ – Does the level of education influence the willingness to invest in P2P lending? $Q4$ – Does former investing experience affect willingness to invest in P2P lending? $Q5$ – What are the most influential predictors of willingness to invest in P2P lending? Question $Q1$ was answered using an OLS model with an insignificant regression coefficient and therefore discretionary income itself cannot reliably define potential investor's willingness to invest in P2P lending. If discretionary income had some significance in influence on the variable $WillInvP2P$, it would be in conjunction with other variables defining potential investor's behavior. $Q2$ was tested using the Mann Whitney U-test with a p -value greater than 0.05 and thus no significant difference in willingness to invest in P2P lending between the two genders was identified. Gender itself isn't enough of a predictor of the decision to make such an investment. According to the tested data, there is no significant correlation between the level of education alone and the willingness to invest in P2P lending ($Q3$). The reason for this might be the fragmentation of the sample into many levels of education, the unknown field of study or the subjectively perceived significance and importance of the pros and cons of such an investment. The results of $Q5$ put education in a different perspective. Former investing experience ($Q4$) does not reliably affect willingness to invest in P2P lending. This finding makes it easier for P2P lending platform providers to inform potential investors about this investment opportunity. While finding the most significant group of predictors affecting potential investor's willingness to invest in P2P lending several multiple linear regression models were created. The most suitable model describing the influence of predictors on variable $WillInvP2P$ is model M_5 , which explains more than 20 % of variability of mentioned dependent variable. Despite the answer of $Q3$, education proves to be of a significant influence in combination with other predictors in the models, namely the number of known P2P lending platforms, the perceived importance of the pros (high income, no bank involved, choice of borrower) and cons (potential problems in reclaiming an investment) and the likelihood of being influenced by the borrower's gender, ethnicity (nationality) or appearance. Younger, more educated people who are able to take the risk of investing in relatively high-yield investments, and who value no bank involvement and freedom of choice, are much more likely to invest in P2P lending. The number of potential investors could be increased by raising awareness of the pros and cons of such investments, especially among the younger generation.

Conclusion

In this paper 479 respondents and their answers on the topic of *investing in P2P lending* were tested, which revealed that most likely investors with the highest willingness to invest in P2P lending in the conditions of Slovakia are women, people who have finished primary school, who have lower income than 646 €, monthly discretionary income less than 50 €, no previous investment experience and do not know P2P lending platforms. In general, investors consider high revenue, choice of borrower and risk of platform crash as the most important and influential factors when considering such an investment.

No statistically significant difference in willingness to invest in P2P lending was found between groups with different levels of discretionary income, gender, and previous investment experience. The level of education itself also does not affect the mentioned willingness. However, studying economic field of studies at universities or boosting financial literacy in secondary schools might raise awareness about these potential investments and help to achieve better informed decisions for investors. Raising awareness of the pros and cons of investing in P2P lending could be in the interest of institutions providing educational programs in financial literacy, economics, and business. The specifics of such an impact require further research.

Multiple linear regression models answering research question Q5 suggest that the willingness to invest in P2P lending is statistically significantly influenced by the level of education of the potential investor combined with the level of perceived importance of the high earning potential of such an investment, the number of P2P lending platforms known, the perceived importance of not involving a bank in investment in P2P lending and the likelihood of being influenced by the borrower's gender, ethnicity or nationality and the purpose of the investment – the borrower's project. The age of the investor, the probability of being influenced by the borrower's appearance (platform dependent) and the perceived importance of the possibility of the borrower defaulting on the loan and the ability to choose the borrower all have a negative impact on the willingness to invest in P2P lending. Other statistical models (e.g. non-linear) describing the behavior of P2P lending investors will be the subject of further research.

All of the above research questions were answered and set goals were reached. The results of this paper could help to optimize decision making in the management of P2P lending platforms, assist in education to improve financial literacy and serve as a good basis for further research.

One Problem, Different Consequences: Innovation and Quality Standards in the Presence of Informal Competition

Ján Huňady^{1,*}, and Kamil Ščerba¹

¹ Matej Bel University in Banská Bystrica, Department of Finance and Accounting, Faculty of Economics, Tajovského 10 975 90 Banská Bystrica, Slovakia

Abstract

Research background: There is a vivid discussion on the potential relationship between quality standards and innovation. Quality standards are often seen as the factor supporting product and service innovation. However, both have their own specifics and different determinates at a micro and macro level. While shadow and informal economy remain a problem, especially in Eastern and Southern European States, we decided to focus our analysis on its potential consequences on quality certification and innovation. Firms' decision-making on the introduction of quality standards and innovation can be affected by competition from unregistered and informal firms.

Purpose of the article: The paper aims to identify the potential consequences of competition from informal sector on a quality standards certification and innovation.

Methods: The analysis is based on the data from a World Bank enterprise survey collected between 2018 and 2020 in selected European countries (EU and non-EU countries). Firstly, we looked in more detail at the characteristics of firms in the sample that applied international quality standards. Secondly, we also examine the introduction of product and service innovation. The focus is on the differences between firms having problems with informal competition and those without such competition. We used standard t-tests and nonparametric tests of hypotheses.

Findings & Value added: The results indicate that there a significantly fewer firms adopting quality certification in the presence of informal competition. On the other hand, firms having informal competitors tend to innovate more. It seems that informal competition similar to formal competition could in fact increase the efforts of enterprises to innovate their products and services.

Keywords: innovation, standards, quality certification, informal sector, shadow economy

1. Introduction

During the recent economic phase often referred to as the sixth Kondratieff wave innovation appears to be one of the crucial engines of economic growth and prosperity. Due to this fact, national and international economic policies should be focused on supporting innovation activities and adoption in both private and public sectors. The innovation of products and services are among those types of innovation which are the most common and the most evident. These types of innovation are closely related to standards and quality certification. Quality standards can be applied to improve the successful introduction of innovative products and services on the market. Standards can represent a signal of the quality of newly developed products and services for customers or play another role in supporting innovation such as assuring interoperability. Both innovation activities of firms and standardisation can be closely related, but they can also have completely different causes and determinants. One of the potential problems that can affect both are activities of firms from the informal sector. This problem is especially valid for countries with a higher share of the shadow economy. The informal firms that bypass state regulations and taxation may be at an advantage and cause problems for properly registered companies. However, this competitive pressure can cause companies to decide to innovate more or try to differentiate themselves from informal

* Corresponding author: jan.hunady@umb.sk

competition with quality certificates. Hence, the competition from the informal sector could lead to positive as well as negative effects on both innovation and quality certification.

The concept of "innovation" is the subject of study of several disciplines, as a result of which the understanding of the concept is quite broad. Schumpeter (1982), which may be called the founder of the theory of innovation in the economy generally, regarded innovation as the economic impact of technological change, as the use of new combinations of existing productive forces to solve the problems of business. According to Twiss and Goodridge (1989), innovation - a process that combines science, technology, economics and management, as it is to achieve novelty and extends from the emergence of the idea to its commercialization in the form of production, exchange, consumption. The simplest definition of innovations is doing something different. Innovation is a word that often is used in the business world and for companies this usually mean something risky, costly and time consuming (Costello & Prohaska, 2013). Innovation can also be explained as a new idea, product, device or novelty. It is a mind-set, a way of thinking beyond the present and into the future. Innovations is important for companies and when used well it can be a process, strategy and management technique (Kuczmarksi, 2003). Innovation can at a fundamental level be the process of generating and combining ideas to make a relationship between present accomplishments and past experiences to solve a future problem. This is often associated with technological feats and it play a critical role in the world economy (Baskaran & Mehta, 2016). Innovation is big in the business world and is sustainable to create value and be strong in the competitive environment.

Certification is "an explicit and formal process for adding visible, salient, and credible extrinsic information about a product or service" (Starr & Brodie, 2016, p. 718). A certification can indicate intangible benefits or attributes to customers to signify a level of status and quality assurance (Cavanaugh, 2010). Despite the added complexity and cost of certification (Jahn et al., 2005), the value-added for certification differs across certification types, locations, industries, organizations and particular products within the organization (Klochov et al., 2016). There are several applications and motivations for certifications in the private and public sectors in multidisciplinary fields. Motivations for implementing certifications include but are not limited to regulating the safety of products or services (Landi & Nicholson, 2011; Rierson, 2017; Yu et al., 2016), being used as a label for competitive advantage and differentiation (Claver et al., 2006; Hernandez-Perlines, 2016) and being implemented for qualitative improvements on systems and processes in both tangible and intangible industries (Aba & Badar, 2013; Dragusanu et al., 2014).

Singer compared the informal sector to a giraffe in that it is difficult to define by usual standards, but easy to recognize when you meet one. Lautier (1990) counters that the informal sector is "a unicorn because the literature abounds with definitions, but you will never have the opportunity to meet one, because it does not exist (Charmes, 2016, p.6). This disagreement on the best faunal metaphor for the informal sector gives us an idea of how challenging the debate on the definition of informality is. An important source of misunderstandings on the definition of informal sector consists in the divergence of research goals among scholars from different disciplines. For instance, the "economic" concept of informal sector (or of its seeming synonyms, e.g., shadow, unofficial, hidden, black, underground economy) has a different meaning to the concept of informality used by statisticians in national accounting (e.g., non-observed economy (NOE), underground production), etc. Although there have been some attempts to reconcile these definitional approaches (Dell'Anno, 2007, 2016; OECD, 2002; Quiros-Romero et al., 2021), a common solution is still not available. According to the strand of literature that focuses on informality from an "economic" perspective, Feige (2016) proposes a taxonomy based on noncompliant behaviors. He points out that noncompliance and "unobservability" are common features in all behaviors in unobserved economies. Accordingly, what distinguishes one unobserved economy from another is a particular rule being violated. Specifically, Feige offers the following definitions: "unreported economy" as when the noncompliance consists in the circumvention of the fiscal code by tax evasion; "unrecorded economy" as when the added informal value added arises from violations of the rules of national income accounting; "illegal economy" as the contravention of rules governing the production and distribution of prohibited goods and services.

In our paper, we examine the potential relationship between the informal sector and innovation as well as the adoption of international quality standards by firms. This problem has so far been rather on the fringes of the interest of economic research and our paper provides new insight. The analysis is based on the micro-level data from the World Bank Enterprise survey from 26 European countries. in firms. Firstly, we examine the share of respondents who innovate and those who adopt quality certificates based on the number of employees. Next, we did the same classification according to the number of competitors in the market. We analysed the potential relationship between both of them and competition from the informal sector. Finally, we make conclusions of the paper with a summary of the most important findings and their implications.

2. Methodology and data

The focus of the paper is on the examination of the potential consequences of the informal sector on quality certification and innovation at the firms' level. It aims to identify the potential relationship among the informal sector, quality standards certification and innovation. To achieve this aim, we analyse the data from the World Bank Enterprise Survey database (World Bank, 2021) which includes firm-level data. Available data was collected by a questionnaire survey of private sector firms. The main objective is to capture nonbiased data based on firms' experiences and enterprises' perceptions of the environment in which they operate. These data are used by the World Bank and other institutions as a benchmark indicator capturing the quality of the business environment. As of December 2019, it covers over 180,000 firms in 150 countries (World Bank, 2021). In our analysis, we focused our attention only on European countries where the data were available at least for years 2018 or 2019. There are 17 EU member states and 9 non-EU European countries. The mentioned data have been analysed and the results are interpreted in the next part of the paper. We concentrate especially on questions related to the informal sector, innovation activities and quality certification. Analysed variables are all based on answers to these questions. We examine and display the data using several graphic methods, and subsequently, we also use hypothesis testing methodology. Specifically, we used testing for the agreement of mean values by means of the parametric t-test and the Wilcoxon non-parametric test. Regarding on rather high number of observations, the results of both tests are similar. In the next section, we show the results in more detail.

3. Results

The results are divided into two main parts. Firstly, we look more in detail on firms' quality certification, characteristic of firms with quality certification and we also examine their attitudes on obstacles related to informal competition. The second part of the analysis is focused on innovation of products and services and its potential relationship to quality certification and competition form informal economy.

The size of the company could be one of the factors affecting the innovation activities. Our analysis is focused especially on innovation of products and services. The share of innovative firms varies among different size classes of firms. More innovation of products and services can be seen in larger firms with over 1000 employees. When we further classified firms into groups with and without quality certification the differences are even more significant. The results can be seen in Figure 1. Firms with quality certification appears to be more innovative across all tree size categories. However, the difference in innovation activity between firms with and without certification is the most significant for the large firms. We can say that large firms with quality certification tend to innovate their products or services the most.

Figure 1. The share of respondents with and without quality certificates classified based on the innovation of products/services and their size

Source: Authors own processing (2023)

Figure 2. The share of respondents with and without innovation of products/services classified based on the number of reported competitors in the market
Source: Authors own processing (2023)

Hence, it is likely that there is some kind of connection between quality certification and innovation, which we will examine in more detail further. Next, we look at the differences in the share of innovative and certified firms with different levels of competition. In this phase, we did not differentiate between formal and informal competition. As it can be seen in Figure 2 and Figure 3 based on the graphs there is no clear evidence for any potential effects of the competition in general. For innovation, the share of innovative firms is slightly growing with the competition to some point, but it is the lowest for those with over 100 competitors. The quality certification shows no significant trend with increasing competition. However, it is also the lowest for firms with more than 100 competitors.

Figure 3. The share of respondents with and without quality certification classified based on the number of reported competitors in the market
Source: Authors own processing (2023)

The informal sector also represents the competition for firms in the formal sector. However, there can be some specifics. The informal activities are not regulated and taxed.

Furthermore, these informal competitors are not able to do quality certification, apply for the patent or officially participate in research. More informal competition mostly means a higher share of the informal economy. Hence, overall informal competition can have different effects on innovation and quality certification compared to competition in general. The differences in innovation activities and quality certification for firms with informal and without informal competition can be seen in Figure 4. On one hand, firms with informal competition tend to be more innovative. On the other hand, they less frequently adopt internationally recognised quality standards compared to those without competition from the informal sector. These results are somewhat surprising and need to be further examined and explained. The difference of almost six percentage points in both cases seems to be substantial.

Figure 4. Share of establishments with internationally recognized quality certificates (left graph) and innovation of products or services over last 3 years (right graph) with and without informal or unregistered competitors

Source: Authors own processing (2023)

To examine this problem in more detail we used another question from the questionnaire survey which is focused on firms' attitudes to the informal sector as an obstacle for their operations. Results are shown in Figures 5 and 6. Firms reported how serious are their problems related to the practices of competitors in the informal sector. A higher share of innovative firms appears to be the groups that are reporting major and severe obstacles in the informal sector. Hence, firms dealing with significant problems related to informal competition tend to be more innovative compared to those with only moderate problems or without these problems. We can assume that more severe competition from unregulated firms could be one of the reasons. However, this assumed correlation can be an effect of many other factors or unobservables. The results could also be attributed to potential information or confirmation biases. The situation in the field of quality certification appears to be contrasting. The firms that reported no problems with competition from the informal sector are the most frequent adopters of quality certification. On the contrary, the lowest share of certificated firms is among those with severe problems with the informal sector and those who did not have enough knowledge to respond to this question. The results suggest that more significant problems in the informal sector can be related to less frequent adoption of international quality standards.

Figure 5. Classification of respondents based on their views of problems related to informal competition and the frequency of introducing innovative goods and services
Source: Authors own processing (2023)

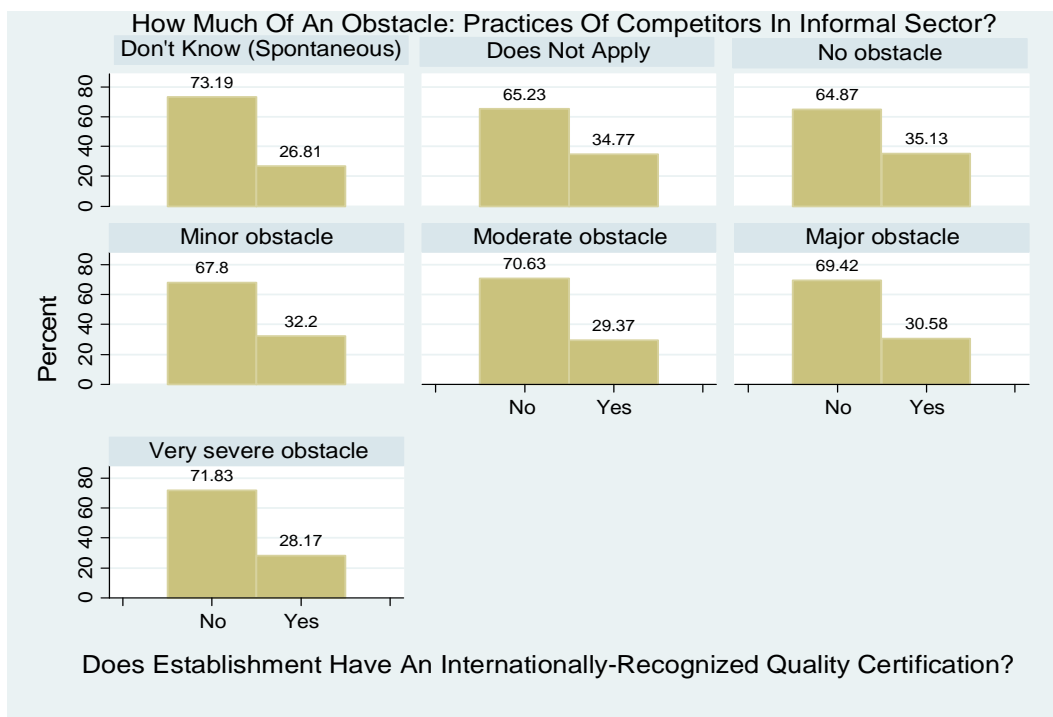

Figure 6. Classification of respondents based on their views of problems related to informal competition and the frequency of adopting quality certification
Source: Authors own processing (2023)

The differences in the share of innovative firms have been also tested by the t-test and Wilcoxon test. The results are shown in Table 1. Both are paired difference tests testing the mean differences in both groups. The results indicate a statistically significant difference in innovation among firms with and without informal competition. This is true for the whole sample as well as for firms with different numbers of competitors from zero to 30. The same is true for the firms with over 100 competitors.

Table 1. Innovation of products and services – mean differences

Number of all competitors:	No informal competition	Having informal competition	Diff.	Mean-comparison t-test (t-stat)	Wilcoxon test (z-stat)	Obs.
Whole sample	0.342	0.287	0.056	6.42***	6.41***	14032
No competitors	0.381	0.314	0.066	0.77	0.78	408
1 or 2 competitors	0.364	0.376	-0.012	-0.306	-0.306	406
3-5 competitors	0.387	0.351	0.036	1.66*	1.66*	2827
5-15 competitors	0.391	0.319	0.072	3.41***	3.14***	2479
15-30 competitors	0.390	0.311	0.079	1.8*	1.8*	541
30-100 competitors	0.348	0.273	0.075	1.34	1.33	291
More than 100 or too many	0.289	0.249	0.041	3.15***	3.15***	5064

Source: Authors own processing (2023)

The same two tests have been used to test the differences in the average share of certified firms. The results are summarised in Table 2 and they are again rather diverse. The difference in the opposite way is statistically significant at the 1% level for the whole sample. When we split the sample into groups of firms based on the competition the results are slightly less conclusive. The share of firms with quality certification is significantly lower in the presence of informal competition at a 1% level of significance for firms having overall from five to fifteen competitors and for those having more than 100 competitors.

Table 2. Quality certification – mean differences

Number of all competitors:	No informal competition	Having informal competition	Diff.	Mean-comparison t-test (t-stat)	Wilcoxon test (z-stat)	Obs.
Whole sample	0.342	0.287	0.056	6.42***	6.41***	14032
No competitors	0.381	0.314	0.066	0.77	0.78	408
1 or 2 competitors	0.364	0.376	-0.012	-0.306	-0.306	406
3-5 competitors	0.387	0.351	0.036	1.66*	1.66*	2827
5-15 competitors	0.391	0.319	0.072	3.41***	3.14***	2479

Source: Authors own processing (2023)

Despite some interesting and promising results achieved by our analysis in this paper, there are several limitations to our approach. First, the probit or logit regression model should be used to determine the potential causality while considering different control variables and factors such as for example the size of the firm, country, and competition. This approach could be used in the further continuation of this research. Moreover, there are also some limitations related to the data from the questionnaire survey provided by the World Bank. The questions and procedures in used in the survey were accurate, but the data can still be biased due to selection, information, and confirmation biases.

4. Discussion

When examining the comparison of the results of our research and other studies, we did not come across the connection of the components we investigated, the informal sector, innovations and quality certification. The standards are a kind of added value to the entire research and bring interesting findings. On the other hand, when comparing the research results, ours results show that exposure to informal competition increases the likelihood of innovation by formal firms. We argue that formal firms use innovation as a channel via which they can protect and sustain their competitive advantage vis-à-vis informal firms. Our arguments are consistent with prior literature that shows a positive relationship between performance and innovation (Hana, 2013; Martín-de Castro et al., 2013; Tushman & Nadler, 1986). The results hold true for various sub-samples based on the size of firms and on the location of firms. de Beer et al. (2016) note that firms in the informal economy have limited skills, use simpler technologies, and face limitations in technical upgrading. According to them, these factors lead to lower innovation among informal firms. Furthermore, innovation allows firms to offer continuous realignment and

integration of technical, market, and knowledge resources (Danneels, 2002; Zollo & Winter 2002). That is, innovation translates the available resources into sustainable competitive advantage relative to informal firms (Lawson & Samson 2001).

Conclusion

Our results show potential relationships between the informal economy and innovation as well as the informal economy and standards adoption. Interestingly we found two very diverse facts. The informal sector seems to have different consequences for innovation activities compared to quality certification. Based on the analysis we can say that firms that face competition from the informal sector tend to innovate their products and services more often compared to those without informal competitors. The same is true for those who respond that the informal economy is a major or very severe obstacle for them. We found that this effect cannot be attributed only to the competition itself, but there are also other reasons. Perhaps firms tend to innovate their products and services to distinguish them from firms in the informal sector. The potential effect of the informal economy should be examined in more detail in future research. On the other hand, we found that firms with informal competitors are less likely to adopt international quality certification. Hence, the informal sector appears to have more negative potential effects on quality certification in general. However, both potential effects should be further examined and analysed by regression analysis to determine the potential casual effect while including other control variables.

Towards a New Mentality in the Business Game – Future Generations as Major Stakeholders

Leonard Calin Abrudan^{1,*}, and *Mirabela Constanta Matei*²

Abstract

Research background: There are aspects that today seem to be suitable for the current framework of the business game. Tomorrow, however, will need an improvement in this regard. Aspects, notions, mentality, rules, framework – all these must be redesigned in order to provide future generations with resources in sufficient quantity. The historical and current approaches could lead to overconsumption in this sense and the future generations will realize that they will not have enough resources at hand in order to make themselves a living.

Purpose of the article: Adverse selection, asymmetric information and moral hazard are among the terms this paper uses to describe how the business game is actually played. A Rawlsian “veil of ignorance” might be a step that should be taken in the process of devising a new strategy. This strategy has to be oriented towards future generations and their future and unknown needs. This paper aims to introduce the idea of an open contract between the current and future generations, a contract that will change the assumptions currently being made and reshape the framework for the aforementioned business game. Sustainable business game – this will be the way of the future.

Methods: The research method used in this paper was a descriptive one, starting with a short review of the domain’s dedicated literature. Placing different perspectives in their own spot and mirroring various views, this paper tries to reveal a feeble red line which spans from the current generations to the future ones, in terms of their economic interests.

Findings & Value added: Typically, a contract has two or more parties related by some mutual interests. However, this paper aims to pinpoint a sui generis type of contract, an open one, capable of encompassing parties that are not in the same time corridor. A difficult thing to comprehend, but a necessary one, given the behavior of current generations, in terms of doing business.

Keywords: sustainable business game, adverse selection, future generations, stakeholders

JEL classification: D63, D86, G41

1. Introduction

Throughout history, at almost every moment of it, there have been conflictual situations between generations, generated by the different endowment of knowledge, skills and abilities. Typically, these conflicts regarded generations which were contemporaneous for a time and they intersected for a while physically and temporally. This paper tries to bring to light a conflict between generations that does not present simultaneity. This is a conflict with parties that are distant in terms of timescale, a conflict between current and future generations. Like any conflict, this one has many facets and this paper is concerned with only one of them – its economic aspect. However, the paper aims to transform this conflict in a game – a business game. Every game has its own rules and ethics and Koehn (Koehn, 1997) considers that this particular game has a „special ethic”, allowing for usually immoral practices as well. Another author (Lu, 2008) believes this game originates from war games, however, as a competitive game and the competition is about resources. This game is about different

* Corresponding author: labrudao@gmail.com

interests, some of them manifested – the current generations and some of them not yet expressed – the future generations` interests.

There cannot be a balance between the current general interest of shareholders and the future generations interest. The shareholders` desire is to receive as much money as possible for their investments and no one could ever deny their claim. The issue here is related to the amount that the shareholders would consider as being enough for them as a worthy reward for their participation in the business.

It is, perhaps, the moment when shareholders could consider the future generations` interests as one of their goals. “*Après nous, le déluge*” is a mid XVIIth century attitude, an obsolete one and it cannot serve as a modern shield for the investors` motivations. Investors need to think in other terms, by setting a significance threshold for their expectations and, in the meantime, integrate some other considerations in their enoughness. Among the said considerations, being thoughtful related to the future generations` needs could be a very sensible approach.

2. Methods

The aim of this paper is to identify a way through which future generations` interests could be considered in today`s ongoing business environment. There are relatively few solid opinions oriented towards the conceptualization of the future generations as major stakeholders, given their poor ability to stand for their future needs and interests.

The research process presented in the paper is divided into two parts, considering its content. Of course, the actual status of the research in this domain was presented, alongside with the theoretical concepts used and with the Sustainable Development Goals, stated by the UN. Then, for the sake of this research endeavor, two major research questions were posed:

Research question no. 1: Are the current generations able to understand that the future ones could have needs and interests of their own?

Research question no. 2: Are there some certain methods/instruments/ways through which these needs and interests could be taken into account and, at the same time, make major stakeholders from the future generations?

Placing different perspectives in their own spot and mirroring various views (including author`s opinions), this paper tries to reveal a feeble red line which spans from the current generations to the future ones, in terms of their economic interests.

3. Results

As results, the possible answers to the posed questions will be revealed, as they were identified by the authors. Additionally, a *sui generis* type of contract will be proposed. Typically, a contract has two or more parties related by some mutual interests. However, this paper aims to pinpoint a different kind of contract, an open one, capable of encompassing parties that are not in the same time corridor. A difficult thing to comprehend, but a necessary one, given the behavior of current generations, in terms of doing business.

4. Discussion

Certain notions will be used to describe, as accurate as possible, the view of the authors upon this topic. Adverse selection, moral hazard, asymmetric information, greenwashing and many others are among these notions. Some of them are serving the purpose in their original meaning, others being placed under an unusual light, in order to reveal new facets of them, as logical argumentation instruments.

Especially when it comes to a *sui generis* type of adverse selection. Usually, the adverse selection refers to a situation in which the parties are contemporaneous with each other and one or some of the said parties are at a disadvantage compared to the other/s. In this case, the seemingly contradictory interests of the shareholders/investors are not simultaneous with those that future generations might express for themselves. Not only the adverse selection presents, in this case, some particularities, but also the moral hazard and the asymmetric information concepts are to be placed under the scope and to be analyzed.

The time difference, between the moments in which the mentioned interests are manifested, pushes the concept of asymmetric information to its crispiest maximum, considering that the two exponents of interests are as separated as they seem plainly detached. It cannot exist a greater time separation than

this, between the future generations` and today`s investors` interests. However, adverse selection is just a particular case for asymmetric information – “Adverse selection occurs when asymmetric information is exploited” (what-difference-between-moral-hazard-and-adverse-selection, n.d.). The following image depicts the authors` vision on this time separation and on the difference between the two instances.

Figure 1. Timeframe in which adverse selection and asymmetric information could occur
 Source: elaborated by the authors

In the picture above, t_0 , t_1 and t_2 , respectively, are different moments in time in a logical and chronological order.

As a support for this last paragraph`s idea, an article, written in 2006 (de Jong, P.; Ferris, S., 2006) consider that, in insurance business, adverse selection “is not, at present, a severe problem for insurers”, but it may become if some exogenous factors are influencing the market. Among those exogenous factors, one can identify the authorities that can impose various restrictions, as well as the increase that may appear in the level of knowledge of the counterparties, i.e. insurance buyers. Two words could be stressed in the assertion mentioned authors have made and these words are **at present**. Getting out from the insurance business scenario, and going back to the problem at stake, that of the future generations` interests and their inability to be a part in the trade, it is necessary to enhance the level of awareness for the present actors of the economic system. This awareness should be directed to the future generations and their potential future needs. They will need a neat and tidy environment, some resources to be able to make themselves a living, well preserved beautiful landscapes and educated and healthy people, as well.

The Sustainable Development Goals - SDGs

The issue here is that not only the care for environment and for the amount and quality of resources actual generation should be concerned of. Another important thing, probably the most important of all, is the quality of the education and of the health status that the actual generation is providing to the future ones. This standpoint should be one of the utmost importance for future generations. It is also included in the UN 17 SDGs, number three and four in the SDGs` matrix – good health and well-being and quality education, respectively. Access to qualitative educational system, with a steadily improved curriculum, alongside with a continuous preoccupation for some enhanced characteristics of the healthcare system, all these could form a future oriented program.

In fact, many elements in the SDGs` matrix refer to issues related to the future generations and their interests. In the following part of the paper, those elements will be ranked depending on their degree of association with the future generations` interests, according to authors` opinion.

Firstly, in Figure no 2, the UN matrix of SDGs is presented.

Figure 2. The UN matrix of Sustainable Development Goals

Source: <https://www.un.org/sustainabledevelopment/news/communications-material/02/08/2023>

As the matrix shows, almost all of the elements are somehow related to the future generations' interests, but some of them are more directly linked with these interests than others. Moreover, some of them seem not to be in association with the potential needs of the future generations, being in connection only with the actual requirements for a better world.

In the following table (Table no 1), these elements will be grouped from the strongest association with the future generations' interests, and to those that are relatively weakly connected with the said interests. The analysis will try to present the elements in a matter of degree approach.

Table 1. Several degrees of association between the elements in the SDGs matrix and future generations' interests

Degree level	UN SDGs elements
1	3. Good health and well-being 4. Quality education 6. Clean water and sanitation 13. Climate action 14. Life below water 15. Life on land
2	5. Gender equality 10. Reduced inequalities 16. Peace, justice and strong institutions
3	11. Sustainable cities and communities 12. Responsible consumption and production
4	1.No poverty 2. Zero hunger 7. Affordable and clean energy 8. Decent work and economic growth 9. Industry innovation and infrastructure 17. Partnerships for the goals

Source: made by authors, based on the UN SDGs matrix, presented in Figure 2

In the first degree of association with the future generations as major stakeholders (Abrudan, L.C.; Matei, M.C.;Abrudan, M.M., 2021), this paper is placing six elements, as well as in the last degree, while in the middle are three for the second rank and two for the third, respectively. Of course, this distribution is a matter of debate, but from the authors' standpoint, which is rallied with the possible vision of the future generations.

This distribution is based on the perceived, at authors' level, relationship of all the elements with the potential needs the future generations may have. A good health status, based on a neat and tidy environment, with clean water, climate issues awareness, concerns related to the quality of life (in water and on land), has to be a corollary of all these and a desire every self-aware human being should possess. Alongside with a well-maintained and improved education system. All these attributes of a good life are goals that could be achieved through a careful way of thinking from the current generations' standpoint. This is the first degree of association.

The second bracket, which has three elements, refers to a softer approach, not as direct related to the future generations' needs as the first degree. Some solved issues regarding the inequality of any kind between the human beings (regardless if the inequalities refer to gender aspects or to income, economic or of other nature), could provide a strong foundation for the quality of the future social relationships. Reliable institutions, which can provide perceived trust in them, alongside with a fair and impartial justice and, of course, the generally desired peace, all these can lead to a better way of life, characterized by a perceived safety and many other reliefs related to the every day's dreads.

Sustainable cities and communities are a necessary condition for a continuous development process. Better managed and maintained, at all levels, the future communities, cities or other forms of organization, will be able to provide better conditions for the future generations as they come and on a regular basis. On the other hand, the consumption and production issues related to the resources that are processed into production factors should be seen in a different light. Future generations will need a certain amount of resources to make a living and to thrive and it is better to make the consumption plans according to this aspect.

The fourth degree of association was considered as being weakly related to the future generations' interests and more linked to the current issues that actual generations have to cope with. These elements from the last bracket, as well, could influence the well-being of the future generations, but authors consider that they are momentarily.

Examples of how the things are going

Regardless of their level of association with future or current generations' interests, these Sustainable Development Goals are to be complied with. The point is that current generations, through some of their representants, act slow in this direction. Especially when it comes to reconfiguring the business game's framework. This framework viewed through its ongoing process of adaptation to the continuously changing character of the needs, will be a legacy to future generations. Financial crisis, as a result of the misuse of the said framework elements, have a recurrence based on a perpetual lack of understanding, at the level of those who are in charge.

In this sense, returning to the adverse selection and its relationships with the future generations, there is need to bring another element into discussion. Moral hazard, a related concept to those that have been put in the light, plays an interesting role in this scenario. Natural greed, inherent to the human being, alongside the "*carpe diem*" and the other above mentioned adage, could serve as a handy excuse for the nowadays investors. Especially when the said investors receive the support of the financial advisers and scholars. Another professional category which easily could back this propensity is represented by the managerial and executive instances at company's level. Fiduciary duty, in the same phrase with the general interest of the shareholders, could absolutely provide this type of support.

An useful example of how things are happening, is represented by the derivatives markets, of any kind. There is only a 15 years timespan since the last significant financial crisis and the havoc it created. (Attar, A.; Mariotti, T.; Salanié, F., 2014) appraised these financial assets and introduced the idea that derivatives as structural financial assets usually rely on a plethora of underlying assets, with significant differences between them, and „their designers are likely to hold private information about their quality” this way creating „an adverse selection problem”. Authors of the article delivered a short inventory of these assets – „mortgage-backed securites, collateralized debt obligations and credit default swaps”. Let alone that some of them were rightly entitled toxic assets. Even though the authors linked this existing adverse selection with the liquidity provision, one can identify many other problems related to this situation, form ethical, going through legal and ending with economical and financial stability on short run. All these financial shocks could lead to the occurrence of a distrust atmosphere on long term. In the financial field information of a good quality and availability is an asset per se and the lack of it, especially when this lackness is valid only for one of the parties, raises some serious suspicions regarding the whole system. Of course, in this matter are involved many aspects, not only the lack of information, and one of them was mentioned earlier in the paper – natural greed of the human being. In terms of sustainability, the

behavior of the market's actors, both sellers and buyers, should consider the future of the system. Even though the crisis was not about physical resources but about financial ones, the stability of the economic system is also a legacy that current generations leave to the future ones.

Could be the time to stop or to put some strict limits to casino-capitalism. The banks forgot their primal functions and they entered (and even invented) the toxic assets markets, in order to make more money for their investors (see the amalgamation of the already discussed two elements – general interest of the shareholders and fiduciary duty). The revenues generated by the spread between the two iconic interest rates – credit and deposit, were no more satisfactory, thus other sources of revenues have been sought and/or created. The ever permanent need for improving or enhancing the outcomes (financially speaking), has led to an un-orthodox (eufemistic term) approach of the markets. These financial innovations stimulated an increase in the velocity of money. As a scenario – on a certain market a financial asset is traded. The market will tend toward equilibrium, which means that the economic profits will be zero. A newly invented or innovated financial asset will take the stage, boosting the velocity of money and the volatility of the market. And so on and so forth. The infusion of the newly invented financial assets (e.g. Residential Mortgage-Backed Securities) which were capable to provide a higher remuneration, based on high volumes and, allegedly, high stability, has eventually led to the necessity of a transfusion, concretized in the so-called bailouts. Thus, the securities were no more secure.

The main property of these financial assets is that they are helpful, to a certain extent, for the market, regardless of its type. Real and financial economy are both affected by these assets because of their underlying assets. These assets that rely on other assets are valuable to the economic environment due to their contribution in smoothening the asperities of the price. Through their insertion in the market they produce a narrowing of the spread between the demand and supply prices, usually on a downward trend. Another valuable characteristic is that they are maintaining and increasing the market's liquidity, one of the market's most valuable feature. Alongside with the volatility they provide the market with attractiveness, speculators and hedgers being interested in trading on markets that exhibit this set of features. The presence of the hedgers brings to light another valuable facet of these assets – they are useful risk management instruments.

Another problem, in the same category, is related to the perpetual economic growth. This mantra leads to the idea that a business that does not grow is misconducted. Higher revenues are mandatory in the concept of doing business, being in contradiction with the aforementioned enoughness. This is not wrong when the business is at the beginning of it, or when the size of the revenues is not satisfactory, or in other appropriate circumstances, but when should the size of the revenues be considered satisfactory? When is enough? The issue here is related to the subsequent aspect of considering the increase in the size of the revenues, i.e. a higher level of resources consumption. After a certain treshold of the revenue the inherent need of it tends to fade, remaining just the carrying on sentiment that the revenue is pursued just for the sake of the it, without considering its size anymore.

Another opinion, regarding these issues, is expressed by Bosch-Badia et al. (Bosch-Badia, M.T.; Montlor-Serrats, J.;Tarrazon-Rodon, M.A., 2018) who put together sustainability and ethics with united efforts towards promoting the SDGs and a fairer financial markets. The mentioned authors reiterate the logical nature of the SDGs as long term oriented goals and they promote a more long-run approach for the investors on financial markets.

In another article, a recent one, (Liu, Y., Niu, J., Zhou, Y., & Huang, R., 2023) authors are proposing a combined method, using the social responsibility, green activities and stakeholders management, in order to find a more sustainable development for the corporate environment.

The business game

The business game is an infinite one and it must be played by some different sets of rules than in the case of the finite games. The mindset for the former type of games needs to be adjusted, as well. Using a finite mindset – i.e. the dichotomy of winner – loser, in an infinite game leads eventually to some serious disruptions in the game. The “decline of trust, cooperation and innovation” (Sinek, 2019) is among these disruptions. Adapting the mindset, making it an infinite one, could lead to a new perspective on the game. Transposing the current generations – future generations framework into this sort of infinite game, the actual mindset must move from the aforementioned dichotomy to a newly designed set of rules, projected on a longer period of time, realizing that in this structure there is no winner or defeated, and moreover, remaining prisoners of a finite mentality, in the long run there will only be widespread disappointment. A specific characteristic for infinite games is that they stand the test of time while the participants' time runs

out. The ongoing process of creating the new generations, which will form future generations, will result in a bitter distrust in the current generations` abilities to manage the resources at hand, followed by disappointment in this sense. Psychologically put, this issue could lead also to a lack of fervor towards pursuing their goals from the future generations` standpoint.

Being number one in the business game can be confusing, or even deceiving both to company and its stakeholders. In this infinite kind of game there are too many metrics which measure the parameters of the company`s activity. These metrics are both quantitative and qualitative approaches related. In the following table some of these metrics will be presented, without pretending to be an exhaustive presentation.

Table 2. Descriptors of the company`s economic performance

Quantitative indicators	Qualitative indicators
profitability	customers` preference
market share	reputation
EBIT	prestige
asset turnover and other activity ratios	social importance
	attitude

Source: elaborated by the authors

Besides, another issue should be taken into account – the timespan. It is difficult for a company to keep up with its competition in a long run. One could be the first in the rank for a month, a year or so, but it cannot be forever. Companies are coming and going on the markets, being able to occupy a front place in the rankings for a certain period, but not forever. Generations are changing, the customers` preference is changing as well, the reputation, the prestige and a company`s social importance fade, or even disappear as could the company. Let alone that all these are perceived in a matter of degree not as an absolute value.

In fact, the business game has to be played for the good of it, not for the good of some evanescent company or person. Sinek`s consideration regarding the effects of the ripples that a company, or a person, generates in the pursuit of its own goals, could be correlated with other ideas regarding a more sustainable approach to the business game. The triple bottom line stated by (Elkington, 1998), the ESG criteria, the aforementioned SDGs, the Equator Principles are among these ways of thinking. Indeed, the said ripples could and, in fact, are producing powerful, at some extent, effects in the business environment, in society as a whole. An important aspect regarding these effects is that they are also projected into the future, affecting even people who are not yet been born.

What will happen in the future?

What will happen in the future is the future generations` problem, one could say, but the things are not like that. Of course, free market and liberal economy are both valuable concepts, but there has to be a balance point between them and the future generations` interests. Many companies and individuals act like there is no tomorrow, behind the shield of general interest of the shareholders and of the fiduciary duty, considering, under the moral hazard sentiment, that they do not make any mistake thinking in this manner. They fall here under the exclusion ability hypothesis, by having the right to use what they have at hand, being the owners of what they use, excluding others (i.e. future generations) from using their actual resources. Exclusion ability comes along with the concept of rivalry in consumption, which considers that if one is using a piece of a resource, that piece will be no more available for other potential consumers.

In this sense, if the debate is focused on future generations` interests, then they are *sine qua non* excluded from the usage of the nowadays-consumed resources. They are not even allowed to have the quality of rivals in consumption, the only quality they will be entitled to will be the consumers of the leftovers.

Another idea, in this sense, was presented in (Rothschild, M.; Stiglitz, J., 1976), where authors discuss the externalities that are caused by one of the parties in the insurance business. This idea can be extrapolated to the current generations vs future generations situation. In the article written by the two mentioned authors, the externalities are caused by the high-risk individuals, who are the beneficiaries of a better trade than the low-risk individuals are. In the said situation, current generations are considered in the high-risk category, their behavior being able to inflict future conjunctures, leaving the future generations to cope with them. Indeed, future generations have no say in this matter. The fact that these generations are not contemporaneous with each other might lead to the idea that they cannot be the two

parties of the same contract, but this is a fallacy, even though the said generations are not living at the same time. The current paper is trying to induce the idea that current and future generations are parties of the one and same contract, despite their distance on the time scale.

This situation is not for the future generations only. The environment (with all its attributes) could be in the same circumstance. The difference in this case is not about the time scale, the environment being contemporaneous with current generations. The difference lays in the lack of the ability, from the human beings' standpoint, to consider environment as a stakeholder. Various species of plants and animals are endangered due to the unconscious behavior of the human being. Of course, there are concerns related to them, concerns that are transposed in potential ways of action.

Climate change, life on land and below water, as components of the SDGs, are bivalent, in this sense. They could be viewed both as a current conditioning and towards the future generations oriented. The current actions that are taken, in this sense, will lead to an enhanced quality of these attributes with immediate impact and with a delayed benefit, as well.

The main issue here is that there were and still are opinions (Sober, 1988) according to which the environmental attributes should not be considered as potential stakeholders, because they cannot be subject of an interest. Fortunately, more and more scholars, practitioners and opinion vectors are trying to change this state of affairs.

Conclusion

However, the current paper's idea is to conceptualize the role of all possible stakeholders as active parties of the proposed *sui generis* type of contract – a new business framework, based on a new mindset. Nonetheless, there is a need for more advised voices and actions in this sense. The exponents of these voices could fill in many roles in this endeavor. There is need for regulators, auditors, influencers (in the proper sense of the word) and integrity whistleblowers. The need for the latter comes from the occurrence of so-called greenwashing phenomenon. There are companies that are claiming that they are following the sustainability principles (i.e. ESG criteria) and are acting accordingly, but, in fact, they are just hiding beyond these principles, continuing to perform their activity in a manner characterized by the neglect of these principles. Attracting money from the investors, claiming that the ESG criteria are respected, taking advantage from the low level of the knowledge of the investors (adverse selection, in a way) and using that money to fund activities that are not complying with sustainability principles – that is one good example of greenwashing. There are many reasons for which the investors are less informed. Among them, one could find the lack of time investors have to seek for such details, as well as the credulity of which investors are capable.

Pareto's principle of well-being, on a long run could be a powerful driver in obtaining a sound business environment. Managers have to orient their companies' activity towards sustainability, in order to acquire such a business framework worthy to be considered a proper legacy. As it was stated in the paper, education of any kind, in terms of economics, could contribute to acquiring this goal, as well. If the investors, managers, employees – all reasonable stakeholders, would enhance their quality (expanding, in a good way, their mindset) as actors or resources, the project of this sort of contract could be operational at some moment in the future.

Two research questions were posed at the beginning of this paper and it is the moment to try to answer them, based on all the data presented.

First question, *Are the current generations able to understand that the future ones could have needs and interests of their own?*

A short and exhaustive answer to this question is very hard to propose, however the current mentality with which current generations are endowed – business game as finite and extremely competitive one, does not allow us to think that, in a plenary mode, the current generations are able to realise that the future ones could have needs and interests of their own. Neither are they seriously concern about how to modify the current mindset from the finite nature of the business game towards an infinite approach.

Considering the second research question: *Are there some certain methods/instruments/ways through which these needs and interests could be taken into account and, at the same time, make major stakeholders from the future generations?*, the answer could be as well hard to get.

Before trying to answer this second question, it will be presented another opinion, expressed in an article (Groves, 2019) where the authors reflects on the „ethical and political significance of sustainability“ and „acknowledges the otherness of the future and of nature, while also affirming responsibilities towards both“.

Going back to trying to answer to the second research question, the already mentioned union between sustainability and ethics could be considered as being somehow broad, however a good start. It is the same in the case of considering the SDGs as instruments, or better said, the subsequent policies originating in the implementation of SDGs to be considered as instruments. Besides these two, there are many elements which could provide us a combined answer. The repeatedly mentioned change in the mindset towards acquiring the attributes of an infinite game for business, could participate to the answer, as well. The proposed open contract between the current generations and the future ones could also serve as a framework through which the future generations could be viewed as major stakeholders.

Abstract

Research background: In earlier studies, the authors has been identified the important dimensions of social capital, made attempts to study the structure of social capital in economic systems using the example of the Russian economy. The article examines the influence of some elements of social capital on the innovative activity of firms on the example of the Russian economy.

Purpose of the article: The practical significance of this study lies in the fact that all the main provisions and conclusions of the article can be used in scientific and pedagogical activities when considering issues about the nature and trends in the development of innovative activity of economic agents, will become the basis for further development of methods for quantifying social capital. This will expand the boundaries of factors influencing to innovation processes in economic systems.

Methods: Based on the application of the phenomenological method, the analysis of scientific sources and statistical data, it is shown that the indicator of the age at which 90% of respondents consider their education completed has a close directly proportional relationship with the indicator of organizations' expenditures on technological innovations (the correlation coefficient is 0.9549).

Findings & Value added: The results of the study can be used to improve the knowledge about the role of social relation on the innovative processess.

Keywords: socio-economic development, social capital, innovations, economic agent's, Russia

JEL classification: O11, O39, O53

1. Introduction

Many modern papers are currently devoted to the study of features of innovation activities and sustainable development in different countries. The innovative activity of firms is often positioned as a condition for the successful growth and sustainable development of enterprises, and the national economy as a whole. This thesis is confirmed theoretically, as well as by quantitative estimates. Thus, according to some authors (Tellis et. al., 2009), radical innovation is an important factor in the firm's and state's growth and success. This is also relevant in the context of digitalization of all aspects of socio-economic development, which changes not only the technology, but also the features of the relationship between different groups of economic agents.

According to the research results of Zemtsov and Chernov (2019), firms in the high-tech sectors of the Russian economy that conduct export activities and/or are part of state corporations are growing faster. These conclusions generally correspond to the results obtained earlier by foreign researchers. Although some authors note that the study of export performance is still limited by conflicting empirical test results and the shortcomings of statistical methodologies in different countries (Chen et. al., 2016).

In addition, research in recent years has focused less on the influence of regional and other external factors on the innovation activity of firms. Regional factors, such as access to capital, technology, and markets in research of Zemtsov and Chernov (2019), were statistically insignificant. The author also

* Corresponding author: rastislav.kotulic@unipo.sk

concludes that according to the results of quantitative analysis in Russian economy, firms in none of the high-tech industries had significant advantages in growth, all other things being equal.

This does not indicate a decrease in the previously identified role of these factors, since favorable regional conditions are really important for the emergence and development of innovative business structures. For example, the role of the regional environment for fast-growing firms is studied in the studies of Motoyama and Danley (2012). It is just that in recent years, the emphasis has also been placed on the importance of studying the internal factors of innovation activity of economic agents. The basis for this was the results of a cluster management study, when it turned out that most clusters are unique entrepreneurial ecosystems. Ignoring the local context, top-down initiatives by supervisors to manage cluster development are usually unsuccessful (Martin and Sunley, 2003). As a result, the researchers focused on the study of internal factors of the development of innovative activity of firms, such as the characteristics of corporate culture, opportunistic behavior in the implementation of contractual relations, social capital, culture and established business practices. In modern society, a person's life is inextricably related to his professional activities (Rudaleva and Mustafin, 2017). In the view of some researchers, corporate culture is the strongest driver of radical innovation across nations (Tellis et. al., 2009).

The influence of opportunistic behavior in the form of agency risk on the implementation of innovations is described in the works of Jia, Huang and Zhang (2019). According to the author, innovation creates significant value for the firm, but it is difficult to manage because of agency risk, which leads to investment avoidance and, consequently, to insufficient investment in innovation, and requires detailed research. Mustafin et. al indicate that innovations become the basis for the competitiveness of enterprises, lead to greater efficiency, better quality of products and services (Mustafin et. al., 2019). In addition, opportunistic behavior on the part of firms can be expressed in the use of various manipulative practices, which negatively affects the implementation of innovations by economic agents (Yakovleva et. al., 2016).

Fritsch and Storey (2014) describe in their research papers that over the past decades, the role of both formal institutions and 'soft'skills, such as social capital and the culture of entrepreneurship, has been increasingly recognized in the development of entrepreneurship in a regional context. However, they also note that in a number of high-income countries, despite the stated cultural changes, the relative position of regions in relation to innovatively active firms does not change much over a long period of time.

Social capital is an important concept in modern economic theory, largely due to its popularization by Bourdieu (1986), as well as Coleman (1987, 1988) and Putnam (1993), whose research has formed a generalized understanding of this phenomenon. For example, R. Putnam defines social capital as "the characteristics of social life – networks, norms and trust – that encourage participants to work together more effectively to achieve common goals" (Putnam, 1996, p.66). The role of social capital is especially increasing in the context of the spread of digital technologies and qualitative structural changes in communication processes in society (Iakovleva, Seliverstova and Grigoryeva, 2019).

Thus, further research on the impact of corporate culture, opportunistic behavior of economic agents in the implementation of contractual relations, social capital and the culture of entrepreneurship on the innovative activity of firms – is relevant. The purpose of this work is to study the influence of social capital' elements on the innovative activity of firms (on the example of the Russian economy).

The main hypothesis in this article is about existing statistically significant connection between the elements of social capital and the innovative activity of economic agents. Empirical analysis base on trust's measures in society and macroeconomics indicators of innovation processess.

2. Methods

According to the statistical methodology in Russian government institutes, an organization that carried out innovative activities in the reporting period is an organization that had expenses for innovations in the reporting period. Innovation statistics have been maintained in Russia since 1994. Data on technological innovations are collected in 1994, and on organizational innovations – 2000, marketing innovations – since 2006, environmental innovations – since 2009.

The main indicators of innovation activity of economic agents are:

- the indicators of the share of organizations that carry out innovations;
- the volume of innovative goods, works, services;
- the costs of technological innovations of organizations.

Most of the indicators of various types and elements of social capital of the World Values Survey (WVS) are reduced to assessing the level of trust (trust in the family, trust in acquaintances, trust in

strangers, and trust in the majority). Therefore, to study the internal factors of innovation activity, we selected and analyzed the dynamics of several indicators from the World Values Survey (WVS) database:

- Trust in the Majority (Q57: Most people can be trusted);
- At what age did you finish your education (V 249: At what age did you finish your education).

The data was selected for Russia, for the entire available time interval 1990-2020. Data analysis was applied by analyzing the sum of accumulated frequencies, using the method of comparative analysis of time series data, and correlation analysis.

3. Results

Russia is a developing country, which for two decades has passed the stage of the formation of a new civilizational model (Mustafin et. al., 2019). As a result of the analysis of the dynamics of trust in the framework of the study of social capital in Russia, Almakaeva and Volchenko (2018) come to the conclusion about the growth of trust in power structures and political institutions in Russia in 2006-2017. Trust in strangers people also increases.

The dynamics of condemnation of illegal actions in Russia decreases from 1990 to 2017 (receiving bribes, illegal receipt of benefits, non-payment of taxes). This may indicate an increase in opportunistic behavior on the part of various groups of economic agents. The dynamics of trust in acquaintances and the assessment of the importance of friends also have contradictory trends. As a result, the authors conclude that there are different determining factors for different types of social capital, as well as for indicators within the same type of social capital (Almakaeva and Volchenko, 2018). Indeed, social capital is a complex phenomenon that is difficult to quantify.

Figure 1. Dynamics of trust in the majority in Russia, according to WVS database, in percent
Source: compiled by the authors according to WVS database

Figure 1 shows the dynamics of trust in the majority in Russia, which shows that the share of people who are wary of the majority opinion has been declining over the past decade, and for those who trust it is increasing – which in general may indicate a positive dynamics of social capital in Russia up to 2014-2015. But according to the 2017-2020 study' results, the trends of divergence in society have intensified again.

The readiness of society for the knowledge economy and innovation is also an element of social capital, as well as trust indicators, and can be partially assessed taking into account the respondents' commitment to the concept of lifelong learning, which is expressed in a subjective assessment of the age at which the respondent completed his education.

Thus, according to WVS, in the 5th and 6th waves of values research in Russia, there was a percentage of people who do not consider their education completed and, therefore, found it difficult to answer this question (5 and 4 percent of respondents, respectively). According to surveys of the 4th wave, more than 90% of respondents considered their education completed at the age of 25. According to surveys of the 5th wave, 90% is achieved only by the age of 34, and according to the 6th wave-after 45

years (Figure 2). The results of the 7th wave of studies were published in 2020 and did not include this question, apparently based on the continuation of the stable trend outlined in previous surveys.

Figure 2. The ratio of the proportion of respondents who consider their education completed and their age, the sum of accumulated frequencies, in percent, 1999-2014
 Source: compiled by the authors according to WVS database

Thus, according to WVS, in the 5th and 6th waves of values research in Russia, there was a percentage of people who do not consider their education completed and, therefore, found it difficult to answer this question (5 and 4 percent of respondents, respectively). According to surveys of the 4th wave, more than 90% of respondents considered their education completed at the age of 25. According to surveys of the 5th wave, 90% is achieved only by the age of 34, and according to the 6th wave-after 45 years (Figure 2). The results of the 7th wave of studies were published in 2020 and did not include this question, apparently based on the continuation of the stable trend outlined in previous surveys.

In our opinion, this characterizes positive changes in the public consciousness – it demonstrates a higher potential readiness of people to retrain, learn new things (including innovations).

Thus, the increase in the level of trust in the majority reflects, all other things being equal, the increase in social capital in society. The respondents' acceptance of the concept of continuing education (Figure 2) also reflects, other things being equal, an increase in social capital due to closer interaction of economic agents and readiness for change. These changes, all other things being equal, create a positive basis for increasing the innovative activity of economic agents in the Russian economy.

4. Discussion

Authors tried to correlate these results with the indicators of innovation activity of economic agents on the example of the Russian economy, taking as a key indicator of the innovation activity of firms the costs of organizations for technological innovations, which corresponds to the methodology of accounting for innovations of Rosstat.

According to the studied indicators, we constructed a correlation matrix (Table 1).

An interesting conclusion was that the indicator of the age at which 90 % of respondents consider their education completed has a close directly proportional relationship with the indicator of organizations' expenditures on technological innovations (the correlation coefficient is 0.9549, which is greater than the threshold value of 0.7 and means that there is a strong relationship between the studied factors).

This point can be explained by the transformation of the respondents' worldview in terms of change management, increased readiness for innovation through the adoption of the concept of continuing education and geographical mobility specific to young people. And be one of the internal conditions for the innovation activity of economic agents, and increase the corresponding costs.

Table 1. Correlation matrix of indicators, for Russia

Indicators	The share of respondents who trust the majority, in percent	The age at which 90% of respondents consider their education completed, in years	Costs for technological innovations of organizations (Statistic data for Russian economy), in mln rubles	p-value
The share of respondents who trust the majority, in percent	1	-0.0054	-0.0804	< 0.01
The age at which 90% of respondents consider their education completed, in years	-0.0054	1	0.9549	
Costs for technological innovations of organizations (Statistic data for Russian economy), in mln rubles	-0.0804	0.9549	1	

Source: compiled by authors.

At the same time, it is interesting that the indicator of respondents' confidence in the majority has an extremely weak relationship (correlation coefficients are significantly less than 0.3) with the studied factors. This may be due to the small sample size (data is available only for the previous 6 waves of the WVS study) or the presence of a significant number of different indirect effects that reduce the direct impact of the level of trust in society on the costs of technological innovation.

Conclusion

Like the category of social capital, the concept of innovation activity of economic agents is often difficult to identify and difficult to measure, a complex phenomenon, which entails the complexity of the study of this phenomenon (Grigoryeva and Grigoryeva, 2015).

Statistical accounting of innovations is imperfect due to the wide variety of strategies and actions of economic agents in the development and implementation of innovations. However, the available statistical data give general ideas about the dynamics of individual indicators of innovation activity of economic agents, which is important given the lack of other opportunities to obtain such information at the macroeconomic level.

At the same time, the results obtained suggest a confirmation of the hypothesis that there is a connection between the elements of social capital and the innovative activity of economic agents. The results obtained can serve as a basis for further research in this area, in particular, we assume that there are statistically significant differences in the strength of the relationship between the elements of social capital and the innovation activity of economic agents for different groups of countries.

Thus, the analysis of the influence of the elements of social capital and on the innovative activity of economic agents allows us to talk about contradictory trends, which is shown by the example of the Russian economy. The analysis of statistical data showed a close, directly proportional relationship between the indicator of age at which 90% of respondents consider their education completed and the indicator of organizations' expenditures on technological innovations (the correlation coefficient is 0.9549 – which is significantly more than 0.7). At the same time, the hypothesis that there is a statistically significant relationship between innovation costs and indicators of trust in society has not been confirmed. The reliance on the international experience, taking into account certain features of the Russian economy, will help to avoid protracted crises and unfavorable circumstances (Vasilova et al., 2018).

2. Management

An Analytical View of the Development of Human Capital from the Point of View of the Current Needs of the Labor Market

Jana Cocul'ová^{1,*}, Nella Svetožárovová¹, and Daniela Bertová¹

¹ University of Presov, Department of Management, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The paper focuses on human capital and emphasizes the importance of continuous development to secure employment in the labor market. It explores how globalization, digitization, and aging populations drive the need for new skill sets.

Purpose of the article: The aim of the paper is to provide an analytical view of the problem of the mismatch between supply and demand for skills in the labor market and to point out the need for innovations in the field of education and human capital development.

Methods: The aim of the research is to compare Slovakia and the average of EU countries in the area of supply and demand for selected types of skills. For comparison purposes, an analysis of secondary data was performed, which was drawn from the Skills for Job database published by the OECD. The indicators were calculated by the OECD using data from the European Union Labour Force Survey.

Findings & Value added: Through the analysis and comparison of secondary data, drawn from the Skills for Job database, an up-to-date view of the situation in the area of supply and demand for selected types of skills is provided, thereby pointing out existing deficiencies and especially needs in the area of lifelong learning and development. Based on the data presented the overall cognitive, communication, and digital skills in the Slovak Republic appear to be inadequate. This trend is also observed in the EU, except for communication skills, which can be deemed sufficient based on the average of EU countries when evaluating the labor market.

Keywords: human resources, human capital, labor market, skills, education

JEL classification: J24, I25

1. Introduction

Over the past few decades, the labor market has undergone substantial structural changes, leading to an environment marked by uncertainty and unpredictability. Technological innovations, increased emphasis on efficiency, intensified international competition, and novel work arrangements define the current labor market trend. With the information revolution and knowledge-based economy taking precedence over the industrial revolution, work tasks have become less stable, focusing more on IT technologies and creative skills. As a result, individuals must prioritize adaptability and embrace lifelong learning to thrive in the dynamic labor market landscape.

1.1 Theoretical overview of the issue

As the labor market's external landscape experiences shift, so do the factors concerning employees themselves. One prominent aspect is the phenomenon of career change, which is characterized by frequent changes (Nyström, Dahlgren & Dahlgren, 2008). This evolution has resulted in novel conditions and prerequisites in the labor market. It is evident that in a rapidly changing technological and social environment, mere completion of studies is insufficient to be a proficient employee (Suhányi et al., 2017). To remain competitive in the labor market, secure income, and attain social status, individuals must consistently invest in skill development to stay relevant amidst increasing competition (Clarke, 2008). Employers must actively seek pertinent competencies, encompassing knowledge, skills, and attitudes, to thrive in this evolving landscape (Brown, Hesketh & Williams, 2003; Knight & Yorke, 2004).

* Corresponding author: jana.coculova@unipo.sk

The significance of altering education approaches and fostering adult skill development is widely recognized, particularly when considering the future of economic and social progress (Pater et al., 2022). Discussions surrounding growth drivers, such as globalization and technological advancements, underscore the importance of high-quality skills relevant to the labor market, as they are critical for competitiveness and employability (OECD, 2019). Ensuring productivity growth and securing good jobs requires a strong emphasis on skills. Fundamental skills like literacy, mathematical literacy, and ICT literacy serve as essential prerequisites for easy entry into the labor market and for adults to maintain stable and high-quality employment (Stef & Mirea, 2021). To build a successful career, individuals must embrace a mindset of continuous learning and adaptability to navigate changing working conditions and career paths (Riel et al., 2012).

The overarching goal of education is to enhance employees' productivity in various ways. However, education may not always directly equip individuals for the specific tasks they will encounter in their professional roles (Helms Jørgensen, 2004). Adult education and training play a crucial role in preparing individuals to face challenges by fostering their capacity to develop and adapt to different job requirements (Sala, 2011). To ensure a steady supply of qualified labor, the dynamic and evolving labor market necessitates increased investments in learning and education (Livingstone, 2010). While the demand for more educated individuals has risen, it remains uncertain whether the current workforce precisely matches the present workplace demands (Rasovec & Vavrinova, 2014).

Identifying a universal set of competencies that employers seek in today's employees might be elusive; however, specific types of competencies tend to emerge consistently in studies exploring current workforce demands (Pool & Sewell, 2007). In addition to job-specific skills, labor market requirements include an ethical aspect that encompasses integrity and the ability to comprehend and respect the explicit and implicit rules, values, and norms present within an organization. This ethical dimension is fundamental in interpreting diverse contexts and aligning with the distinct organizational culture (Nilsson, 2010).

Instead, labor market demands are intertwined with a broader spectrum of general competencies and personal traits (Tomlinson, 2008). Employees are expected to possess flexibility, adaptability, and a continuous learning mindset throughout their careers (Nyström, Dahlgren & Dahlgren, 2008). Workers must be capable of gaining a comprehensive understanding of diverse tasks within the organization, functioning effectively in multidisciplinary environments, and fostering collaboration and communication with others (Perry et al., 2014).

The domain of education and development is going through significant transformations, in parallel with changes in our work environment (virtual work arrangements) and work methods (increased technology adoption) (Štefko et al., 2021). Adaptability to change has emerged as a constant aspect of work, and for numerous workers, the challenge lies not in accessing information but in making coherent sense of the abundance of available data. As Kraiger (2014) points out, the need for employee training is set to continually increase, with a rising preference for technology-based training over traditional face-to-face training.

1.2 Trends in skills demand

According to the international group of stakeholders engaged in the OECD Future of Education and Skills 2030 project, skills are defined as the capabilities and requirements needed to execute specific tasks and effectively apply one's knowledge to achieve objectives. These skills are an integral aspect of a comprehensive notion of competence, which encompasses the utilization of knowledge, skills, attitudes, and values to meet intricate demands.

OECD Learning Compass 2030 distinguishes three different types of skills (OECD, 2018):

- cognitive and metacognitive skills that include critical thinking, creative thinking, learning and self regulation;
- social and emotional skills, which include empathy, self-efficacy, responsibility and cooperation;
- practical and physical skills that include the ability to use new information and means of communication.

Cognitive skills encompass a range of thinking strategies that enable individuals to utilize language, numbers, reasoning, and acquired knowledge. These skills encompass verbal and non-verbal abilities, as well as higher-order thinking skills. Additionally, metacognitive skills involve learning capabilities and the adeptness to apply one's knowledge, skills, attitudes, and values (OECD, 2018).

Social and emotional skills are a set of individual abilities that can be expressed in consistent patterns of thought, feeling and behavior that enable people to develop and nurture relationships at home, at school, at work and in the community, to carry out their civic responsibilities.

Physical skills are a set of abilities to use physical tools, operations and functions. They include manual skills, such as the ability to use information and operate technological devices and new machines, play musical instruments, play sports, etc. (OECD, 2016).

2. Methods

The aim of the paper is to provide an analytical view of the problem of the mismatch between supply and demand for skills in the labor market. The gap between the skills sought by employers and the skills possessed by workers is becoming progressively more demanding. This predicament is driven by factors such as digitization, globalization, and the rapid aging of the population, all of which contribute to an imbalance in the availability and demand for skills.

The aim of the research is to compare Slovakia and the average of EU countries in the area of supply and demand for selected types of skills. For comparison purposes, an analysis of secondary data was performed, which was drawn from the Skills for Job database published by the OECD. The indicators were calculated by the OECD using data from the European Union Labour Force Survey (LFS: EU). The OECD Skills database presents an overview of the discrepancy between skill demand and supply across different countries for various job positions (OECD, 2023).

The subject of the comparison are 4 groups of skills, namely cognitive, communication, digital and social skills.

Skills are defined as hard-to-find (or in shortage) when employers are unable to hire employees with the required skills on the labor market and at normal wages and working conditions. Surplus skills refer to situations where the supply of a particular skill outweighs the demand for it.

The tables show the comparison of the Slovak Republic compared to the EU average with regard to the mentioned types of skills (updated for 2022), namely:

1. cognitive skills
2. communication skills
3. digital skills
4. social skills

Positive values indicate a shortage of skills, while negative values indicate an excess of skills. The greater the absolute value, the greater the imbalance. A value of 1 represents the largest shortage and a value of -1 the largest surplus.

Through the analysis and comparison of secondary data, drawn from the Skills for Job database, an up-to-date view of the situation in the area of supply and demand for selected types of skills is provided, thereby pointing out existing deficiencies and especially needs in the area of lifelong learning and development.

3. Results

The first group of skills that are the subject of research are cognitive skills. In the group of cognitive skills, the subjects of research were skills such as (1) Learning, (2) Originality, (3) Quantitative abilities and (4) Reasoning and Problem-solving.

Deficiencies in Learning and Problem-Solving skills were observed, both in Slovakia and the EU average. Particularly, there is a notable deficit in learning skills compared to other types of skills within the EU average.

Table 1. State in the field of demand and supply of cognitive skills

	Learning	Originality	Quantitative abilities	Reasoning and Problem-solving
Slovakia	0.093	-0.002	-0.060	0.036
EU average	0.201	-0.002	-0.151	0.030

(Source: <https://stats.oecd.org/>)

Based on the data presented in Table 1, it can be assumed that skills such as Learning, Reasoning and Problem-solving are insufficiently developed within the EU and also within the Slovak Republic. These

are precisely the skills that are in high demand on the market. The reason is precisely the changes related to the nature of work, where a higher level of intellectual and critical thinking is often required. It can be assumed, it is the learning methods based on memorizing a large amount of information that are used in schools that hinder the development of skills such as Reasoning and Problem-solving. The development of skills such as Reasoning and Problem-solving requires the development of critical thinking, which must be developed already at an early school age.

The second group of skills that received attention is communication skills. The following types of skills were monitored in this group, namely (1) Active Listening, (2) Communications and Media, (3) Reading Comprehension and (4) Speaking.

Regarding communication skills, the Slovak Republic exhibits a deficiency in two specific areas: Reading Comprehension and Speaking. However, the EU average shows contrasting results, with both Reading Comprehension and Speaking skills reported as surplus.

Based on these findings, it can be assumed that there is a lack of an innovative approach to education in schools that would develop the skills necessary for the current needs of the labor market. Reading Comprehension is a fundamental skill for the development of critical thinking, which guarantees that an individual in the future will be able to evaluate a lot of information in terms of importance for his work, which is especially necessary in the current era of information overload. Similarly, the skill of Speaking requires development already at an early school age. Speaking is an essential skill for any profession where communication with people is necessary. The development of these skills requires a change of approach in education of students.

Table 2. State in the field of demand and supply of communicative skills

	Active Listening	Communications and Media	Reading Comprehension	Speaking
Slovakia	-0.081	-0.011	0.037	0.019
EU average	-0.203	-0.064	-0.013	-0.046

(Source: <https://stats.oecd.org/>)

An important set of skills for which demand will grow significantly in the future is digital skills. Digital skills appear to be the most in short supply among the other skill groups, which points to the fact that digitization represents a very fast process to which education is not able to respond quickly enough. Unlike the EU average, SR has a better result in the Computer programming, where it turns out that there is enough labor with the given type of skills. However, unlike the EU average, there is a lack of workforce in Slovakia that would master Digital data processing and Web development.

Compared to other groups of skills, digital skills can be considered a new type of skills brought about by the new, digital age. Therefore, in the case of employees, lifelong learning plays an important role, which must be seen as an essential part of development for employment on the labor market. The lack of digital skills is a problem affecting most EU countries, not only Slovakia. It is important that countries know how to provide opportunities for the development of digital skills, not only within the framework of school education, but also within the framework of lifelong learning.

Table 3. Status of demand and supply of digital skills

	Computer Programming	Digital Content Creation	Digital Data Processing	ICT Safety, Networks	Web Development
Slovakia	-0.022	0.086	0.034	0.010	0.005
EU average	0.060	0.107	-0.002	0.020	-0.007

(Source: <https://stats.oecd.org/>)

Within the social skills group, attention was paid to skills such as (1) Coordination, (2) Decision Making and (3) Persuasion and Negotiation. Social skills are generally considered to be in surplus, which is a positive assessment. There are no notable discrepancies in the demand and supply of these skills between Slovakia and the EU average within the specified group. However, the skill of Persuasion and Negotiation was found to be deficient.

Table 4. Status in the field of demand and supply of social skills

	Coordination	Decision Making	Persuasion and Negotiation
Slovakia	-0.043	-0,015	0.039
EU average	-0.083	-0.032	0.021

(Source: <https://stats.oecd.org/>)

When considering the total values, the overall cognitive, communication, and digital skills in the Slovak Republic appear to be inadequate. This trend is also observed in the EU, except for communication skills, which can be deemed sufficient based on the average of EU countries when evaluating the labor market.

The results prove the fact that school education systems are not able to respond quickly enough to the development of new skills that are currently needed for the labor market. As it is very difficult to implement changes in educational systems, it is important to support lifelong learning programs for adults in particular. In the case of Slovakia, the participation in adult education can be evaluated rather negatively, since in 2021 it was only at the level of 4.8%, which makes it one of the countries with the lowest rate of adult education in EU (Eurostat, 2022).

Table 5. Comparison of cognitive, communication, digital and social skills

	Cognitive Skills	Communication Skills	Digital Skills	Social Skills
Slovakia	0.035	0.015	0.058	-0.019
EU average	0.059	-0.119	0.058	-0.090

(Source: <https://stats.oecd.org/>)

4. Discussion

It is very important that the skills of workers are in line with the needs of the labor market. Skills imbalances, either shortages (when adequate skills are difficult to find in the current labor market) or surpluses (when certain skills are in excess in the labor market compared to demand and therefore easy to find), can slow the adoption of new technologies, cause delays in production, increase labor turnover and reduce productivity. Individuals lacking the "right" skills would also face poor labor market outcomes.

If the mismatch between offered and required skills, which can take various forms, persists, it can lead to short- and long-term economic and social losses for people, employers and society alike. Based on the analysis of the state of individual types and areas, it concerns the imbalance that exists on the labor market in terms of demand and supply of skills. This use applies not only to Slovakia, but also to the average of EU countries. According to the data from the OECD Skills database for Job, it is evident that the Slovak Republic exhibits varying rates of skill discrepancies. The highest discrepancy rate is observed in digital skills, with a recorded value of 0.058, followed by cognitive skills at 0.038 and communication skills at 0.015. Interestingly, an excess of social skills was recorded, which is regarded as a positive finding. Additionally, when analyzing specific skill types, the most significant lack of skills was found in the Learning skill (0.093).

Based on the comparison of Slovakia and the EU average, no differences were found in the area of lack and excess of cognitive skills. Learning and problem-solving skills were found to be lacking. An interesting finding is that these are precisely the skills that need to be developed at an early school age. School education systems and specific ways of educating children play a big role here, which in the case of Slovakia are often based on the passive reception of a large amount of information, which does not force students to analyze and evaluate the information (Suhányi et al. 2017). The absence of the development of cognitive skills is then an obstacle to the acquisition of further knowledge.

In the case of communication skills, unlike the EU average, there is a problem with the lack of two types of skills, namely Speaking and Reading Comprehension. These are skills whose development begins already in childhood and which represent prerequisites for the acquisition and development of other skills. As with cognitive skills, school education systems play a major role.

Digital skills are a particular problem. Based on the results of the analysis, these are the most in-demand skills. Due to the fact that the IT sphere is a very dynamically developing field, school systems are not able to respond quickly and flexibly to the demands of the labor market (Spiezia, 2017). Therefore,

lifelong learning systems and also the approach of adult workers themselves play an important role here. Lifelong learning systems are a natural part of skills development.

In the case of social skills, there is no difference between the Slovak Republic and the EU average, as Persuasion and Negotiation are insufficient in both cases. These skills are important in many jobs, especially in areas such as marketing, sales, advertising, and many lifelong learning courses focus on their development (Arntz et al., 2016).

Conclusion

The paper points to the issue of skills mismatch in the labor market. Through the analysis and comparison of data from the Skills for Job database, it provides an up-to-date view of the surplus and shortage of selected types of skills within the Slovak Republic, thus pointing to the need for innovations in the field of educational systems as well as the importance of lifelong learning.

Imbalances in the labor market's skill supply and demand are brought about by structural shifts. To empower the workforce to meet both present and future employer needs proficiently, it is vital to adopt proactive and innovative education and development initiatives designed to align with the labor market's requirements. Given the continuous growth in demand, especially for digital skills, as confirmed by OECD Skill results for Jobs, prioritizing the development of these proficiencies becomes crucial. The most effective approach to address the mismatch between skill demand and supply is through training and development. Ensuring educational programs are constantly evolving to meet the labor market's needs and are attractive to employees fosters a keen interest in self-education and further personal development.

Examining Leadership in Terms of Entrepreneurial Skills Enhancement and Bossing Elimination

Lucia Zbihlejšová^{1,*}

¹ University of Presov, Department of Intercultural Communication,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: One of the main duties of entrepreneurs is to create a favorable and comfortable work environment for their subordinates or employees. It is, therefore, necessary for them to enhance managerial and leadership skills and in this context to deem tendencies to bossing as dangerous in their entrepreneurial activities.

Purpose of the article: The main objective of the presented research is to examine the possible existence of statistically significant correlations between the selected leadership styles and the tendencies to bossing.

Methods: The research data were obtained from 197 respondents aged from 21 to 67 years ($M = 34.57$ years), 55% women and 45% men from various areas of business. To assess the preference of the examined attributes, two methodologies were used: Paternalistic leadership scales (to assess leadership behavior) measuring the factors of Benevolent, Moral, and Authoritarian leadership, and the BOSS methodology (to assess downward workplace bullying, i.e. bossing), which measures Communication-Aimed and Psyche-Aimed Bossing.

Findings & Value added: The results confirmed existence of several statistically significant links between leadership styles and tendencies to bossing of the respondents, pointing to behavioral errors commonly found in the workplace among managers and employees, or supervisors and subordinates. The necessity to study these errors has, thus, been accentuated, particularly in the context of entrepreneurship, where these deviations were found to occur.

Keywords: bossing, leadership, entrepreneur, skills

JEL classification: D23, D91

1. Introduction

Human resource management is currently manifesting itself as a synthesizing scientific discipline that explains the processes of personnel management, drawing on the knowledge of management, economics, psychology, sociology and corporate culture in a dynamic development atmosphere (Antošová 2008). Implementing good human resource management practices and aligning these practices with the company's business strategy has a significant impact on performance. Naturally, all macroeconomic positive implications are obvious here (Rose, Kumar 2006).

The success and competitiveness of the company is decided by the people and their knowledge. The basic condition for the success of any organization is therefore to be aware of the value and importance of a person in the work process. In this context, Budiman et al. (2018) highlight one of the basic tasks of managers, which is to motivate employees to high performance in a constantly changing environment. Motivation can be achieved through many ways, including coaching (Miško et al. 2022). However, according to Birknerová and Frankovský (2017), we often witness many cases of undesirable behavior that is contrary to the expectations, rules and standards of the organization.

The presented paper brings the focus of audience to some of the behavioral errors, which are commonly found in the workplace among managers and employees, or supervisors and subordinates. Human resource management is a broad context within which several phenomena can be observed, some of them positive, such as work engagement, job satisfaction and personal well-being, other rather negative,

* Corresponding author: lucia.zbihlejova@unipo.sk

such as aggression, bullying, or abusive supervision i.e. bossing, which lead to trauma, anxiety, and stress. The main objective of the contribution is to examine the leadership styles of managers in possible connection with the perception of bossing in managerial work and thus contribute theoretically and empirically to this area of knowledge.

1.1 Leadership as an entrepreneurial skill

In terms of the development of entrepreneurial skills, it is necessary to pay attention to the personal potential of managers, specifically the identification of its strengths and weaknesses, analysis of personal development needs of managers, as well as creating a personal profile and personal development plan for managers. This includes mastering appropriate leadership styles. Extensive knowledge from the literature on leadership behavior of entrepreneurs or managers of private companies confirms that leadership is and always will be an important factor for employee motivation, well-being and performance (Albrecht 2005). Behavioral theories about leadership argue that effective leaders need to have highly task-oriented and relationship-oriented competencies (Rowley, Hossain, Barry 2010). However, a thorough review of the literature shows that public sector research is primarily focused on the impact of role-oriented leaders' competencies (such as knowledge, expertise and technical skills) on employees and organizational outcomes. Studies focusing on the impact of leadership relationship competencies, such as creating an atmosphere of trust, showing attention and empathy for subordinates, humor and their impact on employee satisfaction, health and healthy workplace (e.g. Horváthová, Mokrá, Konečný 2023), attitudes and final performance are a rarity in public sector research.

The ethical behavior of leaders has recently come to the fore, especially given the financial crisis that has swept over the economically developed world (Eisenbeiss 2012). Given the adverse impact that such deliberate and illegal unethical practices may have on business, industry and ordinary people in the wider community, researchers have paid and continue to pay close attention to ethical decision-making and practices by leaders (e.g. Eisenbeiss 2012; Stenmark, Mumford 2011; Tomkova et al. 2021; and others).

1.2 Bossing and leadership

In every field, besides mobbing, one can find a boss who resorts to bullying subordinates. Abusive supervision or bossing is a very specific mode of bullying in the workplace, i.e. mobbing and persecution by the boss, where the psychological coercion is initiated by the superior (Novák 2004). Bossing is a specific form of mobbing where the aggressor is the manager or executive. Attacks are targeted at their subordinates in the form of pressure to enforce their obedience, respect and adaptation, possibly enforcing the "voluntary" resignation of a subordinate from the workplace (Topa, Moriano 2013). Russo and Popović (2016) also present bossing as a phenomenon occurring frequently in the workplace, where one or more supervisors apply ongoing aggression on a selected subordinate or group of subordinates.

Dabu and Drăghici (2013) present an overview of bullying practices in business organizations and its consequences on human health, citing Shahbazi et al. (2013, p. 1816), who studied the relationships between workplace bullying and three leadership styles, namely Benevolent leadership (Cheng, Chou, Wu 2004), Moral leadership (Hayek, et al. 2010), and Authoritarian leadership (Salin, Hoel, 2011), which are the very factors comprising the paternalistic leadership style as defined by Farh and Cheng (2000).

Ambrose and Ganegoda (2020) have recently examined how abusive behaviors of supervisors are perceived by their managers as well as their subordinates, and found out that in the manager-supervisor-subordinate triads, there are differences between managers' and subordinates' view of abusive supervision, i.e. bossing.

These two above research studies have inspired us to move the topics of bossing and leadership to the level of their interconnection, which is the essence of the next, analytical part of the presented research study.

2. Methods

The main objective of the presented research is to examine the possible existence of statistically significant correlations between the selected leadership styles and the tendencies to bossing. The following research methodologies were used to determine the assessment of the preference of the examined attributes:

1. Paternalistic leadership scales (Cheng et al. 2004)

The questionnaire based on the original methodology by Cheng et al. (2000) contains 26 items aimed at paternalistic leadership styles, with the respondents having the opportunity to mark their answers on a

6-point scale from 1 (I absolutely disagree) to 6 (I absolutely agree). The methodology enables identification of three attributes of leadership behavior:

- *Benevolent leadership* – leader demonstrates individual, holistic and complex care for their subordinates and their subjective well-being; sample item: „My supervisor ordinarily shows a kind concern for my comfort.“;
- *Moral leadership* – leader demonstrates excellent personal qualities, integrity, self-discipline, role-modelling, and unselfishness; sample item: „My supervisor does not take advantage of me for personal gain.“;
- *Authoritarian leadership* – leader exhibits an absolute authority, power and control over subordinates and requires their unquestionable obedience, respect, and rule following; sample item: „My supervisor always behaves in a commanding fashion in front of employees.“.

The internal reliability coefficient was 0.94 for the benevolent leadership scale, 0.90 for the moral leadership scale, and 0.89 for the authoritarian leadership scale.

2. BOSS methodology – downward workplace bullying (Birknerová, Zbihlejšová, Droppa 2021)

The BOSS methodology is aimed at the issue of assessing bossing on the basis of a psychometric approach. The BOSS methodology contains 17 items describing various forms of workplace bossing. The role of the respondents is to assess each item on a 5-point scale (1 = absolutely disagree, 2 = rather disagree, 3 = neither disagree nor agree, 4 = rather agree, 5 = absolutely agree). It specifies two bossing factors:

- *Communication-Aimed Bossing*: Respondents with high scores in a given factor feel that their superior does not allow them to comment on criticism, does not invite them to the operational or informal meetings of the working team, does not provide them with a turn to speak according to their interest during meetings, does not allow them access to undistorted information to fulfill their tasks, communicates with them minimally, abruptly terminates the conversation when they enter the room, carries out senseless and unjustified actions against their will, spreads gossip, defamation, unsubstantiated claims, half-truths, and intrigues about them, and ignores their opinions and casts doubt on their views.
- *Psyche-Aimed Bossing*: Respondents who score high in a given factor feel that they are criticized by their superior for their political, religious, and other convictions, that the superior damages their belongings and the results of their work, threatens them with physical violence, sexually harasses them, questions their mental state, gives them defamatory nicknames, and denies them additional business education.

The extracted factors explain 54.180% of the variance.

The research data were collected in the period from September 2022 to March 2023 using the non-probability quota sampling method from the total number of 197 respondents. The age of the research participants ranged from 21 to 67 years ($M = 34.57$ years), 55% of them classified themselves as women ($N = 108$) and 45% as men ($N = 89$). The respondents were from various areas of business: 25% of them work in Trade, 20% in Services, 11% in Transportation, 8% in Education, 8% in Production, 5% deal with real estate, 5% work in Administration, 5% in Healthcare, 3% in Banking, 3% in Insurance, the rest work in the Energy sector and other work areas such as I.T. or Gastronomy.

The overall statistical evaluation was processed in the R ver. 4.1.2 software (R Core Team 2022) and IBM SPSS 26. Statistical significance was verified for all tests based on the resulting p-value at the $\alpha = 0.05$.

3. Results

To fulfill the research objective, the normal distribution of individual monitored variables was verified using the Shapiro-Wilk test (Table 1). Since in all cases (within all variables) a significant violation of the normal distribution was demonstrated, the non-parametric Spearman correlation coefficient was subsequently used to analyze the studied variables (Figures 1, 2 and 3). The resulting value of this coefficient always comes from the interval -1 (maximum negative correlation, when the increasing value of one variable directly proportionally decreases the value of the other variable) to +1 (both values increase directly proportionally). A value equal to zero symbolizes that there is no correlation (relationship) between the variables.

Table 1. Descriptive statistics of monitored variables and assessment of data normality using the Shapiro-Wilk test

	Bossing	Benevolent leadership	Moral leadership	Authoritarian leadership
Shapiro-Wilk W	0.931	0.969	0.963	0.982
Shapiro-Wilk p	< .001	< .001	< .001	0.013
Mean	2.11	3.83	3.95	2.98
Median	1.87	3.92	4.02	3.03
Modus	1.00	3.92	5.19	3.26
Standard deviation	0.85	1.17	1.05	1.16
Variance	0.72	1.35	1.05	1.26
Range	3.90	5.00	5.00	5.00
Minimum	1.00	1.00	1.00	1.00
Maximum	4.89	6.00	6.00	6.00

Source: own processing

Based on subsequent analyses, we verified the existence of statistically significant correlations between Bossing and three attributes of Paternalistic leadership. As for the Benevolent leadership style, we noted a statistically highly significant correlation between indecisiveness and the tendency to overthink ($R = -0.47$; $p < 0.001$). Based on the value of the correlation coefficient ($R = -0.47$), we evaluate this relationship as moderately strong (interval 0.3 to 0.7) and negative (as the value of Benevolent leadership increases, the value of Bossing decreases). It is possible to state that there is a statistically significant medium strong negative correlation between Benevolent leadership and Bossing. The links between the monitored variables are illustrated in Figure 1.

Figure 1. Correlations between Bossing and Benevolent leadership

Source: own processing

Respondents who scored high in the factor of Benevolent leadership evaluate their supervisor as a family member, someone who cares about them and encourages them, is also interested in their personal life, helps them when they are in need and tries to understand what is the reason why they don't perform well.

When analyzing the links between Bossing and Moral leadership style, a statistically highly significant correlation between the variables was also confirmed ($R = -0.50$; $p < 0.001$). Based on the value of the correlation coefficient ($R = -0.50$), this relationship can be assessed as moderately strong (interval 0.3 to 0.7) and negative (as the value of Moral leadership increases, the value of Bossing

decreases). Therefore, there is a statistically significant moderately strong negative relationship between Moral leadership and Bossing. This relationship between the monitored variables is shown in Figure 2.

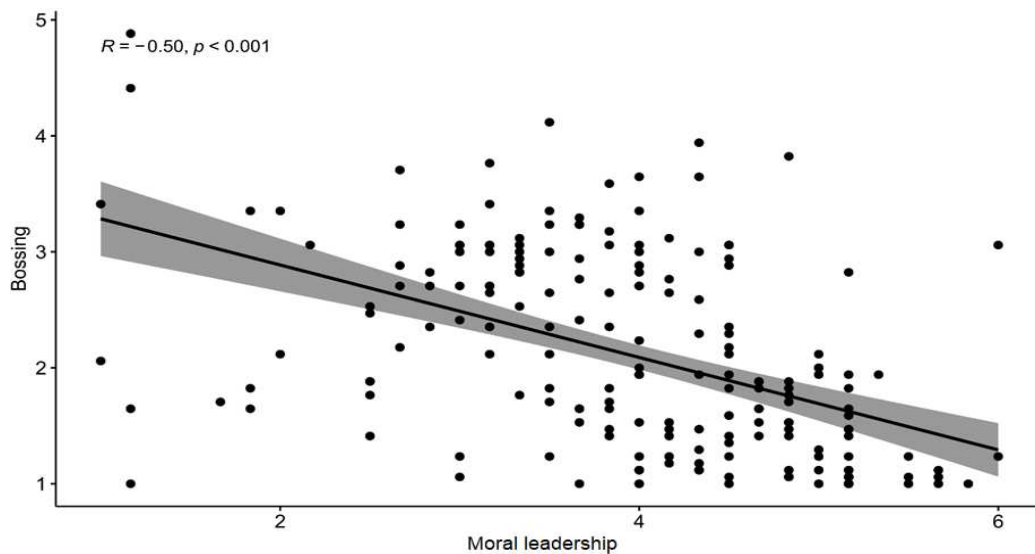

Figure 2. Correlations between Bossing and Moral leadership
Source: own processing

Based on the results, the respondents who scored high in the Moral leadership factor evaluate their superior as someone who does not envy the abilities and strengths of others, does not try to get special privileges with the help of his privileges, does not take credit for the achievements and contributions of others, does not use them expressly only for his own benefit and ultimately does not even use personal relationships to obtain illegal personal gains.

A statistically highly significant correlation was confirmed between Bossing and an Authoritarian leadership style ($R = 0.60$; $p < 0.001$). Based on the value of the correlation coefficient ($R = 0.60$), this relationship may be regarded as moderately strong (interval 0.3 to 0.7) and positive (as the value of Authoritarian leadership increases, the value of Bossing increases). Thus, there is a statistically significant moderately strong positive relationship between Authoritarian leadership and Bossing. The relationship between the observed variables is shown in Figure 3.

Figure 3. Correlations between Bossing and Authoritarian leadership
Source: own processing

Respondents scoring high in the factor of Authoritarian leadership rate their superior as a person who always has the last word, has a habit of behaving in a commanding manner, when working with them, one can feel under pressure, emphasizes the need to achieve the best performance of all and insists on following their own rules, on the basis of which they apply strict discipline.

Based on these analyses, it can be concluded that the main objective of the presented research, which was to examine the possible existence of statistically significant correlations between the selected leadership styles and the tendencies to bossing, was fulfilled and existence of these links was confirmed.

4. Discussion

Within the main research objective, which is to find out whether there are statistically significant connections between selected undesirable forms of business behavior and paternalistic leadership attributes, we focused primarily on the connection between bossing (as an undesirable form of business behavior) and moral, benevolent and authoritative leadership styles (as paternalistic leadership attributes). Bossing, however, is referred to by many foreign authors rather as the term "abusive supervision", which in literal translation we understand as abusive supervision. Yu, Duffy, and Tepper (2018) report that the domain of abusive supervisory behavior consists of hostile acts that include yelling at direct reports and belittling, blaming, and ostracizing them. Richard et al. (2020) argue that abusive supervision lacks an ethical element and define it as the extent to which a direct supervisor engages in consistent hostile verbal and nonverbal actions toward a subordinate.

When it comes to the links between abusive supervision and leadership styles, the findings by Li et al. (2019) across three studies show that authoritarian leadership and abusive supervision moderate each other's effects in suppressing subordinates' proactive behavior. Khan et al. (2010) confirmed the relationship between abusive supervision or bossing and negative employee results, i.e. work tension, emotional exhaustion and intention to turnover. In the context of developing countries, they found a positive empirical result for all the hypotheses they established, that is, the more bossing is applied, the higher the tension at work, emotional exhaustion, and turnover intention.

Watkins, Fehr and He (2019) examined how leaders' perceptions of the instrumental benefits of abusive supervision shape their tendencies to abuse their employees. They did so by conducting a between-subjects experiment by randomly assigning participants to one of two experimental conditions, observing several variables, e.g. Abusive supervision, Instrumentality beliefs manipulation, and Empathic concern. Results of their study provide evidence that some leaders consider abuse to be instrumental in nature.

Stempel and Rigotti (2018) investigated the role of gender in abusive leadership practices, along with the effects of abusive leadership on employee health. Their findings suggest that although there were no gender differences detected between the ratings for female and male leaders regarding abusive supervision, they confirm that the leaders' gender did play a role in employees' perceptions of abuse, and that the perceived abusive supervision is more strongly related to increased emotional exhaustion and somatic stress when the leader is male. In addition, Kernan et al. (2011) found in their research that the effects of abusive supervision on workers' work-related attitudes were moderated by some, but not all, cultural values. In the future studies of this issue, the gender and cultural contexts should, therefore, also be considered.

Conclusion

The presented research study was designed to point out certain behavioral errors, which are commonly found in the workplaces among managers and employees, or supervisors and subordinates. The main objective of the contribution was to examine the leadership styles of managers-entrepreneurs in possible connection with the perception of bossing in managerial work. The links between Benevolent leadership and Bossing, Moral leadership and Bossing, and Authoritarian leadership and Bossing have been recorded, indeed, which suggests that the analyzed predictors are identifiable at the level of practical experience rather than at the level of theoretical definition and cognition. In this context, they can be considered as essential characteristics of entrepreneurs' behavior in the social situation.

From the viewpoint of future research on the given issue in business management and area of entrepreneurship, several steps could be taken. First of all, the cultural context should be considered as a possible limitation or another study direction, as bossing can manifest itself differently within various cultures. In this sense, also the concept of staffing, i.e. upward bullying could be analyzed and further

compared within various settings. To what extent is bossing prominent on the different levels of management is yet another question provoking deeper discussion.

It can be concluded that the stated objective has been met and the paper represents a theoretical and empirical contribution to the discussed area of knowledge. Detection of the positive links between Authoritarian leadership and Bossing also imply that in the future, it is necessary to put an emphasis on prevention of the undesirable behavior occurring in the workplaces. Education in this area should be key. As bossing tends to expand in businesses across the world, it would be appropriate to put periodic training on it. A good system of education, prevention, identification of bossing attributes, transparent criteria, practices, and possibly repression could help to resolve this complicated issue.

Risk and Crisis Management in Enterprises with the Risk of Impending Bankruptcy in the Slovak Republic

Mária Petruščáková^{1,*}

¹ University of Economics and Management in Bratislava, Department of Small and Medium Business, Furdekova 16, 851 04 Bratislava, Slovakia

Abstract

Research background: The current global situation and the situation in national economies means many existing businesses face of the problem of solving the post-covid period and now energy crisis. Some enterprises have reached the brink of bankruptcy. In the Slovak Republic, a new legislative regulation was adopted, which will enable companies with the threat of bankruptcy to use risk and crisis management solutions to improve and stabilize their financial situation and prevent bankruptcy. The new management in these companies can use analogous procedures that have been recorded in the past in the successful restructuring and stabilization of companies.

Purpose of the article: To find out how businesses in bankruptcy approach the stabilization of the financial situation, what is the frequency of changes with an impact on the economic result, and to propose working procedures for risk and crisis management according to the new legislation in businesses with imminent bankruptcy in the Slovak Republic.

Methods: For our research we chose the method of empirical analysis on a sample of 164 companies that were tested 3 years before entering bankruptcy with a 5-factor Altman Z-score to demonstrate riskiness, and then we followed the development of selected items of assets and liabilities and their trend in these companies.

Findings & Value added: Based on the percentage development of selected items of the financial statements, we can predict some functional measures to achieve the stabilization of a company threatened with bankruptcy in their crisis and risk management as part of preventive actions.

Keywords: risk management, crisis management, bankruptcy, enterprises in risk

JEL classification: D22, G33

1. Introduction

Currently, the much of the scientific community in the field of economics focuses on innovative processes, highly advanced technologies aimed at management, production, economic activity, digitization of the business sphere and the sphere of public administration. This trend is justified and understandable. However, the post-covid period, the crisis in international trade relations and the resulting energy crisis have put many businesses in the exact opposite position, where they are struggling with financial problems and are on the verge of bankruptcy. Our intention is to point out the possible methods and decisions of companies with prediction of distress leading to their stabilization of the financial situation in new conditions.

1.1. Management in companies facing bankruptcy

In the member countries of the European Union, the number of small and medium-sized enterprises constitutes a very high share of the total business environment. Large and decisive enterprises make up a numerically almost negligible share. For a better overview, we present the published number of enterprises by size in the countries of the European Union and in the Slovak Republic for the year 2019 (Eurostat database):

* Corresponding author: petruscakovam@gmail.com

Table 1. Size structure of the business sector in the Slovak Republic and in the EU in 2019

		Enterprises size category					Total
		Micro (0 - 9)	Small (10 - 49)	Medium (50 - 249)	Large (250 +)	SME	
EÚ-27	<i>Number of business subjects in the non-financial corporate economy</i>	21 553 171	1 361 585	210 000	43 000	23 124 756	23 167 756
	<i>Share in the number of business subjects</i>	93,00%	5,90%	0,90%	0,20%	99,80%	100%
Slovakia	<i>Number of business subjects in the non-financial corporate economy</i>	497 812	11 172	2 505	594	511 489	512 083
	<i>Share in the number of business subjects</i>	97,20%	2,20%	0,50%	0,10%	99,90%	100%

Source: Eurostat. The data includes enterprises operating in industries that cover SK NACE sections B to N of division 95. At the time of material processing, the data was updated for 2019.

Among all small and medium-sized enterprises, the vast majority belong to the sphere of private enterprises. According to the data of the Statistical Office of the SR in Slovakia, these enterprises in private ownership make up 90%, international enterprises only 1.2% and foreign enterprises up to 8.8%.

Over the years from the establishment of the Slovak Republic (1993) to the present, the trend in the number of business spheres has been increasing, but in the post-covid period, the number of active companies has started to decrease, and on the contrary, there is a gradual disappearance of companies and their entry into bankruptcy. The development of bankrupt companies in Slovakia is presented below:

**Figure 1.** The emergence and demise of companies over years

Source: FINSTAT SR database

There is a realistic assumption that the number of bankrupt and dysfunctional companies will continue to increase.

Future development of the companies is highly dependent on the evaluation and analysis of financial situation as well as taken steps at present. To interpret the indicators correctly for the future position of the companies is crucial regardless of the size, the type of operational activities, or any other characteristics that companies have. (Švábová; Michaková; Ďurica; Nica; 2020). The prediction of the companies' financial distress position and risk of bankruptcy is crucial for rating agencies, managers, investors, bankers and also for the shareholders of the company itself and even more the countries' economy at large. (Alaka; 2018). Avoiding bankruptcy in a company with a threat to financial stability, even in companies in distress is the task of risk and crisis management or a professional advisor.

1.2. Management in companies facing bankruptcy

1.2.1. Risk management

In every activity, a subject carrying out it and making decisions may encounter risk. The risk for the business sector is represented by several factors, which are described in the literature in different ways, most often we talk about the threat as a result of a negative impact on business activities. Risk (Šimák; 2016) is a qualitative and quantitative expression of danger, degree or intensity of danger. It is the probability of the occurrence of a negative phenomenon and its consequences, but the result of the risk can be both a negative and a very positive consequence.

In the decision-making process, each subject usually proceeds according to a certain scheme, which could also be expressed as a flow chart with steps that are connected to each other, follow each other and lead to final decisions. Very simply and briefly, we could describe the whole process as a sequence of steps (Míka; Hudáková; Šimák; 2015):

- goal setting with identification of problems
- determination of criteria, requirements for the goal
- consultation on solution variants with their subsequent analysis, identification of positives and negatives, impacts, risks, - selection of the optimal variant,
- implementation of the adopted decision, its monitoring and evaluation,
- feedback, evaluation, drawing conclusions from possible mistakes or negative impacts.

It is important in these processes whether all risks are known in advance, or they are not known. Known risks can be included in the decision-making process, quantified based on historical experience, frequency of occurrence, geographical and macroeconomic conditions. The inefficiency of risk management occurs immediately at the first an important step. It arises when management only monitors the internal environment, while forgetting to monitor the external environment, or vice versa, monitors the external environment and does not pay close attention to the internal environment. (Halan; 2021).

In recent years, there have been such changes on a global scale, which meant and mean risks for business that were previously unknown and unforeseen. Adapting to the requirements in a short period of time is an extremely difficult task. Many companies failed to eliminate or exclude risks and are on the verge of bankruptcy. In this phase, it is appropriate to combine risk management with crisis management.

1.2.2. Crisis Management

Crisis management as a term was not understood as an economic category from the beginning of its use, but later it began to be used in solving macroeconomic and microeconomic problems. At the microeconomic level, we can understand crisis management as a system of principles and measures of economic subjects, especially industrial enterprises, aimed at solving situations threatening prosperity and economic stability. (Míka; Hudáková; Šimák; 2015)

The activity of crisis management starts only after some risks have not been managed or at a time when the risks could not be foreseen in any way. In this context, crisis management is an effort aimed at solving the emerging crisis on a micro level, which is the result of internal, but especially external causes (e.g. international conflicts, pandemic). In this sense, crisis management on a micro level implements measures to influence the course of and cope with a societal crisis, an effort to restore the functioning of business processes and ensure or improve the financial stability of the company. (Černaj; 2022). In this case certain intervention measures of the state or local government are effective. The current crisis of price development in an intense inflationary spiral, energy crisis and financial stagnation can be considered as a crisis on a societal level, as well as at the micro-level of enterprises

Solving the crisis at the lowest levels of the economy is the way to ensure that the already existing risks do not grow into consequences at the level of national economies.

1.2.3. Enterprises with the threat of bankruptcy in the Slovak Republic

We can talk about a company in decline or bankruptcy if it shows a long-term inability to fulfil its payable liabilities, a long-term unfavourable payment situation persists in it, which gradually leads to the limitation of economic activity and subsequently leads to its demise. According to the Slovak legal system, the concept of bankruptcy is associated with restructuring, or settlement. Another option is liquidation. The inclusion of a company among bankrupt companies begins with a proposal for bankruptcy or liquidation of the company.

Neither in the Slovak Republic, nor currently in other countries, is the point in time of real bankruptcy the same as the point when the company is officially declared in bankruptcy. To find out the real difference, we carried out empirical analysis in the intention of determining the prediction of the risk of bankruptcy and subsequent measures to achieve stabilization. In any case, the issue of predicting the financial situation of a company will always be up to date due to its great importance not only for the company itself but also for all the entities that come into contact with it. (Georgescu; 2017)

1.3. New institutes in enterprises with the threat of bankruptcy

In connection with global and national crises, state intervention is needed to help solve the situation. As one of the steps taken by the state in the Slovak Republic, we can consider the adoption of Act No. 111/2022 Coll. about solving the impending bankruptcy. Its validity only started in May 2022, so it is not clear whether it will live up to expectations. Its role is to enable the reversal of a critical situation by taking steps that can reverse the unfavourable situation in the long term with professional help. If this process is unsuccessful, bankruptcy proceedings follow. Proceedings before bankruptcy concern primarily companies that are partners of the public sector (they are registered in the Register of public sector partners), as well as the procedure for non-public companies.

The solution before possible bankruptcy is to apply for preventive proceedings. In this procedure, an expert advisor for preventive procedures is appointed to the position of manager or co-manager, who has all the professional, educational and knowledge prerequisites for taking measures that stabilize the financial ability of the company to fulfil its liabilities, such as:

- development of a proposal, concept and final public or non-public plan,
- determination of preventive action, most often with the help of a consultant in preventive action, an expert who performs activities comparable to a risk manager,
- the time of temporary protection before the decision to permit preventive restructuring,
- progress of preventive restructuring.

In accordance with what crisis and risk management means in practice, the individual steps will focus on activities that will show a sequence expressed graphically:

Figure 2. Preventive process in steps

Source: own processing

The result of the entire preventive procedure is the financial and production stabilization of the company, or its decline expressed by entry into correct bankruptcy.

2. Methods

For our research, we chose an empirical analysis carried out in two steps:

- analysis of the financial stability of companies in the Slovak Republic
- analysis focused on the development of selected item of financial statements of companies in distress.

In first step we tested in total a sample of 164 companies by prediction model Altman's Z-score. Many prediction models based on traditional prediction techniques have still been developed around the world. Given the different opinions of experts on various prediction methods, it can be argued that every method has its advantages and disadvantages, and also limitations of its use. (Karas; Srbová; 2019; Kováčová; Klieštík; Valášková; Durana; Juhászová; 2019)

The tested sample consisted of well-functioning enterprises as well as enterprises that went bankrupt. The sample were companies they are not trade shared on market stock. The reason was a relatively small number of companies whose shares are traded on the stock market. According to data from the Slovak Stock Exchange, there are 248 companies that are stable. A 5-factor model was used in the test. Modified models of Altman's Z-score were created for the needs of individual countries, which also included additional factors. In Slovak conditions, a factor with the assessment of liabilities and receivables after the due date is also often used. However, these data are not listed in the Register of Financial Statements of the Slovak Republic or in any other publicly available source.

The notation of the used formula lists 5 ratio indicators (Altman; 1993), each of which is multiplied by a coefficient:

$$Z = 1.2x_1 + 1.4x_2 + 3.3x_3 + 0.6x_4 + 1.0x_5$$

whereas

x_1 = net Working Capital to Total Assets ratio

x_2 = Retained Earnings of past periods to Total Assets ratio

x_3 = Earnings before Interest and Tax to Total Assets ratio, the so-called EBIT

x_4 = Market Value of Equity to Total Liabilities ratio

x_5 = Total Sales to Total Assets ratio.

When assessing individual indicators, it is necessary to start from the company's financial accounting. The calculated results are then sorted into the following statements about the risk of possible bankruptcy of the company:

$Z > 3.00$ = safe zone, business with a high probability of survival

$1.80 > Z > 2.99$ = grey zone – the risk of bankruptcy cannot be clearly determined

$1.79 > Z$ = distress zone, company in immediate danger of bankruptcy.

The test was calculated for the years 2018 - 2020 and was supposed to determine whether a company with a reported risk within 3 years actually entered bankruptcy.

The analysis also monitored companies that entered bankruptcy in the years 2020-2022 despite very positive results of their economic activity even in 2018.

In the next step of the analysis, we compared the development of selected items of the financial statements of companies that entered bankruptcy in 2020 - 2022 from the original sample of 164 companies. The number of companies in bankruptcy was 51. The comparison was based on the data listed in the Register of Financial Statements of the Slovak Republic. On the base of these indicators in the years before and during bankruptcy, we followed a development analogy that can point to working measures for the financial stabilization of companies in financial distress. We focused on:

- development of depreciation and property status. Long-term assets were calculated based on the gross balance (without influence of depreciations),
- the development of equity and the results of business operations before entering bankruptcy,
- the development of interest costs and the state of loans in companies in difficulty.

The intention was to find out whether the selected indicators have a decreasing or increasing tendency and to figure out the percentage of development. The first part of the analysis was only a starting point for monitoring the development of selected indicators of the financial statement, on the basis of which measures can be determined that lead to the improvement of the financial situation and its stabilization and could indicate the possibilities of risk management in preventive proceedings. At the same time, they must

be in accordance with the legislation, therefore it is necessary to state the legal status when interpreting the results of the analysis.

3. Results

In the Slovak Republic, according to the research we can conclude that in a selected sample of companies that officially were not in bankruptcy by the end of 2022 (Commercial Register of the SR), there is a high risk of their financial stability according to financial analysis indicators. Of the total tested group, it was found that up to 8.42% of the enterprises presented as "working" show high-risk results (the results are not in the safe zone, but in the distress zone) – the number was 8 enterprises from 97 working companies. This indicates that they are not financially stable and in a period of 1 - 2 years would enter bankruptcy, if they were unable to reverse their situation. Up to 22.7% of enterprises they entered bankruptcy had very positive results of their economic activity even in 2018 – in number there were 17 bankrupted companies from 75 well-functioning companies. Due to the influence of macroeconomic factors, changes occurred even in stable enterprises, which resulted in a significant decrease in the financial ability to fulfil their obligations. It is in these companies that risk management methods in combination with crisis management should be especially pronounced in order to reverse any negative developments and impending bankruptcy. A total of 67 companies from the examined sample entered bankruptcy.

We identified also an increased (less pronounced) risk in another 10.88% in the so-called grey zone of Altman Z-score in tested companies. These numbers are high, meaning that up to 20% of businesses need to deal with their critical situation.

Almost 23% of business subjects (22 companies) that did not enter bankruptcy experienced a distress zone of their ability to fulfil financial liabilities.

In the development of selected item of the financial statements we have identified following tendencies:

Table 2. Development of selected indicators of financial statements for 2018 - 2022 for companies in bankruptcy

Indicator	Long-term assets	Depreciation	Warehouse Stock	Equity	Loans	Interest Costs
Increase	4	2	3	2	35	12
Decrease	26	50	26	54	5	18
Without changes	35	15	36	11	27	37

Source: own processing

The procedure for averting the risk of real bankruptcy can be compared in individual companies. Individual reasons for the emergence of risks in connection with the macroeconomic climate require individual approaches to changes.

Unlike in the past, when crises arose gradually and their onset could be predicted, we are currently observing a trend when:

- crises arise after some unexpected event,
- they often threaten not only one company, but one or more industries or a geographical area,
- the crisis is often negatively influenced by opinion-forming media,
- as a result of the pressure to use scientific and technical achievements in practice, and the introduction of automation and digitization, there is a frequent susceptibility to the emergence of a crisis, especially in companies dependent on the introduction of these technologies,
- businesses are not able to deal with the situation in the most efficient way, and interventions are not fast enough, so the crisis takes on an extensive character. (Mihok; Kádárová; 2012)

The current situation can be described in many companies as a combination of internal and external reasons for their critical situation. To formulate conclusions according to the results of the analysis, it is advisable to know the past and ongoing causes of the problems of companies:

- the government's restrictive measures to prevent the spread of the contagious disease Covid-19,
- a state of war near the territory of the Slovak Republic with a significant impact on changes in the personnel policy of most employers,
- the energy crisis, which is currently taking the form of extreme price growth,
- crisis in the supply of some materials, problems in overall logistics due to the high dependence on

- the import of materials necessary for the full functionality of enterprises,
- an inflationary spiral with enormous price growth that exceeds the long-term average, documented by the following developments:

Figure 3. Development of inflation in the SR in 2010-2022 in %

Source: Statistical Office of the SR

When dealing with the critical destabilized state of the company, the advisor in preventive proceedings will certainly use the analogy for the previous restructuring and the analogy of the progress of companies in the period before bankruptcy.

In Slovakia, businesses in selected industries have fallen into crisis, and this was most pronounced in the tourism and gastronomy industries. If we abstract from strategic restructuring with strategic interventions, and the crisis did not arise as a cyclical state of the functioning of each company, we will focus on operational restructuring and measures in the company to eliminate problems.

Through an empirical analysis of the development of some balance sheet values and profit and loss statements in a selected sample of companies in the period before bankruptcy, we found that up to 62 % of some companies' procedures were analogous and aimed at achieving stabilization of the financial situation. It involved the implementation of the following measures in individual areas:

Area of production process and internal processes:

- reassessment of the use of long-term assets and sale of inefficiently used assets, which occurred in 38.8% of companies in crisis. This resulted in a decrease in gross total assets before depreciation,
- re-evaluation of the depreciation plan, the frequency of this procedure is 74% of enterprises in which there was a decrease in depreciation, which reflected a decrease in the achievement of sales (and therefore also the use of the depreciated property) and at the same time a time shift of costs to the following periods,
- changes in the logistics of permanent stocks in the warehouse, sale of long-term stocks and a change in the acceleration of stock turnover, which keeps the minimum financial value in the stocks, but in such a way that the flow of production is not interrupted. The sale of material stocks occurred in 39% of the sample,
- the search for the highest possible number of substitute material inputs, which is not a direct analogy according to the performed analysis, but becomes a necessity, as there are currently serious restrictions on the international market. The Slovak economy is highly dependent on international trade, for the import of material inputs as well as for the export of production.
- significant changes in cost intensity in all areas.

Area of customer-supplier relations:

- renegotiation of existing liabilities with an effort to reduce them so that creditors receive a reduced payment for their financial claims but higher than they would receive in the process of applying their claims in the bankruptcy process. This procedure is at the same time (only from 2021) according to the conclusions of the Court of Justice of the EU,
- conclusion of payment schedules with state institutions and creditors,

- prolongation of loans with temporary suspension of instalments. This trend was also reflected in the companies in the analysis, when the credit level did increase in 52.23% of the companies, almost 40% maintained the credit level without significant changes.

Area of personnel management:

- requests for changes in top management. The new law proposes that the role of the top manager should be taken over by an expert advisor. An analogy with the previous procedure does exist, but in the case of restructuring in bankruptcy proceedings, the trustee takes over the role, in the case of preventive proceedings this is not a condition.
- changes in the number and structure of employees, as overemployment and low efficiency of spent wage funds were often demonstrated. Due to the fast increasing spent (minimum) wage, it is very necessary to conduct a consistent personnel policy (the growth of the minimum wage for 2010-2023 reached an increase of 127%, from the start amount in 2010 EUR 307.70 to the current EUR 700.00).

Despite certain differences in the approach of the trustees in the restructuring, it is possible to assume that the professional advisor will take the positives of the restructuring process and expand them with activities that will mitigate risk factors, develop a consistent crisis business plan and will proceed to the management of the company's assets with the care of the owner.

4. Discussion

According to our analysis, the reliability of testing companies using the Altman Z-score method represented an error rate of 24% in the critical zone, 8% in the grey zone, and up to 35% in the safe zone. We compared our results with an analysis carried out in the Czech Republic (Kapounek; Hanousek; Bílý; 2022), which tested 64,842 companies using the Altman Z-score method. The error rate was 22.6% in the critical zone, 10.15% in the grey zone and 33.2% in the safe zone. Similar results are presented in the article (Valášková; Švábová; Ďurica; 2017), when the error rate for all zones is reported at an average level of 24.7% for 1-3 years before bankruptcy. The Altman Z-score reliability results of using the method are therefore very comparable.

We compared our results in the area of procedures in restructuring with the proposed procedures of other authors, e.g. in the publication *Managerial Aspects of Crisis Management* (Mihok; Kádárová; 2012) the procedures of the crisis manager are presented, which confirm the results of the analysis.

The authors divide the implemented measures into short-term and long-term. Very similar procedures are also described in internet articles (Seneši; 2014; 2016), which lead to the recovery of the company's financial stability.

Research on the effectiveness of preventive action has not yet been published, and our research did not even focus on the results of preventive action, so it is not possible to have a discussion on this topic.

Conclusion

The need to find a solution to the long-term inability of companies to pay their obligations both at the level of companies and at the level of the national economy is currently highly relevant. The phenomenon of secondary insolvency appeared massively in the countries of Eastern Europe in the period after the change of regime in the beginnings of private ownership and private business. In the following years, the development of the business environment stabilized. On the market, new businesses were and are being established and other businesses closed down. This trend did not have significant year-on-year deviations after the stabilization of the market.

However, the period of global crises means that even small businesses are getting into trouble at their own level. These are the consequences of state restrictive measures, price crises, international trade crises, a state of war or an energy crisis. All these factors represent risks that were not foreseeable and for which the private sector could not have been prepared, certainly not the area of small and medium-sized enterprises. This is the reason why many got into financial distress.

Since these are crises on a wide scale, state intervention is also necessary to manage them. It can be compensatory aid, subsidies or other forms of support for public and private enterprises. However, these measures are always only short-term and do not have a conceptual character.

In the Slovak Republic, a legislative regulation was created as a response to a social order to solve the financial distress of companies, the purpose of which is to try to reverse the negative development in companies with imminent bankruptcy. The legal framework provides assistance in the form of a period of temporary protection and preventive action, which should bring about the revitalization of businesses.

Companies are offered to move to a higher level of restructuring with the help of a professional advisor. It is not clear today whether the application of the law will bring the expected effect. In any case, it can be expected that the expert advisor will proceed with a certain analogy compared to the procedure that has been applied so far in restructuring and will extend this by the possibility of re-evaluating the contractual relations.

We tried to select the recommended measures according to the literature and to verify on the analysis whether these measures were used and with what frequency even in the previous procedure of bankruptcy trustees and companies on the verge of bankruptcy. It gives an image of the possibility to follow a proven path, but expanding it with new possibilities. However, other measures will also need to be put into practice. Currently, the temporary reduction of VAT for selected activities is not a conceptual and long-term stabilization measure, even though it can undoubtedly contribute to stabilization at least in the field of gastronomic enterprises.

Abstract

Research background: Managers in any position within the corporate hierarchy must have relevant managerial competencies. With the help of key competencies, managers make an important contribution to corporate values and the achievement of desired performance. Emotional and social competence represents an important aspect of business and managerial work and is fundamental for a successful manager.

Purpose of the article: The paper focuses on the issue of social and emotional managerial competencies. The aim of the research was to find out the existence of statistically significant connections and differences between social and managerial competencies and the gender, age, and length of practice of entrepreneurs.

Methods: The data were obtained from 156 entrepreneurs, 108 of them women (69.2%) and 48 men (30.8%), aged from 20 to 65 years (mean age 37.62 years, standard deviation 10.745) with the length of experience ranged from 1 to 43 years (mean length of experience 13.49 years, standard deviation 10.854), and length of managerial experience ranged from 1 to 37 years (mean length of experience as managers 6.10 years, standard deviation 6.562). The research was conducted through a questionnaire focused on the perception and assessment of the social aspect (21 items) and emotional aspect (15 items) and using factor analysis.

Findings & Value added: The results confirmed statistically significant correlations in terms of age and length of practice of entrepreneurs. The findings did not confirm statistically significant connections in terms of gender differences. The paper contributed to the development of the research on a given issue.

Keywords: managerial competence, social competence, emotional competence, entrepreneur

JEL classification: D90, D91

1. Introduction

The subject of holistic management is a set of knowledge about the competence requirements of the subjects of management, i.e. individuals, groups of people, and the management of organisations. In addition to the professional and practical pillars, the social side of personality is increasingly emphasized. The maturity and moral qualities of an individual complete the complex picture of a person (Porvaznik, 2007). Levenson et al. (2006) examine the relationship between managerial competencies and performance at both the individual and organizational unit levels with the result that competencies are positively related to individual-level performance, and individual managerial performance may be enhanced by mentoring on a competency system. Stenberg (1997) presents a theory of managerial intelligence.

Competence is a reflection of a manager's ability to behave appropriately to the situation in accordance with the function they perform. Vodák and Kucharčíková (2011) argue that managerial competencies consist of skills and abilities that shape the manager's performance in such a way that it is perfect and all the required tasks are fulfilled. Managers must create an appropriate working environment in the team, and their role is to resolve conflicts in the workplace, evaluate subordinates, lead them, and delegate tasks.

* Corresponding author: zuzana.birknerova@unipo.sk

Kubeš et al. (2004) argue that the term key managerial competencies can be understood as those common to all managers in a company. In other words, managers in any position within the corporate hierarchy must have them. In this sense, the term key will be understood as the primary, main, most important, and necessary for the performance of managerial work. With the help of key competencies, managers make a significant contribution to corporate values and the achievement of desired performance.

Čambál et al. (2013) state that key managerial competencies can be considered as, for example, planning, strategic thinking, organizing, analysing processes, improving management, ensuring optimal number and structure of employees, developing employees, leading people, communicating effectively, conducting interviews, presenting, creating and leading teams, controlling and providing feedback, making decisions, and using creativity.

1.1 Social Managerial Competencies

According to Šramková (2022), social competence is a construct that carries the ability to combine thinking, emotions, and behaviour to cope effectively with the demands and rules of the social environment. Current research addresses, for example, the ability to form and maintain relationships, successful social problem-solving, effective communication in social relationships and various situations, decision-making skills, constructive conflict resolution, effective application of basic social skills (empathy), role they occupy in the work community. The manager's perception of their own person in the social-work group is reflected in their self-assertion, self-motivation, and self-knowledge.

Another issue are social skills of the manager in the context of social structures and relationships. In their study, Frankovský, Štefko & Baumgartner (2006) confirmed the existence of the internal structure of the described forms of behavior and defined two factors: socially negative solution and socially positive solution considering it an appropriate basis for constructing the diagnostic tool for measuring social intelligence. From the first time a manager joins a work team, they develop an attitude and a relationship with the social group to which they belong. Establishing relationships, integrating into the team, and adapting to the work environment is a critical moment that will influence the overall perception of the work environment. In defining the relevant and vital social skills in the context of the work climate, we consider the following skills to be the most important to develop: listening skills, mutual acceptance, appropriate conflict resolution, social sensitivity, value orientations, interpersonal relationships, elements of pro-social behaviour, communication for self-presentation and social relationships.

Social competence as a skill can hardly be developed by some traditional forms of education. So far, the most appropriate form of its development is social-psychological training.

1.2 Emotional managerial competencies

Emotions influence practically everything in a person's life; they determine whether we like something. They help in decision-making, they influence our choices, they contribute to who we spend time with and who we fall in love with. Emotions sometimes cause us to make a split-second decision, and then we carry the consequences for a lifetime. Emotions determine what leaders we choose and what leaders choose us. All of these reasons make emotional intelligence so invaluable (Bariso, 2019). Sorokova (2004) writes that emotional ability is a higher endowment.

The emotional competence of a manager includes skills such as sympathy, communication, humanity, courtesy, empathy, or self-confidence. Emotionally intelligent managers get along very well with other people, are good listeners, and are usually very popular in their team because they accept the people around them exactly as they are. They even know how to handle setbacks well, are persistent, and, last but not least, they can handle conflict situations sovereignly (Reichel, 2019). Soft skills such as the ability to work in a team, communication and integration skills, autonomy, responsibility, and motivation are required in professional life. Good leaders should apply a worker-centered management style, along with appropriate social know-how, and should be able to motivate employees to high performance. In reality, however, social competence is often lacking in managers. The consequence is a loss of activity and loyalty, as well as so-called "internal job resignation" by employees (Reichel, 2014).

Emotional intelligence is the ability to use emotions in ways that are beneficial to us (Bariso, 2019). It is useful to divide it into four competencies:

1. Self-awareness is the ability to recognize and understand our own emotions and how they affect us. This includes the ability to recognize one's own emotional goals, strengths, and weaknesses.

2. Self-management is the ability to manage emotions in a way that allows tasks to be accomplished and goals to be achieved. It includes self-control, which means that we can control or manage our own emotional reactions.

3. Social awareness is the ability to perceive the feelings of others correctly and to understand how these feelings influence behaviour. It is based on empathy, which enables one to perceive and understand things from the perspective of others.

4. Relationship management is the ability to get the most out of relationships with other people. This includes the art of influencing others through communication and behaviour, motivating them through explanation and persuasion.

All four abilities are interconnected and naturally complement each other. However, they are not always interdependent. We may naturally excel in some aspects and have weaknesses in others (Bariso, 2019). The research of this paper focused on the assessment of social and emotional managerial competence attributes. The aim of the research was to determine the existence of statistically significant relationships and differences in the studied phenomena in terms of gender and age of entrepreneurs.

2. Methods

156 entrepreneurs participated in the conducted research, 108 (69.2%) women and 48 (30.8%) men. The age of the interviewed entrepreneurs ranged from 20 to 65 years (mean age is 37.62 years, standard deviation is 10.745). Entrepreneurs reported their length of experience ranged from 1 to 43 years (mean length of experience is 13.49 years, standard deviation is 10.854), and length of managerial experience ranged from 1 to 37 years (mean length of experience as managers is 6.10 years, standard deviation is 6.562).

The research was conducted through a questionnaire focused on the perception and assessment of the social aspect (21 items). Through factor analysis, we extracted four factors:

- F1: Open communication: I create a friendly atmosphere before negotiations, meetings, and appointments. During meetings, negotiations, appointments, and interviews I act friendly. I talk openly about disagreements and inconsistencies. I consider the ability to listen actively to be important in my work as a manager. I consider non-verbal communication to be important.
- F2: Assertive communication: I consider my communication and behaviour to be assertive. I consider the development of assertive behaviour in manager communication to be important. Communication is important in a manager's job. I prefer formal communication in managerial work. When communicating with employees, I prefer interviewing. I arouse respect in subordinates.
- F3: Aggressive communication: I arouse fear in subordinates. I react angrily when subordinates fail to accomplish assigned tasks. I consider my communication and behaviour to be aggressive. I prefer manipulative practices when communicating with employees.
- F4: Positive communication: I consider my communication and behaviour to be active. I prefer formal communication in my managerial work. It is very important for me to set a direction to follow. I am goal-oriented and always finish things. If my team accomplishes all tasks, I feel excited. I can learn from past mistakes and avoid them.

The questionnaire was also used to measure the assessment of the emotional aspect (15 items) by entrepreneurs. Through factor analysis, we extracted four factors:

- F1: Empathy: I consider empathy, as the ability to empathize with the world of others, to be important in the work of a manager. I consider eye contact and facial expressions to be important when communicating with employees in order to reach a quicker agreement. I can understand what others are really thinking through their facial expressions, and body language. I can anticipate how others will react to my behaviour.
- F2: Emotional maturity: I can get rid of negative feelings that prevent me from doing my job. I can successfully establish new relationships with new people. I can cope easily with new situations. I can recognize the feelings and moods of others. I can look at things from the perspective of others.
- F3: Communication barriers: poor listening skills is the most common barrier to communication. Lack of concentration is the most common barrier to communication. Difference of opinion is the most common barrier occurring in communication.

- F4: Negative feelings: if my subordinates fail, I feel sad. If my subordinates fail, I feel guilty. Dislike is the most common barrier occurring in communication.

The individual items were assessed by the entrepreneurs on a six-point Likert response scale, with the individual scales being 0 - definitely no, 1 - no, 2 - rather no than yes, 3 - rather yes than no, 4 - yes, 5 - definitely yes. We established hypotheses, which were tested by correlation analysis (Pearson correlation coefficient) and difference analysis (t-test for two independent samples) in IBM SPSS Statistics 26 statistical software.

- H1a: We assume that there are statistically significant gender differences in the assessment of social managerial competence attributes.
- H1b: We assume that there are statistically significant gender differences in the assessment of emotional managerial competence attributes.
- H2a: We assume that there are statistically significant connections between the assessment of the attributes of social managerial competence and the age and length of practice.
- H2b: We assume that there are statistically significant connections between the assessment of the attributes of emotional managerial competence and the age and length of practice.

3. Results

Hypothesis H1a: "We assume that there are statistically significant differences in the assessment of social managerial competence attributes in terms of gender" was assessed by t-test for two independent samples. We present the results of the difference analysis in Table 1.

Table 1. Gender differences between n assessing the attributes of social managerial competence

	Gender	N	Average	Standard deviation	t	Significance
F1 Open communication	female	108	4.9000	0.87989	0.293	0.770
	male	48	4.8583	0.66391	0.326	0.745
F2 Assertive communication	female	108	4.6173	0.85266	-0.279	0.781
	male	48	4.6563	0.68365	-0.304	0.762
F3 Aggressive communication	female	108	2.1713	0.85219	-1.244	0.215
	male	48	2.3594	0.91371	-1.211	0.229
F4 Positive communication	female	108	4.8457	0.59711	1,561	0.121
	male	48	4.6806	0.63751	1,522	0.132

Source: own processing (2023)

The differential analysis shows that there are no statistically significant differences between the attributes of social managerial competence and the gender of entrepreneurs. It means that male entrepreneurs and female entrepreneurs use individual types of communication to the same extent. All entrepreneurs interviewed state that their communication is open, assertive, and positive. They assessed the aggressive form of communication on a scale of disagreement rather than disagreeing with the given form of communication.

We can state that Hypothesis H1a: "We assume that there are statistically significant differences in the evaluation of the attributes of social managerial competence in terms of gender" was not confirmed with the performed analysis.

The existence of statistically significant differences in the evaluation of the attributes of emotional managerial competence from the point of view of gender was again determined by means of t-tests for two independent samples in the statistical program IBM SPSS Statistics 26. We established hypothesis H1b: "We assume that there are statistically significant differences in the evaluation of the attributes of emotional managerial competence from the point of view of gender." The results of the differential analysis are processed in Table 2.

Table 2. Gender differences in the assessment of attributes of emotional managerial competence

	Gender	N	Average	Standard deviation	t	Significance
F1 Empathy	female	108	4.7130	0.79412	0.315	0.753
	male	48	4.6719	0.64238	0.342	0.733
F2 Emotional maturity	female	108	4.4593	0.63732	-0.749	0.455
	male	48	4.5458	0.72844	-0.711	0.479
F3 Barriers in communication	female	108	4.4846	0.99049	0.376	0.707
	male	48	4.4236	0.79222	0.409	0.683
F4 Negative feelings	female	108	3.8025	0.87783	-0.217	0.828
	male	48	3.8333	0.66311	-0.242	0.809

Source: own processing (2023)

Based on the difference analysis of the research, we found that there is no statistically significant difference even in the evaluation of the attributes of emotional managerial competence from the point of view of the gender of the addressed entrepreneurs. It means that female entrepreneurs use the same level of empathy in their managerial work as male entrepreneurs, they are emotionally mature, they are not affected by negative feelings and they perceive barriers in communication in the same way. All attributes were assessed by entrepreneurs on a scale “yes” to “definitely yes”.

We can state that Hypothesis H1b: "We assume that there are statistically significant differences in the evaluation of the attributes of emotional management competence from the point of view of gender" was not accepted in view of the performed analysis.

The aim of the research was also to find out the existence of statistically significant connections in the investigated phenomena in terms of the age and length of practice of entrepreneurs. To verify the goal, we established hypothesis H2a: "We assume that there are statistically significant connections between the evaluation of the attributes of social managerial competence, age and length of practice". The results of the correlation analysis (Pearson's correlation coefficient) are processed in Table 3.

Table 3. Connections between the assessment of the attributes of social managerial competence, age and length of practice

	F1 Open communication	F2 Assertive communication	F3 Aggressive communication	F4 Positive communication
Age	,191*	0.149	-0.111	0.117
	0.017	0.063	0.169	0.144
Length of practice	,203*	,189*	-0.089	0.065
	0.011	0.018	0.269	0.418
Length of managerial practice	,250**	,177*	-0.050	0.095
	0.002	0.045	0.535	0.236

Source: own processing (2023)

From the point of view of the correlation analyses presented in Table 3, we can conclude that there are statistically significant positive correlations between Open and Assertive Communication and the age and length of experience of entrepreneurs. It means that the older the entrepreneurs are, as well as the longer their experience, the more open and assertive the communication becomes. Older entrepreneurs create a friendly atmosphere, talk more openly about disagreements, consider active listening and the development of assertive behaviour in their work important, and prefer formal communication and respect.

We can state that hypothesis H2a: "We assume that there are statistically significant connections between assessing the attributes of social managerial competence and the age and length of practice" has been accepted.

In order to verify the goal, we also established hypothesis H2b: "We assume that there are statistically significant connections between assessing the attributes of emotional managerial competence and the age and length of practice". We described the results of the correlation analysis (Pearson's correlation coefficient) in Table 4.

Table 4. Relationships between assessing emotional managerial competence attributes and the age and length of practice

	F1 Empathy	F2 Emotional maturity	F3 Barriers in communication	F4 Negative feelings
Age	-0.001	0.014	0.074	-0.027
	0.992	0.860	0.358	0.736
Length of practice	0.043	0.033	0.092	-0.050
	0.593	0.681	0.253	0.536
The length of the managerial practice	0.074	,156*	0.023	-0.055
	0.357	0.049	0.773	0.496

Source: own processing (2023)

From the results of the correlation analysis, we found that there are statistically significant connections between the evaluation of the attributes of emotional managerial competence in terms of age and length of practice in one aspect, which is Emotional Maturity. From the above, it follows that the longer the length of management experience of the entrepreneurs addressed, the more they are able to get rid of negative feelings, successfully establish new relationships, cope with new situations, and look at things from the perspective of others.

We can state that hypothesis H2b: "We assume that there are statistically significant connections between the assessment of the attributes of emotional management competence and the age and length of practice" was accepted in one aspect.

4. Discussion

Emotional and social competence represents an important aspect of business and managerial work. Mental well-being, self-control, emotional maturity, sociability, as well as effective communication are fundamental qualities of a successful manager.

In research, Arruda (2017) observed an increasing need for emotional and social competence in managers and executives. He states that successful international companies place a high emphasis on emotional and social intelligence when hiring new employees. Both employees and managers who do not have sufficiently developed given competence are considered threatening to the operation and success of the organization. Groves (2005) talks about leadership model consisting of social and emotional skills.

Miško, Vagaš (2018) investigated gender differences in the emotional intelligence of managers using the TEIQue methodology - assessment of trait emotional intelligence. They recorded a higher score in the Self-Control factor for men and a lower score in the Emotionality factor. The authors claim that the use of emotions in managerial work supports the creation of a suitable work environment and better relationships in the workplace. Their research showed that female managers are better at expressing emotions than male managers. Petrides, Furnham (2006) point to gender differences in professional interests and coping with stress. The authors argue that more socially and emotionally intelligent managers cope with stress better.

Goleman, Boyatzis (2008) state that there are differences between men and women, especially in the sensitivity of women and greater social trust in men. The authors identified the mentioned differences in the managerial environment. In our research, we did not confirm statistically significant gender differences in the investigated phenomena. Male entrepreneurs, as well as female entrepreneurs, rated

themselves in the attributes of social and emotional competence on a positive agreement scale. Both men and women attach an equally positive meaning to social and emotional competencies in their managerial work.

Birknerová, Frankovský (2017) investigated the correlations between social intelligence and length of managerial practice. The authors claim that the length of practice of managers is related to the opportunity to gain many life experience. By analyzing the obtained data, they confirmed the existence of statistically significant connections between the length of practice of managers and the attributes of social intelligence. The authors noted negative correlations in relation to empathy, manipulation, social information processing, and social receptivity. Frankovský, Ištvaníková & Štefko (2009) obtained research results that contributed to a solution to the issues of trans-situational stability and selection of behaviour strategies based on the situation.

The research carried out by us shows that the assessment and understanding of the attributes of social managerial competence are related to the age as well as the length of practice of entrepreneurs. We found that there are statistically significant positive correlations between the Open and Assertive communication of entrepreneurs and the age and length of practice of entrepreneurs. Within the attributes of emotional competence, we noted one correlation between the length of practice and the Emotional Maturity aspect.

Several other authors pay attention to similar issues in their studies e.g. Connelly, Crook, Combs, Ketchen & Aguinis, H. (2018); Baron & Tang (2009); Greven, Kruse, Vos, Strese & Brettel (2023); Cortes, Jaimovich & Siu (2021); Distel, A.P., Sofka, W., de Faria, P. et al. (2022); van Knippenberg & Dwertmann (2022) or Campbell, Bilgili, Crossland & Ajay, B. (2023).

Conclusion

In the research, we paid attention to assessing the attributes of social and emotional competence, namely open, assertive, aggressive, and positive communication, empathy, emotional maturity, barriers in communication, and negative feelings. To conclude, they represent an important aspect of business work. The development of social and emotional competencies in managers is connected with the application of social psychology knowledge. One of the possibilities for using this knowledge is social-psychological training, which has expanded into the field of organizational psychology or its management. It teaches sensitive perceptions of persons and certain situations. Following this perception, it teaches the creation of a wide range of actions and reactions in critical and complex situations. For managers in the business environment, regardless of gender and age, lifelong development, education, and enhancement of their skills and knowledge in the field of soft skills are necessary.

Abstract

Research background: The problem of ethics, values, and economic indicators represents a complex challenge in understanding how organizations function within their structures, processes, culture, and economy.

Purpose of the article: The aim of this article is to explore the interconnectivity and impact of various factors that influence organizational culture within a company, including employee satisfaction.

Methods: Factor analysis will be used to identify key factors and interrelationships that affect organizational behavior and decision-making processes. By employing the DMAIC method (Define, Measure, Analyze, Improve, Control), this study systematically examines the external, internal, and deep environment, as proposed by Edgar Schein. These three dimensions play a crucial role in shaping organizational ethics, values, and economic indicators. The external environment encompasses factors such as market dynamics, legal and regulatory frameworks, relationships with suppliers, customers, and public influence, among others. The internal environment focuses on organizational structures, processes, and cultural norms that govern individual and collective behavior within the organization. The deep environment represents the fundamental assumptions, beliefs, and values that form the basis of organizational identification and guide its ethical decision-making.

Through factor analysis of these dimensions, this article aims to uncover patterns and relationships that shed light on how organizations address ethical challenges within their economic context.

Findings & Value added: The findings of this article have the potential to contribute to the development of frameworks and strategies for organizations to improve their ethical performance, align values with economic indicators, and promote a culture of responsible decision-making. Understanding and addressing the complex interaction of ethics, values, and economic indicators are crucial for organizations to operate sustainably and responsibly in today's rapidly changing and evolving environment.

Keywords: values, organizational culture, dimensions

JEL classification: A13, M14

1. Introduction

In the 1970s, the topic of Corporate Social Responsibility aroused a very difficult debate. This debate has generated a great deal of interest in the nature of what an organization fundamentally is and, furthermore, what role organizations should play in society. At its core, this debate reveals how important an organization is, and how relevant it is to modern society (or rather post-modern society).

* Corresponding author: lucjan.klimsza@vsb.cz

Nadler and Tushman define an organization as a complex social system (Nadler, Tushman, 1980). This definition is very general, and any social system that shows signs of complexity can be placed under this definition. On the other hand, one can imagine an organization that is made up of individuals, and such an organization no longer falls under this definition. Michael Armstrong defines an organization as (Armstrong, 2015. p. 161.): "An organization is an entity that exists to enable the achievement of the organization's goals through the collective efforts of the people who work in or for the organization."

Armstrong's definition has significantly narrowed the field of defined, but in doing so, it has specified the descriptiveness of the phenomenon we wish to know. The problem with this definition is the term subject, which needs to be changed to object. For the term subject is accompanied by attributes such as: will, thought and action. The subject that claims such a name must have all these attributes. It makes decisions on the basis of free will, is characterized by logical-critical thinking, and acts. Armstrong ascribes subjective attributes to the object; he assumes that the organization thinks and defines, wills and acts, acts and creates. Another problem of the organization that Michael Armstrong defines is the objectification of the organization. Although he speaks of the subject, he nevertheless defines the organization through what. However, such a conception of organization is wrong because in an organization, or rather behind every organization, there are real subjects - people who think, will and act. For this reason, we will define organization as based on Ghoshal and Barlett's definition (Ghoshal and Barlett, 1995): "(...) a portfolio of dynamic processes that overlay and control the vertical, authority-based processes of a hierarchical structure. "Horizontal tasks", cooperation and networking between organizational units are promoted, at the expense of "vertical tasks".

In this definition, the subject of the action, which is a human being, is concealed. However, this definition very accurately describes the organization as a social system that is hierarchically controlled, and in which dynamic processes lead to the achievement of set goals. If we use this definition, it will make it easier for us to examine the first question as a basic theory, i.e.: how do organizations function with respect to their structure, processes and culture? The question of the structure, processes and culture of an organization would not be fully answered if we did not include the economics of the organization and financial transactions. How do organizations work? This is a very complex question that needs to be looked at from a multidisciplinary perspective. How do organizations work with respect to their structure, processes, culture and economics?

1.1 Organizational Culture in the Stakeholder Theory

Since the late 1970s, the phenomenon of organization and the role of economics cannot be viewed in the same way. This debate has been influenced by Milton Friedman with his 'Fundamentally Subversive Doctrine' (Friedman, 1962). In this doctrine, Milton Friedman lays down the fundamental axiological value of freedom. Without this premise, no organization can do business. In his article *The Social Responsibility of Business is to Increase Its Profits*, Milton Friedman adds below:

"There is one and only one social responsibility of business--to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud." (Friedman, 1970. p. 7).

By the early 1970s, the phenomenon of organization ceased to be understood only in terms of shareholder theory. Shareholder theory was simple and elegant and can be expressed as follows: The only business of business is business. The problem with this theory is the absolute reduction of the problem of organization to the single purpose of profit. However, everyone knows that the activity of any organisation transcends the environment of the organisation itself and has often very positive, but often devastating, effects on its environment. Profit maximization is an elegant theory for the organization itself, or more accurately, for the owners of that organization. However, the consequences of profit maximization efforts are already felt in the environment of the organization itself, for example among the employees.

"Nobel prizewinning economist Milton Friedman famously wrote that the social responsibility of business is to increase its profits (Friedman, 1970, p. 126). He did not believe that company leaders had any social responsibility, be it for eliminating discrimination, avoiding pollution, or creating jobs." (Schroeder, 2002. p. 260).

The traditional view of the organization through shareholder theory was modified by Andrew Pettigrew. He noted the relationship between culture and organizational performance. In other

words, an organization is not defined by the profit generated by the products or services that the organization offers to its customers, but by something more. Andrew Pettigew called this "something" organizational culture. This is an area that has been neglected, underestimated, or even deliberately overlooked by economists and financial analysts. The model was developed by Edgar Schein divides the organization into three basic parts: external, internal, and deep environment (Schein, 2004, p. 95).

Another milestone that developed organizational culture was Charles Handy, who developed this aspect into a theory that is an intermediate between shareholder theory and stakeholder theory. This theory is another important milestone towards a holistic view of the functioning of organizations. However, it does not provide simple answers to how organizations work and what processes lead to the success and sustainable development of an organization (Collier, and Roberts, 2001).

The last theory that offers a holistic view of how organizations function is the stakeholder theory. Edward R. Freeman defines stakeholder theory as follows: "Stakeholder theory is a set of propositions that suggest that managers of firms have obligations to some group of stakeholders. Stakeholder theory is usually juxtaposed with stockholder theory: the view that managers have a fiduciary duty to act in the interests of stockholders. The stakeholder is an ironic twist of the stockholder to signal that firms may well have broader obligations than the traditional economic theory has assumed," (Freeman, 2005. p. 496).

Freeman presents stakeholder theory against the traditional shareholder theory, which was presented by Milton Friedman. While shareholder theory is based on the utilitarian behaviour of all market stakeholders, the question arises whether stakeholder theory is also based on the utilitarian behaviour of all stakeholders. In utilitarian conception, every subject who participates in economic activity is merely a means of this activity. In Kant's ethics, by contrast, the person is the end of all action. From the categorical imperative two important premises for economic life in society can be derived, namely: the responsibility of man for his actions and the dignity of man as an end in himself. Although no such studies are available, it can be assumed that stakeholder theory is based on this ethical foundation.

In the absence of studies, it is important to examine the ethical foundations on which stakeholder theory is based. Another important question is the effectiveness of this theory in practise. Is this theory not only useful for contemporary practise, but is it useful in the longer term? Is it sustainable? In order to answer this question, we need to ask: is this theory measurable? There are a number of questions that arise with stakeholder theory, including what needs to be measured and how does one measure what needs to be measured? These are still not fully explored areas, which Michael Armstrong calls 'the black box of management' (Armstrong, 2014., p.101.). The reason is quite simple. We know and can quantify economic inputs, we know and can quantify outputs in the form of products, services, or something else. But what processes take place between inputs and outputs? That is a much more complex question. The answer to this question will not be found in the analysis of a classical organizational structure, nor will it be found in the organizational environment. It is the overall structure of the processes that occur within organizations.

To understand these processes, a much broader view of the black box of management is needed. Freeman argues that an approach to stakeholder theory necessarily needs several areas of analysis (Freeman, 2005. p. 496): "Any business needs to be understood at three levels of analysis. The first concerns how the business as a whole fits into the larger environment, or the rational level. The second concerns how the business relates to its environment as a matter of standard operating procedures and routine management processes, or the process level. The third concerns how the business executes actual transactions or deals or contracts with those individuals who have a stake."

Freeman distinguishes the following areas that are important to analyze. Although Freeman calls these areas in different ways, it corresponds to Edgar Schein's classic division of organizational culture (see table 1.).

Table 1. Organizational culture

E. R Freeman Theory Stakeholders		E. Schein Organizational culture	
Rational Level	How the business as a whole fits into its larger environment, or the rational level.	External Environment	How management interacts with the external environment.
Process Level	How does the business relate to its environment as a matter of standard operating procedures and routine management processes, or the process level.	Internal Environment	How management interacted with the internal environment.
Transactional Level	How the business executes actual transactions, or deals or contracts with those individuals who have a stake.	Deap Environment	Location and output of the source.

Source: Based by autors's studys, 2023.

We can find at Rational Level, which can also be called the external environment of the organization: the financial community, activists, suppliers, government, political parties, consumer protection authority, trade associations and competitors. Process Level, which can also be called the internal environment of the organization, includes mainly: owners, managers, unions and employees. Transactional Level, which can be called deep environment, represents interaction between the management, owners and other entities outside the organization. These interactions concern the use and allocation of financial, material, human resources and intellectual capital of the organization, (Lance, Butts & Michels, 2006).

2. Methodology

In order to find and quantify the relationships between financial analysis indicators (quantitative) and the values of the organization (qualitative), it is first necessary to quantify these values. The method used in this paper measures the value attitudes of respondents (employees) using ordinal Likert scales. The attitudes were obtained in a specific organization using a standardized questionnaire survey in two years, namely 2020 and 2022. In both years, more than 1,700 respondents across all occupations participated in the survey, making it representative research. The company's key financial indicators were also collected in the same years.

Exploratory factor analysis (EFA) was used to find relationships between the attitudes (company values) found. Due to the small number of items in the scale (3 or 4), the polychoric correlation coefficient was used to measure the relationships and the principal axis method of PA was used to extract the factors, which, as stated, for example, by Soukup (2021), are just suitable for small ordinal scales (with less than 5 scales). In this way, 5 or 6 factors defining the values of the organization from the perspective of its employees were identified. These factors (latent variables) represent the internal states of the company according to Wittgenstein (2017). A model of the inter-internal relationships between these states is then determined by statistically significant correlation values. This model is represented graphically by a diagram. The quality of the model was verified by CFA confirmatory factor analysis using the weighted least squares method (WLSMW), (Rhemtulla et al., 2012).

A standard reliability measure, Cronbach's alpha (α), was used to measure the consistency of the emerging factors and the entire questionnaire. Scale inversion was performed for items that have an orientation opposite to that of the rest of the scale. According to Lance et al. (2006), the α value for a consistent factor or battery of questions (questionnaire) is at least 0.7. This value corresponds to approximately 50% validity of the data.

The quality of the model built with CFA is expressed using the RMSEA (root mean square error of approximation) and Tucker-Lewis index TLI (Xia and Yang, 2019). As stated by Williams and Holahan (1994), the boundary between a good and a bad model is expressed by an error of approximation (RMSEA value) of less than 0.1. The Tucker-Lewis TLI value should be at least 0.9 for a good model.

Gap analysis was used to quantify changes between corporate values between 2020 and 2022. This method, proposed by the American mathematician and economist Igor Ansoff and further developed by, for example, Allen Newell and Herbert A. Simon, is aimed at identifying a shortcoming, gap, or difference between the current state and the expected, desired, or other firm's state (Tontini and Picolo, 2010). In this paper, the gaps (differences) between the perception of firm values in 2020 and 2022 are

analyzed. The aim is to test the hypothesis that improving values of a firm's financial ratios in the post-covariance period (between 2020 and 2022) correlates with improving perceptions of firm values. The structured questionnaire and the developed factor model allow us to identify specifically which internal factors (latent variables) or items (manifest variables of the factor model) have improved and which have remained the same or worsened between 2020 and 2022.

Given the scales used for the items measuring each attitude, the value gaps thus created (between 2020 and 2022) can be measured on scales of -2 to +2 and -3 to +3, respectively. As reported by Rhetmulla et al. (2012), for ordinal scales defined in this way, comparative parametric tests based on the student distribution (Norman, 2010) can already be used to test for changes between the two periods. However, because the use of parametric tests for ordinal scales leads to an underestimation of the test criterion, in line with Tontini and Picolo (2010) and Martin (2008), a significant gap (attitude difference) will only be identified if the p-value (significance) of the test is less than 0.01.

The following discussion will use the DMAIC method Define, Measure, Analyse, Improve, and Control. A structured, systematic, and data-driven approach is used to improve, optimise, and stabilise product and process quality through teamwork. The phases are interconnected, and the output of the previous phase is always the input to the next phase.

3. Results

The results of the survey conducted in the company are shown in the following spider graph, which compares the results of the survey conducted in 2020 and 2022. Each value category was equally represented by five different questions, and the higher the value of the question, the smaller the satisfaction.

Figure 1. The results of the company surveys in 2020 and 2022
Source: own processing (2023)

The chart shows that there has been an improvement in the company's perception of values (most for social values, least for individual values, where we can find questions related to satisfaction with wage or opportunities for personal development, etc.).

As already mentioned, the aim was to find relationships between attitudes using factor analysis. The result of CFA is shown in Figure 2. The quality of this model is high, due to the values of RMSEA = 0.036 and TLI = 0.99. The model shows five significant factors that determine significant corporate values. On the left side of the figure are the internal factors, and on the right the external factors. A significant correlation between the factors Working Conditions and Company Reputation is also evident.

Figure 2. The resulting factor analysis model
Source: own processing (2023)

Table 2 shows the results of the gap analysis between the values of the above factors for the years 2020 and 2022. The gap values and the level of statistical significance are shown using a sign scheme (o = not significant, * = 0.05, ** = 0.01, *** = 0.001).

It is evident that there were positive shifts in perceived values for all factors. For internal factors, this shift is statistically insignificant (negligible), but for external factors it is statistically significant, even at the 0.01 level. The most significant change was observed for the Communication factor. This result is in accordance with the spider graph in Figure 1.

Table 2. Gap analysis results

Factors	gap	significance
Working Conditions	0,03	o
Quality	0,02	o
Cooperation	0,02	o
Communication	0,15	***
Company reputation	0,08	**

Source: own processing (2023)

In this period, a financial analysis of the company was also performed. Financial analysis focusses on evaluating and interpreting a company's financial information and provides business owners, managers, and investors with important information about the financial health, performance, and stability of a company. On the basis of these analyses, it is possible to better understand a company's current situation, identify its strengths and weaknesses, and make strategic decisions to maximise profits and reduce risks.

First, a comparison of financial performance was made during the 2016-2022 reporting period. Input data for the financial analysis were obtained from the company's annual reports. Figure 3 shows the company's financial results for the individual periods. These are earnings before interest and taxes (EBIT) and net income (EAT).

Figure 3. Trends in Economic Activity
Source: own processing (2023)

In 2016, performance was at its highest, followed by a decline in 2017. In the following years, the results fluctuated, with a significant increase in 2018 and the very next year in 2019. In 2020, there was a significant decrease, but in 2021 and 2022 the operating result increased again.

The return on assets is an indicator that reflects the profitability of a company's invested assets. From the above values, we can see that the return on assets ranged between 4.00% and 4.93% during the period under review. It is an important indicator that shows how efficiently the company uses its assets to make profits. Return on Equity is an indicator that expresses the profitability of the company's equity. From the above values, we can see that the return on equity ranged between 4.75% and 5.59% during the period under review. This ratio is important for investors and owners of the company because it shows how efficiently the company uses its equity capital to make profit. In both cases, it can be seen that the trend is downward.

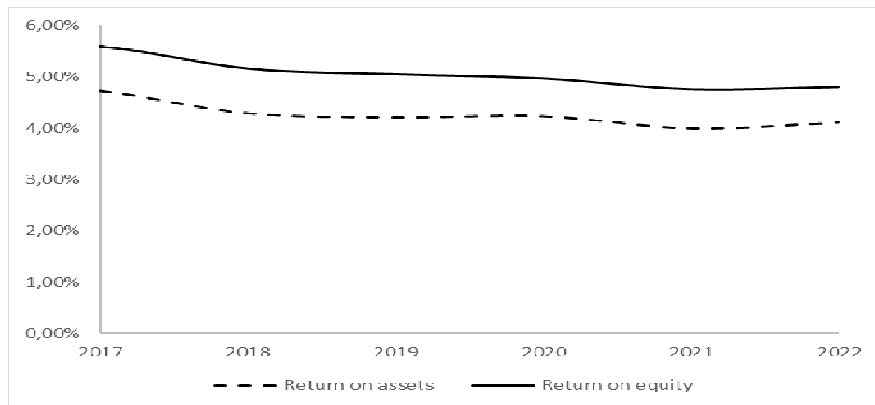

Figure 4. Trends in Economic Activity
Source: own processing (2023)

Generally speaking, it can be said that during the period when the research was conducted within a given organisation, financial indicators improved. This trend can also be observed in other indicators that are not presented here.

4. Discussion

One of the objectives of this paper is to show the interconnection, the dependence of the quality of organisational culture, and organisational performance. To mention the role of subjects, i.e., employees in the process of value creation, including value added, which is positively reflected in the financial indicators of the organization.

Human resource management, organisational culture, and organisational performance are interconnected vessels. Human resources (HR) and human resource management (HRM) at all levels co-create each organization's specific culture. This, influenced by synergistic effects, has an impact on HR and HRM. The two 'connected vessels' co-create the level of performance of the organization. The result then influences the culture and the way HR is managed.

The characteristics of HRM include an emphasis on improving motivation, quality, work life, work engagement, employee relations, performance, etc. The tasks of HRM include optimal use of employees' capabilities, team building, interpersonal relationships, personal and social development of employees, and perhaps also the reputation of the organisation. Specific HR policies include, among others, remuneration, training and development, career development, recruitment, and selection, etc.

From the above-mentioned rather general characteristics, terminology, it is clear that in their subsequent implementation, all those co-shape the culture of the company and consequently its performance is revealed. M.Armstrong (2007) devoted to the influence of HRM on the performance of the organization, authors who define this influence by the imperfect verb is assumed, or associate this influence with causal ambiguity, contingency factors, black box shrouded in mystery, etc. It is pertinent to ask what kinds of organizations are involved and what is the reason they view the influence of HRM on organizational performance in this way.

There are organizations where HR works intuitively, without much administration, and organizational performance is high. Instead, the culture of the organisation is the source of success. Then there are organizations with a developed HR background, much of it is standardized, evaluated, and yet the

organization's performance is poor. The source of failure can be found in top management and HR management at all levels. The third group is organisations where HR is a living organism, part of TOP management, but also of all other levels of management, which complement each other, including the requirement of necessary data, which can interpret and directly and indirectly influence the performance of the organization by its approach. These organizations are closest to a learning organization, consciously working with intellectual capital. Their success is based on quality: TOP management, HR management at all levels, and organizational culture.

That 'assumed' immeasurability and elusiveness of failure and success that can be hidden in, for example, the 'black box' is found in the experience described by (Baron, Armstrong, 2008, p.59) "too often we have been assured that collecting data and creating metrics about people's contribution to the business is too difficult, too costly or too time-consuming".

At the same time, these authors refer to the fact that companies have large amounts of data, "collecting data collected during the hiring process, during the training process, in the performance management process, based on compensation and the opinions of the people employed. In addition, they have access to data from customers, indicators, and financial operations. The problem is not so much in retrieving the data, but in interpreting the results of their analysis.

Today, at the beginning of the 21st century, the link between the culture and the economics of an organization is built physically and mentally by specific employees. In the Introduction the concepts of subject and object were mentioned. The subject is then the human being, the employee. This division is also correct from the point of view of intellectual capital, or human capital. Intellectual capital goes past the utilitarianism mentioned, incorporating Pettigrew's something extra, organizational culture, among other forms of awareness and working with tacit and then explicit knowledge.

Friedman's stakeholder theory is present in Intellectual Capital, as are two important premises for economic life in society derived from Kant's categorical imperative: the responsibility of man for his actions and the dignity of man as an end in himself. Human capital can then be attributed with the aforementioned attributes such as the will, the thought of action, etc. It is human capital, comprising knowledge, skills, abilities, experience, emotional, and action potential, etc., beyond the boundaries of the enterprise, which creates and links the culture and economy of the organization. It is the people, the employees, who, often for selfish reasons, want their work to be measured, analyzed. There is no doubt about the importance of data in this context.

In 2019, the company defined the requirement for the development of a new, different satisfaction questionnaire, the main objective of which was to analyse the understanding and perception of the level of the company's values by its employees. Both the commissioner and the executor of the survey wanted to learn about the employees' views in this area and also wanted to look for and find correlations between specific values, the quality of the organizational culture, the performance of the organization and the work of HR. Everything is summarized through the DMAIC method

In 2020, the survey was conducted using the Multidimensional Analyzis of Ethical Leadership Questionare method (MAELQ), where the selected values (agreed by the client) were divided into four groups of Social Values, Individual Values, Company Values, Consumer Values, which contained specific questions. The number of respondents was over 1700 and surveys were performed in the spring 2020 and 2022.

According to the GAP analysis, the goal was to find gaps that would show potential for improvement. Based on the results obtained, XYZ Company decided to mainly improve the way of leadership, the behaviour of those who hold the positions of direct supervisors, line managers. It expected that the result of the improvement (e.g.: their attitudes, opinions, approaches, responsibilities, ethical practises, etc.) would be reflected in the other areas investigated. The company also decided to raise awareness of the company's values.

In the period between the first and second surveys, there was targeted and long-term training of direct supervisors, line managers. The next step was to replace some of them. By reminding them of the company's values and anchoring them in different contexts of work and activity, the aim was not only to raise awareness but also to make visible the impact on the company's bottom line. According to the GAP analysis (follow-up survey), the areas under review in particular have seen an extremely significant change, which has had a positive impact on the bottom line between 2020 and 2022; see Figure 1,3.

Production and customer audits, interviews with direct supervisors and rank-and-file employees, analyses of HR work and other control organisms drive and control the set changes.

To the question why not only company should consider the link between HRM, the culture of the organization and its financial indicators as very important, one possible answer is offered by (Košturiak, et al., 2010, p. 207) who write what is most important "It is the flow of innovation and improvement that takes place in the background of the production system, it is the flow of people and the acquisition of experience and knowledge in the DNA of the process, it is culture, learning and leadership. Managers who are responsible for developing people and culture." Even if these are the very things that are not visible at first glance. Nevertheless, they are not visible, the results of the analyses indicate a positive change in employee satisfaction and the company's financial indicators.

"In one of them, they said to a group of American soldiers, we are doing an experiment with you, how many pits you dig in a day - dig the pits here, and in the evening a bulldozer will come and cover them up again nicely. They said to the second group: We have such a quiet grove - they even showed them some trees - but because there will be construction here, all these trees will be removed by the bulldozer. We only have 24 hours to replant them, and we need pits. Please dig. The result was that the latter dug two and a half times as many holes as the former, though otherwise they were the same boys." (Šantora, Zajič a Kohák, 2001, p.144).

Conclusion

The aim of this paper is to point out the connection between corporate culture and financial indicators of the company, or to point out that the improvement of corporate culture (represented by employee satisfaction) has a positive impact on the company's financial indicators. Through a questionnaire survey, the weaknesses of the corporate culture (or the different categories of values) were identified. Then, by factor analysis, the values that most affect employees were pointed out. And the measures taken in these areas led to an improvement in the perception of these values and therefore an increase in employee satisfaction. This has undoubtedly had a positive effect on the financial indicators monitored as well, despite the fact that the company was struggling with the reverberations of the covid crisis and dealing with the energy crisis, which affected the company in a very significant way. Although performance was affected by a number of other factors, especially macroeconomic ones, we are not afraid to accept the fact that the increase in employee satisfaction and therefore corporate culture had a significant positive impact on the company's financial indicators.

Burnout Syndrome: Incidence of Burnout among Employees of Family Businesses

Gabriela Poláková¹, Petra Horváthová^{1,*}, and Terezie Krestová¹

¹ VSB - Technical University of Ostrava, Department of Management Faculty of Economics,
Sokolská třída 33, 702 00 Ostrava 1, Czech Republic

Abstract

Research background: Burnout syndrome has become a critical issue in various work environments. Employee burnout is not an individual's problem, but an employer's responsibility. Our research focused on whether some groups of employees are more susceptible to burnout than others. Therefore, burnout syndrome was examined among 115 employees of the family businesses. Employee characteristics were as follows: 56 % male; mean age group 41-60 years (43 %); mean length of practice 5-15 years (43 %); and 23 % managers.

Purpose of the article: The paper aims to present how the incidence of burnout syndrome varies depending on the length of the practice of the respondents and their age.

Methods: Data were collected using the questionnaire to determine levels of burnout in March and April 2023. The internal consistency was checked by Cronbach's alpha. The descriptive statistics and the one-way ANOVA were used to examine the burnout of employees and related factors.

Findings & Value added: The factor, which is significantly associated with burnout, is the age of the employees. In the sample, the higher burnout levels were predominant among younger employees in age groups under 40's. Further experiments did not confirm the hypothesis that the length of practice plays a significant role in the burnout level. The insights gained from this study can guide HR teams in implementing targeted strategies to enhance employee well-being and overall organizational health.

Keywords: burnout syndrome, family business, age, well-being, HR strategy

JEL classification: I12, I30, M54, M59

1. Introduction

Employees are the most important resource for the successful functioning of any organization, not excluding public organizations, as they play a key role in achieving performance and maintaining the stability of any organization (Horváthová et al., 2023). Burnout is a syndrome described as a state of exhaustion that may occur in a very wide range of occupational contexts (Maslach, 2016) in which employees become cynical concerning their work and experience decreased professional efficacy (Schaufeli et al., 2017). (Hillert et al., 2020) describes burnout as a state of psychophysical exhaustion, deterioration of relations, and a sense of professional inefficacy and disillusion. Burnout is a psychological response to work stress that is characterized by emotional exhaustion, depersonalization, and reduced feelings of personal accomplishment (Vnukova Sebalo et al., 2023). Burnout is linked to impairments in cognitive functioning and impacts the mental and physical health of employees (Čiganská & Birknerová, 2022). Burnout has a serious socio-economic impact in terms of decreased level of performance, high resignation rate, and premature retirement (Schaufeli et al. 2017). Seluch et al. (2021) have provided workplace factors that contribute to burnout: workload, control, reward, community, fairness, and values. Personality is a major contributor to the ways individuals react to the environment and empirical evidence suggests that certain aspects of personality may affect average stress levels (Čiganská & Birknerová, 2022) and stress-related disorders such as burnout (Luo et al., 2023). A core characteristic and predictor of burnout is high neuroticism (Hillert et al., 2020). The link

* Corresponding author: petra.horvathova@vsb.cz

between anxiety and burnout, particularly the dimension of emotional exhaustion, has also been empirically proven by Asi et al. (2021).

Staff burnout is increasingly viewed as a concern in the mental health field (Apostol & Voroneanu, 2021). Burnout is associated with an increased risk of personal problems and also problems in the workplace. A lack of solutions can be caused health problems for many years. That is why many organizations today are also dealing with burnout syndrome to prevent its consequences. Burnout syndrome can apply to any occupation that requires a strong personal commitment to work and where there is an imbalance between demands and opportunities to recover resources (Grebski & Mazur, 2022). Burnout can also be considered a serious career crisis (Schaufeli et al., 2017). Maslach defines burnout as a psychological syndrome that arises as a long-term response to chronic interpersonal stressors at work. In response, it produces overwhelming exhaustion, feelings of cynicism and detachment from work, and a sense of ineffectiveness and lack of accomplishment (Maslach & Leiter, 2016). Burnout particularly affects individuals who entered their working lives with high hopes, ideals, and ego commitment and subsequently experience physical, emotional, and mental exhaustion (Hillert et al., 2020). As noted by Schonfeld & Bianchi (2022) the problem of defining burnout concerns its overlapping effect with other syndromes and disorders, such as depression and anxiety. They have revealed that depression is an important determinant of exhaustion. Cynicism and relationship deterioration have consistently been explained only by organizational context. Fastje et al. (2022) suggest that performance-driven climates are positively related to burnout.

These results highlight the dangers of performance-driven work climates on employee well-being. Untreated burnout leads to a decrease in worker productivity and eventually depression and other psychological problems (Grebski & Mazur, 2022). Managers play an important role in employees' exposure to psychosocial constraints (low decision attitude, low social support, high job demands, or low rewards). Parent-Lamarche & Biron (2022) indicated that the psychosocial safety climate was associated with burnout and was also indirectly associated with lower managerial quality.

As can be seen from the above, burnout syndrome can play an important role in addressing the issue of work wellbeing and performance in all types of companies, family businesses not excluding. According to the authors, best of their knowledge, such research has not yet been conducted in Czech family businesses, so they decided to fill this research gap. Thus, this paper aims to present how the incidence of burnout syndrome varies depending on the age and the length of their practice for Czech family business employees.

2. Methods

The research focused on employee burnout syndrome in the Czech private sector family businesses was conducted in March 2023. The selection was performed as random sampling from a database^{****}. In total 700 organizations across the economic sector and size were contacted. The sample consisted of 115 respondents the attitude questions, and a Likert scale was used. All survey questions utilized a 7-point Likert scale (1-7). Descriptive statistics were used for the following variables: burnout level, gender, age, length of experience, and job position.

The structure of the research is composed of two themed sections. The first section of the research will examine the effect of length of practice on burnout level. The second section deals with the effect of age on the burnout level. To meet the objective of the paper, research questions (Q1-Q2) and hypotheses (H1-H2) were formulated based on the previously mentioned findings. The evaluation of the conducted survey allowed answering them. Statistical significance was analyzed using analysis of variance (one-way ANOVA) as appropriate. There was also used a correlation analysis to examine relationships between the variables stated in the hypotheses. Pearson's correlation coefficient shows the negative relationship between age and level of burnout. A simple regression analysis was performed to show the direct linear relationship between burnout and gender. There was used A box plot in descriptive statistics for graphically demonstrating numerical data through their quartiles. The internal consistency of a set of survey questions was measured by Cronbach's alpha. All analyses were carried out using Microsoft Excel.

The authors wanted to survey employees' level of burnout syndrome which is why the authors, so they used an abbreviated Maslach Syndrome Inventory questionnaire (Maslach, 2016) when they focused on two negatively tuned factors of this questionnaire - emotional exhaustion and depersonalization. They

The database of the organizations was obtained from <https://www.databazefiremcr.cz/>.

used the following fourteen survey questions: Item 1: Work drains me emotionally. Item 2: At the end of the workday, I feel exhausted. Item 3: When I wake up in the morning and think about work problems, I feel tired. Item 4: I feel like I sometimes treat co-workers or clients like they're impersonal. Item 5: Working with people all day is exhausting for me. Item 6: I feel "burned out", and exhausted from my job. Item 7: Since practicing my profession, I have become less sensitive to people. Item 8: I am afraid that the performance of my work is making me emotionally hard. Item 9: My work brings me feelings of futility and dissatisfaction. Item 10: I feel like I'm doing my tasks so hard that it's draining me. Item 11: Today, I don't care what happens to my colleagues or clients. Item 12: Working with people brings a lot of stress to me. Item 13: I feel like I'm at the end of my strength. Item 14: I feel that co-workers or clients attribute some of their problems to me. These questions all use a 7-point Likert scale ranging from 1 Not at all to 7 Very strongly.

3. Results

Cronbach's alpha coefficient was used to measure the internal consistency, or reliability, of a set of survey items. This statistic is used to help determine whether a collection of items consistently measures the same characteristic. Cronbach's alpha quantifies the level of agreement on a standardized 0 to 1 scale. Higher values indicate higher agreement between items. The statistical output is in Table 1.

Table 1. Cronbach's α calculation

Cronbach's α calculation			
k	14	Sum variance item	37.9
k/(k-1)	1.077	Cronbach's α	0.905
Variance total	237	Internal consistency	Excellent

Source: authors (2023)

The overall Cronbach's alpha is .905. It means the internal consistency of a set of survey items is excellent.

The normed score for burnout was defined as no burnout: ≤ 1.75 , low burnout: ranging from 1.76 to 3.5, average burnout: ranging from 3.51 to 5.25, and high level of burnout: ≥ 5.25 .

Table 2. illustrates some of the main characteristics of the descriptive statistics of the sample (N = 115). The mean burnout score of the analyzed population was in the middle of a low level of burnout (2.89). This value starts to be a signal for a threat of burnout. Further analysis of burnout syndrome showed that the median is 2.71 and the value that occurs most frequently in the given statistical set is the modus (1.93). The standard deviation is relatively small (1.10) which means that the elements of the statistical population are mostly similar. The variance as a measure of how far a set of numbers is spread out from their average value is 1.22 for the burnout syndrome.

Table 2. Descriptive statistics of burnout level of the sample

Burnout	
Mean	2,888199
Error avg	0,102909
Median	2,714286
Modus	1,928571
SD	1,103575

Minimum	1,214286
Maximum	5,714286
Sum	332,1429
Number	115

Source: authors (2023)

As the first step, the authors focused on answering research question Q1.

Research question Q1: Does the length of practice affect the degree of burnout?

In the sample of respondents, the experience of 5 to 15 years was most often mentioned

(49 respondents, 43 %), followed by the experience of up to 5 years (31 respondents, 27 %), the experience of 16 to 30 years was almost identical (29 respondents, 25 %) and 5 % of respondents reported more than 30 years of experience. The following hypotheses were defined for answering research question Q1.

H1₀: The length of practice does not affect the level of burnout.

H1₁: The length of practice significantly affects the level of burnout.

In the next step, the hypotheses (H1₀, H1₁) were tested by one-way ANOVA (see Table 3.).

Table 3. Anova: one way: testing the effect of length of practice on burnout

Factor						
Groups	Count	Sum	Mean	Variance		
Till 5 years	31	85.42857	2.75576	1.210127		
5 to 15 years	49	144.0714	2.940233	1.384215		
16 to 30 years	29	87.71429	3.024631	1.168103		
Over 30 years	6	14.92857	2.488095	0.241667		
ANOVA						
Source of variation	SS	df	MS	F	P-value	F crit
Between groups	2.176702	3	0.725567	0.589325	0.62326	2.686384
Within groups	136.6614	111	1.231183			
Total	138.8381	114				

Source: authors (2023)

The F test statistic is.5893 and the corresponding p-value is.6233. Since this p-value is not less than.05, we do not have sufficient evidence to say that the length of practice leads to different mean burnout levels. A one-way ANOVA revealed that the length of practice has no significant impact on burnout in the sample because $F (0.5893) < F \text{ crit } (2.6864)$. The burnout levels are not statistically significantly different. Therefore, the null hypothesis is confirmed and in summary, the above results confirm that the length of practice does not significantly affect burnout.

In the next part of the analysis, the authors focused on the effect of age on the level of burnout syndrome.

Research question Q2: Does the age of employees affect their burnout level?

A closer look at the age of the respondents, it can be seen that the most numerous groups of employees are in the age group of 41 to 60 years (49 respondents, 43 %), employees under 30 years represent 22 % (25 respondents), employees from 31 to 40 years represent 23 % (26 respondents) and employees over 60 are 13 % (15 respondents). The correlation analysis between burnout and the age of respondents (see Table 4.) shows a weak negative correlation (-0.25). Contrary to expectations in the given data sample, employees with older age have lower burnout levels.

Table 4. Correlation between the age of respondents and their burnout level

	Age	Burnout
Age	1	
Burnout	-0,24978	1

Source: authors (2023)

The following hypotheses were defined for answering research question Q2.

H2₀: Age has no impact on burnout syndrome.

H2₁: Age has an impact on burnout syndrome.

The hypotheses (H2₀, H2₁) were tested by one-way ANOVA (see Table 5.).

Table 5. Anova: one-way: testing the effect of age on burnout

Factor						
Groups	Count	Sum	Mean	Variance		
Under 30 years	25	79	3.16	1.152755		
31 to 40 years	26	84.35714	3.244505	1.428642		
41 to 60 years	49	133.2857	2.720117	1.139421		
Over 60 years	15	35.5	2.366667	0.725121		
ANOVA						
Source of variation	SS	df	MS	F	P-value	F crit
Between groups	10.61198	3	3.537326	3.062117	0.031136	2.686384
Within groups	128.2261	111	1.15519			
Total	138.8381	114				

Source: authors (2023)

A one-way ANOVA revealed that age has a significant impact on burnout syndrome in the sample because $F(3.0621) > F_{crit}(2.6864)$. The p-value is 0.0311. Since this p-value is less than 0.05, we have sufficient evidence to say that age leads to different mean burnout levels. This means that there is a statistically significant difference in burnout levels between at least two age groups. This is statistically proven at the chosen 5 % level of significance. Overall, these results indicate that burnout syndrome is predominant among younger employees in this sample of respondents.

Focusing on gender and position in the organization, the statistics look like this: The sample of respondents is considerably unbalanced in the proportion of superiors and subordinates. The sample consisted of 27 managers (23 %) and 88 subordinate staff members (77 %). To focus on gender, the sample of respondents was almost gender balanced, 50 (44 %) of respondents were women and 64 (56 %) from them were men.

4. Discussion

An initial objective of the project was to identify employees' levels of burnout syndrome in private family business companies in the Czech Republic. Concerning the first task, it was found that the mean level of burnout syndrome was low. This low mean level of burnout may be explained by an acceptable workload, reasonable control, sufficient rewards, a pleasant and friendly community, fairness, and higher values of the organization. An alternative explanation for this result is that it is due to an enjoyable working environment, good working conditions, respectable interpersonal relations at the workplace, and interesting, inspiring, and attractive job content, but also by the fact that employees are placed in the right jobs and do the meaningful work they want. The mean burnout level is currently low but there is still a potential threat that it may worsen. A satisfied employee can quickly become dissatisfied with the threat of burnout. Unmonitored and untreated burnout can cause a decrease in employee performance and cause several psychological personal and work issues. The psychosocial safety climate and management quality are key factors for employee well-being. There is no time comparison in monitoring employees' burnout levels. So it is not known whether the burnout level is increasing or decreasing in this group of employees and what the trend is. This may be interesting to observe in the future to have a more complete picture.

Research questions were focused on the impact of age and the impact of length of practice on the burnout level. A one-way ANOVA revealed that the length of practice does not affect the level of burnout. Groups of employees divided according to their length of practice have very similar mean values of burnout level. The situation is different concerning the age of employees. Based on the one-way ANOVA, there was found sufficient evidence to say that the mean burnout level is statistically significantly different between analyzed age groups of employees. A weak negative correlation was found between age and burnout. What is surprising is that the statistic showed that a higher level of burnout was predominant in younger age groups (especially younger employees under forty). Several factors could explain this observation. Firstly, insufficient resistance to stress and workload, less experience among new, young employees, or insufficient training. Secondly, younger employees may feel that their knowledge, skills, abilities, and potential are not being fully used, or on the other hand, they can feel overloaded. Another possible reason can be that they are not easily in the right places. They may feel that they don't have enough opportunities to show what they can do. Or they may feel more in control and may wish to be

more autonomous. They may feel that they do not have opportunities for further development and growth and can be frustrated by this. On the other hand, a higher level of burnout may be related to lower abilities to assert oneself in a team or establish positive relationships in the community. Another possible explanation for this is that they cannot sufficiently separate work life from private life and then constantly solve work problems in private life as well. And this fact can cause more stress for them. The concrete reasons for higher burnout levels among the youngest group of employees still need to be identified in further research. This outcome is contrary to that of Desmette & Villoti (2022), and Hybels et al. (2022) who found the probability of burnout syndrome is higher among older individuals. Hybels et al. (2022) justify the burnout syndrome of older employees by the inability to meet the physical demands of the job (due to older age), high workload, or lack of support in the organization. According to Parker & Tavella (2022), the burnout of older workers can be characterized by high workloads with a lack of challenges at work and fewer growth opportunities. There are also opposing views, Sak and Kolesárová (2012) state that how a person can manage stress and resist burnout does not depend on age. The prominent Czech psychiatrist Honzák states that older employees themselves attribute their higher resistance to burnout syndrome to the "lessons" they have learned through experience (Honzák, 2022). Burnout is a professional's occupational disease that must be recognized early and treated (Parker & Tavella (2022). Burnout is the result of chronic stress in the workplace which has not been dealt with successfully (Vnukova Sebalo et al., 2023).

Conclusion

The purpose of the current study was to determine employees' burnout levels in private family business companies and explore the influence of age and length of practice on burnout.

This study has identified a low mean burnout level. The research has also shown that the length of practice does not have any effect on the burnout level. The next major finding was that age statistically significantly affects the burnout level, especially in younger groups.

Before this study, it was difficult to predict employees' burnout levels in the analyzed company. The contribution of this study has been to determine employees' burnout levels and confirm significant factors influencing burnout. The results gained from this study may be of assistance to the management of the analyzed company to focus on improving the current situation and avoid a potential threat to worsen. It is clear that burnout is a significant problem in mental health, both in its prevalence and its association with a wide range of other problems for individual staff persons, for the organizations that employ them, and likely for the people whom they serve.

A limitation of this study is the small sample size. The study is limited by the lack of information on employees' subjective reasons for their feelings. Since the study was limited to examining burnout in one period, it was not possible to analyze the trend over time. Although the paper is based on a small sample of participants, the findings suggest there is an association between age and burnout and between gender and burnout.

From the results of the research, it is possible to determine the occurrence of burnout syndrome in other categories as well, such as gender and position in the organization. Also, there can be complemented comparison with other research in this area. The research should be repeated to analyze a trend of burnout over time. More broadly, research is also needed to specify employees' subjective reasons for their feelings to avoid further possible worsening. It would be contributing to the next research to investigate if employees with their characteristics and traits are in the right jobs concerning their burnout. A key policy priority should therefore be to plan for the long-term care of employees in the area of burnout and satisfaction.

Employer Competencies Requirements for University-Educated Students: Surveys from 2020 to 2022

Terezie Krestová^{1,*}, Lucie Bestová¹, David Hibler², and Alice Šustková²

¹ VSB – Technical University of Ostrava, Department of Management, Faculty of Economics, 17. listopadu 2172/15, 708 00 Ostrava, Czech Republic

² VSB – Technical University of Ostrava, Career Center, 17. listopadu 2172/15, 708 00 Ostrava, Czech Republic

Abstract

Research background: In modern human resource management, there is a growing emphasis on competencies that encompass recruitment, education, and career development. The traditional focus on knowledge, skills, and experience has evolved into a comprehensive approach that evaluates applicants based on their competencies, including the abilities and skills required for specific tasks. The Career Centre at VSB Technical University of Ostrava conducts annual surveys to explore the expectations and possibilities within the university-graduates-employer relationship.

Purpose of the article: This article aims to analyse surveys conducted between 2020 and 2022 to identify emerging trends in employer requirements for graduates.

Methods: The surveys targeted significant employers in the Moravian-Silesian region that employ university-educated professionals. Data collection involved focus groups and semi-structured interviews with HR representatives. The findings were then evaluated by a psychologist.

Findings & Value added: The surveys revealed that employers increasingly prioritise adaptability, rapid onboarding, proactivity in learning, and teamwork. While soft skills are particularly valued in nontechnical fields, graduates in technical disciplines also require them alongside their technical knowledge. Given the rapid advances in science and technology, the ability and willingness to learn new things are deemed crucial competencies. The findings provide a valuable foundation for graduates to focus on developing the competencies desired by employers, enabling their personal growth and employability. Additionally, the results serve as feedback to the university, prompting adjustments in study programmes and additional education to align with the evolving employers' expectations.

Keywords: competencies, graduates, employer requirements

JEL classification: A23, I23, J24, M50

1. Introduction

In the current approach to human resource management, competencies are a key factor on which basic HR processes rely. Competencies can be used to detail job descriptions, establish hiring criteria, recruit candidates, conduct performance evaluations, identify training needs, plan careers, and succession planning (Ali et al., 2021). The concept of competence in the context of HR activities has appeared in the literature since the 1970s, with the meaning of capability. In the past, it was believed that having the right qualifications was sufficient for performing a job. However, over time, this concept was replaced by the broader concept of competence (Karwehl, 2021). In general, competencies can be considered as a set of knowledge, skills, and personal attributes that influence the nature of work. They can be measured against generally accepted standards and can be improved through training and development. In practice, it can be observed that although managers have a clear idea of the competencies an employee should possess for a given position, they are not always able to determine the importance and required level of these competencies (Horváthová et al., 2019).

* Corresponding author: terezie.krestova@vsb.cz

Technological development places high demands on companies, requiring them to adapt not only their production processes but also their human resources, which serve as the driving force and competitive advantage of every company, even in the current digital age. The implementation of competence-based policies, programs, and strategies by organizations would facilitate the judicious and optimum utilization of their resources, thereby paving the way for sustainable competitive advantage (Ganie, 2019). Acquiring new technology or new equipment is usually a matter of financial investment, but acquiring new employees with the right competencies or retraining existing employees for new conditions is a highly challenging task with many uncertain variables that can negatively affect the entire process.

For this reason, there is a growing trend not only to emphasize hard skills, i.e., the professional competences acquired through education or work experience but also to give much more emphasis to soft skills, i.e., the individual competences of each person that define their abilities in social and work interactions, as well as their ability to adapt to and understand new conditions.

The aim of this paper is to analyse surveys conducted between 2020 and 2022 that focused on the competences employers require graduates to possess and to identify trends in employers' expectations of students. While schools can teach students the necessary technical competencies, graduates must also have the soft skills to be employable in the labour market. Ideally, a perfect combination of technical and soft competencies is required for a given position (Sujová et al., 2021).

2. Theoretical background

Mirabile (1997, p. 74) defines competency as knowledge, skill, ability, or characteristic associated with high performance on a job, such as problem solving, analytical thinking, or leadership. Some definitions of competence include motives, beliefs, and values. According to Draganidis & Mentzas (2006), competency is a combination of tacit and explicit knowledge, behaviour, and skills that gives someone the potential for effectiveness in task performance. Banfield & Kay (2012) said that a specific competency can also be understood as an underlying characteristic of a person, that is, a trait, a belief, an ability, or an attitude that distinguishes one person from another and explains differences in job performance.

When we talk about the competence of an employee, we mean that he or she has the necessary characteristics to the extent that he or she can handle the tasks assigned. It is assumed that if an employee is competent, he/she performs his/her tasks well or at a higher-than-expected level. To speak of a competent person, three prerequisites must be met. He or she must have the qualities, abilities, knowledge, skills, and experience that he or she needs to behave competently. Additionally, the person must be motivated to use the behaviour and see the purpose of it. Last but not least, there are external conditions that enable this person to use this behaviour (Spillerová et al., 2004, p. 27). The first prerequisite is the most influential; it can be developed in the direction we need. For the second assumption, it is the person's personality traits, such as motives, attitudes, and values, that are very difficult to change.

Both of the first two assumptions are related to the personality of a particular person and complement each other. If someone has the necessary competences but is not motivated to use them, these competences are useless. Conversely, if a person has strong motivation, but does not have the necessary competencies, they will not achieve the desired result. The third assumption is independent of the person but equally important for the most effective use of competences. If a person is competent and has the right motivation to use his/her competence, if external conditions do not allow him/her to do so, he/she will not achieve the desired effect. As Kandula (2015) states, not all qualities and characteristics need to be considered competencies. To qualify a characteristic as a competency, it must lead to effective performance and contribute to job success.

In general, competencies can be divided into professional competencies, which refer to the set of professional requirements needed to perform a job in a given position. They are commonly referred as hard skills. They are measurable or can be verified by a test or examination. They can be broken down according to the field to which they relate or according to the nature of the activity to which they relate. They are the practical skills required for the performance of a particular work activity, but also the theoretical knowledge required for that performance. The next category is general skills, which are not exclusively related to a specific job but are the general requirements needed to perform the job. They are transferable and applicable across disciplines. Digital competences are related to digital literacy. It includes not only competences related to working with, searching, and processing data but also competences related to creating digital content or using digital technologies. However, the last category,

which appears to be increasingly important, is soft competencies. These competencies are not dependent on expertise, they are general competencies needed to perform a job well (Ternikov, 2022, MPSV, 2017).

The fact that a candidate has a particular competence does not mean that he or she is suitable for a particular position or activity. Today, it is necessary for each employee to have multiple competences at different levels. For this reason, competency models are used. For students, competency models can verify the potential to define effective performance. Subsequently, the training content can be adapted to individual development goals (Getha-Taylor et al., 2018). The basis of education, regardless of specialisation, should consist of so-called generic competences, which are interdisciplinary, as opposed to specific competences that are characteristic of individual disciplines (Ferrerias-Garcia et al., 2021).

The basic prerequisite for working with competences is their identification. It is not possible to define the necessary competence without identifying its need and determining the basic characteristics of the activity for which the competence is needed. As stated by Spillerová et al. (2004), the process of identifying competencies has several stages; see Figure 1.

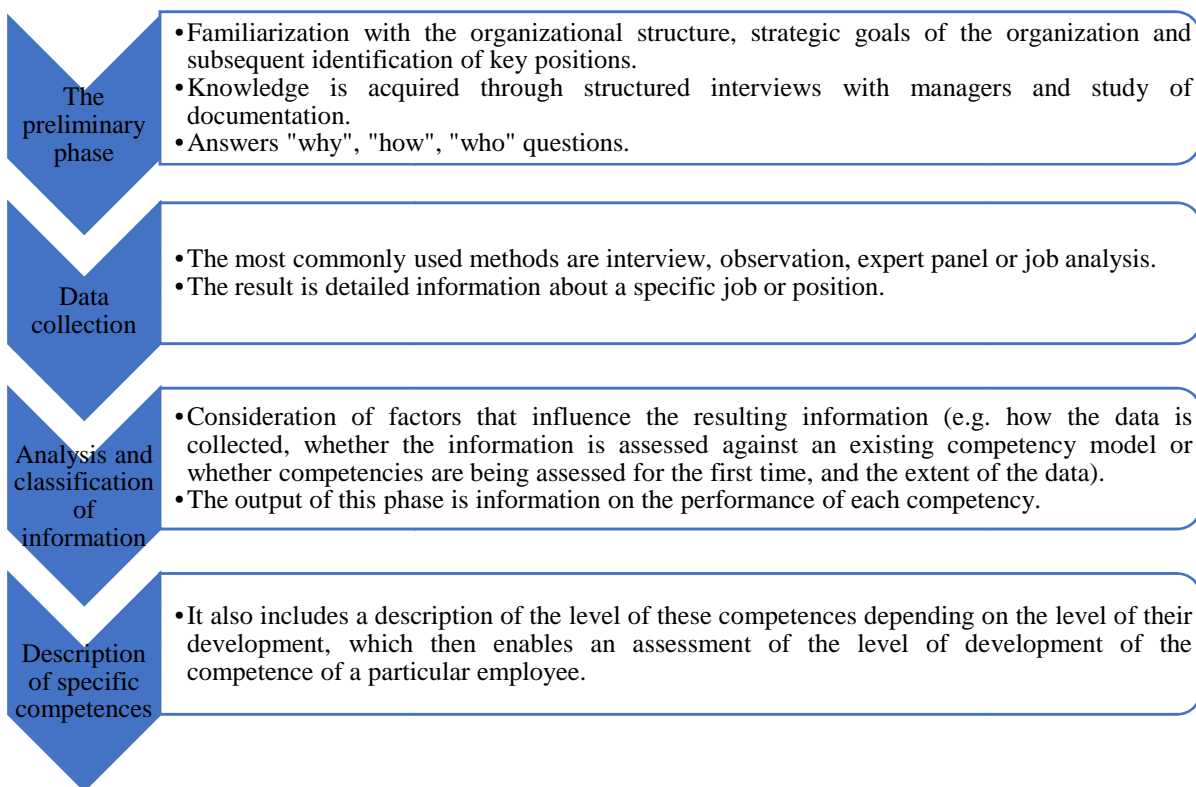

Figure 1. Process of identifying competences

Source: own processing (2023)

2.1 Changes in competency requirements

In the context of today's rapid technological development, it can be stated that competence is not a constant variable. Competences can have a "life cycle", that is, they emerge, develop, and then disappear (Kovács, 2009). At the same time, there is a need for new competences, which are usually related to new trends and developments and are expected. The critical phase for organisations is usually the realisation of the need for a new competence and the necessity for employees to acquire the new competence. This identification often occurs only when the absence of the new competency starts to cause serious problems in organisational processes. For the above reason, organisations should continuously monitor their competences, update them, or identify completely new ones.

Since the beginning of competency research, technological progress and the alteration of competence demands among employees have drastically reshaped the landscape of employment. The handling of complexity and large amounts of information has become essential to stay up with the developments in today's world. Globalised competition has led to an increasingly intense 'War for Talents' under volatile circumstances (Karwel, Kaufeld, 2021).

3. Methods

The research was focused on what competencies organisations will demand for university graduates in the coming years. This information will help both to define and describe the requirements in question and to help students focus on developing these competencies.

3.1 Conducting the focus group method

Given the relatively homogeneous composition of the groups, it was anticipated that the interaction would yield profound insights into the topic at hand. The discussions were skilfully guided and directed by the moderator. Typically, the optimal number of participants for each group ranged from six to eight individuals. Consequently, the interviews were conducted in three separate sessions, allowing the researcher to uncover emerging trends within the topics explored by each focus group while simultaneously satisfying the data saturation requirement inherent in qualitative research.

The primary objective of the focus groups was to effectively deliberate on predetermined topics within a limited time frame. The collected data was analysed with simplified content. Semi-structured interviews and discussions were consistently divided into three to four core segments. The initial segment involved collecting information about the respondents and the companies they represented. Subsequent segments exclusively focused on the employers' expectations of student competencies. Furthermore, additional blocks addressed pertinent issues currently or potentially addressed by the Career Centre.

3.2 Semi-structured individual interviews

The research was conducted through semi-structured individual interviews with representatives of companies in the HR, recruitment, or development sectors. A total of 20 interviews were conducted over two years (June 2021 and May 2022) were conducted, all online via Zoom and MS Teams. All interviews were recorded for further analysis. The data saturation condition set by qualitative research was met. Data were analysed using simplified content analysis. The semi-structured interviews were divided into four basic blocks. In the first part, information about the respondent and the company he/she represents was collected. In the next blocks, questions focused on employers' expectations of students and vice versa, the outlook of the labour market in 5 years, and cooperation with universities.

The analysis was conducted independently by two researchers to increase the validity of the results, and the conclusions below are an intersection of their findings.

4. Results

Based on the results of the first survey conducted in 2020, the competencies most frequently required by graduates by employers can be divided into 3 groups. The first group consists of requirements related to the approach to work and to the company, namely, the desire to work, achieving a certain degree of compatibility of the candidate's personality with the company and the team, and the ability to work in a team. The second group of required competences relates to the approach to work and problem-solving. Employers reported that they value the ability of candidates to analyse a situation, solve new problems, and propose new ways and procedures. The last pair of competencies expected of the candidates included the ability to communicate and present the results and the results of their work. The general consensus was that soft skills were more important than hard, domain-specific knowledge and skills. There was a consensus among employers that language skills were an essential, but still under-represented, competency for graduates.

In 2021, which was influenced by the Covid-19 pandemic, the research was more orientated toward recruitment trends; in any case, here too, employers defined the requirements they had for applicants. The results show that in recruitment they do not only focus on professional knowledge and skills, which is expected to a certain extent for all candidates with comparable education, but they place much more emphasis on the potential of the candidates, which can be described by three basic characteristics based on the research results. It is important that the candidate fits the company culture and shares values similar to those of the company and its current employees. The expected competence is adaptability, that is, the ability and willingness to adapt to new practises and trends. Motivation is a very important aspect that determines whether or not a candidate is hired. The employer is interested in the motivation of the candidate to work for the employer and to do the job, but also in whether he or she is motivated to go above and beyond.

The latest available results are from 2022 when the research focused on what employers' expectations are from the career portfolio offered by the VŠB-TUO Career Centre. This is basically about what

competences graduates will be equipped with. The requirements are very closely linked to the globalisation of the market, so there is a constant need for sufficient language skills among graduates. As in previous surveys, the required competencies were related to the transition from study to work, employers require a proactive approach to work, the ability to adapt to the working regime, and they also expect a certain degree of self-discipline. This requirement is a consequence of the Covid-19 pandemic, where many employers are persisting with the option of working from home, with limited control by a supervisor who has to rely on the self-discipline of his/her subordinates. There is a continuing interest in the ability to keep abreast of current industry trends and the ability to present one's results effectively.

It can be concluded that although individual sub-studies focused on different areas, we can find common features in the results in the required competences. One of the basic requirements of all employers in all surveys was the language skills of graduates. According to the National System of Competences, language competence is classified as a general competence that is not exclusively linked to a specific position; it is a general requirement for the performance of work. They are transferable and applicable across disciplines (MoLSA, 2017). Other required competencies can already be included in the area of soft competencies, which are not dependent on expertise but are general competencies required for good job performance (MoLSA, 2017).

Using the structure of the National Competence Framework, the most commonly required soft competencies can be divided into three areas. The first is personal competences, where employers most often required competences for lifelong learning, i.e. the ability and willingness to accept new information. Next, there are requirements for flexibility in the sense of the ability to think operationally and flexibly and to adapt to new situations and creativity, which is understood as the ability to create, think, see, and do things differently than usual. Another area is interpersonal competences, specifically the competencies to communicate effectively and to cooperate, which employers expressed by requiring the ability to work as a team. A sub-field is performance competencies. Here, the most frequently mentioned competency was the competence to be proactive, i.e., the ability and willingness to engage in activities beyond job duties, requirements, and expectations. Competence for autonomy and, last but not least, competence to plan and organise work were also desirable.

5. Discussion

The findings of our research exhibit comparability with internationally published results, extending beyond the domain of engineering graduates, thereby suggesting an interdisciplinary trend of significance. To illustrate, research conducted in Hungary reveals that graduates with a bachelor's degree in human resource management are expected to possess foreign language skills, teamwork skills, and effective communication abilities in addition to their professional competencies (Bogdány et al., 2023). Similar outcomes are observed in a survey investigating the competencies of human resource professionals in relation to organizational digital transformation. Once again, competences for continuous learning and communication skills are among the main requirements (Van den Berg et al., 2020). However, it is important to acknowledge the limitations of the conducted research. Firstly, the relatively short duration of the study precludes the secure identification of long-term trends in employers' competence requirements for graduates within a span of three years, although its outcomes can be compared with other international studies. Additionally, the sample of company representatives was restricted in both number and focus, primarily comprising companies that employ graduates in technical fields. Future research endeavours can expand the pool of respondents, as well as concentrate on investigating the latest trends in recruitment and selection processes. This may involve exploring aspects such as the digitization of these processes, the utilization of artificial intelligence, and the subsequent impact of these changes on employer demands.

Conclusion

Common characteristics of the competencies required by employers have been identified in various research studies. Regardless of the specific field, language skills and soft skills are consistently in high demand as they transcend expertise and contribute to overall job performance. Soft competencies encompass personal, interpersonal, and performance-related aspects. Employers place significance on attributes such as the ability to learn new information, flexibility, creativity, effective communication, teamwork, a proactive approach, independence, and skills in planning and organizing work.

In light of the rapid development of technology, which impacts the labour market and candidate requirements, it is foreseeable that the demand for hard skills will undergo change, rendering several competencies obsolete. Consequently, applicants and current employees will need to acquire novel

proficiencies. Nevertheless, it can be presumed that within this rapidly evolving landscape, greater emphasis will be placed on soft competencies linked to adaptability and continuous learning. Language skills and digital literacy will extend beyond technical professions, becoming imperative across diverse domains.

Gamification in Management: Enhancing Engagement, Motivation, and Performance

Guy Kaufmann^{1,*}

¹ University of economics in Varna, Department of Computer science of Management and Business,
77, Kniaz Boris I Blvd., 9002 Varna, Bulgaria

Abstract

Research background: In today's competitive business environment, fostering employee engagement, motivation, and performance is crucial. This comprehensive study takes an in-depth look at the role of gamification in management practices, specifically how applying game design elements in non-game contexts can effectively address these challenges.

Purpose of the article: The purpose of the article is to explore how gamification can be effectively used in management to enhance employee engagement, motivation, and performance. It offers a detailed look at the benefits, methods, and potential challenges of applying gamification in a corporate setting. The article aims to serve as a comprehensive guide for organizations considering the implementation of gamification strategies, while also highlighting the need for further research on its long-term effectiveness and ethical implications.

Methods: The study explores multiple gamification strategies, including Points, Badges, and Leaderboards (PBL), narrative contexts, challenges and quests, real-time feedback, social features, and adaptive difficulty levels.

Findings & Value added: Evidence indicates that gamification significantly enhances participation, motivates employees, and fosters skill development. However, the effectiveness of these strategies is contingent upon thoughtful implementation aligned with organizational culture and objectives. Ethical considerations and implementation barriers are discussed to provide a comprehensive view.

Keywords: gamification, management, employee motivation, performance, socio-economic impact

JEL classification: M10, M12, M54

1. Introduction

In today's dynamic and competitive business environment, organizations are constantly seeking innovative approaches to enhance employee motivation and improve performance. One such approach gaining traction is gamification. Gamification involves applying game design principles, mechanics, and elements in non-game contexts, such as management practices (Deterding et al., 2011). This definition contrasts “gamification” against other related concepts via the two dimensions of playing/gaming and parts/whole (figure 1). A well-designed game is a guided missile to the motivational heart of the human psyche. Applying the lessons that games can teach could change your business, the way you learn or teach, even your life (Werbach & Hunter, 2020).

Gamification holds the potential to transform traditional management practices by infusing elements of challenge, achievement, and rewards into various tasks and processes. It can be utilized in areas such as employee training, performance management, goal-setting, and feedback systems (Reeves & Read, 2009). By leveraging game-like features, organizations can enhance employee engagement, improve productivity, and foster a positive work culture.

This section provides an overview of gamification in management and its potential implications for organizational success. The key theories and frameworks underpinning gamification will be explored, along with its relevance in contemporary management practices (Zichermann & Linder, 2013).

* Corresponding author: gk6385@gmail.com

Figure 1. “Gamification” between game and play, whole and parts
 Source: Deterding et al., 2011

2. Methods

Gamification leverages elements from game design to engage users in non-game contexts. It involves applying various strategies and techniques to make activities more enjoyable, rewarding, and meaningful for participants.

2.1 Benefits of Gamification in Management

There are a lot of benefits that come from the results of using gamification in management.

The benefits include enhancing engagement, boosting motivation, improving skills, fostering teamwork, and improving performance.

2.1.1 Enhanced Engagement

One of the primary advantages of gamification in management is its ability to enhance employee engagement. A meta-analysis by Hamari et al. (2014) found that gamified systems yield positive outcomes concerning engagement and attitude towards tasks.

Games have a natural capacity to captivate individuals and create a sense of enjoyment and flow. When applied to work-related tasks and processes, gamification can transform mundane activities into more interactive and enjoyable experiences.

Gamification taps into the psychological aspects that make games engaging, such as rewards, competition, and social interaction. By incorporating these elements, companies can make mundane tasks more engaging, thereby increasing employee involvement and commitment. For example, SAP uses gamification to engage its employees in sustainability efforts, significantly increasing participation rates in sustainable activities (Werbach & Hunter, 2012).

2.1.2 Boosting Motivation and Productivity

Gamification provides a powerful tool to boost employee motivation and productivity. By offering employees choices and control over their tasks, gamification fosters a sense of autonomy and empowerment, which fuels motivation. Through well-designed progression systems, employees can gradually develop their skills and experience a sense of mastery, which further enhances motivation and productivity. Furthermore, gamification can emphasize the purpose and impact of employees' work,

connecting it to larger organizational goals and societal impact. This sense of purpose inspires employees to go above and beyond, resulting in increased productivity.

Self-Determination Theory posits that humans have intrinsic needs for competence, autonomy, and relatedness (Ryan & Deci, 2000). Gamification can cater to these needs by providing autonomy through choices, competence through challenging tasks and feedback, and relatedness through social features. A study by Robson et al. (2015) found that gamified elements like leaderboards and badges significantly increased motivation among sales representatives.

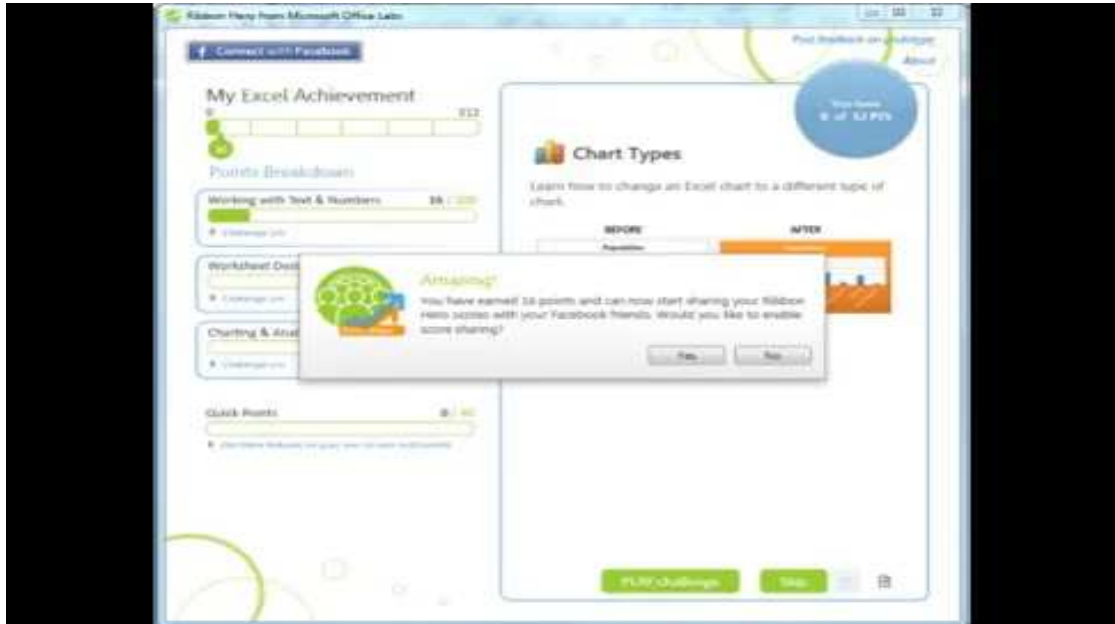

Figure 2. Microsoft's Windows Language Quality Game used to motivate staff to help find glitches before the launch of Windows 7
Source: Zichermann & Linder, 2013

2.1.3 Improved Skill Development

Gamification in management can also facilitate learning and skill development within organizations. By incorporating game-based elements into training programs, employees can engage in interactive simulations and scenarios, allowing for hands-on practice and experiential learning. This approach promotes a safe environment for experimentation, encourages knowledge retention, and facilitates the development of critical skills. Gamified learning experiences can also promote collaboration and knowledge sharing among employees.

Gamification enables skill development through constant feedback and challenge levels. It effectively supports mastery learning (Guskey, 2012), allowing employees to build on existing competencies (Kapp, 2012).

For instance, gamified simulations allow employees to practice their skills in a realistic and risk-free environment. These simulations can recreate challenging scenarios that employees may encounter in their roles, allowing them to develop and refine their skills through hands-on experience. Immediate feedback within these simulations enables employees to learn from their mistakes and iterate on their approaches, enhancing the learning process.

2.1.4 Fostering Teamwork

Fostering teamwork is essential in almost any group setting, whether it's in a professional organization, an academic environment, or even in social activities. Teamwork allows for the blending of various skills, personalities, and insights, which often results in more effective problem-solving and a more productive output.

Fostering teamwork is a continuous process that requires ongoing effort, adaptability, and a willingness to work toward a common goal.

By incorporating leaderboards and team challenges, gamification promotes a healthy sense of competition and collaboration, fostering teamwork and collective problem-solving (Zichermann & Cunningham, 2011).

2.1.5 Improve Performance

Enhanced engagement and motivation often lead to improved performance.

The element of competition introduced through gamification can stimulate employees to push their boundaries, strive for excellence, and continuously improve their performance.

This competitive element can drive higher levels of effort and performance as employees seek recognition and the satisfaction of being at the top of the leaderboard.

Studies have indicated a positive correlation between gamified environments and performance metrics (Sailer et al., 2017). For instance, a case study on Deloitte Leadership Academy revealed that the introduction of gamification resulted in a 37 percent increase in the number of users returning to the platform, thereby improving the skill development essential for performance (Meister, 2013).

2.2 Key strategies

Several key strategies can be employed to realize these goals, each supported by academic research and practical examples.

2.2.1 Points, Badges, and Leaderboards (PBL)

One of the most commonly used gamification methods is the use of Points, Badges, and Leaderboards (PBL). The PBL system is often considered the cornerstone of gamification strategies. Points act as immediate markers of progress and accomplishments, making abstract goals concrete (Deterding et al., 2011). Badges are given as rewards for accomplishing specific challenges or tasks, serving as status symbols and encouraging a sense of ownership. They can also be shared socially, catering to the need for social recognition (Christy & Fox, 2014). Meanwhile, leaderboards create a competitive environment, sparking interest and engagement among employees (Hamari et al., 2014). However, it's important to note that excessive competition may deter collaboration; thus, these elements should be balanced and aligned with organizational objectives.

One of the most well-known examples of Points, Badges, and Leaderboards (PBL) in a corporate setting is the gamification system implemented by Salesforce, a leading Customer Relationship Management (CRM) software provider. Salesforce's platform offers a feature called "Salesforce Trailhead," a learning experience platform that gamifies the process of learning Salesforce.

Figure 3. Fitbit Badges
Source: Werbach & Hunter, 2020

2.2.2 Narrative Context

Another strategy is to provide a narrative context for tasks to make them more meaningful. Games often use story elements to engage players, and the same can be applied to work environments. Adding a narrative can heighten the sense of purpose and make tasks more emotionally engaging (Zichermann & Cunningham, 2011).

Incorporating a narrative into tasks helps infuse a layer of emotional investment, adding a new dimension to otherwise mundane tasks. For example, customer service representatives could be positioned as "heroes" on a mission to solve customer issues, which in turn, increases the perceived importance and engagement of the task at hand.

One widely recognized example of incorporating narrative context in a corporate environment is the approach taken by Deloitte University with their leadership training program called "Greenhouse." Deloitte Greenhouse sessions are designed to break the mold of traditional corporate training, often using stories and narratives to immerse participants in real-world scenarios.

2.2.3 Challenges and Quests

Creating challenges and quests taps into the human need for achievement (Ryan & Deci, 2000).

Quests and challenges can be developed in alignment with key performance indicators (KPIs) and specific business objectives. They break down complex tasks into smaller, more digestible pieces, facilitating step-by-step progression and mastery. Rewards earned from completing challenges can be both intrinsic (sense of achievement) and extrinsic (badges, points), catering to various motivational needs (Kapp, 2012). These elements not only introduce problem-solving aspects to daily tasks but also create a clear path toward mastery, which can lead to enhanced performance.

Microsoft's "Office 365 Champions Program" serves as a notable real-world example of implementing challenges and quests in a corporate setting. This program aims to accelerate the adoption of Office 365 tools within an organization by identifying and empowering internal champions who are enthusiastic about these tools.

2.2.4 Real-Time Feedback

The use of real-time feedback loops ensures that employees can adjust their performance immediately.

The power of real-time feedback is exemplified in the immediate gratification and learning opportunities it provides. An employee doesn't have to wait for an annual review to understand their performance; they can adapt and grow continuously. This instant feedback not only fulfills the psychological need for competence but also enables immediate course correction, thus contributing to skill development and improved performance (Sailer et al., 2017).

One real-world example of the use of Challenges and Quests in a corporate setting is the initiative undertaken by IBM through its "Innov8" platform. Innov8 was initially designed as a business process management (BPM) simulation game, aimed at training employees and other stakeholders in various aspects of business decision-making and strategy.

2.2.5 Social Features

Social features like team-based quests, collaborative challenges, or forums for sharing accomplishments can provide a support system and increase the sense of community. It also enhances the sense of community and relatedness among employees.

This not only promotes cooperative behavior but also fulfills the human need for relatedness and belonging, which is a powerful motivator for engagement (Robson et al., 2015).

A well-known example of the integration of social features in a corporate setting is the use of Yammer, a social networking service used for private communication within organizations. Owned by Microsoft, Yammer functions like a social network for the workplace and is often described as "Facebook for business."

2.2.6 Adaptive Difficulty

In gaming, the level of challenge adapts to the player's skill to maintain engagement. A similar approach can be beneficial in the workplace. Adjusting the level of task difficulty based on an employee's skill level ensures that tasks are neither too easy nor too challenging. Striking this balance sustains engagement and promotes a state of "flow," where employees are fully immersed in the activity at hand. This concept, based on the Flow Theory, has been linked to high levels of performance and job satisfaction (Csikszentmihalyi, 1990).

Duolingo, the language-learning app, offers an excellent example of adaptive difficulty in an educational context, and its principles have been adapted for corporate training programs as well. While Duolingo is not strictly a corporate example, its adaptive difficulty techniques have inspired similar implementations in corporate training and development platforms.

Level	Description	Example
<i>Game interface design patterns</i>	Common, successful interaction design components and design solutions for a known problem in a context, including prototypical implementations	Badge, leaderboard, level
<i>Game design patterns and mechanics</i>	Commonly reoccurring parts of the design of a game that concern gameplay	Time constraint, limited resources, turns
<i>Game design principles and heuristics</i>	Evaluative guidelines to approach a design problem or analyze a given design solution	Enduring play, clear goals, variety of game styles
<i>Game models</i>	Conceptual models of the components of games or game experience	MDA; challenge, fantasy, curiosity; game design atoms; CEGE
<i>Game design methods</i>	Game design-specific practices and processes	Playtesting, playcentric design, value conscious game design

Figure 4. Levels of Game Design Elements
Source: (Deterding et al., 2011).

3. Results

Gamification strategies such as points, badges, leaderboards, and virtual rewards can incentivize desired behaviors, foster healthy competition, and promote continuous improvement (Landers, 2014). It can create a sense of enjoyment, autonomy, and mastery, leading to increased productivity and satisfaction (Huotari & Hamari, 2016).

Moreover, gamification in management has shown potential in enhancing learning and development initiatives. It can provide interactive and immersive experiences, making training programs more engaging and effective (Kapp, 2012). Collaborative gamified platforms can also encourage teamwork, knowledge sharing, and problem-solving among employees (Hamari et al., 2014).

Implementing these methods in a thoughtful and balanced way can help organizations harness the full potential of gamification in enhancing employee engagement, motivation, and performance. However, it is important to note that the effectiveness of these methods can vary depending on the unique needs and dynamics of each organization.

The effectiveness of these methods depends on factors such as the target audience, context, and the specific goals of the gamified experience. Combining several methods can create a rich and engaging experience that caters to different motivations and preferences.

Remember that effective gamification is not a one-size-fits-all approach. The methods you choose should align with your target audience's preferences, the context of the activity, and your specific goals. Regular assessment and adaptation based on participant feedback and behavior are essential for maintaining engagement, motivation, and performance over the long term.

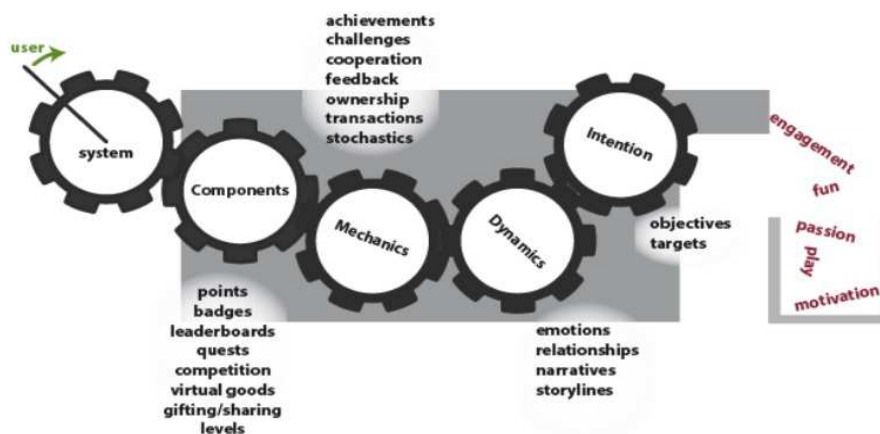

Figure 5. Gamification successful achieved by the key elements join & run in unity in favor of the user
Source: Wood & Reiners, 2015

4. Discussion

While gamification in management offers promising avenues for enhancing employee motivation, engagement, and skill development, its application is not without challenges. Despite its promise, gamification is not without its pitfalls. A misaligned gamification strategy can lead to unethical behaviors and can demotivate employees who are not competitive (Nicholson, 2015). As such, it is crucial to implement gamification in a manner aligned with the organizational culture and goals.

However, it is crucial to acknowledge potential challenges associated with gamification in management. Misalignment between game mechanics and organizational goals, excessive competition, and the risk of short-term motivation without lasting impact are among the potential pitfalls to consider (Zichermann & Cunningham, 2011).

4.1 Ethical Considerations

Previous research indicated that gamification techniques could introduce risks to the business environment, and not only fail to make a positive change, but also raise concerns about ethics, quality of work, and well-being in a workplace (Algashami, 2018).

There is also concern about the ethicality of manipulating employee behavior through game mechanics (Mollick & Rothbard, 2013).

4.2 Implementation Barriers

Implementing gamification strategies effectively requires a deep understanding of organizational culture and employee preferences, making it resource-intensive (Robson et al., 2015).

Conclusion

Gamification in management presents a valuable approach to enhance employee engagement, motivation, and performance. By leveraging game mechanics and design principles, organizations can transform work-related tasks into enjoyable and immersive experiences. The benefits of gamification include increased engagement, boosted motivation, improved productivity, and enhanced learning opportunities.

Gamification offers opportunities for employees to find joy and purpose in their work, while also promoting learning, skill development, and collaboration.

However, organizations must address challenges such as alignment with overall objectives, careful management of competition, and the need for ongoing maintenance and updates. With a thoughtful and strategic approach, gamification has the potential to revolutionize the workplace and drive positive outcomes for both employees and organizations.

This essay argues that gamification has significant potential in enhancing engagement, motivation, and performance within the realm of management. However, the success of such initiatives depends heavily on thoughtful and strategic implementation. Organizations must be vigilant in aligning gamification strategies with their broader goals to harness its full potential.

As gamification in management continues to evolve, further research is needed to explore its long-term effectiveness, ethical implications, and specific applications within diverse organizational contexts.

Managing the Health Risks of Climate Change is Imperative for Human Health: What Does a Health Provider Need to Know?

Aiham Gotani^{1,*}

¹ Ziv Medical Centre, Department of emergency medicine, Zefat Academic College, Jerusalem St 11, Safed 1320611, Israel

Abstract

Research background: Climate change is considered one of the world's greatest threats, endangering both physical and mental health, while also directly limiting international development. The World Health Organization (WHO) has gone so far as to label it the most significant health challenge of this century. The impacts of climate change are being felt across natural and human systems globally, carrying substantial repercussions for a diverse array of sectors, including agriculture, business, trade, healthcare, and social well-being. However, despite its undeniable importance, there exists a notable dearth of comprehensive studies delving into the knowledge and awareness levels of medical and nursing personnel concerning climate change. This lack of research is impeding the formulation of effective strategies for climate change education and management within the healthcare system.

Purpose of the article: The purpose of the study is to investigate the stance of service providers concerning climate change and its impact on health. The study aims to develop strategies that can enhance staff knowledge and awareness, particularly in health management under conditions related to climate change.

Methods: An observational cross-sectional study was conducted among nurses and physicians working in the departments of emergency rooms and internal medicine departments in various Israeli hospitals. The study will include participants composed of physicians and nurses. Data on participants' perceptions, knowledge, and awareness of climate change and its effects can be collected using an online questionnaire.

Findings & Value added: The health impacts of climate change command increasing policy and public attention as the climate continues to change rapidly. adaptation is no longer tomorrow's choice, but today's imperative. To effectively adapt to the field of public health, it is crucial to establish multisectoral and multidisciplinary responses that involve close collaboration among individuals, communities, governments, international organizations, and the research community. This collaborative approach is necessary to address and mitigate the adverse health impacts of climate change.

Keywords: climate change, health risks, nurses, public health, physicians

JEL classification: I15, Q58, M1

1. Introduction

Climate change poses a significant challenge to humanity and has profound implications for public health. According to the World Health Organization (WHO), it is even regarded as the greatest health challenge of the current century (Beillouin et al., 2022). This global phenomenon is considered one of the most serious threats, directly endangering both physical and mental health while also imposing limitations on international development (Stephenson et al., 2013). The recent changes in climate patterns are already having a significant impact on natural and human systems worldwide, leading to far-reaching consequences across various sectors such as agriculture, business, and health (Watts et al., 2019). For these reasons, climate change is considered the greatest health threat of the 21st century and beyond (Hubbert et al., 2020).

The climate crisis is one of the most serious threats to public health in the 21st century, and it is projected to worsen in the coming years (Watts et al., 2018). In 2020, global attention was drawn to the coronavirus pandemic and its wide-ranging impact on public health. The corona crisis, along with climate change, provides evidence of the interconnectedness between countries in the realm of public health and the disproportionate harm faced by vulnerable populations, including those with low incomes, minorities,

* Corresponding author: aiham.go@walla.co.il

women, the elderly, chronically ill individuals, and those who work outdoors in sectors such as infrastructure, construction, and agriculture (Al et Romanello, 2021). There has been an observable increase in the frequency, duration, and intensity of extreme weather events, including heatwaves, storms, floods, droughts, and fires. Additionally, temperatures, sea levels, and air pollution have all seen noticeable increases (Watts et al., 2018; Delmotte-Masson et al.).

Numerous studies have explored the attitudes and awareness of medical and nursing professionals regarding climate change and its impact on human health. In a survey conducted by the American Association of Physicians, which aimed to assess physicians' perceptions of climate change, research findings indicated that climate change is primarily driven by human activities. The majority of respondents reported observing health effects in their patients, particularly noting an increase in the severity of chronic illnesses linked to air pollution. As a result, they emphasized the need for physicians and healthcare organizations to educate the general public and take appropriate action on this issue (Sarfaty et al., 2015).

Another study conducted in the United States examined the knowledge and awareness of climate change among public health nurses and revealed that they perceive significant threats to the human environment. However, they noted a lack of resources, action plans, and strategies to address these threats (Polivka, Chaudry, & Mac Crawford, 2012a). Therefore, it is crucial to assess the knowledge, awareness, and readiness for action among frontline healthcare workers, such as nursing and medical teams in public hospital emergency departments, who are expected to address the growing morbidity and injuries resulting from climate change (La Torre et al., 2020).

1.1 Climate change

Weather and climate exert a substantial influence on life on Earth, playing a vital role in supporting the biosphere and ensuring human well-being (IPCC, 2014). The recent shifts in climate patterns are largely attributed to human activities and their impact on the environment, which has resulted in significant consequences for resources and various sectors globally (Watts et al., 2019).

In 2020, global attention was focused on the coronavirus and its extensive impact on public health. Both the COVID-19 crisis and climate change demonstrate the interconnectedness of countries worldwide regarding public health and the disproportionate impact on vulnerable populations, including those with low incomes, minorities, women, the elderly, the chronically ill, and outdoor workers (e.g., in infrastructure, construction, agriculture) (Romanello et al., 2021).

Climate change is recognized as one of the most serious global threats, endangering the future health of human populations and directly challenging international development (Stephenson et al., 2013). It is considered the greatest health threat of the twenty-first century, causing severe problems in various areas, compromising people's health, and resulting in high mortality rates (Hubbert et al., 2020). The Intergovernmental Panel on Climate Change's fifth report highlights the warming of the Earth in recent decades, increasing temperatures, rising sea levels, escalating air pollution, and changes in the frequency and intensity of extreme events such as droughts, floods, and storms (IPCC, 2014).

1.2 Consequences of climate change on human health

Climate change has various impacts on the health sector, both directly through physiological effects and indirectly by influencing chronic and infectious diseases, as well as mortality and morbidity rates due to external factors (Watts et al., 2019). Climate change, in conjunction with other natural and human-induced stressors, affects human health and disease in multiple ways. It exacerbates existing health threats while also giving rise to new ones. However, not all individuals face an equal level of risk. Factors such as age, economic resources, and geographical location play a crucial role (McDonald, 2020).

Climate change-related health risks encompass various aspects, including physical and mental health. These risks include trauma resulting from extreme weather events, illnesses associated with high temperatures, and compromised water and food safety (Huang et al., 2013). The disruptions caused by climate change have significant health implications, such as increased respiratory and cardiovascular diseases, injuries, and premature deaths linked to extreme weather events. Furthermore, there are changes in the prevalence and geographical distribution of foodborne, waterborne, and other infectious diseases, along with threats to mental health (Cruz et al., 2020). Vector-borne diseases, cardiovascular and respiratory illnesses, and psychosocial health impairments are also among the health impacts related to climate change (McIver et al., 2015). Additionally, there is an expected increase in widespread and dangerous fires following extreme weather events (Beillouin et al., 2022).

1.3 The health system and climate change

Countries need to strengthen their health systems to effectively and promptly respond to the increasing morbidity and mortality caused by climate change, reduce vulnerability to climate-related stresses, and cope with the challenges posed by extreme events that strain the system's infrastructure (WHO, 2015). The role of the health care system in the climate crisis can be understood in four aspects. Firstly, the health care system is a significant contributor to greenhouse gas emissions and should take action to mitigate these emissions (MacNeill, McGain, & Sherman, 2021). Secondly, the system must prepare for a surge in demands for emergency medical services and hospitalization due to extreme events and prolonged periods of heat and drought (WHO, 2015). Thirdly, the health system plays a crucial role in preventing adverse health outcomes, including those related to climate change, by mitigating exposure to extreme climatic conditions, raising awareness among vulnerable populations, addressing health inequities, and promoting healthy behaviors, thereby reducing the vulnerability of at-risk populations (WHO, 2015). Lastly, health systems need to safeguard their infrastructure from the impacts of extreme events, such as power outages during storms, floods, or heatwaves (Negev et al., 2019).

Physicians and healthcare organizations can play an active role in educating patients, the general public, and policymakers about climate change and its impact on human health, as well as helping to mitigate the health harms caused by climate change (Hubbert et al., 2020). Therefore, it is important to integrate the subject of climate change into the curricula of medical, nursing, and public health programs in a structured manner. This integration should provide a comprehensive and interdisciplinary perspective, aiming to cultivate a new generation of healthcare professionals who have a deep understanding of climate change and its multifaceted effects on health (Paz, Negev, Davidovich, 2019).

A climate change strategy or plan refers to a government's policy intentions to undertake a series of actions aimed at reducing greenhouse gas (GHG) emissions and/or adapting to climate change. Currently, there is a lack of collaboration on climate change preparedness among various sectors including health, environment, welfare, education, and homeland security (Negev et al., 2019). Effectively managing climate change presents a significant challenge, thus necessitating the development of a strategy and multidisciplinary interministerial national action plans. Preparedness and adaptation are ongoing processes that require flexibility to incorporate new knowledge and information. Furthermore, these plans must be dynamic and adaptable, considering new information to enhance preparedness (Burke et al., 2015).

2. Methods

An observational cross-sectional study was conducted among medical and nursing staff working in Israeli hospitals, specifically targeting doctors and nurses in emergency and internal medicine departments across various hospitals in the State of Israel.

Regarding the sampling method, this study aimed to include the entire target population rather than drawing from a specific sample. The questionnaire was distributed through various channels, including medical associations such as the emergency medicine association, the internal medicine association, and the nurses' association. Additionally, the questionnaire was shared within WhatsApp and Facebook groups that the researchers and their colleagues were members of. Overall, the study aimed to capture data from a wide range of medical and nursing professionals working in Israeli hospitals, with efforts made to reach out to the target population through multiple channels for questionnaire distribution.

The research instrument used in this study was a validated questionnaire, which included various variables such as knowledge, awareness, willingness to act, and the importance of incorporating the topic of climate change among medical and nursing teams. The questionnaire was adapted from a previous study conducted by Mona Sarfaty and colleagues (Sarfaty et al., 2016). The first part of the questionnaire comprised closed-ended questions related to the participants' general background and their awareness of climate change. For example:

1. Have you ever heard of the terms climate change, global warming, and greenhouse effect?
- Responses: 1 = No, 2 = Somewhat, 3 = Quite a bit, 4 = Very much.
2. Where have you previously encountered the mentioned terms?
- Responses: Participants could choose from the following nominal scale options: Newspapers, television, hospital, books, course of study, Internet.

3. Results

In the initial section of the questionnaire, the medical and nursing staff were presented with several general background questions concerning climate change. One of the questions inquired whether the participants were familiar with the concepts of climate change, global warming, and the greenhouse effect. Approximately 42% of the sample reported a high level of familiarity with the concepts of climate change, global warming, and the greenhouse effect, indicating that they had heard about these concepts extensively. Additionally, around 31% of the sample reported a moderate level of familiarity, suggesting that they had some knowledge about these concepts.

The research findings indicate several key insights. Firstly, the vast majority of the sample (95%) believes that climate change is currently occurring. Furthermore, a high level of confidence (approximately 88% sure-very sure) is expressed in this belief. Regarding the causes of climate change over the past 150 years, approximately 55% of the participants believe that it was entirely caused by human activities, while an additional 23% believe that human activities played a major role in causing climate change. In terms of the state's efforts to mitigate the effects of climate change on human life, a majority of the sample (around 62%) believes that the state should invest extensive efforts, even if it entails significant economic costs.

Lastly, participants were asked about their personal experiences as healthcare professionals regarding the effects of climate change, such as illness, injury, or allergies. Unfortunately, the provided information does not include the diagram illustrating the distribution of their responses. Overall, the research highlights the widespread recognition of climate change among healthcare professionals, a strong belief in the role of human activities in driving climate change, and a call for significant efforts to address its impact on human health.

Figure 1. Distribution of personal experience of the effects of climate change

The research indicates that approximately one-third of the sample of health professionals reported experiencing the effects of climate change to a moderate extent, while another third reported experiencing it to a small extent. The data suggests that a significant portion of the participants has observed and personally encountered the impacts of climate change in their professional capacity.

The research findings indicate a significant positive relationship between the level of knowledge on climate change consequences and the willingness to act on the subject. The higher the participants' knowledge on climate change consequences, the greater their willingness to take action. This confirms the second research hypothesis. Furthermore, there is also a significant positive relationship between the level of awareness on climate change consequences and the willingness to act on the issue. Participants with higher awareness levels demonstrate a greater willingness to take action.

4. Discussion

Climate change is widely recognized as a severe global threat that poses risks to both physical and mental health. Despite its coverage in the media and increasing attention in medical and public health research, the level of knowledge and awareness among medical and nursing teams in Israel regarding climate change and its impact on public health has not been adequately investigated. These teams play a

crucial role in preventing harm to public health and treating patients affected by climate change-related conditions. The presented research aimed to assess the knowledge, awareness, and willingness to take action among medical and nursing staff in Israeli hospitals regarding climate change. It also explored their perspectives on the importance of integrating climate change topics into medical and nursing curricula to effectively manage this crisis. By understanding the current state of knowledge and perceptions among healthcare professionals, appropriate measures can be taken to enhance their preparedness and response to the health implications of climate change.

The present study aimed to investigate the level of knowledge and awareness among medical and nursing staff regarding climate change. Additionally, it examined how various background characteristics, such as job characteristics and socio-demographic factors, influenced their understanding of climate change and its consequences. Furthermore, the study explored the significance of incorporating health education into medical and nursing curricula, as perceived by doctors and nurses. The objective was to enhance knowledge, develop effective coping strategies, and foster the assimilation of values that can contribute to improving human health in the face of climate change. Moreover, the study assessed the willingness of medical and nursing teams to take action in response to environmental climate changes.

The findings of our research indicate that medical and nursing staff in Israel recognize the importance of incorporating climate change topics into medical and nursing studies, rating it as medium to high in terms of significance. They also demonstrate a moderate level of willingness to take action on climate change within their professional responsibilities. These findings align with a study conducted among African-American doctors, where a significant majority of participants expressed support for increasing public awareness of climate change and implementing measures to protect individuals from its health effects. The participants emphasized the need for health education, promotion, and effective management of the healthcare system in response to climate change. They also agreed that extensive preparation for climate change should be a top priority for health systems (Sarfaty et al., 2014). These parallel findings highlight the importance of addressing climate change within healthcare professions and integrating it into practice and education.

Climate change is considered a significant and tangible threat to all of humanity. By raising the level of knowledge and awareness among medical and nursing teams who care for patients at risk of being affected by climate-related consequences, we can provide opportunities to create health infrastructures for many patients. Research findings have shown that there is a high level of knowledge and awareness among medical and nursing staff regarding the implications of climate change. On average, participants in the study reported a relatively high level of knowledge on climate change (mean of 9.60 on a scale of 0-12 with a standard deviation of 2.50) and a relatively high level of awareness on the topic (mean of 3.06 on a scale of 1-4 with a standard deviation of 0.96). Furthermore, the research highlighted that the nursing staff had a higher level of knowledge and awareness compared to the medical staff. These findings align with previous studies that examined the knowledge level among public health nurses, where the majority (76%) demonstrated moderate to high knowledge on climate change-related health issues and diseases resulting from these changes (Xiao et al., 2016). Similarly, a study conducted among African American physicians from various hospitals found that they possessed knowledge about the negative health impacts of climate change on the human population and emphasized the need for health systems to prepare and prioritize this issue (Sarfaty et al., 2014). Public health nurses and physicians perceive the environment as threatened and recognize the significant role of nursing and medical units in treating physical and mental effects on numerous patients due to climate change. Therefore, there is a need to increase and enrich knowledge on this subject (Polivka et al., 2012b).

In contrast, these findings contradict previous research conducted in Romania, which examined the knowledge, skills, and practicality of family physicians regarding climate change and its implications. It found that the level of knowledge among physicians was low, possibly due to their focus on various diseases without linking them to climate change, which could be a significant cause for exacerbation and complications of these diseases (Croitoru et al., 2020).

Raising the awareness of the medical and nursing teams on the subject will enable a faster and more accurate diagnosis, as well as the provision of professional treatment to patients when necessary. To achieve this goal, strategies and dedicated training programs must be developed for health system employees. Additionally, staff awareness must be increased by making essential information available regarding personal preparation for climate change, with an emphasis on at-risk populations such as the elderly and patients with underlying illnesses.

The anticipated climate changes necessitate a paradigm shift in the preparedness and response capabilities of government ministries and health organizations to address emergencies. The research findings underscore the crucial role of medical and nursing teams in emphasizing the shared responsibility of various entities, including the Ministry of Health, in effectively managing health risks arising from climate change. These findings align with prior studies conducted among medical and nursing teams. For instance, Huang et al. (2013) conducted a study on heat events resulting from climate change, highlighting the significance of implementing public health adaptation strategies. These strategies encompass a range of actions, such as providing accessible medical advice, improving housing conditions, urban planning, establishing early warning systems, and enhancing the preparedness of the healthcare and social systems to mitigate the consequences of climate change. Similarly, another study emphasized the imperative of developing comprehensive programs aimed at enhancing communication between the health sector and climate-related initiatives (Sheehan et al., 2017). In essence, it is essential for healthcare professionals, government departments, and health organizations to actively engage in educating patients, the general public, and policymakers about the far-reaching effects of climate change on human health (Sarfaty et al., 2015).

In conclusion, these findings suggest that healthcare professionals who encounter patients affected by climate-related events advocate for the inclusion of preparedness protocols within the healthcare system. This includes hospitals, health insurance funds, and health offices. If necessary, internal procedures should be established to guide staff members in their response to emergencies. In cases where specific aspects of dedicated preparation for climatic events are lacking, efforts should be made to address these gaps by developing appropriate protocols. By implementing these measures, healthcare organizations can enhance their readiness to effectively manage the health risks associated with climate change and provide optimal care to those affected.

Conclusion

Climate change poses a significant threat to human health, and its global nature has led to increased attention from multilateral frameworks and international organizations. This study highlights the importance of enhancing knowledge and awareness among medical and nursing teams in Israel regarding climate change and its consequences. The research findings reveal that medical and nursing staff in Israel do not perceive climate change as a major public health threat. Therefore, there is a crucial need to raise awareness and develop preparedness for the climate crisis across all healthcare professions. The study also underscores the importance of implementing intervention plans and strategies to prepare medical and nursing teams for the challenges posed by climate change. Furthermore, integrating education on climate change and its impact on health into medical and nursing curricula is crucial. By addressing these issues, healthcare professionals can better understand the risks associated with climate change and contribute to mitigating its effects on public health.

There is an urgent need to develop educational programs targeting the general public and healthcare professionals on adapting to climate change. Additionally, government ministries should regularly evaluate the preparedness of medical and nursing teams in dealing with natural disasters caused by climate change. This evaluation should encompass factors such as knowledge, awareness, willingness to take action, and availability of necessary equipment for treating individuals affected by extreme weather events like floods and droughts. Moreover, enhancing the teams' readiness to respond can be achieved through four key pillars: increasing knowledge, providing training to the teams, ensuring accessibility of relevant information, and fostering research efforts. By addressing these aspects, we can better equip healthcare professionals to effectively respond to climate-related emergencies and protect the well-being of individuals and communities.

Research Limitations

The conducted research is subject to several limitations. Firstly, the cross-sectional study design used in this research restricts the ability to infer causal relationships. Another limitation pertains to the sampling process. In this study, the approach involved appealing to the entire target population through an electronic questionnaire, which was distributed to various nurses, doctors, and physicians across different hospitals in Israel. This approach introduces the potential for selection bias and restricts the generalizability of the findings to all healthcare professionals in Israel.

Recommendations for Research and Policy:

Several recommendations emerge from this study. Firstly, the development of educational programs is crucial for both the general public and healthcare system personnel to enhance their preparedness for climate change adaptation. Additionally, government ministries should regularly evaluate the competency of medical and nursing teams in addressing climate change-induced natural disasters. This evaluation should encompass factors such as knowledge, awareness, willingness to take action, and the availability of necessary equipment for treating victims of extreme weather events like floods and droughts.

Moreover, enhancing the readiness of these teams to respond effectively rests upon four primary pillars: bolstering knowledge, providing comprehensive training, ensuring the accessibility of information, and fostering research initiatives."

Unlocking the Potential: A Guide to Managing Employees with Disabilities

Eslam Hujerat^{1,*}

¹ Gaia College, Department of Management, 6th Granados St., 90885 Jerusalem, Israel

Abstract

This article discusses managing employees with disabilities in the workplace. It highlights the significance of inclusivity, training, flexibility, open communication, and proactive efforts to create an inclusive environment for these employees.

Research Background: Hiring and retaining employees with disabilities boosts productivity, innovation, and performance. Managing this workforce demands a proactive and inclusive approach to overcome barriers and promote equal opportunities in the workplace.

Purpose of the Article: This article offers insights and tips for managing employees with disabilities helping organizations create inclusive, supportive workplaces that foster success and well-being. It is a guide for employers and managers to promote inclusion and empowerment.

Methods: This article reviews literature, best practices, and case studies on managing employees with disabilities. It gathers insights from academic research, industry reports, and professional publications. The methods include examining current strategies used by organizations for a diverse workforce inclusive of those with disabilities.

Findings & Value Added: This article emphasizes the value of inclusivity, training, flexibility, ability-focused approaches, open communication, and proactive inclusion efforts. These strategies boost employee engagement, productivity, and overall organizational success. The article offers practical recommendations to guide organizations in managing workforce diversity, particularly for employees with disabilities.

Keywords: employees with disabilities, workplace inclusion, diversity management accommodations, disability awareness

JEL classification: M5, M21, L1, D4

1. Introduction

The inclusion of employees with disabilities in the workforce has become an increasingly important topic in contemporary society. Organizations are recognizing the value and potential of individuals with disabilities and are striving to create inclusive work environments that support their employment and career development (Keisling et al., 2022). This article examines the management of a population of employees with disabilities, exploring various aspects related to their inclusion and well-being in the workplace.

The background for this is both the academic and social understanding of disability and the demographic background of the developed countries that are undergoing a process of aging and reduction of the workforce (Zhu et al., 2019) and the increasing emphasis on equal opportunities in the workplace, more people with disabilities enter the workforce (Gould, et al., 2020). This is seen as a positive development in creating diverse and inclusive workplaces. Traditionally, diversity management strategies regarding disability have often followed an identity-conscious approach. In this approach, employees with disabilities are labeled as such, and specific management programs, like workplace accommodations, are designed to address their needs. Workplace accommodations are adjustments to the job, work environment, or work processes to reduce physical and social barriers for people with disabilities. Under the identity-conscious approach, employers assume that employees with disabilities face lower organizational status and are victims of discrimination and stigmatization. Consequently, they reactively adopt reasonable accommodations to meet legal requirements and mitigate the perceived inferior status of these employees (Colella and Bruyère, 2011, p. 478).

* Corresponding author: islamhujerat94@gmail.com

However, it is important to note that while the identity-conscious approach has been a common strategy, there is a growing recognition of the need for a more proactive and inclusive approach to diversity management, especially concerning disability. This evolution in thinking acknowledges that people with disabilities should not be seen primarily as victims needing assistance but as valuable contributors to the workforce who can bring unique skills and perspectives. Employers are increasingly shifting towards a broader, identity-blind, and inclusion-focused approach to diversity management. This approach emphasizes creating an inclusive work environment where all employees, regardless of their disability or other diverse characteristics, have equal opportunities, are valued for their contributions, and can thrive without feeling stigmatized or singled out. This shift in perspective recognizes that diversity and inclusion are not just about complying with legal requirements but about harnessing the full potential of all employees, including those with disabilities. Employers are encouraged to move beyond merely accommodating disabilities and instead focus on fostering an inclusive culture that welcomes and supports all employees, irrespective of their backgrounds and abilities. This shift can lead to a more productive, innovative workforce and a stronger, more inclusive organizational culture (Fuchs, 2018).

Historically, workplace accommodation has primarily focused on meeting the needs of people with disabilities (Baldrige & Swift, 2013). While this approach is important for ensuring equal opportunities and full employment for people with disabilities, it tends to overlook the potential effects of accommodation on other important stakeholders, such as coworkers without disabilities (Schur et al., 2014). Scholars and experts advocate transitioning from the identity-conscious approach to a broader identity-blind approach in diversity and inclusion efforts. The identity-blind approach emphasizes creating equal and inclusive environments for all employees, regardless of their diverse characteristics. The identity-blind approach recognizes that workplace accommodation should extend beyond people with disabilities. It should also consider the needs of other groups, such as older workers, pregnant women, employees with religious needs, and those with family responsibilities. These individuals may require accommodations like flexible working schedules and family-friendly programs. One of the challenges highlighted in the passage is the lack of research on the positive effects of workplace accommodation for employees without disabilities. Most studies have focused on the positive effects of people with disabilities or cost-benefit analyses for employers. This gap in knowledge limits the promotion of workplace accommodation in organizations and hinders the realization of the full potential of both employees with and without disabilities (Man, 2020).

The importance of this topic is underscored by several scholarly articles that shed light on different dimensions of managing employees with disabilities. One key aspect of effective management is the provision of accommodation. Schur, Nishii, Adya, Kruse, Bruyère and Blanck (2014), explore the accommodation practices for employees with and without disabilities, highlighting the importance of creating an inclusive and supportive workplace. Accommodations can range from physical modifications to the work environment to flexible work arrangements, assistive technologies, and adjustments in job tasks or schedules. Such accommodations aim to level the playing field and enable employees with disabilities to perform their roles effectively.

In addition to accommodations, promoting inclusivity is crucial in managing a population of employees with disabilities (Fuchs, 2022). Organizations must foster a culture that values diversity, educates employees about disability issues, and encourages respectful and inclusive behavior. By focusing on abilities rather than disabilities, employers can create an environment where individuals with disabilities are valued for their skills, talents, and contributions. This approach not only benefits employees with disabilities but also enhances overall organizational performance and innovation (Gupta et al., 2023).

Another important factor is providing training and resources to managers and supervisors. Managers play a critical role in supporting employees with disabilities, and they need to be equipped with the knowledge and skills to effectively manage this population. Training programs can cover topics such as disability awareness, communication strategies, understanding legal obligations, and best practices for providing reasonable accommodations. By investing in manager training, organizations can create a supportive and inclusive management culture that positively impacts the experiences of employees with disabilities (Keisling et al., 2022).

Open communication is vital in managing a population of employees with disabilities. Employers should create an environment where employees feel comfortable discussing their disability-related needs and concerns. This includes encouraging open dialogue, active listening, and addressing any potential barriers or misconceptions. By fostering a climate of trust and understanding, organizations can ensure

that employees with disabilities have a voice and can actively participate in decision-making processes that affect their work and well-being. In short, managing a population of employees with disabilities requires a comprehensive and inclusive approach. Accommodations, promoting inclusivity, providing training, and encouraging open communication are essential elements in creating an environment where employees with disabilities can thrive. The scholarly articles referenced in this introduction provide valuable insights and research on different aspects of managing employees with disabilities, contributing to our understanding and knowledge in this field. By implementing effective management strategies, organizations can harness the talents and potential of individuals with disabilities and create inclusive workplaces that benefit everyone involved (Ghosh, Liu & Mishra, 2022).

Articles presented here and others in the field contribute valuable empirical research, program evaluations, and employer perspectives. By analyzing and synthesizing information from these sources, researchers can gain deeper insights into effective management strategies and better understand the barriers and opportunities in employing individuals with disabilities. This body of knowledge aids in promoting more inclusive and supportive workplaces for all.

Keisling, Crispin, and Cone's (2022) article evaluates the outcomes of a leadership academy designed to enhance disability services among state employees. It offers insights into the effectiveness of this program and its impact on the management of employees with disabilities. Ghosh, Liu, and Mishra's (2022) article present a cross-organizational review of labor market participation for employees with disabilities in India. It explores challenges and opportunities related to disability employment across various organizations and sectors. Houtenville & Kalargyrou (2012), focusing on the leisure and hospitality industry, this article delves into the viewpoints of employers regarding recruitment practices and challenges in employing individuals with disabilities. While specific to one industry, it sheds light on broader challenges employers face in managing employees with disabilities.

2. Methods

This article employs a comprehensive approach to explore effective strategies for managing employees with disabilities in the workplace. By utilizing these methods, this article aims to provide an overview of the key strategies and practices contributing to successfully managing employees with disabilities. The research draws from various sources to offer valuable insights and actionable recommendations for employers and managers seeking to create inclusive and supportive workplaces. To gather relevant insights, the following methods were utilized:

Literature Review: A thorough review of existing literature was conducted. This included academic research papers, industry reports, and professional publications. The review encompassed various sources to compile an extensive and diverse set of perspectives and findings.

Analysis of Best Practices: This article analyzed best practices in disability management. Insights were drawn from successful strategies implemented by various organizations to effectively manage a diverse workforce, specifically focusing on employees with disabilities.

Case Studies: Real-world case studies were examined to provide practical examples of effective management strategies. These cases shed light on how organizations have successfully promoted inclusion and empowerment among employees with disabilities.

3. Results

The results of several key studies shed light on various aspects of managing employees with disabilities, offering insights into the critical role of employer practices, workplace climate, acceptance, and supportive policies. These findings underscore the need for a holistic and multi-faceted approach to manage the population of employees with disabilities effectively. A positive workplace climate, acceptance, and supportive policies are paramount in creating an inclusive work environment. Moreover, the results highlight the critical role of employer practices, including proactive efforts to foster inclusivity and accommodate the needs of employees with disabilities. Organizations can use these findings to inform their strategies and practices, ultimately creating a supportive and inclusive workplace that enhances the well-being and productivity of all employees, including those with disabilities:

1. Importance of Employer Practices and Workplace Climate (Von Schrader, Malzer & Bruyère, 2014): This study emphasizes the significance of employer practices and workplace climate concerning disability disclosure. The findings reveal that an employer's commitment to fostering a supportive and inclusive work environment plays a pivotal role in employees with disabilities' decisions to disclose their disabilities. A positive workplace climate, characterized by inclusivity and support for reasonable

accommodations, substantially increases the likelihood of disability disclosure. Conversely, a negative or unsupportive work environment acts as a formidable barrier to disclosure, hindering the effective management of employees with disabilities.

2. **Factors Influencing Acceptance (Vornholt et al., 2013):** This study explores the factors influencing the acceptance of people with disabilities in the workplace. The findings reveal a complex interplay of elements that impact acceptance. Positive attitudes and perceptions of disability, a deep understanding of disabilities, previous experience working alongside individuals with disabilities, and supportive organizational policies and practices contribute to higher acceptance levels. Conversely, negative stereotypes, a lack of awareness or understanding, and limited accommodation resources can impede the acceptance and effective management of employees with disabilities.

3. **Individual and Organizational Factors (Vornholt et al., 2018):** This study provides a comprehensive overview of disability and employment, emphasizing key factors for managing employees with disabilities. The results underscore the importance of individual characteristics, such as self-efficacy and coping strategies, in facilitating the successful employment and management of individuals with disabilities. Additionally, organizational factors, including supportive policies, practices, and workplace accommodations, significantly contribute to positive employment outcomes for employees with disabilities.

4. Discussion

The research results presented in the articles mentioned offer a profound understanding of the pivotal factors contributing to successfully managing employees with disabilities. These findings underscore the complexity of effectively managing a diverse workforce that includes individuals with disabilities. Our research findings highlight the multifaceted nature of disability management. Employers and organizations are strongly encouraged to adopt a proactive approach to creating supportive work environments. This approach entails the implementation of inclusive policies and practices, along with active efforts to transform attitudes and foster a culture of acceptance within the workplace.

By addressing both individual and organizational factors, organizations can empower their employees with disabilities to not only succeed but also thrive. This benefits the individuals by providing equal opportunities and support and contributes to the organization's overall success and diversity. These insights serve as a valuable guide for organizations seeking to enhance their disability management strategies and promote truly inclusive workplaces.

The research findings hold profound implications for organizations and employers committed to creating environments where all employees, including those with disabilities, can flourish and contribute their unique talents and perspectives:

1. **Significance of Employer Practices and Workplace Climate:** The study by Von Schrader, Malzer, and Bruyère (2014) underscores the importance of employer practices and workplace climate. It highlights that a positive and inclusive work environment is paramount for employees with disabilities to feel comfortable disclosing their disabilities. When organizations create an atmosphere that values diversity and embraces disability inclusion, they foster trust and enhance the overall management and well-being of their employees with disabilities. This finding calls for proactive efforts from employers to establish inclusive policies, engage in disability awareness training, and develop practices that demonstrate a commitment to inclusion.

2. **Importance of Acceptance and Attitudes:** The research conducted by Vornholt, Uitdewilligen & Nijhuis (2013) and Vornholt, Villotti, Muschalla, Bauer, Colella, Zijlstra & Corbière (2018) further underscores the significance of acceptance and attitudes towards employees with disabilities. Positive attitudes, knowledge about disabilities, and previous experience working with individuals with disabilities contributed to greater acceptance. Employers can be pivotal in promoting understanding and dispelling misconceptions about disabilities within their organizations. By fostering a culture of acceptance and support, employers can create an environment where employees with disabilities feel valued and included.

3. **Individual and Organizational Factors:** The study by Vornholt, Villotti, Muschalla, Bauer, Colella, Zijlstra, and Corbière (2018) emphasizes the role of individual factors, including self-efficacy and coping strategies, in determining the employment outcomes of individuals with disabilities. Organizations can support their employees by providing resources for skill development, self-advocacy training, and career advancement opportunities. Moreover, organizational factors, such as supportive policies, practices, and accommodations, are critical for facilitating the successful integration and management of employees with

disabilities. Clear policies and procedures for disability accommodations should be established to ensure employees have access to the necessary resources and support to excel in their roles.

Conclusion

In conclusion, the research on managing the population of employees with disabilities highlights the significance of creating inclusive and supportive work environments. The results emphasize the importance of employer practices, workplace climate, acceptance, and supportive policies in effectively managing employees with disabilities. To successfully manage employees with disabilities, organizations need to foster a culture that values diversity, promotes inclusivity, and provides appropriate accommodations. Employers should invest in disability awareness programs, training, and resources to enhance understanding and acceptance within the workforce.

Individual characteristics, such as self-efficacy and coping strategies, play a role in the employment outcomes of individuals with disabilities. By providing opportunities for skill development and career advancement, organizations can empower employees with disabilities to reach their full potential. The findings highlight the need for a comprehensive approach that addresses both individual and organizational factors. By implementing inclusive practices, promoting positive attitudes, and offering support, organizations can create an environment where employees with disabilities can thrive and contribute effectively.

Overall, the research underscores the importance of recognizing the abilities and potential of employees with disabilities and integrating them into the workforce with equal opportunities. By embracing diversity and providing the necessary support, organizations can create a more inclusive and equitable work environment for all employees.

Abstract

Research background: Having just overcome the coronavirus epidemic, Central and Eastern European's organizations are facing another crisis, the energy crisis resulting from the conflict between Ukraine and Russia. The flood of refugees, dependence on Russian natural gas imports and extreme inflation are all factors of economic and social problems which have a significant impact on the functioning of the organizations. High energy prices, weakening purchasing power of money, wage tension and a sense of insecurity have a significant impact on employees' trust and loyalty to their organization.

Purpose of the article: The aim of the study was to assess the commitment of Hungarian employees to organizations in the light of the crises of recent years.

Methods: For the primary research, we conducted a questionnaire survey among Hungarian SMEs in the spring of 2023. The target group for the survey were actively employed Hungarian employees. We chose the snowball method as the sampling method. Our research followed the logic of deductive research, whereby we formulated two hypotheses based on theory and similar research and tested them using statistical methods.

Findings & Value added: Our research has statistically shown that the more an employee can identify with the problems of the organization, the stronger their commitment to the organization. Furthermore, we found a significant relationship between employee commitment and trust in the organization. In times of crisis, it is even more important for organizations to do all they can to improve employee commitment, which can be helped by communicating with employees, involving them in solving organizational problems and reassuring employees that they can count on the organization's support in all circumstances.

Keywords: organizational commitment, employee trust, crises, small and medium enterprises, Hungary

JEL classification: O12, D81

1. Introduction

An unexpected negative event has an impact on the relationship between the employee and the organization. Organizations' response to an unwanted crisis is limited to internal activities such as prevention and preparedness, recovery from the difficulties and utilization of opportunities, which can be achieved through a supportive environment, effective communication, adequate digital preparedness and commitment. The key to effective crisis management is leadership commitment and appropriate communication. The task of management is to create a sense of security and trust, and to ward off fear and anger (Mohamad et al., 2022). Crisis situations cause mistrust, the relationship between organizations and their employees becomes unbalanced, employees are sensibly affected by the unpredictable situation of their organization and the management's crisis reaction (Chang et al., 2021). At the organizational level in particular, it is the role of HR management to carry out these tasks. HR management is the decision-making and proposing body for all activities that affect employees, thus influencing employee commitment (Al Doghan, 2022). The biggest sufferer of crisis situations is the SME sector, it is still questionable to what extent HR management is able to support SMEs in difficult times, which gives room

* Corresponding author: kornel970829@gmail.com

for research to fill the gap. To avoid difficulties and solve existing problems, committed management and employees are needed (Prouska et al., 2023).

In the management theory literature, commitment refers to the employee's attachment and loyalty to the organization and identification with the organisation's values. If the value system of the organization can be matched by the value system of the individuals, the commitment to the organization increases, in the opposite case, if the value system conflicts, then the commitment decreases or becomes completely insignificant (Mangaliso et al., 2021). In fact, organizational commitment is an emotional state that influences an employee to stay or change jobs. This psychological relationship between the organization and the employee has an impact on the effectiveness of the organization and on the performance of employees and their satisfaction with their organization. In addition to the emotional attachment to the organization, commitment also includes the costs of leaving the organization and the ethical aspects of staying with the organization, which affect the intention of employees to leave (Ölçer & Coşkun, 2021). A committed employee is proud to be a part of the organization. The leader's personality and leadership style also contribute significantly to employee commitment. If a manager leads by example and continually encourages their employees, the chances of commitment to the organization increase. Through humane and ethical management, employees are willing to invest more time, energy and money in their work (Cheng et al., 2022). The precise clarification of tasks and performance-related expectations, as well as the reward for a job well done, are factors that increase employee commitment (Ngwama & Ogaga-Oghene, 2022). An employee who is committed to the organization has a good understanding of its operational mechanisms, can identify with the profile of the organization, the decisions of the management and the employees who work in the organization. The chance of commitment can be seen at the very early stage, when joining the organization. The process and depth of the formation of social relations within the organization can also affect the development of emotional and cognitive attachment and loyalty (Yuesti & Adnyana, 2022). Employee commitment also increases organizational commitment. The stable organizational background provided to employees significantly influences their vision of the future. If they feel important and valued, they can identify with the organization's problems, as well as fight with the biggest challenges for the survival of their organization (Maryati & Astuti, 2022). The commitment to the organization is the result of a two-way process, according to which, on the organizational side, it is possible to encourage the employee's productivity, increase his willingness to act, and strengthen his confidence by providing suitable working conditions. Establishing a mutual relationship based on trust is a lengthy and time-consuming task, the result of which is the development of employee creativity and full commitment to the organization. Involving employees in decision-making not only enhances the psychological connection of employees with their organization, but also provides a significant competitive advantage through the sharing of new experiences and ideas (Słupska et al., 2022). Some demographic characteristics, such as educational attainment, age and marital status, are important determinants of employee commitment. Nevertheless, the position in the workplace, the working time and the satisfaction of the basic needs of the employee are important aspects (Hussein et al., 2022). In a recent study, Gašić and Berber (2023) show that flexible working hours have a positive effect on employee commitment and turnover reduction, which is most pronounced among highly skilled employees.

Trust is one of the forces that hold society together. It is a glue between the employee and the organization, enabling the employee to identify with the values of the organization, and facilitating greater participation in solving organizational problems and achieving organizational goals (Jiang et al., 2022). Trust is based on cooperation between the organization and the employee, which is a key factor in increasing efficiency and quality of work and building long-term relationships (Aristana et al., 2021). Commitment, loyalty and trust in the organization contribute significantly to employee satisfaction, which reduces the thought of changing jobs and increases performance and responsibility (Abdelazim Ahmed et al., 2022). Trust is the key to building a stable organization, a bond based on ethical values between management and employees. It is an essential component of the organization to achieve development directions and breaking points (Yuan et al., 2022).

In addition to many other advantages of remote working introduced as a result of the coronavirus epidemic, being away from the organization appeared as a negative consequence, which reduced loyalty to the organization. Nevertheless, in a positive sense, the pandemic may have inspired employees and their organizations to fight the health crisis together. External environmental disruptions affect internal stressors and conflicts, but mutual cooperation and cohesion deepen the sense of commitment to the organization (Mihalache & Mihalache, 2022).

2. Methods

The aim of the present study was to assess the organizational commitment of employees in the Hungarian SME sector in the light of the crises of recent years. In our own research, we followed the logic of deductive research. The theoretical framework was summarized based on the research problem, according to which we also formulated our own hypotheses. An online questionnaire survey was used to conduct the primary research. The sampling method was the snowball sampling, whereby the potential respondent could forward the questionnaire to others.

The data collection was kept confidential by ensuring full anonymity of the potential respondent. The first part of the questionnaire asked for the respondent's demographic information (e.g., gender, age, education, place of residence, marital status). In the second half of the questionnaire, questions were asked about the respondent's organization and their relationship to it. The questionnaire used scale-type questions, where the respondent could rate each statement on a Likert scale from 1 (not at all) to 7 (completely). To check the measurement adequacy of the scales, the Cronbach's alpha reliability index was assessed.

After filtering out the incorrectly completed questionnaires, we managed to collect a total of 206 assessable questionnaires respondents. The sample is not fully representative. The data were statistically analysed. The data were subjected to a normality test. The data collected are from a normal distribution, so parametric statistical calculations were performed to test the hypotheses.

3. Results

H1: The more an employee can identify with the problems of the organization, the more committed is to the organization. We chose as our independent variable how much the individual feels ownership of the organization's problems and assumed that this would change their commitment to the organization. The change in the averages supported this, so we performed an analysis of variance to prove our hypothesis.

Table 1. Descriptive Statistics

	N	Mean
I don't feel that the problems of the organization are mine at all.	55	2.89
I feel that the organization's problems are partly my own.	112	4.34
I can fully identify with the organization's problems.	39	5.85
Total	206	4.24

Source: Own research (2023)

Our data showed a normal distribution, so we could run the test. The homogeneity of variance was impaired ($p=0.012$), so we looked at the results of the Welch test. There was a significant relationship between the two variables ($p=0.000$), so the Games-Howell test was used to test whether the mean differences between the groups were due to chance or were statistically proven.

Table 2. Welch robust test of equality of means

	Statistic ^a	df1	df2	Sig.
Welch	40.386	2	93.191	0.000

a. Asymptotically F distributed.

Source: Own research (2023)

Those who did not feel any ownership of the organization's problems and those who felt some ownership of the organization's problems differed by an average absolute difference of 1.448 mean points in their level of commitment to the organization ($p=0.000$).

The mean absolute difference between those who do not feel any ownership of the organization's problems and those who feel full ownership of the organization's problems was 2.955 ($p=0.000$).

There was a mean absolute difference of 1.507 between those who felt partly ownership of the organization's problems and those who felt fully ownership of the organization's problems ($p=0.000$).

Based on these results, it can be concluded that there is a significant difference between the groups, so our hypothesis is accepted.

Table 3. Games-Howell test for phase-wise comparison among the means

			Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
Games-Howell	I don't feel that the problems of the organization are mine at all.	I feel that the organization's problems are partly my own.	-1.448*	0.289	0.000	-2.14	-0.76
		I can fully identify with the organization's problems.	-2.955*	0.330	0.000	-3.14	-2.17
	I feel that the organization's problems are partly my own.	I don't feel that the problems of the organization are mine at all.	1.448*	0.289	0.000	0.76	2.14
		I can fully identify with the organization's problems.	-1.507*	0.260	0.000	-2.13	-0.88
	I can fully identify with the organization's problems.	I don't feel that the problems of the organization are mine at all.	2.955*	0.330	0.000	2.17	3.74
		I feel that the organization's problems are partly my own.	1.507*	0.260	0.000	0.88	2.13

Source: Own research (2023)

H2: There is a significant relationship between trust in the organization and organizational commitment.

We chose to trust in the organization as the independent variable. By changing this we made our dependent variable, which was organizational commitment. We started by examining at the averages and found that as trust in the organization increases, and organizational commitment also increases. To prove a significant difference between the groups, we performed an analysis of variance.

Table 4. Descriptive Statistics

	N	Mean
I don't trust my organization.	34	2.91
I trust my organization conditionally.	105	4.89
I trust my organization.	67	6.34
Total	206	5.03

Source: Own research (2023)

Our data showed a normal distribution, so we could run the test. In the test, the homogeneity of variance was impaired ($p=0.002$), so the Welch test showed a significant relationship ($p=0.000$) between the two variables.

Table 5. Welch robust test of equality of means

	Statistic ^a	df1	df2	Sig.
Welch	90.528	2	86.051	0.000
a. Asymptotically F distributed.				

Source: Own research (2023)

Then we examined the differences between the groups. Those who had no trust in their organization and those who had conditional trust in their organization differed in absolute terms by an average of 1.974 mean points ($p=0.000$).

In the case of those who did not trust their organization at all and those who fully trusted their organization, this absolute difference was 3.432 ($p=0.000$).

In absolute terms, 1.458 differences could be detected between the groups where employees conditionally or fully trusted their organization ($p=0.000$). Based on the results, our hypothesis H2 is accepted, with significant differences between the groups.

Table 6. Games-Howell test for phase-wise comparison among the means

			Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
Games-Howell	I don't trust my organization.	I trust my organization conditionally.	-1.974*	0.280	0.000	-2.65	-1.30
		I trust my organization.	-3.432*	0.271	0.000	-4.09	-2.78
	I trust my organization conditionally.	I don't trust my organization.	1.974*	0.280	0.000	1.30	2.65
		I trust my organization.	-1.458*	0.181	0.000	-1.89	-1.03
	I trust my organization.	I don't trust my organization.	3.432*	0.271	0.000	2.78	4.09
		I trust my organization conditionally.	1.458*	0.181	0.000	1.03	1.89

Source: Own research (2023)

4. Discussion

There is currently a labour shortage in Hungary. It is important for organizations to measure the satisfaction of their employees, to look for the motivational factors that will keep them with the organization in the long term. As a result, turnover decreases and employee satisfaction increases, as demonstrated in the theoretical framework of Krajcsák's (2022) research. Our research was carried out during the crisis of the last few years, which caused an uncertain situation in the labour market. This was the inspiration for our research.

Our hypothesis H1 was that the more an employee can identify with the organization's problems, the more committed is to the organization. This critical period has affected many organizations, just think of the automotive industry. People's jobs have become insecure. Employees who cannot identify with the problems of the organization have low commitment to the organization. In this situation, these employees feel insecure about their jobs or their livelihoods and look for a new organization. Employees who understand the problems of the organization, are committed to the organization in the long term. For them, changing jobs is not the goal, they are trying to understand temporary problems. These employees are

committed to the organization. They are worth paying extra attention to because they drive the organization forward. A common mistake in organizations is not paying enough attention to long-standing employees. The confirmation of our hypothesis H1 can be identified with Lazar et al.'s (2022) international research among logistics companies that achieving employee commitment is the task of the organization. A committed employee treats problems as his own and sees organizational success as his own. It is important that the organization monitors the personal interests and development of each employee, even with regard to age, professional experience and time spent in the organization. We also agree with the findings of Pramudya and Schmuck (2022), who showed in their research in the sector of small and medium-sized family businesses that identification with the organization is associated with deep commitment, which also strengthens staying in the organization.

Our hypothesis H2 show a significant relationship between trust in the organization and organizational commitment. In the theoretical framework of their research, Domokos and Baracska (2022) emphasize the importance of an atmosphere of trust, which is the cornerstone of commitment to the organization, and thus selfless action for the benefit of the organization. People are distrustful at first, and this is also true of the organization. But over time, trust in the organization needs to develop. If this does not happen, organizational commitment will remain low. Pikos (2022) argues in her study, that recent crises have had a profound impact on trust in the organization. The organization must recognise this problem and find a solution. In their research on diversity management, Alshaabani et al. (2022) found that trust is a reciprocal process between the organization and the employees, which is mostly influenced by HR management. Building trust and commitment to an organization is interacting factors, as our research shows. Above all, it is important to communicate honestly and effectively. The best confidence builder is when members of the organization can convince the prospective employee why they should choose the organization. In such a crisis situation, without the presence of trust, the employee will not commit to the organization and will change jobs. This means extra costs for the organization, as it has to find new employees. In their research, Sarihasan et al. (2022) also emphasise the importance of mutual trust, the tendency to be productive, motivated and effective communication within an organization, especially in a negative and unexpected event.

Conclusion

This period of crisis has further highlighted the need for the organization to pay more attention to its employees. High inflation can cause fluctuations in itself, since the catch-up of wages usually lags behind the rate of inflation or follows it only later, and this also makes employees think about their fundamental loyalty.

Our research shows that the problems of the organization need to be communicated clearly and openly to its members. There are difficult times in the life of any organization, and this is natural in a crisis. Employees need to understand what is happening and be reassured that the organization is there for them. If a possible layoff is necessary, this must also be communicated openly and clearly, and the employee must also be helped to find a job. The definition of the problem and the possible solution to it can make the employees committed, as they see the possible vision of the future.

Trust in the organization is low at first but increases over time. In addition to proper communication, trust in the organization is essential. This is a factor that affects organizational commitment. Without trust in the organization, turnover is high, which is basically higher in times of crisis. The organization must give itself to the employee, without which trust cannot be built.

The research revealed that organizational commitment depends on several factors. At the same time, proper communication and the openness of the organization towards the employee can increase organizational commitment. The crisis has highlighted the value of employees and the need to measure their trust in the organization and their ability to become part of the organization, to take ownership of the organization's problems, as these are what determine their long-term commitment.

Force Field Analysis and Optimization – a Key Success Factor by Managing Changes

Andrea Janáková Sujová^{1,*}, and Katarína Marcineková¹

¹ Technical University in Zvolen, Department of Economics, Management and Business, Faculty of Wood Sciences and Technology, T.G.Masaryka 24, 960 01 Zvolen, Slovakia

Abstract

Research background: Fast changing business environment forces the enterprises to build an effective change management. Achieving goals and positive effects of changes is full of challenges. Primary, the success by implementation of changes depends on the precise preparation of a change and a favourable background for its realization. That is why an important role plays the analysis and creation of the favourable environment in a company, called a force field.

Purpose of the article: The aim of the paper is to present the proposal of methodology for the force field analysis and its optimization based on analysis of supporting and braking forces towards changes in a company and its application in a process of change management.

Methods: The methodology of the force field analysis represents the procedure and methods by conducting the FFA. The selected statistical and decision-making methods were used to assess the current state of the force field. The proposed methodology was verified by a case study in the chosen enterprise.

Findings & Value added: The contribution of this papers is the proposal of the complex methodology for analysis of the force field. The role of a positive force field within management of changes was underlined and methods for the force field analysis were suggested. The proposals can serve as a guide by preparation of suitable environment for carrying out changes. The results showed the importance of keeping favourable force field by building enterprise agility.

Keywords: force field, optimization, changeability, change management, enterprise agility

JEL classification: M10, O30

1. Introduction

The business success mostly depends on ability to utilize market opportunities. Reactions to changes of environment and customer's requirements demand to have sufficient current information. Substance of change management is planning and realization of changes on the base of continual monitoring the external or internal reasons for change with aim to secure a permanent increase of internal potential in enterprise. Current changing business environment forces the enterprises to be able perform changes anytime. How to successfully achieve change during economic crises is being asked by many organizations (Ashurst & Hodges, 2010). Digital technologies are breaking down industry barriers, destroying long-successful business models making the traditional competitive advantage deteriorate rapidly by (Rometty, 2016; Weill & Woerner, 2015). Change management as a managerial skill, has been marked as a critical competency in executive surveys (McCauley, 2006). The importance of change management in the present pandemic crisis was highlighted by several authors (Fusch et al. 2020; Hartmann & Lussier 2020; Zainol et al. 2021)

The general process for managing the change and types of changes were described by several authors (Fusch et al., 2020; Kotter, 2012; Kubíčková & Rais, 2012; Sujová, 2013). According to Aljohani, (2016), the process of change is driven by strategic considerations that include the need for improving business processes and integrating ways of working. Such considerations result in well-structured change management programs based on the assumption that the management of change would be done with limited interventions that are objective, linearly manageable and measurable in a short period of time.

* Corresponding author: andrea.sujova@tuzvo.sk

Regarding their opinions the process of change management can be divided to four basic phases (Sujová & Rajnoha, 2012):

- Analytical phase: analysis of initial situation of the enterprise (SWOT factors, force field factors) and determination of needed changes.
- Preparation phase: elaboration of project for proposed changes.
- Implementation phase: defrosting, realization of changes and freezing new conditions.
- Control phase: monitoring achieved effects of changes.

Implementation of a successful change program is full of challenges. Achieving goals and positive effects of changes remains complicated. The success factors by leading the changes were examined in several studies (Zainol et al., 2021; Kotter, 2012; Dobrovič & Timková, 2017; Sung & Kim, 2021; Biggane et al., 2017; Walk, 2022). Most of success factors are common and relate to human factor, learning and communication activities during implementing changes.

Force field analysis (FFA) is widely used decision making tool for creating an organization environment prepared for change implementation. It was developed by Kurt Lewin in 1951 (Lewin, 1951). It helps identify the forces working for or against the desired outcome and allows organizations to develop strategies to address those forces. Typical characterization is that it is a method for identification and evaluation of different factors, assigning weights or scores to them, and analysing their perceived impact on the problem respectively desired change (Kumar, 1999, Kankaraš et al., 2020, McNett et al., 2022).

In the force field model, the force presents an influence existing in the firm, which can be categorized to groups as personal, relational, or systemic groups. The example can be traditions, prejudices, preferences which affect behaviour of people and their attitudes to changes. The other factors can be economic indicators, division of competences, personal features of people, emulation between individuals, mutual misunderstanding. All mentioned factors can be driving (supporting) or contradictory (braking) forces in dependence on situation and required change. (Kotter, 2012; Kubíčková & Rais, 2012).

According to Lewin (1951) the stability of systems and events is created on the base of activity of antistanding forces which try to change the status from stability to instability. In the organization exists a dynamic tension between mutually opposed forces keeping the balance (status quo). If nothing is done, the forces evoking and contradictory to changes are equally strong.

It is needed to know what forces affect the process of change in positive way and which in a negative one. Their knowledge and control is a substantial condition by successful realization of changes. If it comes to violation of forces acting for and against the change, it comes to change in direction to expected goals or against the goals. The situation can develop as follows: return to previous status quo or reaching another goal (Oreg & Berson, 2019).

The aim of the paper is to present a proposed methodology for the force field analysis and optimization based on assessment of supporting and braking forces towards changes in a company and its application in a process of change management. The purpose of the methodology proposal is to make the force field analysis understandable, usable and enforceable by managers in companies.

2. Methods

Based on scientific knowledge, the factors of the force field can be identified. Moving or driving forces support the changes have usually an objective character and affect the firm from outside, for example: rising competition, market globalization and new technologies. They can be found also inside the firm, for example advanced and enlightened individuals – experts, managers or other unsatisfied employees. Contradictory forces brake or block the change and have usually a subjective character and originate inside the firm, for example the lack of sources, internal regulations, contractual obligations. These forces can also affect the firm from outside, as a rigid structure of the sector, traditional customer habits and inflexible suppliers. Internal contradictory forces are mostly connected with aversion to changes or the fear from changes which rise from absence of information and experiences.

True equilibrium assumes that no change takes place because there is a perfect balance between the incoming forces. The opposing pressures of the driving and braking forces result in an approximately stable equilibrium, which is a transient equilibrium (Sujova et al, 2018).

Force field analysis according to Jumara (2005) or Lewin (1951) could be understood as 3 steps process. Firstly, it is necessary to unfreeze status-quo. Movement to a new state is the second step. Final step is refreezing of a new change to make it permanent.

Heinert & Galindo-Gonzales (2020) presents 5 steps recommended to conduct FFA, namely:

- focus on considering change and write it into the centre of paper,
- write supporting forces on the left and restraining forces on the right side of the page,
- allocate weight (score) to each force (1 to 5 from the low significance to the highest),
- sum up scores on each side and if supporting forces are outweighing change should be done, if it is vice versa considering steps to shift imbalance,
- to look at whole process holistically: collective forces for change must be under consideration and it is necessary to try minimizing against forces if it is possible, otherwise, if forces are insurmountable the change is not feasible.

Nowadays FFA is considered a powerful method for managing and planning change in organisations, and so for identifying different forces acting on a potential change issue, source, and strength of these impinging influences. In addition, quantitative and qualitative data for computer software could be gained by FFA (Walker, 2023).

Being possible to perform the change, it is needed to achieve the suitable force field where the driving forces are stronger than the restraining forces. It is the essence of the force field optimization. It requires to support positive, moving forces or minimize blocking forces and a new situation must be achieved: blocking forces become weaker and driving forces become stronger. (Kubičková & Rais, 2012; Sujova et al., 2018). The situation in the force field is depicted in figure 1.

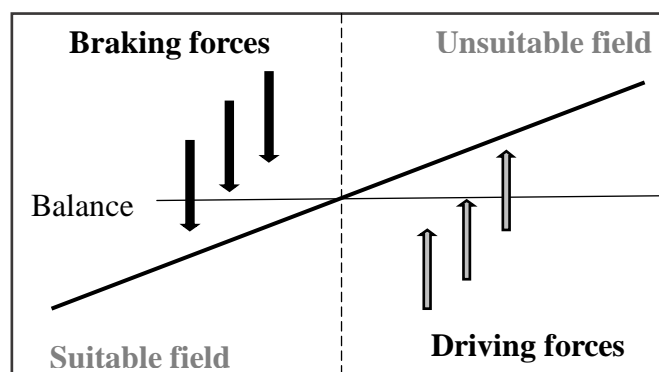

Figure 1. Force Field
Source: own processing (2023)

Description of the process of the force field analysis by several authors was the basis for proposal of the complex methodology for the FFA and its optimization. The designed methodology was verified in the small and medium enterprises. The proposal of the FFA methodology and its verification in the chosen company is presented in the paper.

3. Results

3.1 FFA Methodology Proposal

The methodology of the force field analysis represents the procedure and methods by conducting the FFA. The known information from authors dealing with FFA and its procedure represent only steps that should be done by FFA, the desired – optimal status of the force field by carrying out changes. We haven't found any complex methodology including methods, list of specified factors representing forces or guide how to proceed in FFA.

When drafting the methodology, we took into account the main recommendations of other authors and experiences of companies surveyed in several previous research. The presented proposal of FFA methodology as the result of own research differs from known knowledge:

- it is extended to more steps,
- it contains a guide how to perform each step,
- list of specific forces was created according to literature and surveyed companies,
- the methods were designed to reduce subjectivity in the analysis and at the same time they are understandable, usable and enforceable by managers in companies.

The proposed FFA is depicted in methodology Figure 2.

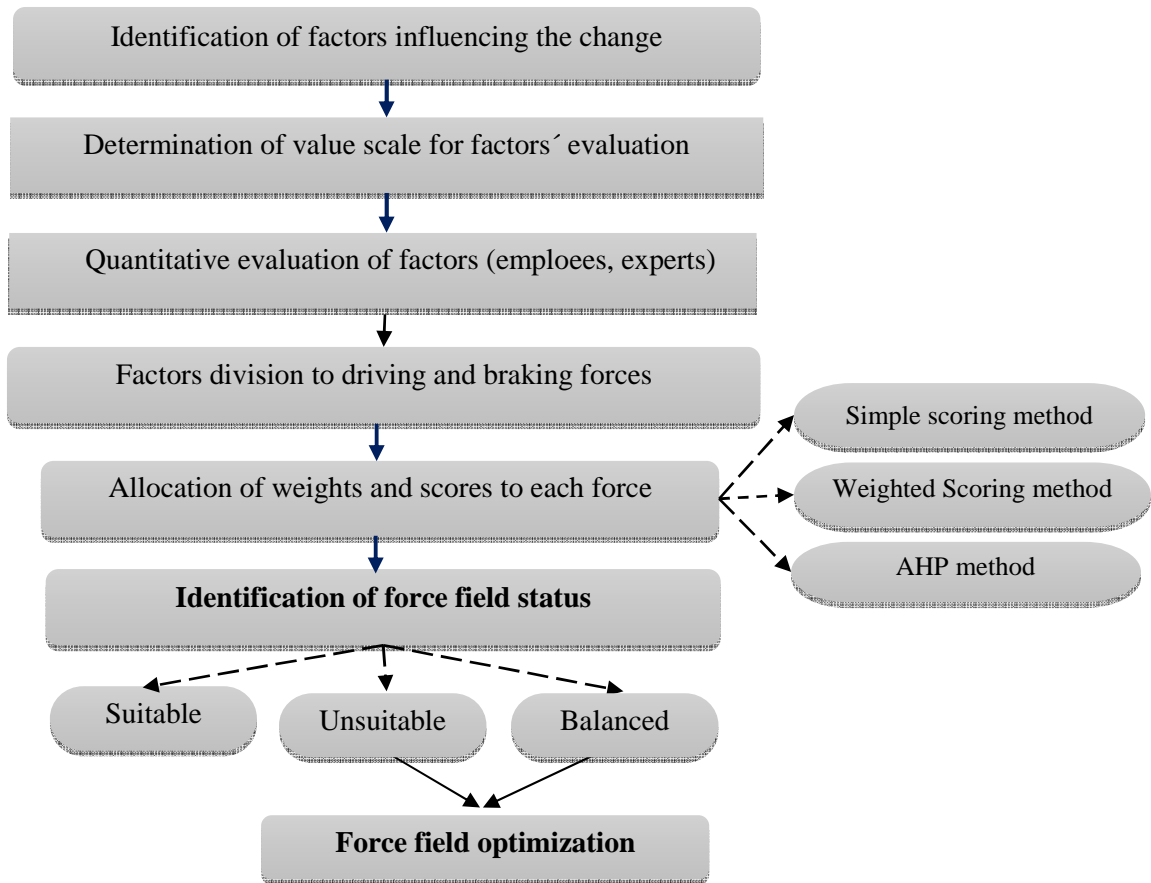

Figure 2. Force Field Analysis Methodology
Source: own processing (2023)

Step 1: Identification of factors influencing the planned change: creating the list of 10 – 20 factors that can have impact on change implementation:

Table 1. List of factors influencing the change implementation

Factor	Factor
Perceiving the importance of change in a company	Importance of further education and learning
Perceiving the changes as necessary and required	Understanding causes and nature of proposed changes
Fear from changes blocks their implementation	Benefits of change in work facilitation
Resistance and negative attitude to changes	Benefits of change in work acceleration
Fear from failure by implementation of changes	Level of informing about the proposed changes
Trust to managers and their ability to make changes	Level of training to changed working conditions
Level of preparing and planning changes	Monitoring effects of changes after implementation
Smooth implementation process by changes	Space for self-development by change implementation
Level of communication of changes with supervisors	Time space to adapt to changes
Opportunity to comment on prepared changes	Lose of the present status

Source: own processing (2023)

Step 2: Determination of value scale for factors' evaluation: the suggested scale to evaluate each identified factor is 1 – 5, where 5 is very good/strong, 4 is good/strong, 3 is neutral, 2 is bad/weak, 1 is very bad/weak.

Step 3: Quantitative evaluation of factors: the factors are evaluated by employees including managers or by experts, if the company enters into cooperation with a consultancy organisation by preparing and implementation of changes. However, our suggestion is to provide the evaluation of factors by 2 groups of people: employees including administrative and operational personnel and managers of the company. The

sample size should be representative and calculated according to formula calculated via <http://www.raosoft.com/samplesize.html> by 95% confidence level and 5% confident interval.

Step 4: Factors division to driving and braking forces: the results of quantitative evaluation of factors will show what factors are driving and what of them are blocking the change. Factors reaching values 5 and 4 are driving forces and factors evaluated by values 2 and 1 are braking forces.

Step 5: Allocation of weights and scores to forces in each group. This step is performed by the same group of people as in the step 3. The methods for this step are suggested as follows:

- *Simple scoring method:* identified forces in each group are evaluated within the scale 1 – 5 where value 1 means minimal significance and value 5 means maximal significance.
- *Weighted scoring method:* each factor within the group of forces is weighted from 0.0 (low) to 1.0 (high importance), while the sum of all weights shall be equal to 1,0 and scored within the scale 1-5. Weights can be assigned by suggestion of experts or managers. To avoid the subjective assignment, the relative frequency of scores by each force can be used.
- *Analytic Hierarchy Process method (AHP):* it is based on pair comparison of the degree of significance of individual factors and it results to ranking the weight of factors in each group of forces.

Step 6: Identification of force field status: summing up scores in each side of forces will show the present state of the force field in the company:

- **Suitable force field:** the sum of scores in the group of driving forces is over the sum in the group of braking forces
- **Balanced force field:** the sum of scores is the same in both groups of forces
- **Unsuitable force field:** the sum of scores in the group of driving forces is lower than the sum in the group of braking forces

Step 7: Force field optimization. This step represents proposals towards creation of favourable force field. The status of unsuitable force field indicates the need of its optimization. The first-rate task of a team managing a change is to minimize the negative attitudes through correct information slicing, education and training providing an increase of knowledge about the importance, goals and effects of changes and acquirement of new skills required after change. The balanced force field needs to be disturbed and driving forces supported.

The readiness of an enterprise to implement change has been identified by Beer in the form of several factors and expressed in a symbolic formula:

$$C = (D \times S \times P) > X \quad (1)$$

where: *C* – change, *D* - dissatisfaction with the current state of affairs, *S* - identifiable and desired target state, *P* - a practical plan to achieve the target state, *X* - cost of making the change.

If any expression in parentheses is close to zero, the change cannot be implemented. The change will only be realistic if the product of the factors in favour of the change exceeds the predicted cost of the change.

3.2 Application of proposed methodology in the company – results

The verification of methodology was provided in the company. The force field analysis was carried out in a manufacturing enterprise of SR, according to size, with a classification of small enterprises with a number of employees of 80. The questionnaire method for data collection was used containing 2 questionnaires. The sample size was 74 employees which is 92 % of all employees including managers in the analyzed company. The sample is representative by 99% confidence level and 3.14% margin error.

The first questionnaire consisted of 15 factors influencing the changes in the company. After evaluation by 5 points value scale, the 6 braking and 9 driving forces were identified. The second questionnaire was aimed at assessing the individual force field factors that block or promote change in the enterprise. The individual factors were rated by a weighted scoring method in order of importance on a scale of 1-5, with 1 being the least important and 5 being the most important. Weights have been assigned according to the relative frequency of median value in scores to avoid additional subjectivity. Results are presented in table 2.

Table 2. Evaluation of the blocking and driving forces in the company

Forces	Score (median)	Weight	Result scoring
Blocking forces			
Distrust of change managers	3	0.162	0.487
The emergence of problems in the implementation of change	3	0.150	0.450
Fear of failure in implementing change	2	0.194	0.388
Loss of status	3	0.181	0.544
Distrust of the unknown	2	0.144	0.288
Doubts about the need for change	2	0.169	0.338
Total	15	1	2.494
Driving forces			
New staff team	3	0.135	0.406
Sufficient staff awareness	4	0.098	0.394
New working technologies and procedures	3	0.127	0.382
Communication with supervisor regarding changes	4	0.107	0.426
Opportunity to comment on planned changes	4	0.101	0.402
Confidence about the need for change	3	0.111	0.333
Room for development during the change implementation	3	0.127	0.382
Training on implementing changes	4	0.095	0.380
Staff remuneration system	4	0.098	0.394
Total	32	1	3.499

Source: own processing (2023)

Presented results in table 2 have shown, that employees respect and adapt to changes, but they also consider changes to be a risk. They are afraid of a position loss or rise of problems by implementation of changes and they distrust to managers of changes. These factors represent a certain attitude of stagnation to changes in the company. Adapting to changes is really demanding not only for workers but also for managers. On the other hand, there was found out that all employees are informed about prepared changes sufficiently and they have possibility to express opinion to changes. Moreover, the employees have possibility to be trained to new changed conditions and they have space for consultation the implementation of changes with superiors and for their own development by change implementation. Every firm wants to have satisfied employees which perform the work the best. Employees are also motivated by suitable remuneration system which presents an advantage by realization of any change, and it also improve attitude to work.

Identification of the force field status: In the analysed company, the driving factors are highly over the braking factors by 17 scores within simple scoring and by 1.01 within weighted scoring. It is a status of a *suitable force field* which enables implementation of changes in the company. The main driving factor is a remuneration system. If the company would create supporting motivation in a form of rewards in connection with implementation of changes, it would improve attitudes to changes by employees who are afraid of changes or don't accept any change in their work and the success by realization of changes would be better. To eliminate forces braking a process of change, the company should minimize an antipathy to changes, fear from changes which are common attitudes of employees or people by changes.

4. Discussion

Ability of changes belongs to contemporary competitive advantages of a company. To perform changes successfully depends on many factors. A specific feature of change management is an awareness of factors which support, and which block realization of a change and they create so called force field in a company. To existence of the force field was pointed to in the work of Lewin (1951) who claim that it is important to have balance between factors of force field for implementation of changes. However, after providing several studies in companies, we found out, that in the process of managing a change it is necessary to create a positive force field. That means, it is needed to reach a status when supporting (driving) forces are stronger than blocking (braking) forces. Only in this environment the changes are feasible.

Models of managing a change according to several authors (Lewin 1951, Jumara, 2005; Kotter 2012) consist of three phases: defrosting, change realization and frosting, where factors of force field play the role. Our findings have shown that a role of force field analysis and utilization of its results can be included in following phases of change management:

- analytic phase: finding out a present status of force field in a company;
- preparation phase: proposals of measures for creation of favourable force field within project of change;
- implementation phase: in the first step “defrosting” the proposed measures are carried out when braking forces became weaker, so that a change can be performed in the next realization step and in the last step “frosting” it is needed to get forces to balance, so that achieved effects of change could be fixed;
- control phase: monitoring balance in a force field and its keeping.

Methodology for the force field analysis and optimization was designed. The existing 3 steps or 5 steps process suggested by Lewin (1951), Jumara (2005), Heinert & Galindo-Gonzales (2020), Walker (2023) was extended to 7 steps and the methods were suggested and described in more detail. The verification of the proposed FFA methodology in the enterprises confirmed its applicability.

In the presented case study, the force field status in the analyzed company is suitable for changes and its optimization is not needed. If the present status of a suitable force field is maintained, the company can be considered to be agile and ready for any change in any time.

Conclusion

The contribution of this papers is the proposal of the complex methodology for analysis of the force field. In works of authors dealing with this issue there is an absence of knowledge, how should be force field analysis carried out and what methods could be used to reduce a subjective approach.

Proposed complex methodology for the force field analysis was implemented in several companies. Results from one chosen company, presented in this paper, have shown the existence of a positive force field in the company for realization of changes. Utilization of the results consists in proposal of actions leading to weaker blocking factors and to stronger driving factors and their integration to phases of change management.

Results achieved by now in the issue of force field analysis within management of change provide a space for further development of knowledge in form of processing a set of measures for the force field optimization. The proposals can serve as a guide by preparation of suitable environment for carrying out changes. The force field analysis can provide insights into the forces influencing the change, it may serve as a complementary tool within a broader framework for measuring and assessing business agility.

The Administrative Challenge of Managing a Police Station

Andalow-Avraham Takala^{1,*}

¹ South-West University, 66 Ivan Mihaylov str., 2700 Blagoevgrad, Bulgaria

Abstract

Research background: Law enforcement has evolved from traditional crime control to broader responsibilities like community policing and crime prevention. Effective execution of these duties relies on police station management practices. With evolving challenges, comprehensive research on police station management is increasingly essential.

Purpose of the article: This study aims to achieve two goals: Firstly, it explores leadership, communication, motivation, and community engagement for better police station management. Secondly, it comprehensively examines police station management in the Israeli West Bank context, potentially impacting global law enforcement discussions. Ultimately, the research aims to improve officer well-being, strengthen community ties, and ensure efficient, unbiased policing services.

Methods: The research is action research within a qualitative method. The data was mainly analyzed thematically.

Findings & Value added: Effective police station management requires consistent leadership, clear expectations, and officer engagement for positive behavior. Proficient management reduces stress, regulates conduct, and boosts officers' well-being and competence. Leadership skills can be proactive or reactive, with proactive approaches involving tailored programs, meaningful participation, and focused routines for better officer engagement. Aligning daily duties with station pace, monitoring, reflection, and positive reinforcement produces superior results compared to reactive strategies.

Keywords: classroom management, discipline management, self regulation, cognitive behavioral intervention, behavior

JEL classification: O03, I01, I03, Z01

1. Introduction

1.1. Police station Leadership

Managing a police station is a multifaceted endeavor that requires adept leadership, streamlined organizational structures, effective communication strategies, and a strong commitment to community engagement (Casey & Mitchell, 2007). Police stations are the cornerstone of public safety and law enforcement within communities. Efficient management practices ensure citizens' well-being and foster positive relationships between law enforcement agencies and the communities they serve (Plank, 2021). Nevertheless, the dynamic and often demanding nature of police work, coupled with the diverse expectations of communities, underscores the necessity of well-informed and adaptable management techniques (Yüksel, 2015).

The existing literature offers insights into various aspects of police station management, ranging from leadership styles and officer motivation to community relations and organizational structure. Scholars have explored the impact of different leadership approaches, such as transactional and transformational leadership, on officer morale, job satisfaction, and overall performance (Noor et al., 2018). Studies have also delved into the influence of communication strategies on internal cohesion and external interactions, focusing on information flow within police departments and interactions with the public (Langbein & Jorstad, 2004).

1.2. Transactional vs. Transformational Leadership

Transactional leadership is a leadership approach that operates on the premise that the relationships between leaders and individuals are primarily driven by instrumental exchanges (Kark et al., 2016).

* Corresponding author: takala978@gmail.com

According to this perspective, people are motivated to perform tasks by the instrumental rewards they receive from their leaders. In this context, rewarding leadership can be seen as a form of "business" leadership, where the leader assesses the situation and adapts the type of reward based on the situation's specific conditions and nature. The fundamental idea behind rewarding leadership is to establish a clear connection between the effort exerted and the rewards individuals receive. Transactional leaders actively engage in instrumental exchange relationships with their subordinates, strategically negotiating and supplying rewards (Yun et al., 2007).

Transformational leadership is a theory that goes beyond individual self-interests, emphasizing collaboration with teams or followers to recognize necessary changes. This involves creating a guiding vision for the change and using influence and inspiration to execute it. The leader works alongside committed group members, elevating their maturity levels, ideals, and dedication to achieving the shared goals. This approach fosters a shift from personal concerns to a broader focus on collective achievement (Odumeru & Ogbonna, 2013). Transformational leadership is a style that motivates individuals to achieve extraordinary outcomes (Bass, 1999). It empowers employees with job autonomy and decision-making authority, particularly after appropriate training. This engenders a positive shift in both individual attitudes and the overall organization. Transformational leaders typically exhibit four key behaviors, referred to as the four I's: Inspirational motivation, Idealized influence, Intellectual stimulation, and Individualized consideration. According to Bass, a leader's Transformational qualities are primarily measured by their influence on subordinates. Subordinates of formative leaders experience trust, admiration, loyalty, and respect, making them more motivated than initially expected. Bass identified three ways formative leaders shape and motivate subordinates: 1) Enhancing subordinates' awareness of the importance of task outcomes. 2) Persuading subordinates to prioritize the organization or team over personal interests. 3) Addressing higher-order needs of subordinates.

Bass proposed three key components of formative leadership: charisma, intellectual arousal, and consideration toward individuals. Charisma involves arousing intense emotions and fostering identification with the leader through encouragement and developmental experiences. A revised version of the theory introduced an additional behavior known as inspiration or inspirational motivation (Hosna et al., 2021). This component focuses on how leaders convey a compelling vision, utilize symbols to direct subordinates' efforts, and exhibit appropriate behavior to inspire their followers. This amended version of formative leadership theory provides a more detailed understanding of the leadership process, highlighting the importance of inspiring and motivating subordinates through visionary communication and symbol usage.

1.3. The applied goals of the leadership tools in the police station

As a head chief of a police station in the Israeli West Bank, Transactional and Transformational leadership (Adriansyah et al., 2020) can be highly relevant to police station management. Transformational leadership emphasizes the importance of inspiring and motivating individuals to rise to higher levels of values and motivation. Here is how it can apply to police station leadership:

Transformational leaders seek to address higher ideals and moral values, such as justice, equality, and peace. In a complex and sensitive environment like the Israeli West Bank, emphasizing these values can help foster a sense of fairness and create a more harmonious atmosphere within the police station. By consistently promoting these ideals, I can encourage my officers to uphold them in their interactions with the community.

Transformational leaders cultivate trust, admiration, loyalty, and respect among subordinates. These qualities are crucial for effective law enforcement and community engagement. By demonstrating integrity, transparency, and accountability in the leadership actions, the head chief can build trust and loyalty within his team, positively impacting their performance and the public's perception of the police force.

Transformational leaders persuade subordinates to prioritize the organization or the team over personal interests. One of the police station head chief role is to motivate the officers to understand the importance of their duties beyond individual ambitions. By highlighting the significance of maintaining security, promoting public safety, and ensuring justice. The head chief can inspire his team to work collaboratively and focus on the greater good of the community.

Transformational leaders recognize and address the higher-order needs of their subordinates. In a challenging environment like the Israeli West Bank, where officers may face stress and emotional strain, providing support mechanisms, promoting professional development, and creating opportunities for

personal growth are essential. The head chief can foster a more engaged and committed team by caring for his officers' well-being and professional advancement.

The Transformational leadership theory highlights the importance of conveying a vision in a heart-moving manner. The head chief should articulate a clear vision for the police station that aligns with maintaining law and order while ensuring respect for human rights and fostering positive community relationships. By effectively communicating this vision, the head chief can inspire his team and gain their commitment to shared objectives.

2. Methods

This study employs a qualitative research approach to explore the leadership effects on officers' motivation within the context of the Israeli police. The research is conducted as action research, focusing on practical interventions to enhance policing practices. Participants in this study include police officers within the Israeli police. The data was collected through interviews and surveys to explore officers' perceptions, motivating factors, views on their commanders, underlying values, and the correlation between station commanders' leadership values, station core values, and officers' daily task motivation. The data collection instruments were structured interviews and surveys designed for the data collection. The data collection procedure included in-depth interviews to gather rich qualitative data, and surveys were administered to collect quantitative responses. Ethical considerations were upheld, including informed consent and protection of participants' confidentiality. The data analysis includes Thematic Analysis, where the data was primarily analyzed thematically, allowing for a comprehensive exploration of the officers' perceptions and motivations.

The Intervention Study (Upcoming) will be the initial phase of the research, and it will serve as the foundation for an upcoming intervention study that will apply Transformational leadership principles to promote responsible, proud, and community-connected policing. The intervention program will take place within the management of a police station in the Israeli West Bank, focusing on inculcating discipline and appropriate behavior in police officers and the management of police offices.

3. Results

The insights gained from the analysis of the questionnaires can be valuable in shaping the leadership approach and improving the overall effectiveness of the police station. We can see that embracing formative leadership, fostering a values-based culture, building trust with the community, creating a shared vision, and empowering police officers all contribute to the success of the police station. By proactively addressing the insights from the research, we can enhance policeman satisfaction, strengthen community relations, and improve the overall effectiveness of the police force.

Here are some key takeaways and their relevance to your role:

The findings highlight the significant influence of commanders on the motivation of police officers and their connection to the community. As a Transformational leader, the head chief can inspire and motivate his officers by promoting higher values and ideals, such as justice, equality, and peace. Leading by personal example and showing appreciation for their work can positively impact officers morale and commitment to their duties.

Recognizing that police officers who identify with the goals of the police and feel a sense of purpose in their work are more satisfied than the other policeman, the head chief can proactively create a values-based culture within the station. A duty to protect and serve the community can enhance the officers' daily work and overall satisfaction.

Recognizing that police officers who identify with the goals of the police and feel a sense of purpose in their work testify that they are more satisfied than the other policeman, this could suggest that a values-based culture can be created proactively within the station. A duty to protect and serve the community can enhance the officers' daily work and overall satisfaction.

Establishing trust between the police and the community is crucial to effective law enforcement. Community engagement has emerged as a critical dimension of contemporary police station management. Police-community relations significantly influence trust, cooperation, and the perception of legitimacy. By understanding the community's needs and improving communication and training between officers and the public, the head chief can reduce friction and increase appreciation for the police. Researchers have investigated the effects of community policing initiatives, problem-solving approaches, and proactive measures on enhancing community partnerships and reducing crime rates. Additionally, studies have explored the complexities of building bridges with diverse communities, addressing cultural sensitivity,

equity, and social justice concerns. This will lead to a stronger connection between the police and the community they serve.

Developing a clear and shared vision for the police station based on the community's needs and aspirations is essential. By involving the community in the planning process, the head chief can foster a sense of ownership and partnership, leading to greater support and cooperation between the police and the public.

Acknowledging that police officers must feel their work is meaningful and aligned with their abilities, the head chief can seek to match tasks with their skill sets and interests. Empowering officers to take on roles as community leaders and entrepreneurs can enhance their self-image and motivation, leading to increased functional capacity and reduced attrition.

Understanding that some officers may struggle with feelings of low appreciation, creating an environment where open discussions about this concern can occur is essential. By providing support and recognition for efforts, even in challenging situations, the head chief can help improve officer morale and motivation.

4. Discussion

The insights from the analysis of the questionnaires shed light on crucial aspects of police station management, leadership, and their profound impact on police officers and the community they serve - a multifaceted nature of police station management, where leadership, values, community engagement, and officer satisfaction intersect. Moreover, by proactively implementing the insights from this research, police stations can enhance officer satisfaction, strengthen community relations, and ultimately improve the overall effectiveness of law enforcement. These strategies are not only relevant to the Israeli police but also resonate globally, offering valuable guidance for police station management and leadership practices worldwide. This discussion will delve into key takeaways and their implications for shaping effective leadership and improving overall police station effectiveness.

Leadership Approach and Building Trust: The findings emphasize the pivotal role of leadership in motivating police officers and fostering a connection with the community. Transformational leadership, characterized by inspiring and motivating officers through higher values and ideals, such as justice, equality, and peace, emerges as a potent strategy. Police leaders, particularly the head chief, can lead by personal example and demonstrate appreciation for officers' work. This approach positively influences officer morale and commitment to their duties, ultimately enhancing job satisfaction.

Values-Based Culture: The research underscores the significance of creating a culture within the police station. Officers who identify with the overarching goals of the police and find a sense of purpose in their work express higher levels of satisfaction. Proactively instilling a sense of duty to protect and serve the community can profoundly impact officers' daily work experience and overall job satisfaction.

Trust-Building with the Community: Effective law enforcement hinges on establishing trust between the police and the community they serve. Community engagement is pivotal in contemporary police station management, as it significantly influences trust, cooperation, and the perception of legitimacy. By comprehending the community's needs and enhancing communication and training between officers and the public, police leaders can reduce friction and bolster appreciation for law enforcement. Building bridges with diverse communities addressing cultural sensitivity, equity, and social justice concerns further solidifies the connection between the police and the community.

Shared Vision: Developing a clear and shared vision for the police station, one that aligns with the community's needs and aspirations, is essential. By involving the community in the planning process, police leaders can foster a sense of ownership and partnership. This collaborative approach increases support and cooperation between the police and the public, strengthening the station's effectiveness.

Empowerment and Task Alignment: Recognizing that officers must find meaning and alignment with their abilities in their work, police leaders should aim to match tasks with their skill sets and interests. Empowering officers to assume roles as community leaders and entrepreneurs can enhance their self-image and motivation. This empowerment increases functional capacity and reduces attrition rates, contributing to a more effective police force.

Recognition and support: Acknowledging the importance of addressing feelings of low appreciation among officers, police leaders should create an environment conducive to open discussions about this concern. Even in challenging situations, offering support and recognition for officers' efforts plays a critical role in improving morale and motivation within the police force.

Conclusion

From the officers' interviews, it becomes evident that effective police station management is marked by the consistent implementation of leadership procedures and routines that establish clear behavioral expectations for officers. This consistency not only brings about order but also cultivates trust. The active participation of officers in police station processes, integrated as a part of management strategy, plays a pivotal role in shaping positive officer conduct. The interviews underscore the notion that proficient management leads to stress reduction, behavior regulation, and an augmented sense of belonging, competence, and legitimacy among officers. Leadership skills pertinent to police station behavior can be categorized into proactive and reactive skills. Proactive skills encompass the design of programs tailored to offer meaningful officer experiences, enabling their involvement in decision-making processes. By embedding direction and focus into routine activities, officers' persistence in maintaining concentration, attentiveness, and participation in police station endeavors can be amplified. Proactively aligning officers' daily duties with the pace of the police station, incorporating monitoring and reflective procedures to comprehend the underlying reasons behind officer behaviors, and consistently employing positive reinforcements to influence behavior, achievement, engagement, and success are considerably more effective than employing reactive strategies in leadership for behavior management.

Trends and Digitization of Human Resources Management - New Forms and Models

Nella Svetozarovová^{1,}, Jana Cocul'ová¹, and Daniela Bertová¹*

¹ University of Presov, Department of Management, Faculty of Management and Business,
Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: To ensure business sustainability and optimize performance capabilities, it is paramount to integrate prevailing trends into human resource management practices. Responding to emerging labor market dynamics has become a continuous mandate for organizations, given the rapid shifts in the business landscape. Consequently, an array of human resource management challenges persists and is expected to endure. The elasticity in demand and the increasingly abstract nature of work are revolutionizing essential managerial roles. The realm of HR management has acquired an unprecedented level of intricacy.

Purpose of the article: The purpose of the paper is to assess the extent of utilization of contemporary patterns within the realm of human resource management, with a specific focus on the phenomenon of digitization. The paper studies interconnections between a cluster of practices referred to as trends in human resource management, the dimensions of the organization, and employee turnover – a pivotal metric for organizational performance.

Methods: To achieve this, a compilation of 10 distinct trends has been identified, encompassing elements such as the integration of social network platforms in HR, job rotation, remote work arrangements including home office and remote working, metamorphic work setups, hybrid work models, and similar factors. These hypotheses are subsequently explored through a sequential exploration of correlations, utilizing Kendall's rank coefficient.

Findings & Value added: While the direct link between HRM trends and turnover remains unverified, the effectiveness of incorporated trends appears to be contingent upon the size of the organization. Within this context, we propose a contemporary array of systemic solutions that address the domains of HR trends and digitization.

Keywords: trends, human resources management, organizations, digitalization

JEL classification: M12, M54

1. Introduction

In general, organizations try to be more competitive and efficient and use modern procedures and technologies in the field of human resources to do so. This includes, for example, the use of human resource management software, process automation, a focus on improving the employee experience and culture, as well as employee development and growth. These trends are increasingly accepted and used in many organizations, but the specific level of use will depend on the specific organization and its goals and priorities.

Tom Marsden, director of professional services at Alexander Mann Solutions, said HR departments really need to add real value to their organisations. In the field of human resources management, the issue of the relationship between human resource management practices, business sustainability and organizational efficiency is a very intensively discussed issue. This trajectory of conversation has spurred a substantial volume of inquiries (Caligiuri et al., 2020; Gigauri, 2020; Meri, 2020), with a prevailing consensus strongly affirming a statistically meaningful positive correlation between existing trends in human resource management practices and operational efficiency.

* Corresponding author: nella.svetozarovova@unipo.sk

Notwithstanding these affirmations, the latent causal link between these practices and efficiency remains shrouded in obscurity. This obscurity underscores the necessity of presenting the tangible benefits stemming from investments in human resource management practices, for any investment decisions made without such presentation would be bereft of solid justification. Moreover, the challenge persists in methodologically quantifying the precise influence of human resource management practices on efficiency.

Individual studies and surveys carried out by different authors from different geographical areas and time periods devoted to the relationship between management, sustainability and performance confirm the existence of this relationship. A significant majority of them proved a positive correlation. Given the established statistical significance of this correlation, it becomes evident that companies are progressively adopting sustainability strategies due to its influence. These strategies are yielding novel outcomes across various facets of organizational performance, thereby culminating in an enhancement of companies' competitive prowess within the market. Deloitte conducted an examination into how the execution of a business sustainability strategy influences the organizational performance of firms (2011, 2012 and 2013).

Currently, human resource management is affected by many impacts and therefore several implications can be drawn. The results of a worldwide survey carried out by Cranet (2022) point to several facts. In the world ranking, key trends for 2020 in the field of human resources management include the so-called well-being (overall physical, mental and social well-being), as evidenced by 80% of the surveyed companies. This is followed by employee compensation (79%) and the third most important trend is: knowledge management, the changing role of HR and ethics. The most significant difference is in the perception of the importance of a multigenerational workforce. At the global level, 74% of respondents consider it important. Global companies are the least prepared for digitization and integration of artificial intelligence and generally for introducing technologies into their teams. The above study identifies significant trends in human resources, making it the largest global study on human resource management, talent management and related topics. The study is based on knowledge obtained on the basis of a survey in which almost 9,000 respondents from 119 countries of the world took part. All the mentioned changes require organizations to identify and implement new strategies for acquiring and developing and rewarding key employees.

1.1 Challenges of HR Managers and Social Media Platforms

Innovations, commonly embodied as emerging technologies or shifts in organizational frameworks, simultaneously bring about alterations in the prerequisites for the labor force. This transformation necessitates workers to cultivate novel and intricate expertise, thereby escalating the requirement for individuals with advanced educational backgrounds. This phenomenon sets off a competition between technology and education, characterizing a scenario wherein advancing technology reshapes the demands on the workforce's demand facet, thereby propelling educational systems to respond by providing more pertinent knowledge to a broader segment of the populace. When technology triumphs, the demand evolves at a swifter pace than the educational environment can adapt to, thereby favoring individuals with higher educational qualifications. This trend has been observable in developed countries since the latter portion of the 20th century. (Amstrong, Taylor, 2015)

Ruparel et al. (2020) examined the influence of online professional social media in human resource management. He mentioned that the Internet has played a reframing role in the lives of individuals. Social media platforms (SMPs) were originally introduced to facilitate the communication of personal and professional interests. SMPs are expansive, dynamic and enable the sharing of several types of content. DeNardis and Hackl (2015 In: Ruparel et al., 2020) conceptualize SMPs as encompassing the following three technological features:

- (a) mediation of the content generated by users;
- (b) interactivity among users and direct contact with online content; and
- (c) interconnection of individuals with other users on the network.

Different SMPs serve different purposes. For example, Facebook is used for social networking, Twitter is used for micro-blogging, YouTube for content sharing and viewing, Snapchat for image sharing, and LinkedIn for professional networking. Among the various PSMs that ease the process of employment, several studies have identified LinkedIn as the most convenient and effective website for employers and job seekers. In fact, LinkedIn (94%) was found to be the best platform among PSMs for

hiring individuals for vacant job roles, followed by Facebook (65%), Twitter (55%), Google Plus (18%), YouTube (15%), and Instagram (13%). In addition, Grissa (2016) and Ruparel et al. (2020) included websites such as Viadeo, Xing, YouPeek, and SkilledAfricans, to conceptualize professional networking sites.

Beyond just tailored advertisements and passive waiting for anonymous applicants, LinkedIn provides a platform that includes a network of "headhunters." This network serves as a mechanism to proactively engage with specific individuals. This employee recruitment approach leverages social connections to entice top-tier candidates through endorsements from their acquaintances and individuals familiar with the prospective employer. (Ďurechová, Glatz, 2019)

Technological progress offers HR specialists who look for "talents" new possibilities. Utilizing fresh and readily accessible applications in the market brings about a transformation in the creativity and approach of HR professionals and managers to their work. The utilization of modern ICT tools for recruiting employees also redefines the essence of their roles. (Štefko et al., 2014) Contemporary employees are expected to achieve exceptional outcomes and excel without being caught off-guard by fundamental tasks like cross-cultural communication, navigating intricate internal IT systems, engaging in tele or video conferences with their globally dispersed teams, and promptly addressing issues online. The forthcoming generation is not only reshaping human resource management practices, but also influencing global values and the very significance of established concepts. (Frejtichová, 2015)

Nazarov et al. (2020) conducted a more detailed analysis of modern trends in working with staff by using digital technologies (Table 1) due to their abilities to improve the efficiency of personnel management.

Table 1. Modern trends in working with staff

HRM trends	The software platform that implements it
Automatically fill in candidate profiles based on their pages in professional networks	LinkedIn
Anonymity in pre-selection	Jobsnap, djinni.co
Use of social networks for selection of candidates	Telegram, Facebook, Twitter
Automation of personnel selection	Applicant Tracking Systems - Jobscan
Automation of recruitment processes – onboarding, adaptation, training, development, internal document flow of the company	ZOHOPeople, BambooHR, HURMA
Forecasting and HR – analytics	
Monitoring the mood of employees	HURMA, eNPS, Gallup Q12
Combination of recruitment and HR processes	
Integration with calendars, meeting management	Google Calendar
Corporate training	
Digitization of recruitment	Skype, Hangouts, Zoom
Skills testing sites	Codility, TESTDOME, Tests4Geeks, PROMETHEUS

Source: Nazarov et al. (2020)

The analysis by Ďurechová and Glatz (2019) delves into the ever-changing dynamics of the labor market, influenced by the pervasive trend of low population growth across the European Union. A dearth of qualified and skilled workers is becoming apparent within our labor market. In the present age, employers are compelled to react proactively and with adaptability to these evolving circumstances. The landscape has evolved beyond mere loyalty, which was traditionally paramount to employers. Instead, employers are now seeking experience and a conscientious work ethic. They are in pursuit of employees who possess specialization and proficiency in their respective domains, coupled with an entrepreneurial mindset and a collaborative inclination. An area of vulnerability for millennials lies in their craving for admiration and recognition, thus magnifying the necessity for employers to manifest appreciation and acknowledge their workforce. Those employers who recognize the irrevocable distinction between tomorrow and yesterday are poised to attain success in the future, given the perpetual transformations in the labor market milieu. In the imminent years, the recruitment of individuals from the resilient middle generation is projected for middle and senior management roles.

1.2 The relationship of psychology and neuroscience with the modern HR management

In the digital information age, big data and artificial intelligence technologies have brought new opportunities for the talent recruitment. Constant updates and iterations, optimization of the organizational structure and more reasonable distribution of talents are key to achieving the new strategic goals of the company. If an organization cannot keep up with the rapid pace of technological development, it will be difficult to reap the benefits of new improvements and technological advances. In practice, problems such as low screening efficiency, insufficient job matching ability and technology drain in the traditional recruitment process are still being addressed. To improve these processes, researchers suggest using data collection to reduce the amount of data that needs to be processed. Data mining uses massive data and various techniques and statistical methods to obtain more useful information. (Khan, 2022)

Agarwal et al. (2021) think that talent management still makes little use of neuroscientific techniques to solve management problems. Although neuroscientists are only beginning to understand how to use neuroscientific findings in the workplace, there is potential to improve management and understanding of individuals through these methods. Neurological studies in the field of HRM are still unclear and further research is required due to the lack of relevant and credible evidence. An in-depth examination of neuroscientific discoveries is needed to address a wide range of human resource and talent management activities. It's evident that current neuroscience is predominantly deployed to substantiate training and developmental methodologies and to shape training approaches. Nonetheless, notable behaviors illuminate the impact of educational and developmental interventions on individuals. Broadly speaking, insights into leadership, team dynamics, and akin facets should encompass neurological underpinnings, empowering leaders with a deeper grasp of the factors influencing employee performance. The quantity of data amassed by businesses is experiencing rapid growth in contemporary times. This expansion outpaces the capacities of conventional HRM systems for processing and dissecting this data. Consequently, this study introduces a salary projection model rooted in neural networks, with the intent to enhance the efficacy of HRM systems driven by advanced AI technologies. The model employs applicant data to prognosticate their potential remuneration. The outcomes can serve as benchmarks for data-driven HRM systems.

1.3 Hybrid work models

As in the case of remote work, the hybrid model is more focused on managing human resources than on the actual performance of tasks. More emphasis is placed on mutual support, trust and reliance on each other, clarifying working relationships and ensuring that everyone is present at work meetings. Results matter more than personal presence. Effective communication is the basis of hybrid work. It is of fundamental importance for achieving success, but at the same time it is considered a high-risk area. If communication is not properly managed, it can lead to insufficient information flow, knowledge gaps, barriers to effective team collaboration, and exclusion of team members who are not present in the office. All group members are responsible for ensuring effective communication. Departments, sections or teams should discuss their priorities together and set clear expectations. (European Labor Authority et al., 2021)

At the same time, the European Labor Authority claims (2021) that they should set aside time for targeted work and agree on when physical presence in the office is necessary and when not. In connection with the COVID-19 pandemic, measures focused on health and safety, but also on the emotional and mental health of employees, have been introduced. It is important for managers to be flexible and have empathetic conversations with individual employees to discuss any adjustments or support they may need for an effective return to work. In the case of remote work or more flexible forms of work organization, it will be more difficult to monitor the performance of employees. Therefore, managers should adapt to evaluate performance based on the results, ability to achieve goals, contributions and contributions of each employee. It is important that managers provide regular feedback to each employee and update work-related goals when necessary.

According to Ngo (2023), there are four most common types that companies use when choosing a hybrid work model. The first type includes a solid hybrid model. It includes certain rules that determine when and how employees can work from home and when they must work in the office. These models are usually schedule-based and can be tailored to the needs of individual teams or departments. Employees adopt a schedule alternating between office-based workdays and remote workdays from home. This arrangement provides employees with a degree of consistency and foresight, which can yield positive outcomes for their productivity. As the second co-author, she introduced a versatile hybrid model that champions flexibility. This model empowers employees with greater freedom and control over their work location and hours. Individuals have the option to work

from home or the office, tailored to their specific needs and preferences. This approach can be adapted to various circumstances, including familial commitments or health constraints. However, the incorporation of flexible hybrid models mandates employees to embrace greater accountability and self-governance. Following this, the primary hybrid model for organizational operations within physical office settings is presented. It allows employees to work from the office, but also from other places, such as cafes or other public spaces. This model allows employees to change their work environment and adapt to their needs and preferences. This model also encourages collaboration and interaction between employees of different departments or teams. As the last model, it introduces the remote hybrid model in the office. This model allows employees to work remotely and access various tools and resources from the office. Employees can work from home or from any place with Internet access and the necessary technology. The model brings flexibility to employees and reduces the costs of renting and maintaining office space.

Boyatzis et al. (2015) offered a comprehensive change model that can better enable sustained behavior change in organizations. To be successful, individuals must genuinely care about making the change, engage in intentional effort to make the change, and be aware of the change and the change process. In this model, change begins with the creation of a personal future vision that provides the impetus for change. A personal vision represents an ideal self, which is then compared to the actual self to identify strengths. The difference between the real self and the ideal self creates a learning agenda and provides motivation for change. The likelihood of successful change increases when individuals embrace a learning-centric outlook, fostering a positive self-belief in their capacity to change and directing their focus toward their envisioned self. Conversely, a performance-oriented approach, emphasizing success, validation, and commendation, triggers feelings of anxiety. The premise is that individuals should experience an inherent motivation to change, propelled by the emotional realm of their mind, rather than feeling compelled to change due to external directives. Additionally, trust and nurturing relationships play pivotal roles in facilitating the change process. Numerous studies have indicated that this approach yields more effective outcomes in behavior change compared to the utilization of conventional educational methods.

Human resource management challenges, especially for enterprises operating across diverse global cultures, pose distinct obstacles. Businesses participating in the global marketplace require a multitude of components, along with the centralization of their operational processes. In the sphere of human resources, enhancing global competitiveness and enabling employees within a globally dispersed framework are of paramount importance. Should success on the global stage be the aspiration, it becomes the duty of every organization, irrespective of its size, to grasp cross-cultural corporate divergences and invest in human resources. The authors expound on human resource management complexities unique to global enterprises. Key considerations encompass HR policies, talent identification and retention, as well as training and development. These endeavors, in turn, bolster employees' capacities for innovation and creativity. Furthermore, the intersections of cultural barriers and work dynamics are frequently observed. Other challenges entail comprehending the intricacies of living and working conditions, conducting remote performance evaluations, and implementing training and managerial growth strategies. (Saranya, Asok, 2019)

2. Methods

The aim of the paper is to evaluate the current trends in the field of human resources management with an emphasis on the phenomenon of digitization and to research relationships between a set of practices called trends in human resource management and the size of the organization and the turnover of employees in the organization. For these purposes, we have identified the following set of trends, namely job rotation, home office, work in a meta version, hybrid work model and remote working.

Two hypotheses were formulated:

H1: We assume the existence of a statistically significant relationship between the rate of utilization of human resources trends and the size of the organization.

H2: We assume the existence of a statistically significant connection between the rate of utilization of human resources trends and employee turnover.

The analytical aspect of the research endeavor involved gathering primary data via a well-structured questionnaire. This survey was disseminated among employees spanning various organizations. The

questionnaire encompassed queries posed in a closed-ended format, delving into trends prevailing within human resource management and their impact on enhancing work performance. Topics embraced job rotation, remote work scenarios (home office), engagement in meta versions, and beyond. The questionnaire was generated utilizing the Google Forms platform, remaining accessible online for a span of 2 months, during which a cumulative total of 223 participants contributed to the study.

The research made use of the quantitative methods such as frequency analysis, percentage distribution and correlation analysis. These methods allowed us to identify basic trends in the field of human resources management and their impact on work performance, as well as to determine the most frequently used methods of human resources management. The results were then analyzed and interpreted in order to evaluate the effectiveness of human resources trends and their impact on employee performance quantified through the turnover indicator.

Research hypotheses follow a linear relationship (connection) between pairs of questions with an ordinal character. A Likert scale was used, with 1 indicating a strongly agreeing opinion and 5 strongly disagreeing. Both research hypotheses were evaluated through Kendall's rank correlation coefficient (hereinafter referred to as "Kendall's coefficient") calculated as follows:

$$r_K = \frac{n_c - n_d}{n(n - 1)/2}$$

where: n - number of observations of a pair of variables
 n_c - the number of matching pairs of the pair
 n_d - the number of discordant pairs of the pair

As each of the previously mentioned research hypotheses revolves around questions involving ordinal variables, the selected mathematical-statistical approach falls under the non-parametric methods category. The analysis and subsequent evaluation of these research hypotheses are undertaken using MS Excel and Statistica 13.

3. Results

The initial stage involved identifying trends within HR management and assessing the level of their adoption in correlation with organizational size. Additionally, our objective was to establish whether staff turnover within the organization had witnessed an increase in the past two years subsequent to the revamping of HR practices and the introduction of novel trends. The study cohort encompassed 223 participants, and fundamental particulars pertaining to the surveyed sample are presented in the ensuing section.

In the sample, the highest representation was found among small businesses with a staff size of 10 to 49 employees, accounting for 35.87%. The subsequent significant group comprised medium-sized organizations employing 50 to 249 individuals, constituting 33.18%. Close on the heels were large corporations with a workforce exceeding 250 employees, contributing 25.11% to the sample. The least representation was noted among micro enterprises employing up to 10 personnel, making up a modest 5.84% of the sample. The surveyed organizations predominantly hailed from the private sector, representing 89.69%. Of the complete sample, 60.54% were Slovak organizations, while 77.6% boasted an established human resource management department. An important finding is that up to 70.9% of organizations transformed existing HR practices and introduced new approaches or trends during the pandemic. This result suggests that organizations have been able to adapt to the new challenges and needs of their employees during the pandemic, and that human resource management has become a key factor in this process. Employee turnover over the past 2 years, after the transformation of practices and the introduction of new HRM trends, has significantly increased in the case of 64.13% of organizations. Neutral employee turnover, i.e. termination of employment and contracting of newly hired employees, was recorded in 14.80% of organizations.

As delineated in the methodology section of the document, the research hypotheses trace an ordinal correlation linking the utilization frequency of human resource trends to both the organization's size and the employee turnover subsequent to the restructuring of human resource management practices, serving as a performance indicator.

In the initial hypothesis, we posited the presence of a statistically significant correlation between the frequency of human resource trends' utilization and the organization's dimensions. The outcomes of the correlation analysis are showcased in Table 2.

Table 2. Results of correlation analysis (Kendall's coefficient) - research hypothesis H1

HRM trends	r_K
Talent management	-0.2093*
On-boarding	-0.2022*
Social networking platforms	-0.1502*
Hybrid working model	-0.0572
Work in metaversion	-0.0419
Work from home	-0.2093*
Remote working	-0.2022*
Flexible working hours	-0.0390
Job rotation	-0.0572
Sharing of work	0.0003

* statistically significant at the significance level $\alpha = 5\%$

Source: own work (2023)

The results of the employment of selected trends of human resources from the point of view of the size of the organization can be divided into two groups. The use of HRM trends is not related to the size of the organization, i.e. it is not possible to attribute their greater or lesser use in small (or large) organizations. This group includes Hybrid work model, Work in metaversion, Flexible working hours, Job rotation and Work sharing. However, in the case of 5 trends, the rank correlation proved to be statistically significant. Specifically, these are Talent management, On-boarding, Social networking platforms, Work from home and Remote working. In all cases, this correlation is negative and small, i.e. we observe a slightly higher employment of these 5 human resources trends in larger organizations. Based on the above results, research hypothesis H1 cannot be confirmed. When examining the research hypothesis separately for distinct human resource trends, we were able to affirm the associations.

Furthermore, we examined the connection between the rate of utilization of human resources trends and employee turnover as one of the performance indicators. Employee turnover has increased in the past two years in the case of 64.13% of organizations. We present the results in Table 3.

Table 3. Results of correlation analysis (Kendall's coefficient) - research hypothesis H2

HRM trends	r_K
Talent management	0.0764
On-boarding	0.0327
Social networking platforms	-0.0354
Hybrid working model	0.0168
Work in metaversion	0.0270
Work from home	0.0128
Remote working	0.0376
Flexible working hours	0.0396
Job rotation	0.0837
Sharing of work	0.0524

* statistically significant at the significance level $\alpha = 5\%$

Source: own work (2023)

In none of the 10 scenarios did a statistically significant correlation emerge between the implementation of distinct human resource trends and the evaluation of employee turnover. Based on the correlation analysis outcomes, the affirmation of the second hypothesis cannot be substantiated.

4. Discussion

Human resource management and its trends have a significant impact on work performance and the overall results of the organization. In today's dynamically changing business climate, it is crucial for organizations to adapt to new trends and focus on improving employee engagement and satisfaction. Employees who are engaged tend to perform better and contribute to increased productivity, innovation and lower recruitment and retention costs. Implementation of modern technologies and human resource management systems enable better management, coordination and monitoring of employee performance and human resource management processes in the organization. This could lead to increased efficiency and improved quality of human resource management in the organization. As part of the correlation analysis, we did not confirm the formulated hypotheses regarding the relationship between the rate of use of human resources trends and the size of the organization and employee turnover. Despite this, partial connections were confirmed, that is, trends in human resources that have the potential to be employed independently of the size of the organization and employee turnover. These trends are social network platforms used in the field of HR, remote working, working in meta versions, and talent management.

There are many modern human resource management systems in use today. Renowned studies in the field of HR trends and digitization focus on the following systems (Mitrofanova et al., 2019; Nazarov et al., 2020; Yadav, 2020):

- Cloud Human Resource Management Systems (HRMS) - enable employee management and records in the cloud, allowing access to information from any location and device.
- Knowledge sharing systems - support the sharing of information and knowledge between employees and allow them to easily access information resources.
- Data analysis - modern human resource management systems include data analysis tools that allow employers to analyze and compare various employee data.
- Performance management systems - allow employees and their supervisors to track and evaluate employee performance in real time and assist in setting goals and monitoring their achievement.
- Process automation systems - these systems help employers automate and streamline various processes and tasks, such as time management and employee attendance.
- Mobile applications for human resources management - these applications allow employees and managers to access information about employees and manage the provision of their work using mobile devices.
- Employee Appraisal and Development Systems - these systems assist in the appraisal and development of employees and ensure that employees have opportunities for learning and development.
- Virtual employee tests and games - modern human resource management systems use virtual employee tests and games to increase interest in work and create a positive work atmosphere.

Conclusion

Modern times also bring progress in the field of human resources management. If the organization wants to be successful, it must incorporate new ways, methods, techniques, tools and technologies in the management of human resources. Currently, in an era marked by the effects of the pandemic crisis, the energy crisis and geo-peninsular conflicts, every single area in the company undergoes constant development and is subject to change. The consensus among the authors is that the effectiveness of organizations is substantially influenced by their human resources, which also wield the power to determine success or eventual downfall. Companies are compelled to swiftly pivot towards an innovation-centric approach and refine processes within human resource management. Failing to react with agility and pragmatism can bear catastrophic repercussions. Deliberation is warranted regarding the current relevance of different trends, given that certain trends might not be universally applicable, while simultaneously endorsing and augmenting novel trends. The array of challenges currently confronting businesses must be met head-on in order to survive within the global marketplace. Organizations should embrace a synthesis of both global and local best practices in human resource management. The contribution of the examined study resides in furnishing a substantial framework for juxtaposing human resource management strategies among distinct organizations.

The Relationship Between Quality of Work Life and Job Satisfaction: Practical Perspectives

Daniela Bertová^{1,*}, Nella Svetozarovová¹, and Jana Cocul'ová¹

¹ University of Presov, Department of Management, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The definition of the quality of work life remains open to interpretation, leading to different research approaches among authors. Despite the lack of a precise definition, it is commonly understood as the employees' perceptions of crucial aspects of their work, such as salary, working conditions, relationships with colleagues, job security, and the equilibrium between work and personal life.

Purpose of the paper: This research primarily aims to explore the correlation between the soft aspects of the quality of work life and job satisfaction. Moreover, it seeks to analyze how the age of employees might influence their perception of individual criteria concerning the quality of work life, and whether such criteria exhibit any connections with the marital status of the participants in the designated sample.

Methods: A total of 139 individuals employed in the automotive industry in the Žilina region participated in the research. The demographic analysis revealed that the majority of respondents were males (88.5%), the most represented age group was between 27-39 years (47.5%), and a considerable percentage (68.4%) of participants were married.

Findings & Value added: The results of the research provided evidence that by increasing employees' salaries and providing benefits, their overall job satisfaction can be positively impacted. Moreover, the study highlighted that employees belonging to different age groups have distinct perceptions of specific elements related to the quality of work life, and interestingly, the family status of employees did not play a role in influencing their perception of these criteria.

Keywords: quality of life, quality of work life, job satisfaction

JEL classification: M12, O15

1. Introduction

Over the past few years, human resources departments have shifted their attention towards prioritizing quality work life and job satisfaction. Their main objective is to ensure employees' satisfaction, engagement, loyalty, and efficiency simultaneously. Achieving this goal demands more than just offering a competitive salary and benefits package.

The quality of work life has been a subject of focus since the latter half of the 20th century. In recent years, there have been notable endeavors to establish standardized procedures and tools for measuring not only the quality of work life but also the quality of work, workplace, and overall employment conditions.

Just like the broader concept of quality of life, a consistent definition for the quality of work life is yet to be established. In academic literature, it is commonly referred to as QWL, and it is also associated with related terms *such as the quality of employment, quality of work, good work, and decent work*.

The authors Boisvert and Morton played a pivotal role in attempting to define QWL in 1977. Boisvert's definition described it as "a collection of favorable consequences arising from an individual's work life, with positive impacts on the individual, organization, and society" (Boisvert, 1977; in Sojka, 2014). In contrast, Morton viewed the quality of work life as incorporating "all imaginable aspects of work ethics and working conditions" (Morton, 1977; in Sojka, 2014). Considerable attention is given to objectively evaluating working conditions, capturing workers' expressions of contentment and

* Corresponding author: daniela.bertova@unipo.sk

discontentment, and analyzing social cohesion and stability (Stefana et al., 2021). Throughout the year, several research studies have underscored diverse aspects of QWL - as discussed by Lee (2023), Nauman et al. (2023), and Glaveli et al. (2023) - with a specific focus on the conceptual framework related to fulfilling different needs. Nonetheless, recent trends indicate that the quality of work life is primarily influenced by how employees subjectively assess and perceive their employment within a company. (Stefana et al., 2021).

According to Díaz-Chao et al. (2016), the literature presents two distinct perspectives on the quality of work life. The first perspective is objective and relates to the attributes and features of the working environment, encompassing factors like safety, technology, management systems, organizational processes, and, importantly, salary assessment. The second perspective, on the other hand, is subjective, centering on employees' preferences and their perception of fulfillment.

1.1 Quality of work life criteria

The quality of work life is determined by a range of criteria and characteristics, as acknowledged by numerous authors. To provide an overview of these factors, we present a table (Tab. 1) illustrating the distribution according to several prominent authors and researchers.

Table 1. The quality of work life criteria - an overview according to the authors

Author	Quality of work life criteria
Walton (1980)	<ol style="list-style-type: none"> 1. Adequate and fair remuneration 2. Safe and healthy work conditions 3. An immediate opportunity to use and develop one's skills at work 4. The possibility of continuous growth 5. Social integration in the organization 6. Guarantee of constitutional rights in the organization 7. The relationship between work and life expectancy 8. Social relevance of work life
Muftah & Lafi (2011)	<ol style="list-style-type: none"> 1. Physical factors 2. Psychological factors 3. Social factors
Jay (2014)	<ol style="list-style-type: none"> 1. Hard characteristics (they cannot be influenced - e.g. company loyalty, job content) 2. Soft characteristics (they can be influenced and changed - salary and benefits)
Bashir (2018)	<ol style="list-style-type: none"> 1. Work-life balance 2. Working conditions 3. Salary and benefits 4. Nature of work 5. Social integration and social relations at the workplace 6. Career growth and development

Source: own work according to Sojka (2014)

1.2 The relationship between the quality of work life and job satisfaction

Several research studies have affirmed the existence of a connection between the quality of work life and job satisfaction, examining these variables from different perspectives. Significant contributions in this area were made by Hogenelst et al. (2022), Javanmardnejad et al. (2021), Anita (2021), Fabry et al. (2022), Bogoviz et al. (2022), Glaveli et al. (2023), Kim et al. (2021), and Kortman et al. (2021). Despite the diverse industries in which these studies were conducted, encompassing tourism, automotive, steel, and healthcare sectors, all the mentioned research consistently confirmed a substantial relationship between the quality of work life and job satisfaction. Furthermore, these studies highlighted that an overall positive quality of work life has a direct impact on enhancing employee satisfaction with their work, and both factors are instrumental in achieving high employee productivity.

2. Methods

To facilitate the research, the questionnaire was divided into two distinct parts. The first section focused on gathering demographic and fundamental data about the participants, such as gender, age, marital status, highest education attained, and years of experience. The second part of the questionnaire comprised a set of items dedicated to evaluating both the quality of work life and job satisfaction. This section was carefully crafted by amalgamating and adapting items from established questionnaires, namely Walton's (1980) Quality of Work Life Questionnaire and the Minnesota Satisfaction Questionnaire. (MSQ) (Pio, 2021).

The credibility and consistency of standardized questionnaires are grounded in their validation through previous research. For our research, we opted to include only relevant items from these questionnaires that were best suited for achieving our research objectives.

The questionnaire research employed a variety of mathematical and statistical methods for evaluation. Descriptive statistics such as frequency, minimum, maximum, average, and standard deviation were utilized. Additionally, the reliability of the data obtained from the respondents, considering the variations between them, was assessed using the Standardized Cronbach's alpha method. The calculation of Cronbach's alpha for the entire scale yielded a value of 0.95, signifying sufficient internal consistency of the data and affirming its reliability for further investigation.

The hypotheses were evaluated through two statistical methods: regression analysis was employed to investigate the impact of soft characteristics of the quality of work life on job satisfaction, while a MANOVA test was conducted to assess whether employees' age influenced their perception of individual criteria of the quality of work life and whether these criteria were associated with employees' marital status in the sample.

3. Results

The research sample included 139 employees from the automotive industry in the Žilina Region. Data collection took place between January 2023 and March 2023, using the method of non-random random sampling. Regarding gender, the sample comprised 88.5% men ($N = 123$) and 11.5% women ($N = 16$). The two largest age groups were employees aged 27 to 39 (47.5%, $N = 66$) and employees aged 40 to 50 (24.5%, $N = 34$). Another aspect investigated during the research was the marital status of the respondents. The majority were married - 68.4% ($N = 95$), while 30.2% ($N = 42$) were single employees. In terms of education attained, 43.2% held a secondary school degree ($N = 60$), and 56.8% had completed university education ($N = 79$). Concerning the number of years of service, 61.9% of employees had worked in the companies for an average of 0 to 5 years ($N = 86$).

The Excel program with the XLSTAT add-on and the statistical program STATISTICA were used to test the established hypotheses. Statistical significance was verified for all tests based on the resulting p -value at $\alpha = 0.05$.

3.1 Measuring the quality of work life

Analyzing the average ratings of the respondents across 28 quality of work life items, it was found that the overall perception of work life quality was positive among the employees in the sample, with up to 123 (88.5%) expressing overall satisfaction. Notably, the criteria receiving the highest evaluations were the social relevance of work life ($M = 4.47$), social integration in the organization ($M = 4.35$), and constitutionality ($M = 4.19$). Conversely, the criteria rated with the lowest satisfaction were the relationship between work and total life expectancy ($M = 3.51$) and adequate and fair remuneration ($M = 3.87$).

3.2 Measuring job satisfaction

Based on the responses collected from the individual job satisfaction subscales, we can determine the ones with the highest and lowest average ratings. The aspects of job stability ($M = 4.53$; $SD = 0.58$), working conditions ($M = 4.50$; $SD = 0.67$), and workplace relations ($M = 4.39$; $SD = 0.71$) received the highest ratings. On the other hand, aspects such as material rewards ($M = 3.51$; $SD = 1.01$), recognition ($M = 3.78$; $SD = 0.98$), and career growth ($M = 3.86$; $SD = 0.87$) were rated the lowest. It is worth noting that despite the lower ratings, these subscales were still positively evaluated by the respondents, and the employees expressed satisfaction.

3.3 Hypothesis testing

Based on the defined research goal, three hypotheses were postulated.

H1: There is a statistically significant relationship between the soft characteristics of the quality of work life and the overall job satisfaction of employees.

To examine this hypothesis, we integrated salary and benefits items into the soft characteristics category (according to Sojka's definition from 2014). Additionally, we assessed overall job satisfaction by calculating the average of 11 items defining the respondents' contentment with their job.

Table 2. Descriptive statistics of variables for hypothesis 1

Item	Number (n)	Min.	Max.	Average	STD
Total job satisfaction	139	2	5	4.05	0.50
Soft characteristics of work life quality	139	1	5	3.87	0.77

Source: own processing

At the α (0.05) significance level, we tested the null hypothesis against the alternative hypothesis through regression analysis.

Figure 1. Regression analysis of hypothesis 1

Source: own work

Table 3. Evaluation of regression analysis of hypothesis 1

r	0.6994
R²	0.4891
p - value	1.01E-21
sm. an estimate mistake	0.36

Source: own work

The data presented in Figure 1 indicate that the coefficient of determination (R^2) achieved a value of 0.4891 (48.91%), reflecting a notable closeness between the variables. As per the correlation matrix, the correlation coefficient (r) was determined to be 0.6994, pointing to significant tightness between the variables. Additionally, the positive paired correlation coefficient ($r > 0$) indicates a direct linear relationship between the variables, meaning that higher values of one variable (soft characteristics)

correspond to higher values of the second variable (overall job satisfaction). The p-value calculation demonstrated the statistical dependence between the variables (<0.0001).

The findings indicate a statistically significant relationship between the soft characteristics of the quality of work life and overall job satisfaction among employees in the sample. Improving employees' salaries and benefits is likely to enhance their overall job satisfaction, potentially resulting in increased work efficiency and, importantly, higher company turnover.

H2: There is a statistically significant relationship between the individual criteria of the quality of work life and the age of employees.

To examine the second hypothesis, we utilized the mean value of individual quality of work life criteria items and employees' age demographic data. The corresponding distribution is displayed in Table 4.

Table 4. Descriptive statistics of variables for hypothesis 2

Age category		18 - 26 years	27 - 39 years	40 - 50 years	51 years and more
Number (n)		25	66	34	14
Relative frequency (%)		17.99	47.48	24.46	10.07
Average Value of answers as per individual criteria of work life quality	Salary	3.60	3.78	4.22	3.93
	Working conditions	3.94	3.87	4.21	3.97
	Using own abilities	3.99	3.89	4.27	3.93
	Career growth	3.82	3.77	4.29	4.07
	Social integration	3.56	3.62	4.13	3.98
	Constitutionality	3.97	4.05	4.29	4.07
	A work – life balance	4.10	4.01	4.35	4.00
	Social relevance	4.34	4.49	4.62	4.25

Source: own work

The findings indicate that the age group of 40-50 years (n=34; 24.46%) received the highest ratings across all criteria. To test the hypothesis at the α (0.05) significance level, we employed multivariate analysis of variance (MANOVA), which is well-suited for comparing multivariate sample means. The Wilks criterion, widely utilized in practice, is presented in Table 5.

Table 5. Verification of individual criteria of the quality of work life depending on the age category of employees using the MANOVA test (Wilks' test)

λ	0.742
F	1.681
F	1.547
p-value	0.025

Source: own work

Legend: Lambda (λ) = result value of Wilks test; F = the resulting F value of the MANOVA test; |F| = critical value of test criterion F; p- value = resulting p-value

The results presented in Table 5 demonstrate that the Wilks' lambda value of the test (0.742) falls within the specified range of values for the given test (0-1), signifying slight differences in the mean vectors. Additionally, the calculated F value (1.681) exceeds the critical value (1.547), and the resulting p-

value (0.025) is less than the established significance level α (0.05). As a result, we can assert with confidence that a statistically significant relationship exists between the individual criteria of work life quality and employees' age. This indicates that employees from different age categories perceive the individual criteria of work life quality differently. Among the respondents, those aged 40-50 demonstrate the most favorable perception of the quality of work life, achieving the highest evaluations in all areas. The outcomes imply that younger employees tend to assess the quality of work life criteria with a lesser degree of satisfaction when compared to older employees. The most notable variations in evaluations across age categories are evident in salary, social integration, and career growth. Consequently, the findings suggest that the perception of satisfaction with these work life criteria undergoes the most substantial changes as employees' age increases.

H3: There is a statistically significant relationship between individual criteria of the quality of work life and marital status of employees.

For the purpose of testing hypothesis 3, we assessed the responses to the listed items associated with individual criteria of work life quality, in addition to considering the demographic data regarding employees' age. The key distribution is presented in Table 6.

Table 6. Descriptive statistics of variables for hypothesis 3

Marital status		Single	Married
Number (n)		42	95
Relative frequency (%)		30.66	69.34
Average Value of answers as per individual criteria of work life quality	Salary	3.64	3.96
	Working conditions	3.89	4.01
	Using own abilities	3.89	4.05
	Career growth	3.76	4.02
	Social integration	3.58	3.84
	Constitutionality	4.00	4.13
	A work – life balance	4.15	4.09
	Social relevance	4.40	4.49

Source: own processing

Table 6 presents the count of employees as per individual marital statuses (n), their respective percentages (%), and the average scores obtained in individual criteria of work life quality. The results indicate that the "married" marital status category (n=95; 69.34%) received higher ratings in nearly all criteria, except for "work-life relationship" (4.09). To assess the third hypothesis, we utilized the most appropriate method for examining two independent variables (family status) and eight criteria of work life quality (dependent variable). The MANOVA test evaluates the hypothesis of equal mean vectors for different levels of marital status. The widely used Wilks criterion was employed, and the outcomes of the MANOVA test are shown in Table 7.

Table 7. Verification of individual criteria of the quality of work life depending on the marital status of employees using MANOVA test (Wilks' test)

λ	0.903
F	1.711
 F 	2.011
p-value	0.102

Source: own work

Legend: Lambda (λ) = the resulting value of Wilks test; F = the resulting F value of the MANOVA test; |F| = critical value of test criterion F; p-value = resulting p-value

Table 7 results indicate that the Wilkov lambda test (0.903) demonstrates negligible differences in mean vectors, within the permissible range (0-1). Moreover, the calculated F value (1.711) is below the critical value (2.011), and the resulting p-value (0.105) exceeds the predetermined significance level ($\alpha = 0.05$). This suggests that the marital status of employees has no statistically significant association with the individual work-life quality criteria.

4. Discussion

Based on the research conducted, we have arrived at the conclusion that certain criteria hold significant sway over the work-life quality of the respondents in the given sample. These criteria include the social relevance of work life, social integration within the organization, and constitutionality. Conversely, the respondents displayed the lowest satisfaction when it came to criteria concerning the relationship between work and overall life expectancy, as well as adequate and fair remuneration. Regarding job satisfaction, the aspects that stood out with the highest ratings include job stability, working conditions, and workplace relationships. However, material rewards, recognition, and career growth were identified as the aspects that received the worst ratings. The results of hypothesis testing indicate that by increasing employees' salaries and providing benefits, there is a corresponding improvement in their overall job satisfaction. Additionally, the research reveals that employees from different age groups perceive individual work-life quality criteria differently. Notably, respondents aged 40-50 demonstrated the most positive perspective and consistently provided the highest evaluations. Comparatively, younger employees expressed lower levels of satisfaction, particularly in criteria related to salary, social integration, and career growth. These aspects had a significant impact on work-life quality as employees' age increased. Furthermore, the research shows that family status does not influence the perception of individual work-life quality criteria.

Conclusion

The main objective of the presented research was to extend the findings of previous studies in the realms of work-life quality and job satisfaction while exploring the connection between these two variables. Earlier research have already established the existence of this relationship, and among the most significant contributors to this understanding are studies by Kortmann et al. (2021), Belardi et al. (2021), Rai & Verma (2022), Hogenelst et al. (2022), Javanmardnejad et al. (2021), Anita (2021), Fabry et al. (2022), Bogoviz et al. (2022), Glaveli et al. (2023), Kim et al. (2021), and Kortman et al. (2021). Despite conducting research across various industries (tourism, automotive, steel, and healthcare), all the mentioned studies consistently confirmed a positive relationship between work-life quality and job satisfaction. Moreover, they established that overall work-life quality significantly influences employee satisfaction with their work. In light of these findings, we conducted our own sample study to investigate the impact of soft work-life quality characteristics on job satisfaction, as well as the influence of employee age on their perception of individual work-life quality criteria. Additionally, we explored whether the individual work-life quality criteria are related to employees' marital status within the given sample. We can assert that this objective has been successfully achieved, and the paper represents both a theoretical and empirical contribution to this field of knowledge.

Optimizing Patient Hand-off Safety in Healthcare Management: A Theoretical Exploration of Effective Strategies for Managing Healthcare Workers for Increasing Patient Hand-off Safety

Abed Abdel Halim Ahmed^{1,*}

¹ Gaia College, Management Department, 6th Granados St., 90885 Jerusalem, Israel

Abstract

Research background: The integration of lean principles, evidence-based practices, and standardized protocols shows promise in improving healthcare quality and patient safety during care transitions and hand-offs. This approach, including the full Bedside Shift Handoff (BSH), addresses challenges in communication and coordination, leading to smoother transitions across care settings. Effective communication empowers patients, ensuring accurate information transfer and active engagement in their care journey.

Purpose of the article: This article emphasizes the crucial role of patient-centered care and communication in healthcare, particularly during transitions and hand-offs. Patient-centered care empowers individuals to actively participate in their care decisions, leading to improved outcomes. Meaningful discussions during these transitions transform patients from passive recipients to informed decision-makers, enhancing the patient-provider relationship and tailoring treatment strategies.

Methods: This study uses a qualitative literature review to explore hand-off care in healthcare settings a comprehensive search from the last ten years using relevant keywords. Additional articles were found through citation chaining. Selected literature was reviewed, and qualitative thematic analysis identified themes, patterns, and key concepts. Data was continuously compared to refine themes and identify relationships.

Findings & Value Added: This article emphasizes the importance of patient-centered care in healthcare, highlighting its benefits for satisfaction, safety, and empowerment. Combining lean principles, evidence-based practices, standardized protocols, and patient-centered approaches offers a comprehensive strategy for seamless care transitions. The full Bedside Shift Handoff (BSH) enhances communication, empowering patients for smoother transitions. Patient-centered care enables informed decision-making, strengthens relationships, improves care quality, and tailors treatments for better outcomes. The article provides practical implementation strategies, including leadership support, training, technology integration, and continuous education, fostering a patient-centered culture that enhances communication and safety.

Keywords: hospital management, patient-centered care, bedside shift handoff, lean principles in healthcare, evidence-based practices

JEL classification: I10, I12, I18

1. Introduction

Lean management is a comprehensive management system that aims to streamline operations by reducing waste and time-consuming processes, enhancing safety and quality, and lowering costs within the healthcare sector. This approach utilizes various tools, such as Fishbone diagrams and flow charts, alongside operational redesign, to achieve these objectives. Leading health organizations like the National Health Service (NHS) and the Institute for Healthcare Improvement (IHI) have recommended implementing lean concepts in healthcare settings to improve work efficiency (Bertagnolli, 2018).

Lean manufacturing is a production methodology primarily focused on reducing production system times and response times to both suppliers and customers. It is closely tied to the concept of just-in-time manufacturing (JIT), which aims to align production with demand by supplying only ordered goods. It emphasizes efficiency, productivity, continuous improvement, and waste reduction for both producers and

* Corresponding author: abede@hmc.co.il

suppliers of goods. Lean manufacturing builds upon the JIT approach and further emphasizes the elimination of non-value-adding activities to reduce cycle, flow, and throughput times (Abu Bakar et al., 2022). Lean manufacturing is not limited to the manufacturing process alone. It extends to functions outside of production, such as marketing and customer service. Abu Bakar et al., (2022) note that "Lean Manufacturing Design of a Two-Sided Assembly Line Balancing Problem Work Cell,". While JIT manufacturing centers on the efficiency of inventory strategy to eliminate waste and enhance productivity, Lean manufacturing focuses on efficiency within its system setups to reduce cycle, flow, and throughput times, ultimately adding value for customers.

Abu Bakar et al., (2022) suggest that integrating lean management principles into nurse hand-offs holds the potential to create more efficient, safe, and quality-driven transitions of patient care within hospital wards. By standardizing procedures, eliminating non-value-adding activities, and focusing on efficiency and accuracy, healthcare institutions can improve the hand-off process and ultimately enhance patient outcomes. Just as lean principles have transformed various aspects of healthcare, they can play a crucial role in revolutionizing nurse hand-offs for the better.

Patient-centered care is vital for improving patient outcomes and experiences. It tailors healthcare to individual needs, involving patients in decision-making (Ortiz, 2018). Patient-centered care and lean management can be integrated effectively. Aligning operational processes with patient goals, this integration prioritizes patient needs and preferences: 1. Lean's standardization adapts to patients' preferences; 2. Lean eliminates non-essential processes for patient well-being; 3. Lean streamlines administrative processes, reducing wait times; 4. Patient involvement in lean management enhances process improvement; 5. Both emphasize communication, reducing errors in hand-offs; 6. Continuous improvement aligns with patient-centric care; 7. This integration fosters a culture valuing both patients and efficiency.

1.1. Clinical handover

"Clinical handover" is a globally recognized concept that highlights effective communication and information transfer in healthcare settings. It's known by different terms like "handoff," "transition of care," and more. Essential for patient shifts and care stage changes, it involves exchanging patient information and responsibility among healthcare providers (Abraham et al., 2016). This is crucial during transfers between units or shifts, ensuring seamless care continuity. The varied terminology reflects the process's complexity. 'Report' focuses on content exchange, while 'Handoff' implies a shift in care responsibility. Despite the terms used, clinical handovers are vital for patient safety and continuity. They facilitate effective communication among providers and underscore the need for standardized practices for optimal outcomes. Handoffs encompass transferring information, responsibility, and control among care providers. They're a widespread activity with clinical and organizational significance (Abraham et al., 2016). "Ubiquitous" highlights their prevalence among clinicians, bridging patient information exchange at all hospital levels. Designations like 'sign-out' imply temporary delegation of authority during shifts, indicating different responsibilities. For instance, patients can be handed off without formal sign-out, indicating no formal responsibility transfer. Practitioners emphasize knowledge exchange for patient outcomes (Bowersox, 2016). Researchers study ineffective handoffs and their consequences, including adverse events and safety risks (AHRQ, 2014). Handoffs are pivotal for continuity of care (Criscitelli, 2013) and hold clinical and organizational significance (Abraham et al., 2016).

Patient transfers in clinical settings, such as from the Intensive Care Unit (ICU) to the Emergency Department (ED), are common but not without risks. These transitions introduce the potential for errors, miscommunications, and disruptions in patient care. Nurse handoffs, which include shift reports and care transitions, are frequent occurrences in healthcare facilities. High patient turnover rates, often 40% to 70% daily, coupled with approximately 2 million annual transitions in mid-size hospitals, underscore the prevalence of these handoff situations. It is essential to recognize that these transitions involve the transfer of care responsibility, making them a focal point for organizations prioritizing patient safety and care effectiveness, as emphasized by The Joint Commission and the Agency for Healthcare Research and Quality (AHRQ) (AHRQ, 2014; TJC, 2017)

Despite recommendations, substandard hand-offs continue due to unstandardized processes, missing information, and lengthy procedures. This results in negative consequences like delayed care, inadequate treatment, adverse events, longer stays, avoidable readmissions, costs, inefficiency, and patient and caregiver dissatisfaction (Ayaad et al., 2019). A review conducted in 2016 indicated that four main

obstacles to efficient hand-offs are communication difficulties, social environment, language barriers, and physical environment (Colvin et al., 2016).

Medical errors are a grave concern in healthcare, leading to death and injury. Insufficient hand-off communication is a key contributor to patient harm and mortality (NHS, 2016). The Joint Commission highlights inaccurate hand-offs as a factor in patient harm (TJC, 2012). Hospital adverse events affect around 9% of patients, with hand-off failures contributing to 35% of errors (Patel et al., 2015). Medical errors cause up to 98,000 hospital deaths yearly. In 2016, 251,000 preventable deaths resulted from medical errors, ranking it as the third leading US cause of death (Makary & Daniel, 2016). In response to the many patients being harmed and the costs following that, healthcare organizations realized that event reporting and learning from errors would improve the healthcare system and lead to patient safety, i.e., preventing adverse events for patients (Aspden et al., 2014).

Adverse events can lead to great human suffering not only for patients, but also for their relatives and for the healthcare staff. Health organizations are also negatively affected, causing extended hospitalization, disability at release, or both. The financial costs associated with medical errors further underscore the significance of this problem. The estimated costs due to adverse events caused by drugs were \$5.6 million in 1997 (Bates et al., 1997), and by 2010, these costs were estimated to range up to \$19.5 billion annually in the United States (Milliman, 2010). In British hospitals, adverse events led to costs of £290,268 (Vincent et al., 2001). The costs related to adverse events in Swedish hospital care increased from 185.7 million SEK in 1995 (Soop et al., 2009) to over 11 billion SEK in 2013 (SALAR, 2014).

Researchers understand now that the information exchange process during hand-off communication is complex and despite considerable advancements in technology and skillfulness in healthcare, there are multifactorial influences that can impact hand-offs play out (Ernst et al., 2018). There is limited structure of communication, there are multiple communication approaches (Benham-Hutchins & Effken, 2010), a strong time constraints (Trovó et al., 2021), interruptions and distractions during hand-off (Hedberg & Larsson, 2004), lack of hand-off training (Patterson et al., 2004), and bottlenecks in exchanging shifts, leading to an inability to ensure the receiver comprehends (Calleja et al., 2011). Furthermore, patient transfers often become a multifaceted experience as multiple transfers can occur within different settings during a single hospital stay (Bunn, 2007).

1.2. Suggested solutions

In this paper we will claim, that from a theoretical point of view, there is a way to Ward-Management of the healthcare staff's attitude toward patient safety that can be minded safety culture, improving safeties, reduce costs, save time, and improving the patient experience with a better rounding, team assignments, and handoff procedures.

The transfer of patients within the healthcare system should, ideally, entail a fast, secure, convenient, and efficient motion from one level of care or setting to another, providing seamless care and promoting the continuity of care (Naylor, 2000). Various strategies to improve hand-offs are evident in the literature, including: 1. Standardization of Hand-offs: Using standardized protocols enhances communication by ensuring consistent conveyance of crucial information during care transitions. 2. Clinical Training: Equipping healthcare professionals with effective hand-off skills through comprehensive training facilitates smoother transitions and accurate information exchange. 3. Improving Environment: Creating a conducive environment by minimizing interruptions, providing suitable settings, and reducing noise contributes to successful information transfer (Colvin et al., 2016).

Utilizing evidence-based processes and tools is vital for successful hand-offs. Research indicates positive outcomes of evidence-based practices, including: 1. Reduced Hand-off-Related Problems: Evidence-based processes lowered hand-off problems from 25.8% to 7.9% ($P < .05$). 2. Higher Compliance: Incorporating evidence-based tools increased compliance rates from 86% to 96% ($P < .05$). 3. Clear Transition of Responsibility: Evidence-based tools facilitated smoother responsibility transition, reducing misunderstandings. 4. Fewer Interruptions: Evidence-based practices reduced interruptions during hand-offs from 84% to 90% ($P < .05$). 5. Enhanced Satisfaction: Integrating evidence-based approaches improved overall satisfaction from 55% to 70% ($P < .05$) (Colvin et al., 2016).

In the literature, various strategies to enhance hand-offs have been identified. These include: 1. Standardization of Hand-offs: Implementing standardized protocols for hand-offs has shown promise in improving communication. This approach ensures that essential information is consistently conveyed during the transition of care; 2. Clinical Training: Providing comprehensive training to healthcare

professionals on effective hand-off practices can lead to better communication and smoother transitions. Proper training equips them with the skills necessary for accurate information exchange; 3. Improving Environmental Factors: Creating an environment conducive to effective hand-offs is crucial. Factors such as minimizing interruptions, providing suitable physical settings, and reducing noise can contribute to successful information transfer (Colvin et al., 2016).

A study in a pediatric hospital aimed to enhance hand-offs in a post-anesthesia care unit. The intervention involved sending and receiving teams, utilizing standardized tools. Results showed improved information transfer (49% to 83%), higher satisfaction scores (36 to 44), and shorter hand-off duration (4.1 to 3.5 minutes) (Caruso et al., 2015). The study recommended using standardized tools and a team-based approach for more effective OR-to-PACU hand-offs. Another study aimed to establish the role of nurse-led safety debriefing in fostering a culture of safety during obstetric emergencies. The implementation of a standardized protocol and a formal debriefing course for senior nurses resulted in the identification and resolution of improvement ideas and enhanced working processes (Tirelli & Colpa-Lewis, 2017).

Moreover, shifting from a blame-and-shame perspective to a systemic viewpoint when addressing errors has been suggested. Creating a safety culture involves designing systems that prevent, detect, and minimize hazards and errors. This demands significant efforts within the healthcare system (Reason, 2000). Transforming the healthcare staff's perspective and safety practices is essential for a lasting improvement in safety culture (Longo et al., 2005). Therefore, understanding how to foster a culture of safety based on understanding of how accidents and threats to patients arise is crucial for enhancing patient safety (Nordin, 2015).

Priority in healthcare should focus on strengthening information exchange procedures during hand-offs. Despite its challenges and time-consuming nature, Bedside Shift Hand-off (BSH) is increasingly seen as the gold standard and recommended by national patient organizations (AHRQ, 2014). While BSH aims to ensure safe continuity of care by communicating essential patient data, Galatzan and Carrington (2022) emphasize its primary purpose, highlight that when healthcare teams prioritize safety in hand-offs, it can occupy a significant portion of the workday (19.3% to 29%), impacting workload. BSH's benefits include reducing harmful events and enhancing communication (Winebarger, 2022), but its prevalence as a ubiquitous and organizational activity (Abraham et al., 2016) warrants further examination to determine if it's the most effective way to communicate critical patient information and responsibility (Criscitelli, 2013).

1.3. Communication

Communication is crucial for patient safety in healthcare, especially in Clinical Hand-offs (TJC, 2012). Hand-off communication involves conveying patient-specific information between caregivers to ensure continuity of care (Sears et al., 2014). A Joint Commission report revealed that communication failures were a leading cause of sentinel events from 1995 to 2006, and Over 60% of adverse events since 2006 are linked to poor healthcare communication (JCCTH, 2010). The World Health Organization identifies communication failures as a major cause of adverse events (WHO, 2007). TJC's study indicated that 70% of serious medical errors stem from hand-off communication breakdowns. Poor handoff communication results in errors, inconsistent care, and death. Roughly 65% of sentinel events involve communication issues, and more than 80% of healthcare errors stem from communication breakdowns (TJC, 2017). The expanded number of hand-offs communication creates possible problems based on message errors or information deletions during the handoff communication process. In Australia, clinical handover occurs around 7,068,000 times annually. Hand-offs Communication failures are listed among the top factors contributing to sentinel events in Australian public hospitals (ACSQHC, 2010).

Bowersox (2016) stated that Hand-off communication must guarantee the continuity of the patient care, when control of, or responsibility for, the patient passes from one health professional to another, and important information about the patient are exchanged. The World Health Organization claims that an effective clinical handover can reduce the risk of communication failures between healthcare clinicians (WHO, 2007). Swedish healthcare organizations aimed to enhance patient safety by addressing common areas of patient injury like falls, infections, and errors. This systematic approach initiated proactive efforts, emphasizing patient safety culture (SALAR, 2014). The hand off communication between nursing units remains challenging despite global improvement efforts (Colvin et al., 2016).

Clinicians must communicate effectively through clinical hand-offs for safe, quality care delivery. Adequate communication during nurse hand-offs ensures safe and quality patient care (Abraham et al., 2016). There are four common styles of hand-off mentioned in the literature used between nurses which

are verbal hand-off; tape recorded hand-off; bedside hand-off; and written hand-off. Many studies showed the ability of the use of more than one style during the hand-off with use of structured tools (Anderson et al., 2015)

Emphasizing information responsibility in hand-off communication is key. The frequency of data transmission highlights the need for improvement. Crucial patient details must be communicated to ensure confident care transitions. Nurses' perception influences continuity of care; a robust process enhances responsibility perception. Effective hand-offs face challenges, including interpersonal skills and caregiver experience. Clear communication of essentials is vital for receiving nurses' confident care assumption. Nurses' recognition of their role reinforces accountability and patient awareness (TJC, 2012).

Bunn (2007) explores patient transitions from intensive care to hospital wards, focusing on ward nurses' experiences and challenges. Similarly investigates ICU-to-ward transfers, studying patient, family, and provider experiences, communication dynamics, adverse events, and process enhancement opportunities. The blurred boundaries between units create stress for staff and affect patient experiences. Inadequate communication about patient movements complicates bed allocation decisions. Ward nurses are often unprepared for ICU patient admissions, leading to resource challenges and family tension. Delays in transfers stem from staffing shortages, unplanned transfers, and discharge documentation delays. Proactive ward planning is crucial but often lacking due to bed shortages. Bunn (2007) also highlights ICU bed scarcity and the need for efficient utilization. The study further details the current transfer process to the ward, emphasizing protocols, existing transfer documentation, and factors influencing discharge or transfer delays. This definition underscores the specialized nature of intensive care and its focus on managing patients with life-threatening or potentially life-threatening conditions. It emphasizes recovery potential and acceptable quality of life while highlighting the specialized expertise and facilities essential for supporting vital functions. The balance between resource allocation and patient benefit is emphasized (Bunn, 2007).

Communication tools in healthcare primarily focus on defining the content of hand-off communication (Thomas & Donohue-Porter, 2012). This has led to standardization efforts and tools like templates and checklists (Staggers & Blaz, 2013). Structured hand-off procedures are discussed to improve care consistency, patient safety, and standards (Street et al., 2011). Yet, consensus on content and structure standardization remains limited (Staggers & Blaz, 2013).

1.4. BSH

In Galatzan and Carrington's (2022) research, the sample consisted of one nurse giving and one receiving the hand-off (n = 19). 5 bedside and 5 nonbedside hand-offs were audio recorded and analyzed using content analysis. The hand-off overall contained 34.7% of the data, 51.7% of the information, and 13.6% of the knowledge. Compared with the bedside hand-off, the nonbedside hand-off contained a substantially higher percentage of data and less information. The percentage of knowledge communicated in the nonbedside and bedside hand-off was low at 13.6% and 13.7%, respectively. They conclude that the data compared with the knowledge in the hand-off places nurses at greater risk of experiencing cognitive lapses due to cognitive overload. Staggers and Jennings (2009) studied hand-offs in various formats: audio tapes, face-to-face, and BSH, identifying key content themes. They found that 33% involved clarifying details, 30% conveyed factual patient information, 25% included nursing actions and decisions, and 13% focused on teamwork and transition smoothing.

When a nurse understands all aspects of the patient's care, it allows the nurse to care for the patient in a competent manner (Hall, 2005). The goal is that the hand-off communication procedure must complete the following expectations (TJC, 2012): 1. communication between the giver and the receiver must create an opportunity for questioning. 2. up-to-date information, including care, treatment, condition, and changes must be communicated. 3. knowledge exchanged must be confirmed. 4. an opportunity for the receiving health care team member to examine any relevant information. 5. interruptions must be avoided.

AHRQ (2014) introduced a checklist for BSH: 1. Introduce and invite patients and families to participate. 2. Open the electronic medical record in the patient's room. 3. Conduct a verbal report covering the situation, background, assessment, and recommendation. 4. Perform a focused assessment of the patient and room (e.g., wounds, IV sites, catheters). 5. Review tasks to be completed (e.g., labs, tests, medications). 6. Identify patient or family needs or concerns.

Nurse Bedside Shift Report (BSR) or Bedside Shift Hand-off (BSH) is a recognized solution in healthcare for its positive impact on patient satisfaction, nursing quality, and safety (Grimshaw et al., 2016). The literature emphasizes BSH's benefits, including improved communication and fewer adverse

events (Winebarger, 2022). Paredes-Garza et al. (2022) conducted a systematic review focusing on ICU nursing professionals to assess the effects of bedside hand-off on patient safety. Covering 2016-2021, the review included 15 articles, revealing BSH's advantages. It enhanced precision, reduced distractions, prevented information loss, and actively engaged patients in their care. Despite potential concerns, the overall benefits of BSH outweighed the drawbacks. In contrast, traditional hand-offs lack consistency and occur in less ideal settings, hindering patient observation during shifts. Winebarger (2022) contends that BSH aligns with the Institute of Medicine's six Domains of Health Care Quality: 1. Safe: BSH minimizes errors and safety incidents. 2. Effective: BSH enhances staff accountability and information consistency. 3. Patient-centered: BSH engages patients, families, and caregivers. 4. Communication: BSH facilitates communication about relevant matters. 5. Efficient: BSH improves care coordination and comprehension. 6. Equitable: BSH supports consistent communication, benefiting patients less familiar with hospital processes.

Despite BSH's recognized advantages, its consistent adoption remains a challenge. A significant portion (51%) of surveyed hospitals noted frequent omission of vital patient details during BSH. AHRQ (2014) Highlight BSH's benefits for satisfaction, quality, and safety. However, low adoption persists even in recommended hospitals. Interviews with nurses and supervisors unveiled five themes: time constraints, adjusted approach, tailored critical content, discussing content in and out of patient's room. These findings underline BSH's real-world complexity and the problem of implementation. They discovered that nurses and supervisors found bedside hand-offs much more time-consuming due to increased thoughtfulness and interruptions. So, they adopted a modified approach, combining in-room and out-room hand-off portions, ensuring successful critical information transfer. Initial rehearsals were sometimes conducted outside the room. Nurses felt certain topics weren't suitable for patient presence. Discussions varied based on illness severity and incoming nurse's familiarity.

The intervention included the use of cognitive and behavioral tools. The goal was to teach strategies and tools to strengthen and develop self-reflection, self-management, and self-regulation in the first phase.

In recent years, the concept of person-centered care has emerged as an extension of patient-centered care. Rooted in philosophy, the term "person" encompasses distinct human qualities such as rationality, self-consciousness, and free will. This definition grants individuals a unique moral status, both for themselves and in acknowledging others (Stewart, 2001). Patient-centered care has emerged as a shift from the previously dominant biomedical and paternalistic approach in healthcare. Originally defined as "someone who suffers," a patient now refers to an individual receiving medical treatment for an illness. This approach addresses vulnerability and dependence inherent in being a patient. Patient-centered care developed in response to limitations of biomedical traditions, aiming to understand patients beyond a biopsychosocial perspective (Ortiz, 2018). The concept was introduced by Michael and Enid Balint in 1969, emphasizing psychological aspects in medical thinking. In summary, a person-centered approach to care places individuals at the core, considering their context, history, family, strengths, and weaknesses. This approach shifts from viewing patients as passive recipients of healthcare to active participants in their own care and decisions (Håkansson-Eklund et al., 2019).

2. Method

This study employs a qualitative literature review research design to explore and synthesize existing literature on hand-off care in healthcare settings. A comprehensive literature search was established. A systematic investigation was conducted using academic databases within the last ten years (e.g., PubMed, Scopus, Web of Science) with relevant keywords (e.g., "Clinical handover"; "handoff"; "hand-off"; "handover"; "communicat"; "transition of care"; "continuity of care"; "intershift"; "shift reports"; "Bedside Shift Hand-off"; "patient-centered care"). Additional articles were identified through citation chaining, and references in selected papers were examined for further relevant sources.

Data collection and analysis: The identified data literature and articles meeting the inclusion criteria were systematically reviewed, and relevant data were extracted. The collected data includes author(s), year of publication, research objectives, methodologies, key findings, and implications for transferring the patient from one medical team to another and from department to department. Qualitative thematic analysis identified themes, patterns, and key concepts within the selected literature. A coding framework was developed to categorize and code relevant information, facilitating the extraction of meaningful insights. The data was continuously compared and contrasted, refining emerging themes and identifying relationships between studies.

Since this research involves the analysis of existing published literature, ethical approval is not required. However, ethical considerations include proper citation and referencing of all sources to maintain academic integrity.

The synthesized findings were presented in a coherent narrative format, highlighting key themes, trends, and gaps in the literature. This review aims to provide a comprehensive overview of hand-off concepts, their implementation, and their impact on healthcare outcomes.

3. Results

The literature review revealed several key findings and themes regarding hand-off care in healthcare settings. It highlights the critical importance of effective hand-off communication, patient-centered care, and integrating lean principles in healthcare settings to improve patient safety, quality of care, and overall healthcare outcomes. Addressing communication challenges and empowering patients through shared discussions are essential to achieving these goals:

1. Clinical handover, also known as "hand-off" or "transition of care," plays a crucial role in healthcare settings, involving exchanging patient information and responsibility among healthcare providers. During patient transfers between units or shifts, it is essential to ensure seamless care continuity. Despite variations in terminology, clinical handovers are vital for patient safety and require standardized practices.

2. Inefficient hand-off processes can lead to substandard transitions and negative consequences, including delayed care, inadequate treatment, adverse events, longer hospital stays, avoidable readmissions, increased costs, inefficiency, and patient and caregiver dissatisfaction. Communication difficulties, social factors, language barriers, and physical environments contribute to these challenges.

3. Ineffective hand-off communication significantly contributes to patient harm and mortality in healthcare. Adverse events resulting from medical errors can lead to human suffering, extended hospitalization, disability, and financial costs for healthcare organizations.

4. Effective communication is vital for patient safety during hand-offs. Communication failures have been identified as a leading cause of sentinel events and adverse events in healthcare. Various communication approaches, including verbal, written, and bedside hand-offs, are utilized, each with advantages and challenges.

5. BSH is increasingly recognized as a gold standard for hand-off communication. It emphasizes engaging patients in their care, reducing errors, enhancing communication, and improving patient safety. However, its adoption remains a challenge due to time constraints and complexity.

6. Person-centered care, an extension of patient-centered care, places individuals at the core of their care, considering their unique context, history, family, strengths, and vulnerabilities. This approach transforms patients from passive recipients to active participants in their care decisions, leading to better experiences and outcomes.

7. Integrating lean principles, evidence-based practices, and standardized protocols can enhance healthcare quality and patient safety during care transitions and hand-offs. Addressing communication challenges and empowering patients through meaningful discussions are essential components of this approach.

8. Strong leadership and training in lean principles, evidence-based practices, and standardized protocols are necessary to effectively implement enhanced healthcare quality and patient safety during care transitions and hand-offs.

4. Discussion

The literature review findings emphasize the importance of effective hand-off communication, patient-centered care, and integrating lean principles in healthcare settings. The synthesis of findings from the literature review highlights the critical need to prioritize effective hand-off communication, embrace patient-centered and person-centered care approaches, and consider the integration of lean principles in healthcare settings. These strategies have the potential to significantly enhance patient safety, improve healthcare quality, and elevate the overall patient experience. Achieving these goals necessitates a concerted effort from healthcare leadership to foster a culture of effective communication and continuous improvement while actively engaging patients in their care decisions. By doing so, healthcare organizations can move closer to the ideal of providing safe, high-quality, and patient-centered care. These aspects collectively contribute to improving patient safety, enhancing the quality of care, and ultimately optimizing healthcare outcomes.

The review underscores that hand-off communication is a linchpin for patient safety. Suboptimal hand-offs can result in adverse events, medical errors, and patient harm. Clear, standardized communication during care transitions ensures that all healthcare providers accurately convey and understand critical patient information. As the review highlights, the consequences of communication failures during hand-offs are substantial, leading to patient dissatisfaction, inefficiency, increased costs, and even mortality. These findings reinforce the urgency of addressing communication challenges in healthcare settings.

The literature review provides evidence of the benefits of BSH, particularly in terms of patient engagement and safety. BSH actively involves patients in their care and empowers them to participate in decision-making processes. This approach aligns with the principles of person-centered care, which recognizes individuals' unique qualities and preferences. Patients transition from passive care recipients to informed decision-makers, leading to more personalized and satisfactory healthcare experiences. However, adopting BSH remains a complex endeavor, as healthcare providers must balance the time constraints of their daily practice with the benefits of this patient-centered approach. Strategies for the successful implementation of BSH need to be explored further.

Person-centered care emerges as a critical theme in the literature review. This approach recognizes that patients are not merely recipients of medical treatment but individuals with their context, history, and specific needs. By adopting a person-centered perspective, healthcare providers can tailor care to the unique circumstances of each patient, fostering stronger patient-provider relationships. This shift from passive to active roles leads to better care quality and more favorable healthcare outcomes. Person-centered care is not limited to specific healthcare settings but has broader relevance across various industries, highlighting the importance of understanding and responding to customer or patient needs.

The review introduces the integration of lean principles, evidence-based practices, and standardized protocols as a comprehensive strategy for enhancing healthcare quality and patient safety during care transitions and hand-offs. This approach addresses inefficiencies and communication challenges by streamlining processes and focusing on value-added activities. Lean principles promote continuous improvement and the elimination of waste, aligning with patient safety and quality care goals. However, successful implementation requires strong leadership and training to ensure that healthcare professionals understand and apply these principles effectively.

Conclusion - FBSH Management and implementation

Our review underscores patient-centered care and communication's vital role in healthcare. BSH goes beyond enhancing safety; it empowers patients to actively engage in their care decisions. Full BSH discussions transform the patients from passive recipients to informed decision-makers, amplifying their voice, preferences, and needs. A person-centered approach to care places individuals at the core, considering their context, history, family, strengths, and weaknesses. This approach shifts from viewing patients as passive recipients of healthcare to active participants in their own care and decisions. This inclusive approach fosters a stronger patient-provider relationship, enhances care quality, and tailors treatment for better outcomes. While implementing BSH presents challenges, its benefits in patient satisfaction, safety, and empowerment are substantial.

Our findings about customer-centricity in healthcare have broader relevance, highlighting the significance of this approach across industries. Active listening, understanding customer needs, and tailored service are crucial for all service providers. Our perspective underscores patient-centered care's transformative effect, promoting patient involvement in decisions for improved experiences, health outcomes, and compassionate healthcare systems.

In conclusion, the integration of lean principles, evidence-based practices, and standardized protocols holds the potential to greatly enhance healthcare quality and patient safety during care transitions and hand-offs. By addressing communication challenges through a comprehensive approach, such as the full Bedside Shift Handoff (BSH), patients can experience seamless transitions between different levels of care and settings. This approach is rooted in the understanding that effective communication makes patients feel fully engaged in their care journey.

Our review emphasizes the pivotal role of patient-centered care and communication within the healthcare system. Patient-centered care not only enhances safety but also empowers individuals to actively shape their care decisions. Through meaningful discussions, patients transition from passive recipients to well-informed decision-makers, with their preferences and needs given due consideration. Adopting a person-centered approach that encompasses the whole individual – including context, history,

family, strengths, and vulnerabilities – fosters stronger patient-provider relationships. This shift from passivity to active participation results in improved care quality and tailored treatment strategies, ultimately leading to better outcomes.

Although implementing patient-centered care presents challenges, its undeniable benefits in terms of patient satisfaction, safety, and empowerment underscore its importance. Therefore, the synergy of lean principles, evidence-based practices, standardized protocols, and patient-centered approaches stands as a comprehensive strategy to ensure smooth and safe care transitions while prioritizing the well-being and active involvement of patients in their healthcare journey.

To implement enhanced healthcare quality and patient safety during care transitions and hand-offs is not easy. Involving patients in decision-making through shared discussions is much harder for the nurse's daily practice. That's the reason why healthcare management must provide strong leadership for patient-centered care and communicate its value to staff. To train healthcare professionals in lean principles, evidence-based practices, and standardized protocols for transitions, outlining communication processes and roles with a focus on effective communication and full patient engagement. By implementing these strategies, healthcare management can enhance communication, patient engagement, and care transitions, ultimately improving healthcare quality and patient safety.

Reality Television Programs Impact on Management

Rivka David^{1,*}, and Dvir Oshri¹

¹ Gaia College, Department of Management, Faculty of Management and Business,
6th Granados St., 90885 Jerusalem, Israel

Abstract

Research background: Motivating employees is a critical aspect of increasing productivity and success in the workplace. Recently, organizations have explored innovative approaches to increasing motivation, including the use of reality television programs as a motivational tool. This research area investigates the potential benefits and disadvantages of incorporating reality TV-inspired strategies in the workplace.

Purpose of the article: This article aims to comprehensively analyze the use of reality television programs as a motivational tool in the workplace. It explores the development of reality shows, emphasizing their significance in the world of management and understanding motivation in the workplace, examines the benefits and potential disadvantages, presents case studies and success stories, suggests practical implementation strategies, and critically analyzes existing research findings.

Methods: The article unifies academic literature from various disciplines, including organizational behavior, psychology, and communication studies. It draws on empirical studies, case studies, and theoretical frameworks to provide an all-around perspective. The research findings and critical analysis are based on a systematic review and synthesis of scholarly sources.

Findings and Value Added: Research findings indicate that reality TV-inspired strategies can positively impact employee engagement, teamwork, and personal development. Provide opportunities for employees to challenge themselves, acquire new skills, and raise their confidence. However, organizations must carefully consider potential drawbacks, such as excessive competition and ethical considerations, to ensure a balanced and supportive work environment.

Keywords: motivation, workplace, reality television programs, employee teamwork, personal development

JEL classification: M0, M1, M12, M14, M190

1. Introduction

Motivation plays a critical role in driving employee engagement and productivity in the workplace. Traditional approaches to motivating employees often focus on financial motivations or performance-based rewards (Murray & Ouellette, 2016) However, in recent years, there has been a growing interest in exploring alternative methods, such as reality television programs, as motivational tools in the workplace (Kowalczyk et al., 2018). This article aims to survey the use of reality TV programs as a means of motivation and their potential benefits and downsides (Biressi & Nunn, 2019). By incorporating elements of competition, collaboration, and personal development, reality TV-inspired creativity has the potential to enhance employee motivation, raise creativity, and improve overall organizational performance (Mazzarella, 2017). This article provides an overview of the concept of motivation in the workplace, explores features of reality television programs (Hochschild, 2012), discusses their potential benefits (Lee & Stapleton, 2019), and highlights key considerations for their operation (Davies & Fisher, 2017). By exploring case studies (Ferris et al., 2017) research findings (Nabi & Krcmar, 2017), and practical strategies (Sherry et al., 2006), this article aims to shed light on the effectiveness and implications of using reality TV as a motivational tool in the workplace.

1.1. A Review: The Meaningful Impact of Reality Television Programs in The World of Management

A review of the various aspects of reality programs provides valuable insights into the elements that make them meaningful in the world of management (Biressi & Nunn, 2019). Reality shows have gained significant popularity over the years and are finding relevance in the field of workplace management (Murray & Ouellette, 2016). One key element that makes reality shows meaningful in the world of management is their ability to simulate real-life situations and challenges (Biressi & Nunn, 2019). Many reality shows are designed to mirror the dynamics of the workplace, such as competition, teamwork, and problem-solving (Lee & Stapleton, 2019). By exposing participants to realistic scenarios, reality shows can provide valuable learning experiences that can be applied to the business environment. (Reeves & Nass, 1996). Moreover, reality shows often emphasize the importance of interpersonal skills and emotional intelligence (Hochschild, 2012).

In the context of management, these skills are crucial for building strong relationships, resolving conflicts, and motivating teams (Lee & Stapleton, 2019). For example, shows like "Survivor" and "The Amazing Race" showcase the significance of effective communication, collaboration, and adaptability in achieving shared goals (Lee & Stapleton, 2019). The lessons resulting from these shows can be applied to improve team dynamics, leadership capabilities, and overall organizational culture (Reeves & Nass, 1996).

Additionally, reality shows provide valuable insights into human behavior and psychology, offering a glimpse into the motivations, ambitions, and reactions of individuals in high-pressure situations (Reeves & Nass, 1996). This understanding can be applied in the workplace to enhance employee engagement, motivation, and performance (Murray & Ouellette, 2016). For instance, shows similar to "Extreme Makeover: Home Edition" demonstrate the power of motivation, insistence, and the impact of supportive environments (Murray & Ouellette, 2016). Managers can draw inspiration from these shows to create motivational programs or initiatives that drive employee productivity and well-being (Reeves & Nass, 1996).

Furthermore, reality shows (like "The Big Brother") often feature diverse participants, representing a range of backgrounds, perspectives, and skills (Stavrova & Siegers, 2014). This diversity highlights the importance of inclusivity and equity in the workplace (Stavrova & Siegers, 2014). It encourages organizations to value and leverage the unique talents and contributions of individuals from different backgrounds, encouraging a culture of diversity and inclusion (Stavrova & Siegers, 2014). By embracing diversity, organizations can attach the collective power of varied perspectives and experiences, leading to innovation and improved decision-making (Stavrova & Siegers, 2014).

In conclusion, a review of the benefits of reality shows reveals several elements that make them meaningful in the world of management (Biressi & Nunn, 2019). The ability to simulate real-life situations, emphasize personal skills and emotional intelligence, provide insights into human behavior, and promote diversity and inclusivity all contribute to the value of reality shows in the workplace (Reeves & Nass, 1996). By leveraging these elements, managers can incorporate aspects of reality shows into their management practices to enhance team dynamics, improve leadership capabilities, and drive organizational success (Lee & Stapleton, 2019).

1.2. Understanding Motivation at the Workplace

Motivation is a complex psychological process that drives personalities to take action, persist in their efforts, and achieve desired outcomes (Hochschild, 2012). In the workplace, motivation plays a crucial role in employee engagement, job fulfillment, and overall performance (Kowalczyk et al., 2018). Traditional theories of motivation, such as Maslow's pyramid of needs and Herzberg's two-factor theory, highlight the importance of meeting employees' basic needs and providing essential motivators for optimal performance (Murray & Ouellette, 2016). However, these theories may not fully capture the dynamics of motivation in modern workplaces. To enhance motivation, organizations need to consider factors such as mastery, purpose, and social connection (Lee & Stapleton, 2019). By understanding the core principles of motivation (Biressi & Nunn, 2019), organizations can design effective strategies to inspire and involve their employees.

1.3. Exploring Reality Television Programs

Reality television programs have gained massive popularity in the entertainment industry (Murray & Ouellette, 2016). These shows typically involve unscripted, real-life situations, competitions, and interpersonal dynamics (Murray & Ouellette, 2016). The unique characteristics of reality TV, such as the element of competition, the development of personal narratives, and the emotional investment of viewers,

make them potentially motivational tools in the workplace (Baruh & Cemalcilar, 2019; Biressi & Nunn, 2019). By incorporating elements such as challenges, teamwork, and personal growth, reality TV-inspired initiatives can create a sense of excitement, engagement, and achievement among employees (Lee & Stapleton, 2019; Mazzarella, 2017). These programs provide opportunities for skill development, learning from failure, and developing collaboration (Kowalczyk et al., 2018; Stavrova & Siegers, 2014). However, it is important to carefully consider the alliance of reality TV elements with organizational values, ethics, and the diverse needs of employees (Davies & Fisher, 2017; Gerbner, 2017).

1.4. The Benefits of Using Reality Television Programs at the Workplace

Employment of reality television programs tactics within workplace area, offers several potential benefits. (Murray & Ouellette, 2016; Lee & Stapleton, 2019) Firstly, these programs can create a competitive environment that stimulates innovation and creativity among employees (Murray & Ouellette, 2016; Lee & Stapleton, 2019). By setting challenges and encouraging healthy competition, organizations can inspire employees to think outside the box, generate novel ideas, and enhance problem-solving skills (Kowalczyk et al., 2018; Stavrova & Siegers, 2014). Secondly, reality TV-inspired enterprises provide opportunities for personal development and growth (Murray & Ouellette, 2016; Lee & Stapleton, 2019). Through challenges, feedback, and mentorship, employees can improve their skills, build confidence, and take on leadership roles (Murray & Ouellette, 2016; Kowalczyk et al., 2018). Thirdly, these programs foster teamwork and collaboration by encouraging employees to work together towards a mutual goal (Murray & Ouellette, 2016; Lee & Stapleton, 2019). By promoting cooperation and communication, organizations can enhance the overall effectiveness of teams and improve outcomes. (Kowalczyk et al., 2018; Stavrova & Siegers, 2014) Lastly, reality TV-inspired initiatives can increase employee engagement and job satisfaction by providing a unique and exciting experience in the workplace (Murray & Ouellette, 2016; Lee & Stapleton, 2019).

2. Methods

The benefits of using reality TV-inspired advantages in the workplace were demonstrated by Methods implied in several case studies and success stories.

One notable example is the research on the effects of reality TV-style competition on teamwork that was undertaken by Chen, Wang and Chang (2020). They used a quantitative strategy and an experimental design with several teams in a genuine business setting. Teams were divided between control and experimental groups, with the latter being exposed to the competition that was modeled after a reality TV show. Surveys and performance measures were used to gather information that was compared between the two groups' collaboration and performance. Although the study shed light on the impact of these contests on partnerships, it's important to recognize the possible limitations of a quasi-experimental design, which could not prove causality with the same certainty as a randomized controlled trial. However, this study added important quantitative data to our knowledge of reality TV-inspired workplace interventions. (Chen et al., 2020).

In a different instance, the impact of reality TV-based games on employee motivation was examined in Johnson and Smith's (2018) study using a quasi-experimental design. Participants in these reality TV-inspired activities were chosen from an organizational environment. Pre- and post-intervention surveys were used to obtain data on motivation levels. Employees took part in games inspired by reality TV as part of the intervention. An investigation of quantitative data was done to look at how motivation levels changed. The findings showed that after the intervention, employee motivation greatly improved. These techniques provided important data on the possibility of treatments motivated by reality television to improve workplace motivation.

In Jaramillo-Sierra and Popa's (2017) research, they explored how reality TV programs may be applied in the workplace as learning settings to improve emotional intelligence. They used a qualitative research methodology for their study, centered on in-depth interviews with employees who had taken part in similar programs inside their companies. They discovered important themes related to the growth of emotional intelligence using thematic analysis. These topics gave insightful information about how reality TV-inspired programming might improve emotional intelligence in a professional setting. Even though the study provided a wealth of qualitative information, it should be highlighted that the absence of experimental manipulation or quantitative evaluation in the research design made it difficult to establish causal links. Nevertheless, this qualitative method helped to grasp the experience aspect of embracing reality TV for professional skill development.

In their case study, Corcoran and Crusco (2015) investigated how reality television may be used to develop leadership skills in a genuine working environment. They used a qualitative study methodology, interviewing participants in leadership training that was influenced by reality TV shows in-depth. Decision-making, communication, and teamwork were among the repeating themes that the researchers discovered through thematic analysis in regard to the development of managerial abilities. Although the participants' experiences were insightfully illuminated by this qualitative approach, there are several major limitations to be aware of, such as the subjectivity of qualitative data and the lack of a control group for comparison. Still, the study provided insightful qualitative information for understanding its influence on leadership development in professional contexts, revealing light on the potential benefits of implementing reality TV-inspired leadership training (Corcoran & Crusco, 2015).

3. Results

Reality television has been employed as a motivating tool in the workplace, and research articles have explored this subject, bringing useful insights into its usefulness and impacts. This section highlights the main research's results while offering a critical evaluation of the subject matter.

1. According to research by Johnson and Smith (2018), employees who took part in competitions based on reality TV revealed greater levels of motivation, excitement, and commitment to their work. These programs' fierce competition generates a sense of excitement and challenge which motivates workers to contribute their best efforts. It is critical to remember that a friendly and collaborative work atmosphere is just as important for fostering employee engagement as competitiveness. Engagement may be increased while creating a supportive and cohesive workplace culture by balancing competitive components with cooperation and shared objectives.

2. Teamwork and cooperation: Strategies influenced by reality television may improve teamwork and cooperation inside enterprises. Incorporating team-based challenges and activities modeled after reality TV formats increased communication, coordination, and collaboration among team members, according to research by Chen et al. (2020). Employee collaboration, utilizing one another's abilities, and performance as a team were promoted by the shared goal and competitive environment.

3. Organizations must take care not to promote a competitive climate that delays collaboration. To prevent the advantages of cooperation from being swamped by individual competitiveness, it is crucial to strike a balance between healthy competition and a supportive team dynamic.

4. Personal Growth and Development: Reality TV-inspired strategies can provide employees with opportunities for personal growth and skill development.

Research conducted by Lee and Jones (2019) revealed that employees who participated in skill-enhancement programs inspired by reality TV formats reported increased self-confidence, improved problem-solving abilities, and a greater sense of achievement. These initiatives allow employees to step out of their comfort zones, acquire new skills, and unlock their potential. However, organizations must ensure that the pursuit of personal growth does not come at the expense of employee well-being. The intense nature of reality TV-inspired challenges may put excessive pressure on employees, leading to stress and burnout. Implementing support mechanisms and prioritizing work-life balance is essential to safeguard employee mental health while promoting personal development. While the research findings generally support the use of reality television programs as a motivational tool in the workplace, it is important to approach the topic critically. Limitations exist, such as the potential for unrealistic expectations, unfair evaluations, and the impact on employee well-being. Organizations must carefully consider these factors and tailor their implementation strategies to moderate potential drawbacks and ethical concerns.

In addition, organizations should provide suitable resources and support to facilitate employee participation and success. This may include training, mentorship, and access to necessary tools or technology. Organizations should also set up a transparent and independent assessment procedure to rate performance and determine winners or rewards. The valuation process will boost confidence and preserve the program's integrity if it is transparent and objective. Tracking the program's development and gathering participant comments are also important. This input may be used to pinpoint problem areas and make changes that are needed to enhance the overall experience. Organizations may effectively employ reality TV-inspired programs to inspire workers, foster cooperation, and encourage positive outcomes at work by implementing these beneficial strategies into reality. (Hirschman & Adcock, 2012)

4. Discussion

The impact of reality TV on workplace dynamics has been thoroughly investigated, and findings have shown a variety of potential effects. We discovered the ways in which reality TV-inspired projects may increase motivation, boost cooperation, and promote personal development among employees by using ideas from a variety of fields, including psychology, sociology, and organizational behavior. The real-world implementation of these strategies has been demonstrated through case studies and success stories from various sectors, highlighting its potency in driving creativity, improving employee happiness, and generating favorable results. We have also covered the methodological approaches, including quantitative and qualitative techniques, utilized to comprehend the impact of reality TV on employee behavior.

This study highlights how essential it is to match company values with reality TV-inspired projects, to maintain open lines of communication, and to provide the tools required to encourage employee engagement. We do, however, recognize that our study has several flaws. Depending on the industry and organizational culture, reality TV's effect on the workplace may differ. To dive into these complexities, further study is required. Moreover, further research is needed to determine the viability of such efforts and their long-term effects, especially in a world where digital connections and distant employment are becoming more common. Investigating possible ethical issues with such systems' implementation, including privacy and fairness, might also be helpful. This may make it easier for businesses to incorporate parts of reality TV into the workplace while maintaining a sense of social responsibility. The current research yet offers a solid basis for comprehending how these tactics might improve workplace dynamics and employee engagement.

In closing, our findings indicate that reality TV-inspired tactics may be successful tools for increasing motivation, cooperation, and employee development in the contemporary workplace when used strategically and in accordance with organizational goals. These observations provide insightful advice for businesses looking for new methods to empower and motivate employees in a continually shifting professional environment.

Conclusion

The use of reality television programs as a motivational tool in the workplace offers both benefits and challenges. Throughout this article, we have explored the concept of incorporating reality TV-inspired elements into the workplace and have examined various aspects, including motivation in the workplace, reality TV programs, benefits, drawbacks, ethical considerations, case studies, practical implementation strategies, and research findings.

The beneficial effects of reality TV-inspired methods on employee engagement, teamwork, and personal development are regularly highlighted by research findings. These tactics can boost employee motivation, encourage friendly rivalry, and encourage teamwork. Case studies of businesses that have successfully implemented initiatives influenced by reality TV show culture show the practical advantages of these tactics for increasing worker productivity, creativity, and leadership development.

Organizations must, however, carefully measure any potential negative effects and moral issues related to the adoption of components from reality TV.

Maintaining trust, morale, and productivity depends on making sure that employees are treated fairly, honestly, and with respect. To address these issues and minimize any harmful effects, transparency, clear guidelines, and continual review are essential.

Organizations wishing to incorporate features from reality TV into their working culture might find advice from practical implementation tactics. Key factors to optimize the advantages and reduce the threats include evaluating organizational preparedness, tailoring techniques to the work setting, offering training and assistance, and creating a positive and supportive atmosphere.

In conclusion, when used intelligently and morally, reality television may be a useful tool for inspiring employees in the workplace. Organizations may tie together the motivating potential and produce favorable results for both their workers and the business as a whole by utilizing the competitive and engaging aspects of reality TV in conjunction with their goals and values.

As a further insight, Organizations should continue to be flexible and focused on the demands and worries of their employees as more research and practical applications are developed. Organizations may develop a workplace culture that encourages motivation, cooperation and personal growth by striking a balance between the excitement and encouragement brought on by reality TV-inspired methods and the welfare and fairness of their workforce.

Abstract

Research Background: The upcoming employees of Generation Z can be a huge enrichment for working processes due their high digital competence., but they show a different view on work-life-balance, working aids, dealing with “old fashioned” work commitments old daily routines. Therefore new working conditions are needed to support all team members. Due to the fact that more than 90% of all entities are SME, the relevance and points of interest for SME are included.

Purpose of the article: Purpose is to identify different approaches between Generation Z and other employees on the work process in SME, and the mutual needs during worklife. These factors are e.g. for Generation Z: Commitment, Authority, Stress (work-life-balance), salary, Technology, or remote work. All solution need also to satisfy long-term or older employees.

Methods: Literature research, including data from 2 surveys of Deloitte (Millennials and Generation Z) and McKinsey (“Time to accelerate” / gender diversity). The survey within Generation Z was done as quantitative survey rolled out as mobile phone application and in total 96 participants complete the survey. Standardized items of expectatitons and personal impressions were evaluated.

Finding and value added: Better understanding of chances and needs for mutual benefit in Enterprises (especially SME). Requirements for onboarding/work/termination. The survey structure enables further surveys in different languages and countries, easily done by own cell phones.

Keywords: generation Z, SME, business processes

JEL classification: J11, J24

1. Introduction

The Generation Z are the upcoming generation of employees, born between 1995 and 2010. Generation Z has grown up in the age of technology and most are "digital natives". Their behavior is shaped by the accelerating development of many areas of life - often positive, as well as by mostly negative stresses (e.g. COVID), with loss of perspectives and fears for the future. Onesto (2022) shows typicals like climate change narrative, economic instability, and injustices and all the consequences of the COVID years.

They are able to be real supporting and valuable team members when it is possible to prepare the propriate working environment and an ongoing commitment. It seems, that members of Generation Z are preferred to be high potentials and possible leaders. But the challenge of leading these employees requires possibly a new behavior and new regulations. Literature research (e.g. Schnitzler (2020), Softgarden (2020) or Steckl (2019) about Generation Z and experiences of different companies, show a massive change in expectations and behavior of this generation. Work life balance and the request towards companies to prepare a proper working environment (part time, open time management, expectations towards colleagues, ...) need new standards from companies.

The needs of this generation are clear different to actual known behaviors, how can companies handle these wide range of culture changes and ensure long time satisfying cooperation. The research is done with a focus on SME, because over 90% of all entities are SME, and these SME are searching for high potential employees and the needs for their integration in the daily business.

1.1 Mental Loads for Generation Z

* Corresponding author: peter.ramharter@wicon.cc

The massive accumulation of crisis lead to emotional and physical overloads influences the views of the Generation Z, inherent dangers of general situations influence work and life. The survey of DELOITTE (2021) shows interesting insights in the mental world of Generation Z, see table 1.

Table 1. Mental Loads of Generation Z - Global Millenium and Generation Z Survey

Theme	Consent
Stress and anxiety are dominating the live – have taken time off	35%
Feel stressed all or most of the time	46%
Employer are doing a poor job supporting the mental health of GenZ and they have concerns for future job prospects and future financial situation	40%
Want to work less in the office, remote work can be the future	22%
A job change is welcome within 2 years	53%
Can imagine to stay with a company for at least 5 years	21%

Source: Deloitte (2021)

1.2 Recruiting of Generation Z

Schnitzler (2020) recommend employer branding focused on positioning the company as an attractive employer by communicating the added value of it offers. This includes all target group-specific communication activities aimed at potential employees. The perceived values as well as the interactions in the recruiting process are directly related to the success of recruiting employees.

Wienenergie (2023) shows one of the first reaction in this thematik from a huge energy supplier. Wienenergie is provider of electricity, heat, cooling, natural gas and other required energy derivates and hold a recruiting event, where more than 60 vacant jobs were filled within 15 minutes.

1.3 Onboarding of Generation Z

Schnitzler (2020) recommend employer branding focused on positioning the company as an attractive employer by communicating the added value of it offers. This includes all target group-specific communication activities aimed at potential employees. The perceived values as well as the interactions in the recruiting process are directly related to the success of recruiting employees.

Softgarden (2020) published the study "How do candidates perceive current recruiting processes?" in 2019. There were 6,589 participants with an average age of 35. With 49%, most of the respondents are employed. 16.4% were students, and trainees.

58% said they had abandoned an application in the past although they were interested in the job. Reasons given included: a complicated application procedure, slow response times from companies (interpreted as lack of interest), an unsympathetic behavior from Recruiters or unpleasant job ads. As a reasonable time between the application and an invitation to an interview, 56.7% stated 1 to 2 weeks.

Companies often need more than 4 weeks to respond, which can be problematic, especially for recruiting experts, as they are not on the market for that long. Preferred ways to apply are emails and online forms, which should take no more than 20 minutes to complete. 84.5% of respondents say that what they experience in the application process influences how they view the employer. Key takeaways from the study are that companies should consider the process quality of the application phase as a factor in perceived job attractiveness.

1.4 Employee retention and motivation to stay

The perceptions and attitudes related to the workplace and the factors that influence employee retention differ by generation, age, and gender according Steckl (Steckl Miriam, Simhäuser Ulla, Niederberger Marlen, 2019). Brademann (Brademann I., Poirr R. 2019) reported an online survey completed by 154 bachelor students concluded that Generation Z has a need for affective commitment. Affective commitment is part of the "three-component model" by Meyer and Allen (1990) and describes that employee want to bind themselves affectively to a company (highest form of attachment). For young employees to be effectively committed to a company, various requirements must be met.

The basic requirements are the must-factors, which are essential for building loyalty. These include Personal development, security, salary, transparency, appreciation. Performance factors influence the continuation of a bond: professional identification, harmony, recognition/appreciation, closeness to the manager, meaningful tasks. For companies to differentiate themselves from the competition, the

excitement factors must be fulfilled: Self-determination, caring, tasks clearly structured, tasks varied, tasks challenging, project work, relationship with supervisor, workplace equipment, positive corporate culture, separation of work and private life.

A second survey, Steckl et al. (2019) completed by 383 students in graduating classes in Germany, yielded similar results. Particularly important were Job security, social support, corporate culture, support in the team, pay, recognition of performance, further training, work content, relationship with the boss. The appreciation of one's own ideas and a clear separation of work and private life were also rated as relevant.

To evaluate the different attraction of SME and bigger Corporations, Hermann (2019) shows an online survey with 19.000 participating professionals and managers asked how to assess the competition for qualified professionals from the perspective of SMEs.

The shortage of skilled workers is the biggest challenge SMEs are currently facing. The reasons why candidates apply to smaller companies are: attractive location, meaningful activity (feeling of making a difference) flat hierarchy (individuality). Candidates who do not apply to SMEs give the following reasons: poorer earning opportunities, higher job security and better additional benefits at larger companies. It is important to build a strong employer brand and to communicate one's own strengths to the target candidates.

The location of SMEs is an important aspect when applying and it is important for SMEs to convince skilled workers who lived in the community to come back after their education. To increase regional commitment.

The advantages of SMEs from the perspective of employees are flexible working hours, relaxed working environment, flat hierarchy, meaningful activity, stability, identification potential and a tight-knight relationship between employees.

1.5 Employees Organizational Commitment

The three-component organizational commitment measure to identify ways for managers to drive personal effort. Based on social exchange theory and survey data, an analysis reveals that perceived organizational support (POS) has strong positive effect on affective commitment, no significant effect on normative commitment and a negative effect on continuance commitment. The findings show that only one component of organizational commitment - affective commitment - has a positive direct effect on the surveyed sales people. The study indicates that job satisfaction has positive effects on both affective and normative commitment, but not significant effect on continuance commitment. (Frank Q. Fu; Bolander and Jones (2009) with their application of Meyer and Allens three-component model).

For organizational researchers and managers, the organizational commitment based on the belief that organizations with committed employees achieve superior long-term performance. An example is given for salespeople, which indicate, that the organizational commitment and the job performance is stronger for salespeople than for nonsales employees. Pierce and Dunham's observation that organizational commitment is more important in jobs, that are complex, require adaptability and demand initiatives. The study cites HR Chally that indicates replacement costs of an experienced salesperson with average performance ranges of 40.000 to 60.000 US\$. The report shows also interesting results where salespeople state „lack of attention from upper management“; „management failures“ and so on, but on the other hand, these salesperson had a high level of commitment to the company, which seems strange.

One possible explanation is, that sales people are simply different to traditional employees. They are independent, self-reliant and typically distal from the organization, like boundary spanners (Singh 1993). They also have great autonomy and empowerment. Allen et al (1990) developed a three-component model consisting of affective commitment, continuance commitment and normative commitment. They define affective commitment based on one's values, normative commitment based on obligations and continuance commitment based on calculations of costs and benefits. These components are differentially linked to variables as antecedents and consequents (MEYER et al, 1993). In the following, the model was tested in a variety of empirical settings, e.g. Bentein (2005), Lok Westwood and Crawford (2005).

Conceptual Model and Results

Figure 1. Conceptual Model and Results to reach commitment to remain employed
Source: Frank Q. Fu et al. (2009)

1.6 WERF (2020) Commitments

Roger van der Werf (2020) see the following main commitments in the relationship between company and employees. Affective Commitment against the company includes e.g.:

- how long want an employee to stay
- Identified to companies objectives
- Satisfied with their working environment (equipment, colleagues,...)
- See high value in the work, working as an ambassador for the company

Opposite to Fu et al (2009) define Werf (2020) a calculatorial commitment. The employees in this phase have the feeling, that they must stay in the company, that means the commitment is not on their own accord, it is a must (e.g. wage in other companies is lower, the same job is not available in other companies (or only far away,...)). These employees have inwardly terminated, but stay in the company.

The normative commitment describes the feeling of the employees, that the company want to work with them, and they should stay in the company. If employees are to high normative commitment, employees avoid to leave (to avoid disasters in the company and guilty at themself). As a resumen of this internal conflict decreases the work power of the overall team.

2. Methods

2.1 Literature

Basic Method was the Literature Recherche to the mentioned topics, mainly publications, surveys and high quality scientific literature, but most of the literature is not specific on SME, but several providing literature were found. To sharpen the results and provide data useful for Generation Z and SME, an anonymous survey was done.

- Target Group „Generation Z“, born between 1995 and 2005 and their attitude towards work life

2.2 Survey

The objective of the research, was to find special needs and restrictions for a proper cooperation with Generation Z in daily routines, mainly in SME. The survey was done by mobile phones, sent out to 260 members of Generation Z and 96 answers were generated. The survey includes some demografic questions to gain background informations about the participants. The content related questions were structured as follows: Open questions to generate spontanous and unbiadsed answers, e.g. „which aspects are especially important to you in your work life“. Following multirole options are given and the participants had to rate on a 5 point Likert scale.

Further questions include both – closed end questions and text fields to explain the chosen answers.

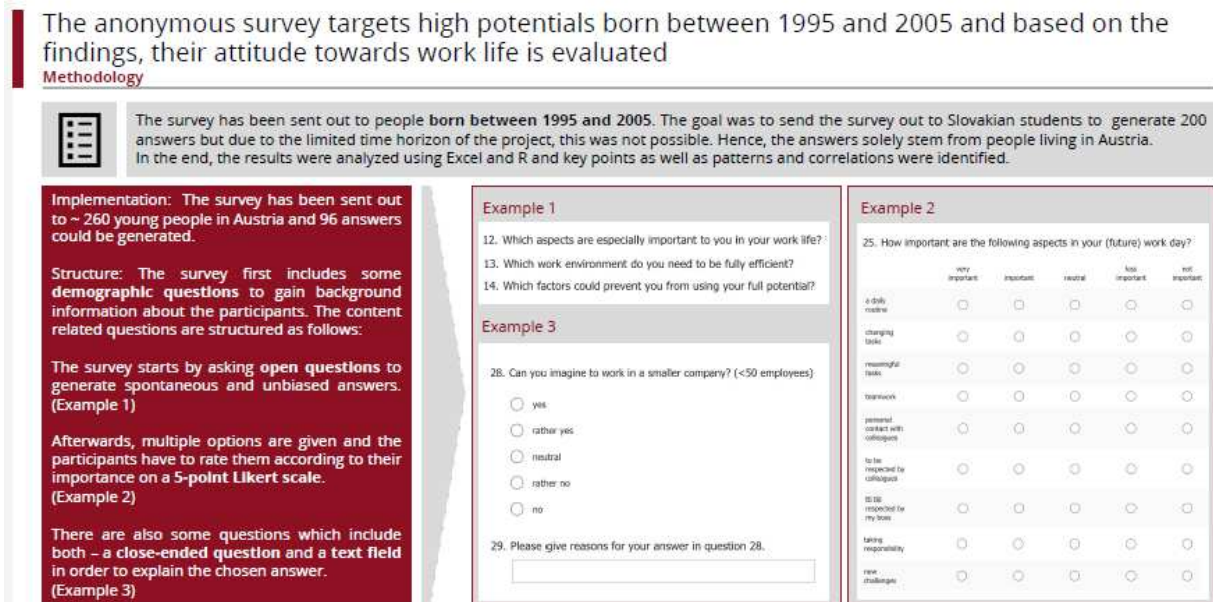

Figure 2. Generation Z Survey – Structured questions
 Source: Ramharter (2022)

2.3 Practical Check

The data of the mentioned survey „Generation Z“ were also compared to other developed documents. First was a company collective document, including organisational handbook for employees, a recruiting handbook for applicants, anonymous interviews about positive and negative influences on the work-flow, and also an interview series with 115 leaders of SME, where trends, needs and values from the managing view were explained.

3. Results

3.1 Generation Z Survey (Generation Z Survey about Work Attitudes)

In 2022 a survey with around 260 asked students, where 96 answered the questionnaire. Main questions and ideas were surveyed. As shown in Figure 4, the main group have finished the bachelor and works for the Maser level, are 19-20 years and working in business and economics.

Figure 3. Generation Z Survey – sociological structure
 Source: Ramharter (2022)

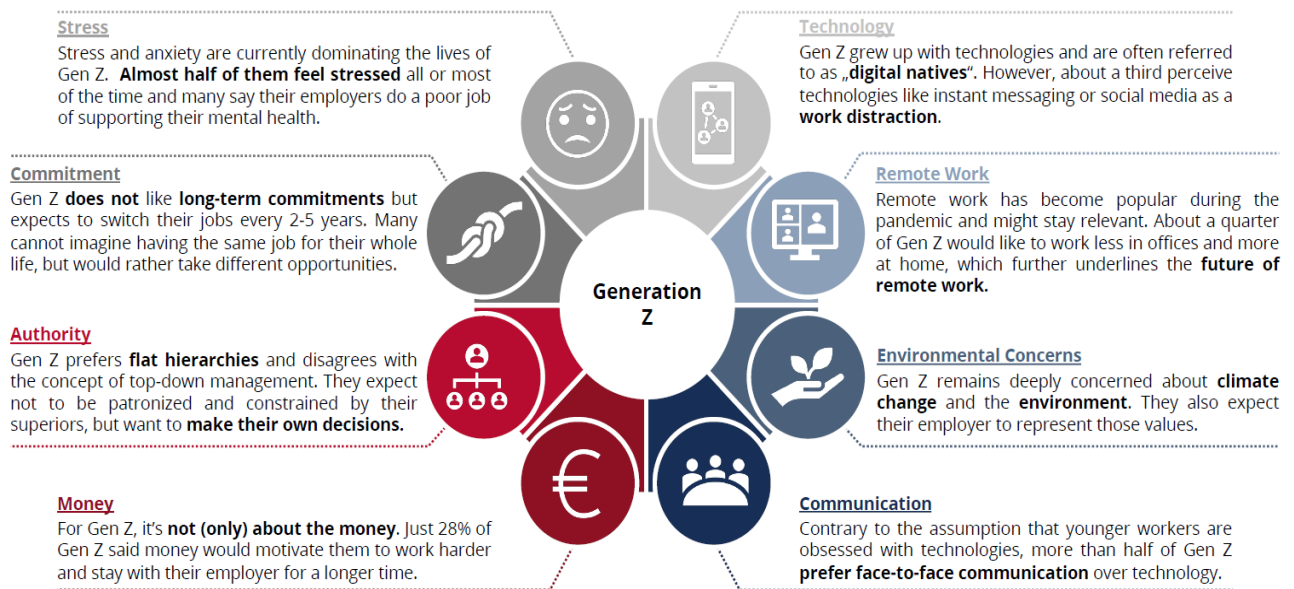

Figure 4. Generation Z Survey – main topics
Source: Deloitte (2021), graphic Ramharter (2022)

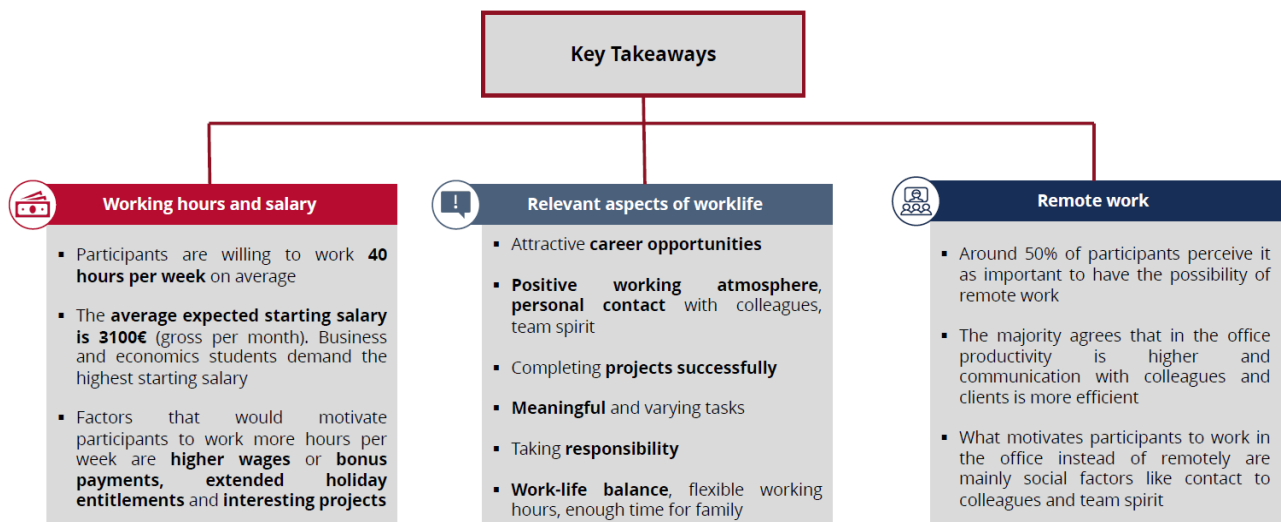

Figure 5 Generation Z Survey – key take aways
Source: Ramharter (2022)

Figure 5 shows, that the Generation Z is willing to work 40 hr/week for an average wage of 3.100, longer working times are possible, depending on extra payments, free time, extended holidays but also to be involved in interesting projects.

Figure 6 shows, that the young professionals can imagine to work in SME, because of flat structures, more responsibility, team spirit (socializing) and a larger pool of tasks – that mean more challenges.

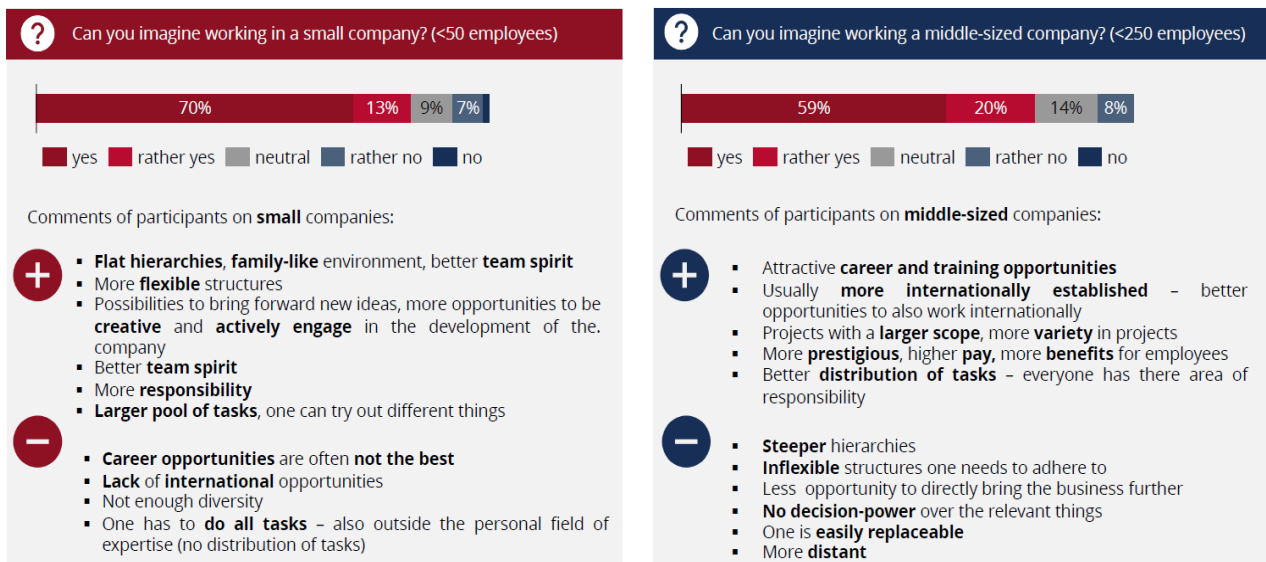

Figure 6. Generation Z Survey - Requirements to work in SME

Source: Ramharter (2022)

Figure 7. Generation Z Survey – work load - wage

Source: Ramharter (2022)

Figure 8 shows, that the young professionals are willing to work 40 hrs per week, but with an average starting wage of 3.100 (Maximum over 4.000 euro) and with benefits like holidays, free time, but also the work on an interesting project. Preferred is a positive working atmosphere, completing own projects, doing meaningful tasks and taking responsibility, but based on flexible working hours and family time.

4. Discussion

4.1 Generation Z Survey

The findings of the survey (Ramharter 2022) are splitted in some main tasks. Task one are the situation in the Generation Z, where different studies shows intrestingly not only a clear powerful, active and exploring generation, it was also founded a field of uncertainty (better expression maybe insecurity) with a lot of fears and sometimes hopeless visions of the future. But in the data of the surveys of Deloitte (2021), Schnitzler (2021), als well as the publications of Softgarden (2020), Brademann (2019) and Steckl (2019) show also the generation, which is easily unsatisfied, because „the employment process takes to much time“, the employer take to less care to my physical health,....the simple „just do it“ is blocked by fears, uncertainty and to much pressure from an unsafe future.

The requirements during the application process requires an additional presentation of the SME/employer towards Generation Z applicants. Besides classical factors is a declaration of the SME regarding environmental concerns (e.g. climate change; lack of ressources), and a direct communication with the foreseen team-manager regarding the planned work flow responsibilities, tasks, remote work and working communication necessary. Although this generation want to take responsibility is it absolutely necessary to exhort them during the daily working tasks. It is also compulsory, that the processes are digital, requires not to much time, quick response times from the SME and an overall time from fist contact to decision of less than 14 days. By lack of these requirements, above mentioned studies showed

58% of abandoned applications. Some companies react, so was it possible that Wienenergie hires 60 people within 15 minutes (Wienenergie 2023).

To ensure retention and work power of the Generation Z are as a basic “MUST” factors of the employer defined, like personal development, job security, salary, internal transparency and appreciation. For better involvement “PERFORMANCE” factors like harmony, recognition, working close to the manager, meaningful tasks are important. For a long term application “EXCITEMENT” factors like self determination, clear and varying tasks, job challenges, good equipment and a supportive company work style are required.

The basic literature show a high independent of the Generation Z, but at the end of the day, responsibilities should be also taken by the managers or the company. Generation Z expect work-stress and see an employer responsibility to take care about their mental health. Flat hierarchies, less Top-Down leadership, no supervisor patronation and the possibility of own decisions are fundamental basics. Money is only for 28% a motivation to stay longer. Surprisingly causes intensive usage of digital features (e.g. instant messaging, social media) work distraction, mainly when it is not started from the Generation Z, but of anybody else. In general a high performing manager is needed, who supports the Generation Z.

Generation Z expect a high wage and have a view of 2-5 years to the next work switch. It is expectable, that a longer binding can base on a normative (or calculatorial) commitment due to the high starting wage, compared with all the advantages of a wellknown working environment and colleagues. With respect to the generally surveyed concerns (e.g. climate change), means the switch of the work also a new risk.

The survey done with 96 members of the Generation Z, shows high interest in work, high interest in interesting projects and change of daily tasks, 40 hr worktime only against high payment, but preferred free time for work life balance. This free time has a higher value than the finalization of required tasks.

Based on the experiences during pandemic Covid (2021, 2022), the approach to work and free time is much more in an area of “it is my right to work at home”, “....to make a break”, and the company has to equalize the challenges. It is of course good, when employees claim their rights, but it is not acceptable when their behavior is critical for work-flows and maybe important tasks get lost. On the other hand is a complete monthly payment on time a must from the employees view. It is not interesting where the money comes from, it is their right to get the full check on time.

For SME with more sensitive and creative projects (like engineering, plant development, ...) is this an important challenge. When it is not possible to create a steadily income by prefabricated products, missing engineering or work tasks may delay incoming payments up in critical hights. But most of the employees see no connection between their work and the income of the company regarding their payroll.

This approach show the thinking of the Generation Z, that they expect binding promises, but on the other hand is it a must, but the company has to understand, that the project is not ready or main tasks are open. The binding character of their own work is often missing, or in better words not so important like the personal needs.

The comparison between SME and Mid Size companies shows from the view of all participants of the survey, that in small companies more different work exists, the team better cooperate and a better working situation due flat hirachies, family like organization, creative engagement, responsibility and more tasks are given. Concerns are in the themes of Career pools, international working, diversity and fears about to much responsibility because of working on all tasks as maybe only one.

4.2 Onboarding, retention and termination

Task two of the findings lightens the emotional and social commitments which are necessary for a succesful long term relationship between the company and the high sofisticated Generation Z. Based on the idea of the commitment to the company or structures of the company, the results of the publications of (Fu et al, Bolander et al (2009) and Werf (2020)) shows that emotional support (the emotional attachment to the organization) increases the affective commitment very strong, is not driving the normative comittment and downgrad a little the continuance comittment.

The situation of the Generation Z is not so easy as it seems. Future fears (often diffuse), high requirements towards companies, possible employers, work life balance and more, makes it for the Generation Z not easy to find (and stay in) an appropriate work place. They providing high demands against the company, the field of work, work time and more and it is difficult for elder people to organize the appropriate job interview and onboarding process – sometimes it is „to much paperworks“, or the process is to complicated, to slow, the benefits are to less and much more. The perceived organizatorial support must

be controlled to reach and increase the affective commitment for a long work time together, keeping the normative commitment down (avoid negative feelings and obligations), (Schlotter, Hubert 2020).

Interesting is, that the termination of employment by the Generation Z does not necessarily means a complete separation from the company. These people are only changing without long lasting judgement. It is more interesting, or more abroad or with more diversity, but the intention is is not to harm anyone.

Best way to accept a termination is to see it as a “new” contact on the market, but with an enormous advantage, that the former employee knows all strengths, weaknesses, opportunities and threats of the company. Instead of an enemy, the former employee is a new networking partner – exchange contacts, project possibilities and can improve the standing on the market. Although is it possible, that this networking partner come back as a high value employee or partner. This approach may be difficult for elder people, but from the view of Generation Z, may the personal advantage lead back to former companies without any regrets.

4.3 Stay, perform and betterment

Base on their personall abilities and the results of the survey, Generation Z is looking for a challanging work, with high responsibility and interest to support the companies as much as possible. But always based on support from main colleques or chiefs and with preffered free time for additional efforts instead of money.

It seems that Generation Z see huge possibilities fails to recognize the difference between the real and virtual world or maybe clearer: they see their own needs as much more important, than the companies requirement. The clear connection between income of the company and ability to pay all employees is seen, but the personal needs and wishes give them more value as to ensure the companies income. This seems understandable, since it is very difficult to recognize these differences with little life experience.

High salary demands on the one hand and only limited willingness for corresponding work input and commitment on the other hand show this also. The expected income is not connected to an valuable output.

Since Generation Z has good access to the digital issues, but not so strong views in the working worlds world, a high quality leadership is required. This could be done, for example, through support/coaches who create personal access to these "Generation Z employees" in the company - or through other forms of collaboration in the company.

Possible forms are e.g. no employment relationship, but contracts for work (may lead to easier termination), Amoebing (small groups, free for own decisions, need high appreciated team leaders, who are accepted by the Generation Z) or simply clearer rules for responsibility and bindingness.

The impression is, that a frame is needed, where Generation Z members knows the rules, are able to handle these rules and willing to cooperate with high appreciated colleagues.

Conclusion

The inclusion of Generation Z in existing companies, will require the adaption of the know processes of requirement and affective comitment. Especially onboarding and daily routines must be adapted for Generation Z needs and supported by an accepted team leader, but only on demand of the employee.

The Generation Z intend to stay in the company when it is interesting or brand new, but to stay longer for boring and repeatendly work is less in the scope. In this case personal needs of the Generation Z will be higher valued, then the daily work. This is normal, but Generation Z will even support their personal work life balance, if projects become critical. Depending on the workflows an equalization between existing team-members and the needs and behavior of new employees will be needed and must be guided by high accepted team leaders.

It also seems essential to provide Generation Z with suitable access companies work and needs. This includes, above all, answering the question "What is my concrete contribution to the good of the company"? As long as the company (teamleader) can transfer an interesting philosophy in a good team surrounded by clear and flexible work milestones, the benefit created by such teams will increase the company values.

Abstract

Research background: To discover why known practices in the management of health care facilities have not been implemented successfully in the proper time after specific new knowledge is gained is the main context of the research. Elucidating the gap between the quality of care provided and possible quality improvements stemming from existing knowledge is the key which might lead to higher quality of care provided and significant cost savings in the health care system.

Purpose of the article: Hospitals are, in many cases, large companies whose management significantly impacts the quality of provided care. Management and management systems play a crucial role in selecting the areas for improvement and are also a fundamental source of disparity in the results achieved. Individual hospitals implement measures with dissimilar content and results in the field of quality. These measures are a combination of human behavior and processes and depend on quality leadership in the organization.

Methods: Through a literature review and in-depth interviews with representatives of hospitals, as well as quantitative analysis, the primary foci were identified.

Findings & Value added: There is an unexpected finding that significant discrepancy in quality awareness between reality and reporting within individual hospitals, as well as across hospitals. The increased transparency and efficacy, particularly in nosocomial disease detection where the reality shows 3,98 times higher than officially reported results, can improve patient care and significantly contribute to transforming the healthcare industry toward delivering higher patient value. It is desirable to verify how targeted interventions might lead to significant quality improvements and economic advantages, which deserves a closer examination in future research.

Keywords: management, quality, healthcare, hospitals

JEL classification: M12, P46

1. Introduction

History documents many cases when specific new knowledge was not implemented successfully in the proper time after it was gained. One example is the discovery made by Dr. Ignac Filip Semmelweis (1818-1865). He was a doctor and scientist working in a hospital and discovered in 1844 how to decrease the number of fatal cases in young mothers due to puerperal fever caused by infections. He repeatedly proved that hygiene significantly improves health results. However, it took three decades for his contribution to be recognized, and professionals started to change their behavior to improve healthcare results. Healthcare today is of much higher quality, and figures such as mortality and life expectancy prove this.

Nevertheless, there is still much room for improvement in implementing new knowledge to achieve better results and improve patient care. Healthcare management is responsible for deciding how new knowledge in the clinical area can be implemented faster to improve outcomes. Much more scientific work beyond this paper is needed to provide further evidence and arguments to win over decision-makers and stakeholders for faster implementation of changes that positively impact added value for patients, efficiency for healthcare providers, and overall quality improvements in public health.

* Corresponding author: groh.tomas@gmail.com

1.1 Background Information

In most cases, hospitals, as leading healthcare providers, are large enterprises, and their management fundamentally influences the quality and safety of the healthcare provided. Patient safety combines human behavior with processes and relies on organizational leadership (Jarrett et al., 2017). When comparing the quality of care between individual hospitals, the most significant sources of heterogeneity are the managerial measures and organizational settings in individual hospitals. (Manhal et al., 2018). Management systems and organizational culture play a vital role in selecting critical areas for improvement (McChrystal et al., 2015). These settings are also a fundamental source of differences in the level and quality of care management that teams achieve in their hospitals. Initiatives aimed at increasing added value for patients in practice are gaining importance (Zanotto et al., 2021), and when measuring the quality of care, a comprehensive view of the patient (Peasgood et al., 2021), who is the primary customer of the health care delivery system, is increasingly taken into account. Many publications are also devoted to the essential role of modern information technologies, which significantly influence the strategy of organizations (Menz et al., 2021). Modern technologies and systems to support clinical decision-making can significantly affect the acceleration and accuracy of diagnostic processes and potentially reduce error rates in diagnosis and treatments. Technologies that promise to improve quality and safety include telehealth, mobile health and clinical decision support. Clinical decision support holds significant promise in improving care quality and safety (Ricciardi, 2021). For example, applications based on artificial intelligence have demonstrated significant potential to reduce the error rate of decision-making and increase the efficiency of care. In many cases, professionals need to be made aware of potential improvements in their work and seldom are able to recognize and admit mistakes in their efforts. The theory of heuristics and biases described by Daniel Kahneman is applicable and used also in medical diagnosis (Kahnemann, 2011). To this end, the use of modern information technologies in healthcare is a growing trend. It enables complex and consistent processing of information, which directly affects the efficacy and quality of healthcare services, as well as safety during diagnosis and treatment (Zijian et al., 2020). The timeliness and accuracy of diagnostics play an important role in transferring responsibility for corrective measures to smaller operational teams, which, in a complex and dynamic environment, is essential support that allows organizations to improve performance (D'Innocenzo, 2015).

1.2 The Research Topic

The main research topic is to investigate if the structural setup in hospitals is effectively organized and can positively contribute to improving quality outcomes. The perspective of quality, value provided for patients, and the focus on hospital healthcare providers' efficacy are within the scope of the research. Quality is less costly when there are more accurate diagnoses, fewer treatment errors, lower complication rates, faster recovery, less invasive treatment, and minimized need for treatment (Porter et al., 2006). Complication rates listed by Michael Porter are directly linked to patient safety as one of the leading outcome indicators reflecting the value for patients. This indicator can be precisely measured in the number of nosocomial diseases, or healthcare-associated infections (HAIs), to evaluate process outcomes. Indicators such as length of stay and infections are still the most frequent measures considered in the literature (Zanotto et al., 2021). Healthcare-associated infections occur in Europe at a significant number of 3.8 million infections annually and cause up to 80,000 deaths yearly (Suetens et al., 2018). In the Czech Republic, these data are not sufficiently documented, although the professional public emphasizes the seriousness of this issue. The link between the structure set up in hospitals in the Czech Republic and quality outcomes measured by HAIs represents the main content of this research paper.

1.3 The Theoretical Framework

The outcomes in terms of the quality of care provided can be structured and evaluated within the Donabedian quality framework (Donabedian, 2002). This approach is based on three pillars: structure, processes, and outcomes. Structure includes all factors that affect the care delivery context. Processes represent how care is delivered from the clinical perspective, and outcomes contain all effects of health care on patients or populations. Based on the literature review, this model has been adopted in many healthcare areas but has not yet been specifically validated in the area of structural setup concerning improving patient safety and HAIs, which positively impacts value creation in healthcare from the patient perspective. The structural setup represents a wide range of areas that must be considered, e.g., the

legislative framework, organization from the point of view of personnel capacity and organizational structure, information systems and technologies, material equipment, management approaches, motivation schemes for employees, supporting tools and technologies to improve diagnostics and analytical capabilities as well as training and education of individuals and teams. Many other efficient practices can be suggested to improve the sustainability of healthcare organizations: improvements in management practices, leadership practices, manager selection, the engagement of clinicians in the management, the promotion of organizational culture and management style, the promotion of virtual health communication, environmental supply chain management, rational resource consumption, and waste management (Mostepaniuk et al., 2023).

There is an enormous scope of potential structural components which effect the outcome, but only two areas were defined and investigated in the structural area for this research paper to evaluate if potential improvements exist to narrow the gap between what is done and what can be achieved. The Donabedian quality framework was adopted for this research.

Table 1. Adaptation of Donabedian quality framework

1. Structure	2. Processes	3. Outcomes
1.2. Legislative framework 1.3. Management approaches 1.4. Organization 1.5. Information systems 1.6. Material equipment 1.7. Task alignment 1.8. Motivation schemes 1.9. Training and education	2.1. Pneumonia (PN) 2.2. Urinary tract infection (UTI) 2.3. Surgical site infection (SSI) 2.4. Bloodstream infection (BSI) 2.5. Gastrointestinal infection (GI)	3.1. Number of HAIs

Source: author (2023)

As documented in the literature, data and their transparency to measure results and timely detection of opportunities that can be proactively and systematically addressed are the fundamental factors which have gained more importance in the last years for improving quality management in healthcare organizations.

2. Research Methods

The selected structural components are analyzed and interpreted in this research separately. As the structural component can be extensive based on qualitative interviews and recommended WHO standards to improve quality and safety, only two structural areas 1.5. and 1.7. included in Table 1 were identified and researched. Various methods were utilized to answer the research questions. The overview of the structural areas, leading research questions, methods, and information about the data sample are listed in the Table 2.

Table 2. Research Questions and Methods

Structural Area 1.5. Information Systems - Accuracy of measurement and transparency of reporting and documentation related to patient safety measured by HAIs		
Question	Methods	Sample
How accurately does the reporting reflect the occurrence of hospital infections?	The research statistically analyzes and compares the mandatory evidence and reporting of hospital-acquired infections done by hospitals with evidence gained through an automatic search engine algorithm based on internationally standardized medical criteria for identifying HAIs. As the software base algorithm uses artificial intelligence to evaluate structured and unstructured data, the verification of the algorithm was proven, and professionals in individual hospitals confirmed proposals of the software. The software, clinical decision support tool (CDST) system, parameterization resulted in a high level of sensitivity (80%) and specificity (99%) in infection detection.	The historical data sample from 5 hospitals, with 2 500 beds in total and 52 812 hospitalizations, was analyzed, and the reported incidence of infections in total and categories based on medical content was compared with the result achieved with the infection detection software.

Structural Area 1.7. Task Alignment - Prioritization of infection prevention in the context of economic value considered in the cooperation with suppliers across hospital stakeholders		
Question	Methods	Sample
How relevant is infection prevention in considering the economic advantage for individual hospital stakeholders in selecting individual suppliers of materials and services?	Quantitative research was performed among workers in hospitals. Data were collected through telephone interviews (CATI) between March-June 2023. The research method within the subject was used. The question was directed only to the respondents who consider the economic benefit important. They were asked in which area they consider economic value most relevant to select suppliers of materials and services. In the predefined areas, the relevance of economic advantage was evaluated on a scale from 1, "definitely do not consider this to be economically advantageous", to 5, "definitely consider this to be economically advantageous". Only responses rating 5 on the scale were included in the percentage evaluation.	The total sample size was n=145, where the number of representatives from executive management = 50, hygienists = 14, head physicians = 41 and main nurses = 40. The sample set was obtained through quota selection according to a predetermined structure.

3. Results

For a better overview, the results comparing manual / mandatory reporting with reporting supported by clinical decision tools supporting infection detection are displayed in Table 3.

Table 3. Comparison of HAIs officially reported and identified with CDST system.

Infection category	Incidence identified by CDST SW / AI Tool	Manually identified and reported incidence	Total number of hospitalizations
PN: Pneumonia	0,72 %	0,16 %	52 812
UTI: Urinary tract infection	0,83 %	0,25 %	
SSI: Surgical site infection	1,07 %	0,20 %	
BSI: Bloodstream infection	0,24 %	0,14 %	
GI: Gastrointestinal infection	0,44 %	0,08 %	
Percentage of Identified Patients	3,30 %	0,83 %	

Source: Processing of the author and the company HARTMANN-Rico a.s. (2022/2023)

The software tool reports significantly higher results, as much as 3,98 times higher, in comparison to manual detection. Higher results are also reported in individual clinical areas relevant to clinicians. However, this detailed division was not the primary focus of this research and is only displayed in the table overview.

The results which documented stakeholder alignment in the hospitals are displayed in Table 4.

Table 4. Task alignment within the organization across stakeholders

	Executive management	Hygienist	Head of department	Head Nurse
Help reduce the risk of healthcare associated infections	74 %	79 %		78 %
Time-saving products for staff				63 %
Quality products reducing the frequency of material replacement/consumption	72 %	79 %	71 %	78 %
Reduce staff effort, thus reducing the occurrence of health problems. problems				55 %
Products are demanded by patients, sell well				
Comprehensive solutions that reduce costs in the long term	60 %	71 %	59 %	45 %
Products which are easy to handle and apply		36 %	100 %	63 %

Products that simplify the work of healthcare professionals		50 %	0 %	65 %
Products that enhance personnel safety	54 %	64 %	56 %	78 %
Products/services enabling more efficient waste management	52 %		49 %	53 %
Products and advice to give the nurse a greater sense of confidence in patient care	48 %			38 %
Products/services to help set up prev. measures and standards of care. care standards	48 %	36 %		35 %
Products and services that help train staff faster		29 %	44 %	40 %
Advice and services to make the use of operating theatres more efficient	50 %		44 %	50 %
Advice to help streamline cost allocation	40 %		49 %	

Source: Assignment of the author and the company HARTMANN-Rico a.s., processing by the Focus agency (2023)

The highest alignment and economic relevance of the infection prevention topic for hospital stakeholders concerning suppliers selected to deliver and support parts of the structural setup are reported by hygienists 79%, followed by head nurses 78% and hospital executive management 74%.

4. Discussion

In the context of the enormous complexity of the healthcare system, which generates a massive volume of data, the proper interpretation and clinical diagnostics based on this data in real time are hardly possible. This might often lead to healthcare professionals using only some available data and preferring to rely more on their experience in their diagnostic and treatment conclusions. These errors in judgment could lead to avoidable mistakes. Instead, healthcare professionals should merge their own experiences with the complex healthcare data related to individual patients. As documented by the survey, identifying infections that happen during the treatment and which must be reported during the treatment process or based on after-action data analysis from patient documentation, the difference between the number that were reported and the actual number of occurrences is significant. The research uncovered the unsatisfactory quality of the identification level during the care process. The reported number of occurrences was 3,98 times lower on average than the reality based on data interpretation using the clinical decision support tool (CDST) with an algorithm dedicated to infection detection. It is evident that paying attention in a structural setting to how data analysis is supported in hospitals might lead to much better quality results in the future. Quality management depends on data that can document the status and progress not only at the level of the overall hospital organization but also at the level of individual hospital teams. Specifically, designed and trained data models in dedicated software applications can contribute significantly to transparency and the speed at which results can be improved.

Each tool requires motivation for its usage, and each innovation needs the right motivation to be applied. Handling the quality of patient care and economy while at the same time ensuring professionals' engagement is a central leadership task. For top healthcare managers to lead the pursuit of increased sustainability in healthcare, there is a need to balance the quality of patient care, economy, and professionals' engagement (Bååthe et al., 2023). The research confirms this precondition and proves that there is a high level of interest in these tools being implemented in hospitals. Hospitals do not develop the systems independently, and the research proves that topics around patient safety and infection prevention, resonate across hospital stakeholders. As stakeholders have shown willingness to cooperate with potential suppliers helping them deal with infection prevention, this shows interest to be at a decisive level. The proven alignment level here indicates a high probability that the changes can be implemented with positive results and lead to significant value generated for patients.

Conclusion

The answers to both researched questions confirm the topic's relevance to healthcare providers and the potential to reach better results by improving structural setup, specifically related to quality improvements in infection prevention. Due to the enormous complexity and volume of data, it is hardly possible to transfer data into relevant information that might be used by clinicians in time of diagnostics and choice of treatment. Improving the structural setup in measurement accuracy and transparency of reporting and documentation related to patient safety measured by HAIs increases the chance for proper identification and diagnostics. Modern technologies offer the potential to reduce limitations in working with big data, support the innovation process, and speed up the implementation measures. The

implementation of measures in the structural area is relevant across stakeholders which is the precondition to introducing these innovations in daily practice.

Continuing the research would be vital to demonstrate how the gap in infection prevention can be narrowed. The need to understand that the working environment with all stakeholders' behaviors and attitudes toward the implementation poses a crucial effect on success (Rawshdeh et al., 2022). Data transparency and the desire by stakeholders to improve are only the preconditions for the factual improvement in the quality of care and value generated for patients. The success of healthcare innovation projects depends on effective management and alignment with the healthcare quality context (Tonjang et al., 2022). It is highly relevant to conduct a practical experiment and management intervention in the structural area of the hospitals to support behavioral changes in the process area. These changes will be necessary to achieve real and sustainable results, such as cost savings related to hospital infection management and improvements in quality by identifying and implementing the right measures resulting in a higher value generated for patients.

Abstract

Research background: Personality plays a significant role in explaining and understanding the innovative behaviour of individuals in the workplace. Interpersonal behaviour is the basis of social interactions and therefore, in the context of managers' performance. The expression of dominance or affiliation in the context of interpersonal behaviour is dynamic and is partly influenced by personality traits and partly contingent on situational factors.

Purpose of the article: The purpose of this article is to compare personality traits and interpersonal orientation with respect to the performance of high-level manager's work.

Methods: The research population consisted of 193 respondents (38.9% female) aged between 24 and 62 years ($M = 41.86$; $SD = 9.42$). Data collection was conducted by administering the methodologies to high-level female managers as part of a comprehensive test set. Personality traits were measured by the Dark Triad Questionnaire, which measures levels of Machiavellianism, narcissism and psychopathy (Cronbach's $\alpha = 0.816$). Interpersonal orientation was measured by the Fundamental Interpersonal Relations Orientation (FIRO) questionnaire, which consists of 54 items that saturate six scales. The Interpersonal Questionnaire (IPQ) contains 72 items where respondents answer on a five-point scale.

Findings & Value added: Interpersonal orientation and its mean values showed that managers scored lowest in expected and expressed affection, and scored highest in expressed control. Finally, in the interpersonal qualities, managers had the lowest mean scores in the aloof trait and the highest mean scores in the warm, extraverted, and assertive traits. The psychological constructs under research have been a long-standing interest of several studies.

Keywords: personality, personality traits, interpersonal orientation, high-level manager

1. Introduction

Personality can be defined as a particular entity (structure or mechanism) that underlies behaviour and is the cause of a particular type of behaviour (Bergner 2020). The best known and most commonly used definition of personality, is that of Allport (1961), who states that personality is a dynamic organization in the psycho-physical system of an individual that determines behaviours and thoughts characteristic for that individual. Funder (2016) points out that personality is characterized by the patterns of thought, emotion and behaviour of an individual along with the psychological mechanisms, hidden or not, that lie behind these patterns. The name of the "Dark Triad" model of personality is related to the personality traits that make up the personality model. The individual personality traits (Machiavellianism, psychopathy, narcissism) can be viewed through the lens of the negative traits associated with them. Jones and Paulhus (2011b) report that the personality traits empirically overlap in the Dark Triad, and each predicts self-promotion, emotional coldness, and aggressiveness. The common core of each personality traits is associated with individuals being indifferent to the harm they inflict on others in pursuit of their own goals. All of the Dark Triad personality traits include selfishness, emotional coldness, and manipulation (Furtner, Maran, and Rauthmann 2017).

* Corresponding author: bozoganova@saske.sk

Interpersonal theory of personality discusses traits that are a mix of two important dimensions of interpersonal meaning, namely power (dominance) and warmth (caring). Given interpersonal theory, virtually every social interaction requires specification of the relationship between the above dimensions. From this perspective, interpersonal dispositions or traits can be defined as differences in preferred or characteristic levels of the dimensions of dominance and warmth in social interactions. Interpersonal theory is represented by a circle that is divided by two axes, one axis representing dominance and the other warmth (Wiggins, Trapnel, 2006). The circular arrangement represents 12 interpersonal styles, which include the dimensions of dominance and warmth in varying proportions. The interpersonal styles include: assertive, dominant, manipulative, cold hearted, aloof, introverted, timid, deferent, agreeable, nurturant, warm, and extraverted.

According to Anwar et al. (2019), personality plays a significant role in explaining and understanding the innovative behaviour of individuals at the workplace, which is an important part of managerial performance. If a manager is perceived by others as the top of the hierarchical structure, then they will be able to achieve the status of leadership personality through quality leadership. The Dark Triad personality model is associated with the prediction of traits that are associated with the performance of the managerial position. Babiak, Neumann, and Hare (2010) found that managers with psychopathic traits occupy high-level executive positions and concluded that they will continue to rise higher. Judge, Piccolo, and Kosalka (2009) point out that narcissism and Machiavellianism predict a desire for formal authority and leadership positions, which means that all three personality traits predict charismatic leadership and the successful use of influence tactics to achieve goals.

Interpersonal behaviour is the basis of social interactions and is therefore an important element of effective relational functioning in an organisation in the context of the management. The expression of dominance or affiliation in the context of interpersonal behaviour is dynamic and is partly influenced by personality traits and partly contingent on situational factors, namely the behaviour of the interacting partner (Ianiro, Kauffeld, 2014). Managers who use an effective people management style correspond with a healthy and supportive work environment, which they thus promote (Malik, et al., 2016). Positive interpersonal manifestations of managers towards employees can ensure the success of the entire organization. It is imperative that managers have their followers and this leads to the effective achievement of organisational goals that promote a healthy and lasting relationship with all stakeholders (Abdullahi, Anarfo, & Anyigba, 2020).

The theory of interpersonal orientation consists of three interpersonal needs (inclusion needs, control needs and affection needs) which were assessed by Macronsson and Semple (2001) in the context of personality traits of Machiavellianism based on the research conducted. They found that individuals with low levels of inclusion, control and affection, demonstrated defensively low personal behaviours and for this reason, high levels in the Machiavellianism scale can be expected. Individuals who behave rationally exhibit moderate levels of inclusion, control and openness and for this reason can be expected to score low on the Machiavellianism scale. Research results have shown a relationship between low or high scores on the dimensions of inclusion, control and affection, and high scores on the Machiavellianism scale. Conversely, moderate scores on the dimensions of inclusion, control, and affection were associated with low scores on the Machiavellianism scale. The Dark Triad is also related to counterproductive work behaviours within the organization that negatively impact interpersonal relationships among employees.

The aim of this paper is to compare the personality traits and interpersonal orientation with respect to the performance of the profession of a high-level manager.

2. Methods

2.1 Research sample

The research sample consisted of 193 respondents (61.1% male and 38.9% female) ranging in age from 24 to 62 years ($M = 41.86$; $SD = 9.42$). The research respondents were high-level managers from the Slovak Republic.

2.2 Measures

Data collection was conducted by administering the methodologies to high-level female managers and executives as part of a comprehensive test set.

Personality traits were measured by the Dark Triad Questionnaire (Jones, Paulhus 2014), where each personality trait was measured by 10 items (Machiavellianism, narcissism, and psychopathy) (Cronbach's

$\alpha = .816$). These traits characterise people based on the extent to which they are manipulative and merciless, through which they achieve their own benefit regardless of the consequences for other people (Číbková & Jakubek, 2014; Heretik, Fronc, & Šrol, 2018). Respondents answered each item on a five-point scale, where 1 indicates strong disagreement - 5 indicates strong agreement.

The FIRO-B questionnaire (Schutz, 1967) is a standardized questionnaire in our country and is used worldwide in personality psychology in the selection of individuals. Fundamental Interpersonal Relations Orientation (FIRO) can be translated as interpersonal relationship theory, which was proposed by William C. Shutz (1958). FIRO-B has been designed to predict interactions between two people (Macrosson, Semple, 2001). FIRO-B has three dimensions of interpersonal behaviour - inclusion, control, and affection. The questionnaire consists of 54 items that saturate six scales (inclusion-expressed, inclusion-wanted, affection-expressed, affection-wanted, control-expressed, control-wanted). Respondents answer on a six-point scale (1 - usually, 6 - never; 1 - most people - 6 - no one). Interpersonal orientation is determined by the relationship between expressed (e) and wanted (w) behaviours. The greater the difference between e and w, the higher the likelihood of the existence of internal conflicts and frustration in the researched area. We also report the overall internal consistency of the questionnaire (Cronbach's $\alpha = 0.861$), but note that the appropriate measure of homogeneity for this questionnaire is the coefficient of reproducibility, as the scale is a composite of Guttman scales (Schutz, 1967).

The Interpersonal Questionnaire (IPQ) (Trapnell, Broughton, 2006) provides efficient and reliable markers of twelve locations around the perimeter of a circular model of interpersonal qualities. This circular model summarizes "interpersonal" dispositions, that is, dispositions that involve interaction between persons (e.g., assertiveness involves social interaction, whereas timidity does not). Interpersonal theory (e.g., Wiggins, Trapnell, & Trapnell, 1996) interprets these traits as different mixes of the two main dimensions of the interpersonal meaning of power (e.g., status, dominance) and warmth (e.g., alliance, caring). The IPQ defines twelve interpersonal styles representing different mixes of these two dimensions: assertive, dominant, manipulative, cold hearted, aloof, introverted, timid, deferent, agreeable, nurturant, warm, and extraverted. For example, the trait "manipulative" defines a dyadic orientation of moderate dominance and very low warmth. The remaining IPQ traits can be understood in a similar way.

The IPQ questionnaire contains 72 items where respondents answer on a five-point Likert-type scale where 1 = strongly disagree - 5 = strongly agree. Each of the 12 scales is saturated with six items. We report the reliability of each scale for our research population: assertive (Cronbach's $\alpha = 0.828$), dominant (Cronbach's $\alpha = 0.623$), manipulative (Cronbach's $\alpha = 0.756$), cold hearted (Cronbach's $\alpha = 0.725$), aloof (Cronbach's $\alpha = 0.743$), introverted (Cronbach's $\alpha = 0.788$), timid (Cronbach's $\alpha = 0.791$), deferent (Cronbach's $\alpha = 0.688$), agreeable (Cronbach's $\alpha = 0.593$), nurturant (Cronbach's $\alpha = 0.745$), warm (Cronbach's $\alpha = 0.764$), and extraverted (Cronbach's $\alpha = 0.784$).

3. Results

The research data were processed in JASP 0.14.1.0. Descriptive statistics were used in the statistical analyses.

Table 1. Comparison of personality traits and interpersonal orientation in high-level managers

	Min	Max	Mean	SD	Skewness ^a	Kurtosis ^b	SW ^c	p
Dark Triad								
Machiavellianism	11	38	26.31	5.28	-0.204	-0.317	0.989	0.193
narcissism	15	46	29.24	5.41	0.074	0.175	0.993	0.493
psychopathy	10	30	18.36	4.41	0.411	0.352	0.968	< 0.01

Warmth	11	30	22.81	3.44	-0.327	0.522	0.979	0.007	
Extraversion	8	29	19.83	4.24	-0.280	-0.200	0.986	0.057	

a = standard error skewness = 0.180; b = standard error kurtosis = 0.357, SW = Shapiro - Wilk testing criteria, c = df = 183

Source: own elaboration

The normality of the distribution was checked by graphical exploration (Q-Q, histogram) and by using the Shapiro - Wilk normality test. On the basis of graphical exploration, kurtosis and skewness, the variables under study can be considered as approximately normally distributed. According to the SW normality test, normality was not maintained for some variables. Nevertheless, we treat the variables as normally distributed because these tests are influenced by the research sample size and the other parameters of the normality check of the variables were correct. For the FIRO-B questionnaire, we did not expect a normal distribution because of the way the results were scored.

The Interpersonal Orientation (FIRO-B) and its mean values showed that managers scored lowest in expected affection (M = 1.60; SD = 1.07) and expressed affection (M = 2.54; SD = 1.58), and scored highest in expressed control (M = 6.84; SD = 2.26).

Finally, on the interpersonal qualities (IPQ), managers had the lowest mean scores on the traits of aloofness (M = 11.03; SD = 3.32) and introversion (M = 12.61; SD = 3.88), and the highest mean scores on the traits of warmth (M = 22.81; SD = 3.44), extraversion (M = 19.83; SD = 4.24), and assertiveness (M = 18.82; SD = 4.70).

There is a weak positive relationship between Machiavellianism and control expressed ($r = 0.228$; $p < 0.01$). There is no relationship between Machiavellianism and control expected ($p > 0.05$). A negative weak significant relationship exists between Machiavellianism and expected affection ($r = -0.236$; $p < 0.05$) - the higher the level of Machiavellianism, the less expected affection the respondent indicates. There was no relationship between expressed affection and Machiavellianism.

4. Discussion

Based on the results of the correlation analyses, it was found that there is no relationship between inclusion and Machiavellianism, also between Machiavellianism and expected control and between expressed affection and Machiavellianism. Previous research by Macronsson and Semple (2001) confirmed the association between low levels of inclusion, control and affection. These interpersonal needs are related to defensive impersonal behaviour and based on this, the authors expected individuals to also possess high levels of Machiavellianism. The research conducted is inconsistent with our results and has not been explicitly confirmed.

Conversely, a weak positive relationship exists between Machiavellianism and expressed control, and a negative weak significant relationship exists between Machiavellianism and expected affection. That is, the higher the respondent's level of Machiavellianism, the less expected affection they indicate. Machiavellianism, according to Wu and Le Breton (2011), is associated with disregard for morality and the use of dishonesty to maintain power. That is, the confirmation of a positive relationship between Machiavellianism and expressed control is related to the maintenance of power, and conversely, the weak negative relationship between Machiavellianism and expected control is consistent with the assumption of Macronsson and Semple (2011), who point to individuals with low levels of Machiavellianism and, conversely, moderate to high levels of inclusion and control. Explicit assessment of individual personality

traits from the Dark Triad model and interpersonal needs, to the best of our knowledge, has not been carried out on a sample of high-level managers, which may provide a stimulus for extension and new insights for further research.

High-level managers scored lowest on expected and expressed affection, and scored highest on expressed control with respect to the interpersonal personality model. Finally, on the interpersonal qualities (IPQ), managers had the lowest mean scores on the trait of aloofness and introversion. This finding is not surprising and also from the perspective of Moss, Ritosso, and Ngu (2006), introverts have a lower need to be appreciated, they have less aspiration to gain in executive motivation such as career advancement, managerial position. They scored highest mean scores on traits of warmth, extraversion, and assertiveness.

Conclusion

The individual personality traits can be considered as an important prerequisite for the performance of a challenging position as a high-level manager. The research results confirmed the importance of using methodologies focusing on personality traits in the selection of high-level managers. Based on the assessment of personality traits and interpersonal orientation of high-level managers, it is possible to set up potential opportunities for future education, or individual coaching, which will enable them to reflect their individual needs.

The psychological constructs under research have been a long-standing interest of several studies, and it would be inspirational to continue future research to assess the personality traits of the Dark Triad in an extended sample of high-level managers and to assess their applied conflict resolution strategies from the point of view of their employees. Comparison of Slovak high-level managers with managers in other countries could provide another stimulus for future research.

Training and Performance in the Outsourcing Industry

Monica Dudian^{1,*}, and Teodora Todoran¹

¹ Bucharest University of Economic Studies, Department of Economics and Economic Policies, Piata Romana 6, 010374 Bucharest, Romania

Abstract

Research background: Looking at the overall business landscape, regardless of the industry, all companies have a form to train new employees, or even more tenured staff, to keep them up to date with the rapidly changing business standards. These activities have a clear objective of improving behaviors, increasing or adjusting results, and upgrading certain practices. Thus, they all share the same expectation of a better performance, ideally also a higher level of motivation and belonging, and lastly a financial benefit for the company.

Purpose of the article: This paper is focused on the practices and implications of training activities within an organization that is part of the outsourcing industry. The objective is to verify the hypothesis that behavioral interventions such as training exercises determine a higher level of professional outcomes, which translates into higher labor productivity at the company level.

Methods: The research was conducted across Europe and targeted audiences in the US. The sample size for the research adds up to 136 respondents, across the mentioned countries. The research was based on a questionnaire with a set of 20 questions related to the research hypothesis.

Findings & Value added: The main conclusion of this research is that training programs are perceived by employees as elements that determine productivity growth both directly and indirectly, by improving motivation, skills, and capabilities. The novelty element is the confirmation of this relationship by observing an industry little explored from this perspective, namely that of outsourcing.

Keywords: outsourcing, training, labor productivity

JEL classification: M53, M54

1. Introduction

The outsourcing concept defines the act of externalizing certain areas, functions, and processes of a company to a third-party service provider. The continuous training of employees is a necessity in the outsourcing industry, which requires cooperation between geographically and culturally dispersed teams and organizations. “Learning and Development”, typically referred to as the training of any large outsourcing service provider has a higher and more structured maturity when it comes to developing skills and capabilities. The reason for such an observation resides in the operating model itself, as the clients surrender their operations and services to a third party which is contractually obligated to maintain a certain level of productivity, accuracy and results, which in most cases has a direct link to the skills of the employees. In the outsourcing industry, training is a key player throughout the employee lifecycle and for the comfort of the served customers. Kirkpatrick (1959) builds the framework for evaluating learning, education, and training programs. This framework consists of four levels:

- “Reaction: assessing what the trainees thought of the particular programme, usually by use of a questionnaire (Level 1)
- Learning: measuring the learning principles, facts, skills, and attitudes which were specified as training objectives and absorbed by delegates (Level 2)
- Behavior: measuring aspects of job performance, which change because of learning and are related to the training objectives (Level 3)
- Results: relating the results of the training programme to organizational objectives and other criteria of effectiveness, e.g. increased productivity (Level 4)”

* Corresponding author: monica.dudian@economie.ase.ro

The model announces a straightforward, quite simple evaluation method in terms of understanding the basic concepts. Measuring the four levels in practice involves a certain level of subjectivity, the most common techniques used being the feedback forms, such as surveys, pre- and post-training intervention, or interviews following a common standardized approach.

Numerous articles validate the positive impact of training on the profitability and competitiveness of the organization, beyond the risks that such an investment in human capital implies. Kurosawa (2001) uses the data collected through a survey administered to the employees of 44 organizations to prove the positive correlation between formal training and business growth. Ng (2005) collected primary data through a survey on the incidence of training among enterprise workers and on the individual earnings and found a generally weak effect of training on employee earnings in China (Shanghai and Guangdong). Bartel (2002) makes a synthesis of the reference literature regarding the return on investment in training, showing that some of these studies are based on data from the companies' internal studies. The same author shows that American companies measure the impact of training on the four previously mentioned levels. The author suggests that an ideal case study would take the form of a field experiment in which the sample would be divided into two groups: one for training and one for control. This method was used by De Grip and Sauermann (2012) on an in-house call center of a telecommunications service provider organization to measure the effect of training on productivity. They show that the training participants experience an increase in productivity and the training generates a positive externality on the performance of teammates who do not participate in the training. Aguinis and Kraiger (2009) performs a synthesis of the reference literature since 2000 regarding the positive effects of training and development on all stakeholders. Hara (2014) studies the impact of training on the productivity of workers with a flexible work regime and of regular workers. To study the changes in work skills and productivity, self-evaluation results from the survey implemented were used on the target group. The results confirm an increase in productivity for both regular and non-regular workers. Using the example of a multinational company in the IT industry, the study of Chatterjee (2017) demonstrates that the investment in human capital embodied in training in the direction of improving technological skills and knowledge of the business field increases profitability. Yanez-Araque, Hernandez-Perlines and Moreno-Garcia (2017) approach the relationship between training and performance from a more different perspective than the studies cited so far: that of the theory of dynamic capabilities. From their perspective, training acts on performance through absorptive and innovative capacities. Arwab et al. (2022) developed a questionnaire on the influence of training on performance, for which they received 397 responses from employees of travel agencies from Delhi, India. Through a relatively complex methodology, they demonstrate the positive impact of training on performance, mediated by employee engagement. Thakkar and Narayanswamy (2022) collected data by interviewing 510 employees of three organizations in the jewelry industry through a 25-question questionnaire on training and productivity, confirming once more the positive impact of training. Pedrini and Capiello (2022), demonstrated using data from 2008 to 2010 that training flow and training stock had a positive impact on labor productivity in the utilities sector. Kucharčíková et al. (2023) used a questionnaire survey to collect primary data from the managers of 113 IT companies in Slovakia regarding how the impact of investment in human capital on performance is perceived. They conclude that "the investment in education and development of employees was identified to be the most frequently performed form of investment in human capital" and that this investment increases the performance of employees.

The methods by which the relationship between training and performance is studied in the reference literature are varied from the perspective of the method of data collection (primary or secondary data), the analysis techniques and the indicators used to measure performance. The research methods used in this work are presented in the second part. In the third and fourth parts, the results of the research are presented and discussed. The last part is dedicated to the conclusions.

2. Methods

The present research was conducted across Europe and targeted audience in the US. The sample size for the research adds up to 136 respondents, across the mentioned countries, all working in the same big outsourcing company. The current research is part of a larger study, based on a questionnaire with 35 questions, which aimed to discover the impact of training on performance, on the factors that affect the retention rate and on professional growth. Of the 35 questions, the questions strictly related to productivity and the factors that influence it were selected and analyzed. The result was a questionnaire of 20 questions, structured in three categories: a set of questions regarding the personal characteristics of

employees (educational level, work and training experiences, gender, age), a category of questions regarding the factors affecting individual performance impacted by training programs and a last category related to employees' perception of the influence of training on productivity. The actual questionnaire was released between February 2022 and March 2022. Answering options ranged from yes / no radio buttons, selecting from multiple choices and Likert scale. Regarding the productivity aspect of the research, the measures proposed in the Likert scale options, have been selected with the guidance of a quality black belt specialist, for defining most common grounds of measuring similar factors of contractual expectations. Training programs were split into two categories: technical and behavioral programs. The survey was announced and explained when launching from top management to all employees and it was anonymous, volunteer base (not a mandate). All answers are set forth from a personal perception of the respondents, as is the case of any questionnaire-based research. The anonymity allowed the respondents to express their views in a most genuine manner, which brings authenticity, relevance and reliability to the data collected. The Cronbach Alpha's was applied to all the Likert scales used in the questionnaire to test the reliability of these scales. The Cronbach Alpha's coefficients are > 0.700 which indicate a very good consistency for these items.

3. Results

The proposed research is tackling the ecosystem of a corporate from the outsourcing sector, so that the results presented below are related to this industry. The structure of the sample is presented synthetically in the following table:

Table 1. Sample Description

Variables		Absolute frequencies	Relative frequencies (%)
Current age	18 -24 years old	9	6.6
	25-34 years old	60	44.1
	35-44 years old	42	30.9
	45-54 years old	17	12.5
	55-64 years old	8	5.9
Current education level	Highschool graduate	12	8.8
	Bachelor	58	42.6
	Master	65	47.8
	Ph.D.	1	0.7
Personal gender details	woman	81	59.6
	man	48	35.3
	prefer not to say	7	5.1
Tenure in the current company	less than 3 years	60	44.1
	3-5 years	35	25.7
	6-10 years	23	16.9
	11-14 years	16	11.8
	> 15 years	2	1.5
Current band level	AA- Agents	45	33.1
	B1- Team Leaders	31	22.8
	B2- Group Leaders	27	19.9
	B3- Deputy Managers	13	9.6
	C1- Managers	10	7.4
	C2- Sr. Managers	8	5.9
	D1 – Associate VP	1	0.75
	D2- General Manager	1	0.75
Role status	Individual contributor	95	69.9
	People manager	41	30.1

Source: authors (2022)

The average age of the respondents is 36 years old, resulting in a better representation of the group of 25–34-year-olds (44%), followed by the 35-44-year-olds (31%). Women are also better represented in the sample (60%), with only 35% being men according to gender declaration. Regarding the education level, 48% have a master's degree and 43 % a bachelor's degree, and a small percentage only have a high school

graduate diploma or a Ph.D. degree. The best represented segment in the company regarding tenure is the group that has worked for less than 3 years (44%) for said company, followed by the group having been employed for 3-5 years (26%), 6-10 years (17%) and 11-14 years (12%). The sampling structure in regard to the current band level of respondents indicates most of them being on the level AA (31%), B1 (23%), B2 (20%) and the remaining 25% on all the rest. The role status splits the respondents in individual contributors (70%) and people managers (30%).

Regarding the training hours per month on average, the distribution of the respondents is: < 1 h/month (36%), up to 2h/month (34%), up to 4 h/month (17%), > 6h/month (13%), as is shown in the following figure:

Figure 1. Training hours per month

Source: own processing (2022)

Regarding the elements most impacted by attending a training program, measured on a Likert scale from strongly disagree (1) to strongly agree (5), the results are presented as follows:

Figure 2. Elements most impacted by attending a training program

Source: own processing (2022)

It can be concluded that there are some neutral opinions regarding the elements which are most impacted by attending training programs such as Increased SLA (service level agreements), Better KPI (key performance indicators), Revenue enablement for customer and Attrition reduction. The respondents agree that the impact was positive in regard to the following elements: Increased productivity, Lower error rate, More idea generation, Better team cohesion, Higher personal motivation, Better work strategy, Time savings, Team management.

A percentage of 79% consider that the technical training programs help to improve the analytic skills and 76% feel that the behavioral training programs help to improve their capabilities.

Table 2. The impact of the training programs

Do you feel the technical training programs helped you improve your analytic skills?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	107	78.7	78.7	78.7
	No	29	21.3	21.3	100
	Total	136	100	100	
Do you feel the behavioral training programs helped you improve your capabilities?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	103	75.7	75.7	75.7
	No	33	24.3	24.3	100
	Total	136	100	100	

Source: authors (2022)

Regarding the skillsets that was applied and improved after attending the excel or google sheets training, the respondents confirm improving all of the mentioned skills, the average score being around 3.7, as it is reflected by the figure 3:

Figure 3. The skillsets improved post attending the excel or google sheets training

Source: own processing (2022)

For the skillsets that was improved by attending the presentation skills/ slide design training, the data from figure 4 indicates the agreement with all referenced elements in the question, with better scores for Better data visualization (3.87) and clearer data communication (3.82).

Figure 4. The skillsets improved post attending the presentation skills/ slide design training
Source: own processing (2022)

Respondents agree that all skillsets applied and improved by attending the behavioral topics, the average score being around 3.8.

Figure 5. The skillsets improved after attending the behavioral topics training
Source: own processing (2022)

The hierarchy of the *most impacted areas* after attending the training programs, measured on a Likert scale, is as follows, based on the received answers:

1. Improved data reporting (4.64),
2. Increased opportunity to move within the organization (4.33),
3. Higher motivation (4.02),
4. Better communication (4.01),
5. Effective activity planning (3.93),
6. Improved leadership skills (3.88) and
7. Clearer strategy in setting goals (3.15).

The majority of the respondents have the opinion that the training programs had a significant impact on their work, and job efficiency and performance, causing an increase in individual productivity, as can be seen in table 3.

Table 3. The impact of the training programs on work, job efficiency, job performance and productivity growth

Do you feel that the any of the training programs that you have attended so far, have had a significant impact on any of your work related areas?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	91	66.9	66.9	66.9
	No	45	33.1	33.1	100
	Total	136	100	100	
Do you personally feel that attending any of the training programs helped - in any way - increase your productivity?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	92	67.6	67.6	67.6
	No	44	32.4	32.4	100
	Total	136	100	100	
Do you personally feel that the training programs have had an impact in your overall job efficiency?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	93	68.4	68.4	68.4
	No	43	31.6	31.6	100
	Total	136	100	100	
Do you personally feel that the training programs have had an impact in your overall job performance?					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	90	66.2	66.2	66.2
	No	46	33.8	33.8	100
	Total	136	100	100	

Source: authors (2022)

The most impacted professional factor after attending the training programs are presented in figure 4 below:

Figure 6. The most impacted professional factor after attending the training programs
Source: own processing (2022)

Communication, self-motivation, and job efficiency are in the first three places, closely followed by productivity.

Regarding the experience acquired after attending the training programs that helped the employees to improve their performance at work, the majority agree and strongly agree (about 67%), 26% are neutral and only 7.4% disagree and strongly disagree with this aspect.

4. Discussions

The previously presented results reveal that the training is perceived by the employees as having a positive impact on most of the components of their work. The degree of agreement regarding the impact of the training is slightly higher (3.72) for the technical training than for the behavioral topics (3.69). It is interesting to note that, although over 75% of the respondents believe that the training improves their analytical skills and capabilities, only about 68% consider that it increases their productivity. This difference suggests that either part of the employees is not aware of the relationship between skills and productivity, or they do not implement the new skills/improvements acquired through training in their work, which refers to the principal-agent model. Any organization that strives to quantify productivity decides to monitor success and performance via multiple means of metrics. In the outsourcing industry such metrics are most often the SLA (custom made basis client needs) and KPI (a complementary measure to the SLA, consisting in measurable strategic goals), as factors of success. The results of the questionnaire show a rather neutral position of the employees participating in the training in relation to these two elements. In the context where the majority states that training increases work performance, a possible explanation could be that SLA and KPI are elements already fixed in the past, while training is perceived as an action with future impact. Another explanation could be that the employees aim to improve their skills through training, rather than to reach the KPIs set by the contract.

Conclusions

The main conclusion of this research is that training programs are perceived by employees as elements that determine productivity growth both directly and indirectly, by improving motivation and skills. This confirms the findings of other authors, mentioned in the reference literature, such as De Grip and Sauermann (2012) and Chatterjee (2017). The novelty element is the confirmation of the relationship by observing an industry little explored from this perspective, namely that of outsourcing, through the processing of primary data collected through a questionnaire.

Since the study refers to the perception of employees, their subjectivity represents the first limit of the research. In addition, this study can be extended by applying statistical models such as correlation analysis and factor analysis, which could highlight new information. Another element to be considered in the future for similar studies is that a larger and more diverse population may bring additional discussion points, or more data for statistical analysis.

Exploring Perceptions of Talent Management in Relation to Generational Diversity of Employees in the Context of Sustainability in a Healthcare Facility in the Slovak Republic

Michaela Harničárová^{1,*}, Juraj Tej¹, Denis Tirpák¹, and Martina Stolárová¹

¹ University of Presov, Department of Management, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: Talent management represents systematic processes in the management of employees who represent exceptional added value for the organization from the point of view of high potential in the future or for the fulfillment of exceptional critical tasks. It is an ongoing and mainly strategic process. A well-set talent acquisition program and systematic work with them brings the organization (among other things economic growth in the form of high-quality and positive results, a goodwill etc.) The generations of employees who currently work on the labor market can be recognized according to criteria (e.g., demographic data, life experiences, sociology, a set of beliefs, attitudes and everything that shaped them during their life and what makes them characteristic). Their differences can be a source of creative power and a source of opportunity.

Purpose of the article: The aim of this paper is to explore differences in perceptions of talent management with respect to generational diversity.

Methods: The questionnaire focused on the issue and was conducted in a hospital that provides inpatient health care, including inpatient emergency services in 9 inpatient wards and 5 specialized ICU wards, where 15 specialized outpatient clinics are also included. The results from the questionnaire survey were evaluated by higher statistical methods (Shapiro-Wilkov normality test, ANOVA test a Kruskal-Wallisov test) using SPSS 22 software. The research sample consisted of 82 respondents out of 120, which is 68.33% success rate.

Findings & Value added: Based on the findings, the research results will benefit the work in a healthcare facility and will also help in setting processes when working with employees.

Keywords: talent management, talented employees, phases of talent management, organization, generation X, generation Y, generation Z, generational differences

JEL classification: J24, M12

1. Introduction

Talent management is one of the ways to improve employee performance and by being future-oriented, it helps organizations to harness the current potential of talented employees to improve future job performance. Pasko et al., (2021) says that Sustainability reporting has become an increasingly common practice among companies around the globe as around 90% of the world's 250 largest companies from Fortune 500 prepare and publish its sustainability reporting.

Creating the conditions for the development and realization of such employees can have an impact on the growth of positive economic result of the whole organization. Talented employees are a long-term asset to the organization and therefore development activities for them should signal that the organization is interested in employing them for the long term. Al Ariss et al., (2014) also demonstrated that talent management is important for at least two primary goals: (i) ensuring that organizations can effectively acquire and retain the best talents, and (ii) retaining these talents for a longer period.

* Corresponding author: michaela.sirkova@unipo.sk

1.1 Talent management

Recently, interest in Talent management in the national context has increased significantly to more fully comprehend the complexities of managing talent in today's globalized world, where organizations are not only competing with each other, but governments and their societies have also joined the talent race' (Khilji & Schuler, 2017, p. 400). Talent management is a broad issue with many definitions. It represents the systematic attracting, identifying, developing, using, maintaining and deploying those employees who represent an extraordinary value for the organization, whether it is their high potential in the future or because they fulfill critical tasks in corporate activities or processes (Ali Taha - Sirková 2012). According to Menity group (2013), talent management is a complex system of activities and processes, the main goal of which is to find new opportunities for the growth of the organization, while talents and innovations are considered the key to growth. The purpose of talent management is to build and subsequently maintain a strong competitive advantage of the organization. Especially after the crisis, organizations began to deal more intensively with people with the ability to look at problems from a different perspective. People with the courage to change things, with vision, able to anticipate and create new concepts. Many successful organizations attach a high priority to talent management and thoroughly deal with the processes themselves, such as e.g. identification of employees with high potential, development of their career, retention or use of their skills. Most booming businesses recognized years ago that the most efficient practices of talent management are directly associated with the organizations culture and strategy (Gamama et al., 2018). According to the opinions voiced by Sparrow et al. (2015) and Graeme et al. (2016), talent is to be perceived through four "perspectives" as human capital that is embodied in the individual's capability to categorize, a productive economic value, social capital, political capital and cultural capital. A talent management program should be fully integrated with other business processes. In order to achieve the expected results of talent management, it is necessary to ensure a continuous cycle of "talent improvement", which includes attracting talents, inspiring them, motivating them, managing them, developing them and rewarding them appropriately. Organizations that do not change their approach to talent management may lose their greatest asset – people (Menity group 2013).

1.2 Generational differences

Organizations that know and can leverage the strengths of each generation, know how to effectively resolve conflicts within generations, tend to keep their employees both productive and motivated, even in the face of economic and societal changes that affect the organization (Bentley university 2017). The interaction between older and younger generations often leads to situations where generational differences are clear but unknown and therefore instinctively negative biases are attributed to them, due to a lack of understanding. Adaptation is the biggest challenge that members of different generations have to face in a multigenerational work environment (Deal, 2007). As research from the Society for Human Resource Management shows, organizations with an effective collaborative multigenerational workforce have a definite strategic advantage (Birkman 2016). There are several benefits that organizations gain when a multigenerational workforce works together. A positive inclusive work culture can lead to business success by increasing recruitment, retention and profitability.

Different sources and authors report different divisions and types of generations, as well as different time horizons. For the purpose of our work, we have chosen the following breakdown of generations as shown in Table 1.

Table 1 Breakdown of generations

Name of generation	Time horizon of birth
Traditionalists	before 1945
Babyboomers	1946-1964
Generation X	1965-1979
Generation Y	1980-1994
Generation Z	1995-2009
Generation α	2010-present

Source: elaborated according to Kelly (2014) and McCrindle, Wolfinger (2011)

2 Methodology for exploring perceptions of talent management in the context of generational diversity

The aim of this paper is to explore differences in perceptions of talent management with respect to generational diversity. The questionnaire focused on the issue and was conducted in a hospital that provides inpatient health care, including inpatient emergency services in 9 inpatient wards and 5 specialized ICU wards, where 15 specialized outpatient clinics are also included. In 2020, the hospital was awarded the "Best General Hospital in Slovakia" award. The results from the questionnaire survey were evaluated by higher statistical methods using SPSS 22 software.

The research sample consisted of 82 respondents out of 120, which is 68.33% success rate. Graph 1 shows the respondents by generation. The largest group in the sample in terms of generation was Generation Y respondents, and they constituted 52.4% of the sample. In contrast, the least numerous group was Generation Z respondents, and they accounted for only 11% of the sample (Stolárová 2022).

Graph 1. Generation breakdown - Generation
Source: Own elaboration

Survey respondents were asked to indicate their level of agreement on each question in the questionnaire. A Likert scale (a) - (e) was used to express the level of agreement, the individual parameters being as follows: a) definitely yes, b) rather yes, c) don't know, d) rather no, e) definitely no. For statistical analysis, given the stated hypotheses and the nature of the data, the Shapiro-Wilk normality test, ANOVA test and Kruskal-Wallis test were used. Statistical analysis was performed using SPSS 22 software.

3 Results and evaluation of hypotheses

Hypothesis 1 We hypothesize that there is a statistically significant difference in the degree of positive perceptions of talent management in an organization with respect to generation. The overall raw score for perceptions of talent management in the organization was obtained by summing the scores from questions 5, 6, 7, 8, 9, 11, 12, 14, 15, 16, 17, 18, 19, and 20. We scored individual responses as follows: Definitely no = 0 points, Rather no = 1 point, Don't know = 2 points, Rather yes = 3 points, and Definitely yes = 4 points.

Chart 1. Level of positive perception of talent management in Generation X organisation
 Source: Own elaboration

Thus, the total score could take values ranging from 0 - Maximum negative perception of talent management in the organization to 56 - Maximum positive perception of talent management in the organization.

Chart 2. Level of positive perception of talent management in Generation Y organization
 Source: Own elaboration

Based on the results, we can observe that the mean raw score of the degree of positive perception of talent management in the organization was on a scale of 0 - maximum negative perception to 56 - maximum positive perception, for Generation X respondents at 29.43 points, for Generation Y respondents at 26.95 points and for Generation Z respondents at 35 points.

Chart 3. Level of positive perception of TM in Generation Z
Source: Own elaboration

To gain insight into the normality or non-normality of the data distribution, necessary for subsequent testing of hypothesis 1 and based on the sample size, we used the Shapiro-Wilk normality test.

Table 2 Shapiro-Wilk normality test

Generation	Shapiro-Wilk		
	Statistic	df	Sig.
Generation X 1961-1978	,967	30	,469
Generation Y 1978-1994	,981	43	,670
Generation Z born. after 2000	,909	9	,309

Source: Own elaboration

Since we found in the normality test reported in Table 2 that the data have a normal distribution, we use parametric tests to test Hypothesis 1.

For hypothesis 1, we sought to determine whether there is a statistically significant difference in the degree of positive perceptions of talent management in an organization with respect to generation. To analyze the hypothesis, we used parametric ANOVA test after considering the tests of normality of data distribution and nature of variables.

Table 3 ANOVA - degree of positive perception of talent management in the organization

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	504,348	2	252,174	1,877	,160

Source: Own elaboration

For the ANOVA test, we look at the Sig column. If there is a value less than 0.05, there is a statistically significant difference between at least two groups. In our case, there is 0.16 and that means there is no statistically significant difference between any two groups.

Based on the results of the one-way ANOVA test presented in Table 3, we can conclude that there is no statistically significant difference between any two generations in the degree of positive perception of talent management in the organization.

Hypothesis 1 was not confirmed.

Hypothesis 2 We hypothesize that there is a statistically significant difference in the perception of an organization's ability to retain talent with respect to generation.

In descriptive statistics for each hypothesis, it is necessary to make such a basic sketch of the variables involved in the hypothesis.

Chart 4. Perceptions of the organization's ability to retain talent in Generation X, Y, Z
Source: Own elaboration

Based on the above results, in terms of perceptions of the organization's ability to retain talent, most Generation X respondents tended to agree with the organization's ability to retain talent and accounted for 40% of their group, most Generation Y respondents tended to disagree with the organization's ability to retain talent and accounted for 44.2% of their group, and most Generation Z respondents tended to agree with the organization's ability to retain talent and accounted for 66.7% of their group.

Based on the nature of the variables, we will use non-parametric tests to test hypothesis.

For hypothesis 2, we sought to determine if there is a statistically significant difference in perceptions of an organization's ability to retain talent with respect to generation. To analyze the hypothesis, after taking into account the nature of the variables, we used the non-parametric Kruskal-Wallis test.

Table 4 Mean Rank Generation X, Y, Z

Generation	N	Mean Rank
Generation X 1961-1978	30	42,42
Generation Y 1978-1994	43	37,27
Generation Z born after 2000	9	58,67
Total	82	

Source: Own elaboration

Table 5 Kruskal-Wallis test

	Perception of the organization's ability to retain talent
Chi-square	6,638
df	2
Asymp. Sig.	,036

Source: Own elaboration

Based on the results of the Kruskal-Wallis test, we can conclude that there is a statistically significant difference in the perception of an organization's ability to retain talent, at least between the two groups with respect to generation.

We now compare the pairs of groups separately and use the non-parametric Mann-Whitney U-test to do this.

Table 6 Perception of the organization's ability to retain the talents in Generation X, Y

Generation	N	Mean Rank
Generation X 1961-1978	30	39,80
Generation Y 1978-1994	43	35,05
Total	73	

Source: Own elaboration

When interpreting the Mann-Whitney U-test, we proceed by looking at the value in the Asymp Sig.(2-tailed). If the value there is less than 0.05 then we know that there is a statistically significant difference between the groups. We then need to figure out what direction that difference is, that is, which group is how different from the other. To do this we use the table on the left, where Mean Rank is like the average for non-parametric tests.

Table 7 Mann-Whitney U-Test

	Perception of ability of the organization to retain talent
Mann-Whitney U	561,000
Wilcoxon W	1507,000
Z	-,986
Asymp. Sig. (2-tailed)	,324

Source: Own elaboration

And so, we can see which number is larger and therefore that group scores statistically significantly more than the other group. In our case, we find that the value of Asymp Sig.(2-tailed) is less than 0.05 and hence there is a statistically significant difference between generations X and Z.

Table 8 Perceptions of the organization's ability to retain talent in Generation X, Z

Generation	N	Mean Rank
Generation X 1961-1978	30	18,12
Generation Z born. after 2000	9	26,28
Total	39	

Source: Own elaboration

In Table 8, the mean rank is higher for Generation Z and thus we know that this Generation Z is statistically significantly more confident in the organization's ability to retain talent than Generation X. We evaluate the other comparisons analogously.

Table 9 Mann-Whitney U-test

	Perception of ability of the organization to retain talent
Mann-Whitney U	78,500
Wilcoxon W	543,500
Z	-1,997
Asymp. Sig. (2-tailed)	,046

Source: Own elaboration

Table 10 Perceptions of the organization's ability to retain talent in Generation Y, Z

Generation	N	Mean Rank
Generation Y 1978-1994	43	24,22
Generation Z born. after 2000	9	37,39
Total	52	

Source: Own elaboration

Based on the results, we can conclude that there is a statistically significant difference between the generations in their perception of the organization's ability to retain talent, such that Generation Z respondents are statistically significantly more confident in the organization's ability to retain talent than both Generation X respondents and Generation Y respondents.

Table 11 Mann Whitney U-test

	Perception of ability of the organization to retain talent
Mann-Whitney U	95,500
Wilcoxon W	1041,500
Z	-2,481
Asymp. Sig. (2-tailed)	,013

Source: Own elaboration

There is no statistically significant difference between Generation X and Generation Y in their perception of an organization's ability to retain talent.

Hypothesis 2 was confirmed.

4. Discussion

By comparing the results of the questionnaire, we concluded that different generations perceive the talented employee differently. While the representatives of Generation X think of talent as a team player, for millennials talent is an employee successful in his/her position and for representatives of Generation Z it is an exceptionally talented person. At the same time, it can be stated that representatives of all generations consistently perceive that they use the acquired knowledge and skills for their career advancement. However, not all of them agree that talented people are offered space for career and personal growth by the organization. While representatives of Generation X perceive this rather negatively, the other two generations see it positively. Generation Y believes that the organization does not focus enough on talent, does not have a well-developed talent management programme, and is more inclined towards the lack of regular performance appraisals, but on the other hand is inclined to say that the performance appraisal process is effective and the findings of the performance appraisal are used to plan further development. It is also worth noting the leaning towards a negative perception of the organization's ability to retain talent. Generation X agrees with conducting regular performance appraisals, but on the other hand they lean towards the statement that the performance appraisal process is not effective and most of them could not answer the question whether the conclusions of performance appraisals are used to plan further development. Generation X agrees with conducting regular performance reviews, but on the other hand is inclined to say that the performance review process is not effective and most of them could not answer the question whether the findings of the performance review are used to plan further development. The issue of talent retention and employer attractiveness was affirmed by both Generation X and Z in agreement.

Conclusion

The goal of talent retention is to ensure the stability of workers in the organization and create an ideal environment for people to stay in the organization, it is important that the organization actually creates this environment. The overall stability is influenced by the reputation of the organization, the selection and placement of employees, the style and level of leadership, the opportunities for education and, of course, recognition, appreciation and remuneration. Our research showed that the organization should focus on a deeper understanding of what talented employees of individual generations imagine under an ideal environment. All businesses must be able to anticipate and seize new opportunities before their competitors (Sareen & Mishra, 2016). The placement of the best employees in the best positions is part of talent management (Devine, 2008).

Abstract

Research background: The problem of assessing enterprises' innovative capacity in order to determine capital investment patterns presupposes the assessment of company resource potential and innovative capabilities, which reflect, on the one hand, the efficiency of resource potential utilization and, on the other hand, is an indicator of the management system effectiveness.

Purpose of the article: The purpose of the study is to form approaches to assessing the impact of the effectiveness of innovation management and the use of intangible resources of an enterprise, including information and intellectual resources, on the overall growth rate of an enterprise's capital.

Methods: By means of correlation modeling, the data of enterprises in Ukraine for the period of 2017-2021 were analyzed, and a model of dependence of economic entities' sustainable development indicators on the existing assets structure and the level of investment in enterprise intangible assets (resources).

Findings & Value added: The established approach will help to determine the principles of managing enterprise intangible resources, which influence the growth of the enterprise's total capital and the formation of its market value for all types of innovative changes.

Keywords: innovations, innovatively active enterprises, capital investments, intangible assets, intangible resources

JEL classification: C51, M21, O30, O32

1. Introduction

The transition of world economic systems to the stage of the information development paradigm is characterized by the innovative process determinability to ensure competitiveness at both macro and micro levels. Under the conditions of the economic systems transformation towards digitalization of the entire economic cycle, the priority in the process of enterprise activity has shifted from tangible to intangible factors of production. According to the World Economic Forum (WEF 2023), the countries leading the ranking in terms of the national economies' competitiveness are also the leaders in terms of the volume of innovative activity and the level of innovation capacity.

The crisis phenomena of 2008-2009 (global financial crisis) and 2019-2020 (the economic crisis caused by the COVID-19 pandemic) clearly extend the dynamics of changes in gross domestic product (GDP) growth of the world's leading economies (Fig.1). Thus in 2020, the EU saw a 5.6% decline in GDP, compared to 4.3% in 2009. At the same time, growth of 5.4% in 2021 was higher than in 2010, and in 2022, there was a further increase of 3.5%. Such a recovery, according to the authors, is caused by the

* Corresponding author: svitlana.lab@gmail.com

high level of innovativeness of the leading economic systems, which are capable of accelerated additional gross product generation due to the application of modern technologies and optimal asset capitalization.

Figure 1. Real GDP of Change, 2005-2022 (% change compared with the previous year)
 Source: own processing based on the database of Eurostat Statistics Explained (2023) and Global Innovation Index (2022)

It should be stated that the presence of intangible resources in the asset structure at the micro level becomes a determining factor in the companies' market value growth and their competitive advantage formation. This is particularly true for their intellectual and information component being the main outcome and generator of innovations. Therefore, it is the increase in the efficiency of cost utilization for innovation activity that should be given considerable attention both at the macro- and micro-level.

The Fourth Industrial Revolution, better known as "Industry 4.0", has taken its name from a 2011 initiative launched by German businessmen, politicians, and academicians who defined it as a means of increasing the German manufacturing industry competitiveness via the increased integration of "cyber-physical systems" (or KPS) into the manufacturing processes (Schwab, 2016). It is hard to disagree with his assertion that the changes being witnessed in the global economy are more than just efficiency gains. They reflect the transformation of the entire modern economy organization paradigm.

It is capital investments in innovative technologies traditionally associated with Industry 4.0, such as additive manufacturing, artificial intelligence, large databases, cloud technologies, and the Internet of Things (Ibarra et al., 2018, Dalenogare et al., 2018, Bai et al. 2020), that can provide for the increase in competitiveness and the sustainable development of both the economies as a whole at the country level and sustainable business growth at the level of individual companies (Müller et al., 2021).

1.1 Innovative Activity as a Driving Factor in the World's Leading Economies Development

The acceleration of scientific and technological progress and the introduction of the latest manufacturing technologies determine the competitive position of any country in the world. Modern economic theory requires a study of the changes that occur under the influence of ever-increasing intensity and expanding the scope of information interactions of all elements of an economy. In this regard, business processes, both at the global and enterprise level, are being reconsidered. This is the fundamental basis for building an effective management system in general and, in particular, the innovation process management system (Piątkowski, 2020, Trinugroho, Law et al., 2021).

The intensification of national economies' economic competitiveness can be traced by analyzing the correlation between changes in GDP and research and development (R&D) expenditures (Kiselakova, Sofrankova et al., 2020).

The growing role of intellectual activity and intangible assets in the countries' economic development is confirmed by the spread of government strategies aimed at strengthening the knowledge triangle, the "angles" of which represent scientific research, business innovation, and entrepreneurial activity.

As can be seen from Fig.2, the countries leading in the competitiveness ranking make significant expenditures on innovative activities, which ensures their innovative vector of development.

Figure 2. Correlation between the level of R&D spending and the countries' GDP as of 2022
Source: own processing based on the database of the Global Innovation Index, WIPO2022

Moreover, the leading countries of the world emphasize the importance of business innovation and company investments in research. At the institutional level, R&D funds are directed to the private sector instead of funding public research. Business innovations are also supported directly and indirectly, which directly affects the development of territories (Yermachenko, et al., 2023).

Under the conditions of reduced growth rates of the economies of most European countries caused by the general crisis of recent years, the conditions for achieving sustainability at the level of individual companies are based on understanding the importance of an optimal combination of the four main directions of sustainable development (Huttmanova, Valentiny, 2019). Among them - are economic, social, ecological, and institutional development. It is the intangible resources created in the economic system that are the drivers of the development of all other systems.

Economic and social development, both at the level of individual companies and at the level of national economies, should be stimulated by the institutional environment of countries. Ensuring and preserving the quality of the environment is a prerequisite for sustainable development within the Industry 4.0 concept (Huttmanova, Novotny & Valentiny, 2019).

The priority direction of policymaking among the leading countries of the world is an investment in human resources and the development of skills necessary to support innovation. This is exactly the direction in which Ukraine and Slovakia tend to develop their national economies' innovativeness.

1.2 Intangible Assets as the Innovation Development Product and the Driver

The innovative activity itself is a source of generating the enterprise's intangible resources, which are capitalized in certain types of intangible assets or cannot be recognized as assets, but increase the enterprise's market value. It should be noted that during the Fourth Industrial Revolution, within the framework of the concept of Industry 4.0, the importance of innovative resources, namely: the latest technologies and developments, intellectual property, brands, software, databases, organizational improvements, the experience of innovative implementations as well as enterprise human capital development due to the improvement of employees professional skills, experienced an increase.

According to the data provided by the Ponemon Institute report (Aon-Ponemon-2022), among 32 companies with the highest capitalization (according to the S&P 500 index), a steady dynamics can be seen towards the overrun of the intangible assets value and growth rate over tangible assets. In 2018, the intangible component of these companies' market value totaled 84%.

According to Brand Finance's research, in 2021, on average, the global enterprise's value is provided by intangible resources by 54% (in the most technological and intellectual industries – by 65-85%). Of

these resources, 43% are formed by the value of intangible resources which are not recognized as assets under International Financial Reporting Standards. Only 4% are reported as intangible assets, 7% are recorded as goodwill (Global Intangible Finance Tracker, 2021).

Research (Brown, Gregory, and Wunsch-Vincent, 2022) states that global intangible assets in 2021 are estimated at \$74 trillion, having increased by more than 25% since 2019 and compared to approximately \$6 trillion in 1996.

Thus, enterprise intangible resources should be part of any integral indicator measuring the success of corporate and national innovation economies and their innovative business capacity.

In order to get a general idea of the concept of the formation of unified approaches to the effective management of the processes of innovation activity, the goal was set in the study: to assess the impact of indicators characterizing the formation of intangible resources on the growth of total capital and the market value of the business for innovatively active enterprises.

2. Methods

The modern stage of scientific content development for "innovatics" as a science of innovative development and innovative activity of the subjects at different grouping levels is characterized by further clarification, distribution, and delimitation of its categorical apparatus. In the introduction to the innovation activity categorical morphology, the definition of enterprise innovative ability is explained by the approach, which emphasizes that the mere presence of high innovative potential does not guarantee its effective application in the process of innovation activity. Therefore, the innovative capacity indicator should be decomposed into static (sustainable) and dynamic components.

The first component includes the resource potential of innovation activity (R_i), formed in the previous business processes of the enterprise. In a general form, it can be represented by formula (1)

$$R_i = (\sum a_{1i} * WRpi + \sum a_{2i} * WRei) + (\sum b_{1i} * MRpi + \sum b_{2i} * MPei) + (\sum c_{1i} * FRpi + \sum c_{2i} * FRei) + (\sum d_{1i} * InRpi + \sum d_{2i} * InRei) \quad (1)$$

In which:

a_{1i}, \dots, d_{1i} represent weighing coefficients of influence of the i -type resource availability level for each component;

a_{2i}, \dots, d_{2i} are weighing coefficients of influence of the i -type resource utilization efficiency level for each component;

n is the number of model indicators;

$\sum WP_i, \sum MRpi, \sum FRp, \dots, \sum InRpi$ represents the sum of attributes characterizing the availability of labor, material, financial as well as information, and intellectual innovation resources, respectively;

$\sum WRei, \sum MRei, \sum FRei, \dots, \sum InRei$ is the sum of attributes characterizing the efficiency of using labor, material, financial, and information-intellectual innovation resources, respectively.

The second component includes the group of indicators which, being based on the existing potential, enable its effective use in future periods. The tuple of such indicators forms the innovative business opportunities of the enterprise. The study refers to the enterprise innovative business opportunities (IP) in the context of assessing the definition of the enterprises' innovative capacity as the ability of the enterprise management system to effectively use the innovative potential for the commercialization of both individual innovative projects and for the implementation of the overall innovative transformation process, which determines the way of enterprise development. This approach is represented by a certain tuple of dependence (2).

$$IP = \{\varepsilon FP, \varphi ROL, \omega IRR\} \quad (2)$$

in which:

FP is the generalizing indicator of the financial state as of the date of the innovation project implementation;

ROL represents the degree of operating leverage, which characterizes the assets structure formed in the previous period;

IRR is the internal rate of return (profitability), which characterizes the efficiency of using enterprise assets.

$\varepsilon, \varphi, \omega$, - coefficients of significance correction.

It should be noted that innovative business opportunities are formed not only within the innovation activity cost management system but also in general by the enterprise operational management system in all its subsystems.

The innovation activity process is characterized by a continuous diffusion process of information flow exchange between the enterprise and the external environment. The application of the provisions of

the research information paradigm implies the definition of information resource as one of the main types that characterize the effectiveness of the enterprise innovation activity process.

Intangible resources as products of innovation activity affect both the resource potential (increase the efficiency of all resource types application) and its innovative capabilities. Thus, it seems significant to study the impact of intangible resources formed in the process of innovative activity on the indicative growth of an enterprise's total capital, which is the basis for assessing the enterprise's market value.

The authors adhere to the approach, according to which not only capitalized tangible and intangible assets but also intellectual resources are formed in the course of the enterprise's innovative activity. Namely, for example, experience after implementing innovations or skills to process information flows, or databases, which can be used in the next business cycles, etc, are formed.

In the course of the study, a hypothesis was formed about a certain dependence of the total capital growth (TE) indicator on the tuple, which contains the share of the volume of investment from the enterprise income, to be directed at innovative transformations (Inv), the level of intangible innovation assets in the total value of enterprise assets (IntangA) and intangible resource (IntangR), which forms itself as a result of innovative activity, but cannot be fully estimated (or identified) in accounting and financial statements.

$$TE = \{Inv, IntangA, IntangR\} \quad (3)$$

The selection of the indicator of the total capital growth rate as a functional variable, which characterizes the enterprise development, is stipulated by its economic significance. It consists in understanding the combination of the enterprise's capital components. It is determined by the authorized capital, all types of additional capital, including direct investments aimed at innovative transformations, and the indicator of "residual profit." If the first two components are clearly estimated in the financial statements (enterprise balance sheet), the latter is formed as the balance sheet profit reduced by the "cost of capital investments in innovation activity". It is proposed to refer to the cost of capital investments as the number of capital investments multiplied by the profitability of an individual business entity. This approach, in its essence, implies the adjustment of the available profit by the number of chances lost by the enterprise under the influence of "refusal" to invest in other types of innovation projects.

The first two factor variables of the tuple (3) can be obtained by calculation based on data contained in financial and statistical reports of enterprises.

The third-factor variable (IntangR) is proposed to be estimated using the rate of change in the degree of operating leverage (ROL), which was formed in the previous period and characterizes the ratio of marginal income and net profit. Since this indicator reflects the "speed" of the enterprise's profits (losses) increase, in case of changes in the company activity volume, it can be used as a characteristic of mutual consistency of all management subsystems functioning, including production, marketing, logistics, sales, etc.

To identify the statistically significant presence of connection, closeness, and direction of interrelations between the functional and the factor variables, the study used the multiple regression analysis model. In such models, determined by a clear interpretation of the parameters, the most widely used linear function, where the parameters with factor variables ($X_1=Inv$, $X_2=IntangA$, $X_3=ROL$) will characterize the mean change in the effective feature ($U=TE$) with the change in the relevant factor with the conservative value of other factors fixed at the mean level.

3. Results

In order to confirm the significance of the selected factor variables for the resulting functional variable – enterprise's capital growth rate, we analyzed and included in the regression model the data on the activities of 20 Ukrainian enterprises in the field of machine building, which are comparable in terms of the activity volume and the size of the assets. The choice of this industry is conditioned by its high level of innovativeness in the Ukrainian economy, as well as by the possibility of distinguishing the influence of the intangible assets formation and the level of innovative activity development on the investment attractiveness of the enterprise. The sources of information for the analysis were annual financial statements and management reports for 2017-2021 published on the official websites of the enterprises. The basic information on the performance indicators of the enterprises selected as the objects of the study is presented in Table 1. Data processing by means of the tabular processor MS Excel, (Fig. 3). Since the study was based on the enterprises' activity in the pre-war years, it is considered inexpedient to apply the

obtained regression equation for forecasting under the conditions of crisis in the Ukrainian economy caused by the aggression of the Russian Federation against Ukraine. But the obtained results can be used for analytical purposes and general trend identification. The findings of the conducted correlation analysis revealed that the factor variables included in the model explain the influence of the functional variable Y (capital growth rate) on the overall indicator only by 19% (R-square=0.19). This indicates the presence of a number of other factors affecting the rate of income growth. This clearly proves the need to take into account the model, which can be used to predict the growth rate of the total capital of an individual enterprise, both the available part of the innovative resource and the material component (formula 1), and it is also necessary to take into account indicators of the level of economic security of the enterprise (Labunska S., Karashevski R. et al. (2019)).

At that, the total value of the regression model statistical significance is $0.0005 < 0.05$. This provided that the confidence interval is chosen at the level of 95%, indicates a statistically significant correlation between the factor variables input into the model and the response variable.

When analyzing each factor variable, it was revealed that all variables X1, X2, and X3 (level of operating leverage, total investment in % of return, and the share of intangible assets in the total assets of the enterprise, respectively) demonstrate statistical significance. Indicator X3 (the level of intangible assets in the assets of the enterprise) has a statistical significance in the model that reflects the growth rate of the capital of the enterprise and provides a significant increase in the functional variable. This is explained by two main reasons. Firstly, the impact on the overall level of profitability of innovative transformations that took place at the enterprises under study in accordance with the concept of Industry 4.0. Secondly, such results do not take into account the assessment of intangible resources in full according to financial and statistical reporting since it includes only their capitalized part.

The analysis of R&D expenditures in the economies of Ukraine and Slovakia over the past twenty years (Fig. 4) confirms the need to pay significant attention to the formation of an innovative product during the implementation of innovative activities.

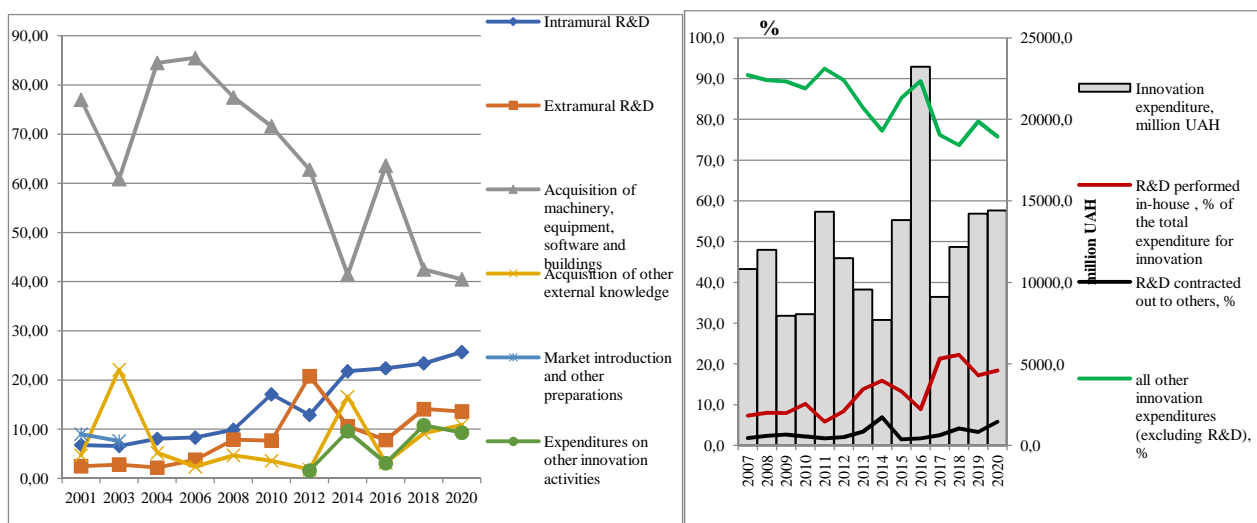

Figure 4. Expenditures on R&D in Slovakia (left hand) and Ukraine (right hand)
 Source: own processing based on the database Statistical Office of the Slovak Republic & of the State Statistics Service of Ukraine (2023)

Not all R&D expenditures lead to the creation of an innovative product and are capitalized in the company's assets. Most of them are aimed at the formation of intangible resources, which are drivers of increasing the competitiveness of the enterprise and the growth of its market value (Fig.5).

Figure 5. Principles of costs identification and assessment in the innovative activity process in order to exercise managerial influence
Source: Labunska, Yermachenko, Sidak (2023)

In order to exercise managerial influence on the effectuation of innovative activity in order to improve its efficiency, it is proposed to distinguish the types of innovation by the stage of capitalization (parameter xIn) as follows:

- i_{11} represents ideational innovation in the form of an informational intangible component, which can be more accurately expressed through the use of the enterprise's intellectual capital with the availability of intellectual potential and resources for its implementation. Intangibility consists of the fact that the idea cannot be sold yet and does not have an unambiguous cost estimation – specialists only possess the primary information that enables them to assume the possibility of the emergence of innovation in a certain sphere of enterprise activity. At this stage, it is even impossible to predict its success or failure;

- i_{12} is attributed to the costs structure – the enterprise considers that the idea, already expressed in the form of a new approach, product, development, method, etc., should be attempted to be implemented and calculates its cost price;

- i_{13} stands for the capitalized innovation in the form of assets – the costs incurred at the previous stage generated profit (income) to the enterprise or increased the value of other assets. The innovation has been successfully implemented and is now part of the enterprise's assets (tangible or intangible) and can be recorded as an accounting object.

If a company generates innovations independently, they traditionally go through one to three stages. From Fig. 5 it can be seen that the enterprise can abandon the innovation in the second stage if its implementation proves to be economically unfeasible. The process of identifying a new innovation with a certain type of asset is not so critical if the decision to enlist it on the enterprise balance sheet is unambiguous and depends to a greater extent on the convenience of accounting. In practice, it is possible to assume a variant when the innovation is implemented and generates income but is not identified as a separate type of asset. Then the costs of its implementation are distributed among other items, and formally it does not seem to exist, being between stages I and II.

The main task of the enterprise during the innovation processes implementation is the selection of the innovation type and the innovation projects portfolio formation for each individual innovation type, which can be introduced based on the assessment and analysis of:

- directions aims and indicators of innovative activity efficiency, based on the analysis of external factors (competitive environment, availability of established innovative ideas (according to the author's

definition: "ideational innovations," i.e., innovations that have not reached the stage of innovative products (goods)), innovative products available on the market) and general aims of the enterprise's business activity within the period;

- the level of enterprise innovative capacity, which was formed in the previous period;

-maximum intended cost volume based on the distribution of the costs in the overall subject-oriented cost management system.

Fulfillment of the set tasks is ensured through the application of the indicator set selection grid, which characterizes the fulfillment of management functions aimed at transferring the relevant characteristics of the innovative activity system into a new state based on the results of innovation implementation (4).

$$U^x \{ \tilde{\eta}0: (K0, E0, A0, \Omega0) \} \rightarrow P1 \rightarrow \{ \tilde{\eta}1: (K1, E1, A1, \Omega1) \}, \quad (4)$$

Where:

U- represents a set of functional stress from the enterprise subject-oriented management systems aimed at a set of objects. This determines the dynamic response and transfer of objects to a new state at the end of the period;

P1-is grid of parameters selection characterizing the new state of the enterprise;

$\tilde{\eta}0, \tilde{\eta}1$ - refers to characteristics reflecting the set of states of the subject-oriented managerial impact plane at the beginning and the end of the period;

K0,1- shows indicators of the subject-oriented plane, which can be unambiguously reasonably estimated based on the enterprise reporting data, the systematization of which is carried out by processing the results of an expert analysis conducted by a group of experienced specialists at the beginning and end of the period, respectively;

A0, A1- are indicators of the subject-oriented plane, which can be unambiguously reasonably estimated based on the enterprise reporting data and selected based on normalized (formalized according to the methodology) selection at the beginning and the end of the period, respectively;

E0,1- show indicators containing verbal characteristics of the system state and can be included in the plane of study, based on the use of fuzzy logic methods, at the beginning and the end of the period, respectively;

$\Omega0,1$ - are the level of influence random, unpredictable factors may have on external and internal environment threats at the beginning and the end of the period, respectively.

Therefore, the formation of approaches to innovative activity management should contain a set of purposeful actions that improve the enterprise's financial and economic condition, determined by the growth of its total capital (with the account taken of the "cost" of its application in the innovative activity process) and leads to internally generated goodwill accumulation.

4. Discussion

The funding results of the regression analysis indicate the need to expand the array of indicators that determine the impact of intangible assets on the growth rate of the total capital of the enterprise. This justifies the need to calculate the internally generated goodwill, which reflects the presence of a generated but not identified information resource.

Medved, Peštović, Saković (2023) prove the significant impact of investments in intangible assets on the business results (profitability) of companies. We agree with the general concept of research and believe that the profitability indicator fully reflects the results of innovative activity aimed at increasing the intangible resources in the total asset structure, as it does not determine the growth of the company's market value.

Research conducted by Mir, Seboui (2006) revealed a positive correlation between the variance in the evaluation of assets recognized in accounting and the company market value as well as earnings management indicators. In our opinion, the correlation between the operating leverage degree and enterprise income adequately explains the maturity degree of the enterprise management system as a whole. The operating leverage degree is considerably affected by the enterprise cost structure; the absolute majority of enterprises under scrutiny are characterized by the dominance of variable costs; according to the data obtained from management reports, only 13.58% of enterprises have a share under 75% of variable costs in the sales cost structure.

With regard to the resulting indicator that affects the overall estimation of the enterprise market value, the growth rate of total capital, which is estimated based on the data of financial statements, was chosen for the study. Certainly, it is impossible not to agree with the approach which presupposes the expansion of such "accounting" estimation. In our opinion, it should be expanded by combining the value of enterprise intellectual capital formed on the basis of the outcomes of innovative activity

(Serpeninova, Lehenchuk, et al 2022). Therefore, Kucera and Dvorakova (2023) draw attention to the existence of a link between the main determinants of intellectual capital, namely human capital, structural capital, and relational capital, and the overall level of capital reported in financial statements.

At the level of individual companies, the choice of latent factors determining the efficiency of innovative activity aimed at producing intangible assets may vary depending on the specifics of the enterprise's activity. For the post-war recovery of the Ukrainian economy, the issues of strategic restructuring of high-tech industries, namely machine-building, information technology, electric power, and the service sector (including hospitality), towards the increase of intangible assets value in the total structure of assets will gain relevance.

Conclusion

The development of approaches to enterprise innovative activity management should be based on the mutual coordination of the functional influence of all management subsystems and be based on a predetermined level of enterprise innovative capacity, which combines the components of innovation potential and innovative business opportunities.

The result of innovative activity is the formation of not only assets, being both tangible and intangible components but also information and intellectual resource, which is not identified in financial and statistical reporting. The process of innovative transformations affects the experience of the enterprise in the completion of innovative implementations and the increase in the value of information and intellectual resource as well as the labor resources in the potential of the enterprise. In fact, clarification of approaches to the evaluation and identification of intangible resources being an object of managerial influence is required. To clarify the definition of objectivity of the managerial influence direction, it is proposed to scrutinize the innovative activity process from the position of differentiation of results by stages of capitalization.

Organization of effective, innovative activity management requires consideration from a holistic perspective, which presupposes;

- firstly, formation of approaches to innovative activity, with respect to the findings of the enterprise's accumulated experience and its innovative capacity, established in previous periods;
- secondly, aligning the aims of the innovative activity management system with the production, financial, management, marketing, logistics, and sales subsystems;
- thirdly, combining the direction of functional influence by the enterprise's innovative activity management system and the economic security system towards the formation of favorable conditions both in the external and internal environment to enable business activity implementation through proactive strategy implementation.

Online Management Tools as Research Tools of Managerial Actions Aimed at Artificial Management Implementation.

Results of the Research

Olaf Flak^{1,*}

¹ Jan Kochanowski University of Kielce, Faculty of Law and Social Science, Management Institute, Stefana Żeromskiego 5, 25-369 Kielce, Poland

Abstract

Research background: Research on Artificial Intelligence (AI) in management slowly appears as a challenge for the future. AI in management seems to exceed any other technological breakthrough that humanity has ever seen and human-machine teaming (HMT) seems to be a promising paradigm to approach future situations in which humans and autonomous systems closely collaborate. After the first age of robotics in mechanical processes and manufacturing rapid development of computer science and Internet has given opportunities to replace team managers with robots.

Purpose of the article: The purpose of this paper is to present results of the research of teamwork during which members were working together with online management tools in the platform of TransistorsHead.com on the given project. The online tools played also a role of research tools in order to record 10 managerial actions taken in that project. The results of the research show how it is possible to track, record and use human managerial actions to implement an artificial manager in a team.

Methods: In the research a long-term, non-participating observation was used. The observation tool a few weeks and the managerial actions were being recorded by online management tools.

Findings & Value added: The papers presents results of research which is a part of a solution of the main scientific problem which has to be solved in a way to artificial management. This scientific problem is what human team managers really do in their teamwork and in cooperation with their team members. All traditional research methods such as questionnaires and interviews give quite poor results. The non-participating, long-term observation of the teamwork together with online tools provide true knowledge which can be used in artificial management.

Keywords: online management tools, research tools, artificial intelligence, artificial management

JEL classification: M12

1. Introduction

Artificial intelligence (AI) can augment human intelligence in teamwork, however, there is still not clear how to implement artificial management (Flak & Pyszka, 2022). Research on AI shows that it could augment human teams in important ways in enhancing team coordination, enhancing knowledge sharing and learning, supporting decision making, as well as evaluation and team performance (Khakurel & Blomqvist, 2022). Additionally, the use of transformer-based language models in artificial intelligence (AI) has increased adoption in various industries and led to significant productivity advancements in business operations (Bouschery, Blazevic & Piller, 2023).

This is said that artificial intelligence has emerged as a promising and increasingly available technology for managerial decision-making. With the adoption of AI-enabled software, organizations can leverage various benefits of the technology, but they also have to consider the intended and unintended consequences of using the technology for managerial roles (Leyer & Schneider, 2021).

* Corresponding author: ja@olafflak.com

Regarding outcomes, teams perform equally as well under both types of management, with trends toward even superior performance from the AI-managed teams. Furthermore, team members perceive the interventions from both the AI and human manager as equally relevant (Gyory, et al, 2021). Some research on mixed human–robot teams show that comprise both robots and humans has expanded attracting the attention of researchers from different disciplines (Wolf & Stock-Homburg, 2022).

There are many more lacks of knowledge regarding the characteristics of human-AI teams, including a lack of understanding of how certain human-human teaming concepts may or may not apply to human-AI teams and how this composition affects team performance (McNeese, et al, 2021).

This would be the real accomplishment of the Drucker’s words that in the future “computers” will not only make decisions but they will do much more (Drucker, 1967). Looking for an answer if it is possible to replace human team managers with robots, it leads to a strong need of establishing some patterns of team manager work (Halliday & Stacey, 2009). It is claimed that a subject of team management has always come to a simple question: what makes a team manager? (Sinar & Paese, 2016).

This implies the scientific problem, how to record managerial actions in order to know what the manager does and to emulate him. Because the managers use all the time some managerial tools (Rustholkarhu, et al, 2022), the next is the research question: are the research tools are useful in recording managerial actions?

The purpose of this paper is to present the use of online management tools as research tools to implement artificial managers in place of human managers. The research method was a long-term observation conducted on the basis of a methodology for studying organizational reality, called the system of organizational terms. Participants in the study were 3rd year management students of Jan Kochanowski University of Kielce. Research tools were online management tools implemented in TransistorsHead.com platform (<http://transistorshead.com/>).

Section 2 presents the research method, consisting of the assumptions of the system of organizational terms on how to represent the work of a manager in the form of processes and resources, which create managerial actions that should be recorded to implement artificial managers. This section also briefly presents the design of online management tools. Section 3 shows the results of a study that used online management tools as research tools. Section 4 discusses the results in comparison with traditional approaches to representing managerial work based on managerial skills and managerial roles. Section 5 presents conclusions and further research plans for the implementation of artificial management.

2. Methods

The method used in the research consisted of two parts. The first part is a methodological concept of studying phenomena in organizational environment, which allow us to design online management tools and use them as research tools in many experiments in the field of team management automation. The second part of the method are online management tools which record managerial actions of a manager and team members.

The system of organizational terms is a methodological concept which consists of ontological and epistemological aspects designed for research team management aimed at artificial management. The philosophical foundation of the system of organizational terms is based on Wittgenstein’s philosophy, his theory of facts (the only beings in the world) and “states of facts”. According to this approach the organizational reality can be represented by events and things. Specifically, as shown in Figure 1, each event and thing have the label $n.m$, in which n and m represent a number and a version of a thing, respectively. Event 1.1 causes thing 1.1, which in turn releases event 2.1 that creates thing 2.1. Thing 1.1 simultaneously starts event 3.1 which creates thing 3.1. Then, thing 3.1 generates a new version of the first event, i.e. event 1.2. In such a way, a new version of the first thing (1.1) is created and it is called thing 1.2. Every event and thing is an organizational term, although the things are called primal organizational terms and the events are called derivative organizational terms. The way of labelling comes from the answer to a simple question: what would exist when a team manager stops doing anything? The answer is: things would exist as they are more stable and coherent over time comparing to events.

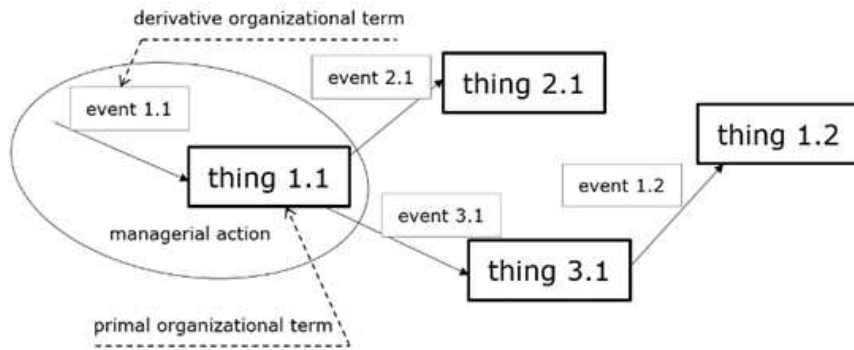

Figure 1. Fundamental structure of organizational reality based on occurring facts
Source: Flak (2018)

Things (primal organizational terms) in the organizational reality represent resources (Crick & Crick, 2023). Events (derivative organizational terms) in the organizational reality represent processes (Sliž, 2022). By the same token, the system of organizational terms combines the resource approach and the process approach in the management science in a way that team management processes effect in team's resources. Therefore the managerial actions is defined as a real activity, which a manager does in order to play a managerial role when he has a certain managerial skill (Yang, Flak, & Grzegorzek, 2018), the managerial action structure consist of, e.g. event 1.1 and thing 1.1. This is shown in Figure 2.

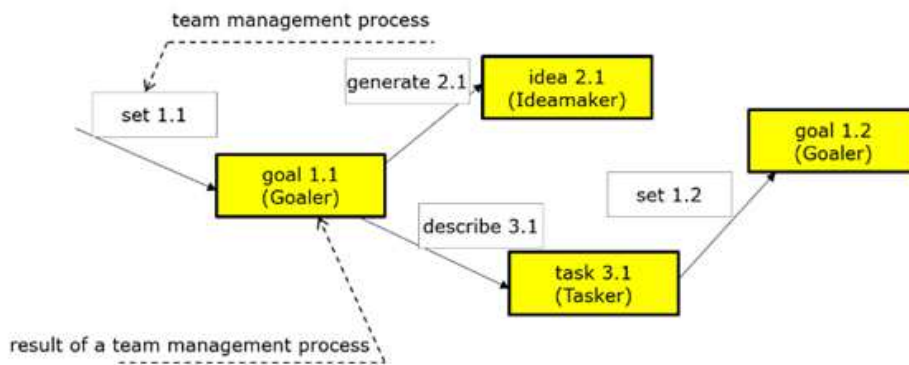

Figure 2. The example of creating resources by processes in team management
Source: Flak & Pyszka (2022)

Despite the fact that on the abstract level this approach is quite clear and easy to understand, a real problem concerns a method of measuring certain organizational terms. It is quite obvious that data which describe organizational terms should be recorded in a way, which allows to represent a team manager unambiguously without any doubts or subjective conclusions. This problem can be described by two questions: (1) which organizational terms could we measure and (2) how to do it? The project of the system of organizational terms includes answers to both questions.

Firstly, it is possible to measure only things as effects of processes (Flak, 2023). Even when we try to measure a process, its parameters must concern a state of the world before and after when this process happens. This means that the parameters concern some kind of a resource which is being changed during this process. In team management this issue looks as it follows.

As it is shown in Figure 2, when a team manager sets a goal (a team management process represented by Event 1.1 – setting 1.1), it is possible to measure features of goal 1.1. If later (e.g. after describing a task – describing 1.1 and task 1.1) this team manager does the next setting of the same goal, he launches the next team management process. Then the features of this team management process are changed and represent the second version of this team management process (setting 1.2 and goal 1.2). The difference between features of goal 1.2 and goal 1.1. let do reasoning on the team management process which happened in this period of time. Such an approach to ontology of team management lets represent all such processes by standardized features vectors with data grouped in content, time and psychosocial domains.

Secondly, if it is only possible to measure things (e.g. goal 1.1), there should be a special research tool which could let record the parameters of goal 1.1 keeping to the rule of minimum influence on a team

manager. The solution is a research tool built-in a management tool, which a team manager uses during day-to-day work. In other words, when a manager does something (e.g. set a goal) with a certain tool, this tool should record the parameters of the goal during the managerial work (e.g. before and after setting).

In order to verify the assumptions of the system of organizational terms described above the innovative online management tools were designed and implemented in TransistorsHead.com research platform. This approach partly based on a well-known method of time and motion study in management science. The author conducted several experiments on recording managerial actions based on this approach, showing the potential of this concept in team management automation.

To begin with, there are some assumptions. First, the functioning of an organization manifests itself in solving organizational problems. Second, one of the most important ways to solve organizing problems is to use instruments, called managerial tools (Flak, 2018). The managerial tool is, so to speak, detached from the person of the manager, his predisposition and ability to use management techniques and methods. A managerial tool is an algorithmized and certain way of performing a management function, which is possible for any manager (Flak, 2013).

Using a managerial tool, a manager can use various techniques, that is, purposeful and rational, theory-based ways of doing the work efficiently and effectively (Chopraa & Gopal, 2011). Taking into account the meaning of the phrase “Managing is about getting things done”, one can conclude that the concept of behavioral unit provides an opportunity to take an analytical approach to the management process and separate the various elements of the process. Each managerial tool is there for the manager to take just one “behavioral unit” (Hatfield & Weider-Hatfield, 1978).

Namely, there is a close relationship between the behavioral unit and the process and resource approach in an organization. R. Cooper and S. Fox call the combination of these two approaches the instrumental action approach (in the original “instrumental action” – author’s note) (Cooper & Fox, 1990). In the literature you can find the view that processes in the organization can be indirectly identified by recording the social processes that take place in the organization as a community. By recording individuals of behavior (managerial actions) we can tell a lot about the functioning of any organization.

So what characteristics should a managerial tool have? There are several (Glykas, 2011):

- fulfilling the function of an instrument during the implementation of processes in the organization,
- dividing the process into small fragments (according to the concept of “unit of behavior”),
- the effect of using the tool is to create an object that is a consequence of the process or serves to document it in the form of information (this object in the accepted theory of facts is a thing, and the language of management science is a "resource" - author's note),
- the possibility to make a record of the organization's resources as a result of the processes taking place in it,
- the ability to analyze the information recorded in the management tool on the connection of processes and resources with each other,
- regulation of processes and resources from the point of view of optimal functioning of the organization,
- determining the effects of the implemented processes and the characteristics of the resources necessary to carry them out.

Managerial tools also meet assumptions such as (Flak, 2013):

- it is possible to construct managerial tools used in many management techniques in many management areas,
- tools monitor the work of the manager and employees,
- tools provide automatic analysis of data on user behavior.

In order to these assumptions of the system of organizational terms described above the innovative online management tools were designed and implemented. They are in TransistorsHead.com research platform which is a knowledge management system used to team management. In the Figure 3 there is a dashboard of TransistorsHead.com. Types of managerial actions recorded by this system means as it follows: 1 - set goals (GOALS), 2 - describe tasks (TASKS), 3 - generate ideas (IDEAS), 4 - specify ideas (SPECIFICATIONS), 5 - create options (OPTIONS), 6 - choose options (DECISIONS), 7 - check motivation (MOTIVATION), 8 - solve conflicts (CONFLICTS), 9 - prepare meetings (MEETINGS), 10 - explain problems (PROBLEMS). The dashboard of the online management tools are presented in Figure 3. The online management tools were used in the experiment which results are presented in Section 3.

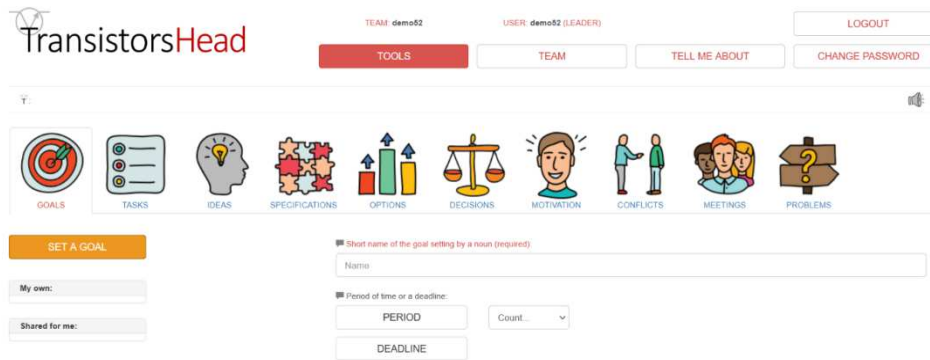

Figure 3. The dashboard of online management tools
Source: Flak (2023)

3. Results

The long-term observation was conducted from December 14, 2022 to January 14, 2023 among the students of management faculty of Jan Kochanowski University of Kielce, Poland. The study involved 26 participants in 5 groups - four groups had 5 participants, and one group had 6 participants. Participants in the long-term observation were given the task of preparing documentation of the program project on the YT channel in the Talent Show format. The task of the participants was as follows: formulate an organizing problem and solve this problem - propose a detailed format for the program and preparations for its implementation. The result of the study participants' work was a pdf document containing a detailed description of the solution to the organizing problem, consisting of the following elements. Participant used the online management tools implemented in the TransistorsHead.com platform, including 10 online management tools, as it is shown in Figure 3 and described in the Section 2.

Table 1 presents a total time of use the online management tools by participant in one of the group. For example, a team manager used a tool for setting goals (type 1) for 3382 seconds throughout the study. Since the managerial tools were shared, some team members were even more active in using certain tools than their manager himself. This can be read by the time of use of each tool. The tool usage time is equal to the duration of a given managerial action taken by a manager or team member.

Table 2, on the other hand, contains the number of uses of each tool by individual team members. For example, the goal-setting tool (type 1) was used by the team manager 70 times. This does not mean that the manager produced 70 different goals. It's simply that many times he went back to the tool and worked on existing or new goals..

Table 1. Duration of a given managerial action taken by individual team members

User of online management tools	Type of managerial actions									
	1	2	3	4	5	6	7	8	9	10
team manager	3382	4481	2270	662	1057	1502	2161	825	4832	5758
team member 1	4553	4224	2210	155	587	122	1138	918	5108	6241
team member 2	3691	376	2061	1588	2784	127	784	523	4292	5249
team member 3	3662	2751	2854	6078	1836	22	2679	1228	2233	1479
team member 4	5768	2599	2186	3435	1515	1073	918	984	2679	4405

team member 4	35	81	83	106	64	29	54	48	77	40

Source: own elaboration

Figures 4, 5, 6, 7, 8 show different trajectory of 10 managerial actions, recorded by 10 managerial tools in TransistorsHead.com in team work period. What is interesting, all team members had different trajectory of their managerial actions even than they were working on the same projects in the same group. This shows that the system of organizational terms together with TransistorsHead.com can be used in building knowledge on a succession of managerial actions done one after another by a team manager. Numbers in types of managerial actions mean: 0 – no managerial action, 1 – set goals, 2 – describe tasks, 3 – generating ideas, 4 – specifying ideas, 5 – creating option s, 6 – choosing options, 7 – checking motivation, 8 – solving conflicts, 9 – preparing meetings, 10 – explaining problems.

4. Discussion

The view of manager's work has been changed over one hundred years. Until the moment when AI emerged from laboratories to the real world creating AI processes matched to the capabilities of human process management (Gyory, et al, 2022), nobody cared if the representation of manager's work. At the beginning of scientific management, the picture of a manager in an organization was defined by his classical functions, such as a reflective planner, an organizer, a leader and a controller (Fayol, 1916). Later a view of a nature of a manager has been dominated by two approaches.

Firstly, in 1964 Koontz and O'Donnel launched a discussion on the meaning of managerial skills (Koontz & O'Donnel, 1964). In 1974 Katz proposed an approach in which managerial skills represented managerial work. The managerial skill was defined as an ability to work effectively as a team manager and to build cooperative effort within the team which the manager leads (Katz, 1974). The dominating typology of managerial skills divides skills into 3 groups: technical, interpersonal and conceptual skills. Technical skills were regarded as most important for supervisors, interpersonal skills for middle managers, and conceptual skills for executives (Kaiser, et al, 2011). One of the latest typologies of managerial skills of managers contains such needed skills as critical thinking, problem solving, an ability to organize data, conceptual thinking, evaluating ideas, persuasive skills etc. (Ullah, Burhan & Shabbir, 2014).

Secondly, in 1980 Mintzberg concluded that the manager's work can be described in terms of 10 roles within interpersonal, informational and decisional areas which were common to the work of all types managers. Managerial roles are defined as areas of job activities which are undertaken by a manager (Mintzberg, 1980). Mintzberg introduced to the management science a typology of managerial roles which contains such roles: a figurehead, a leader, a liaison, a monitor, a disseminator, a spokesman, an entrepreneur, a disturbance handler, a resource allocator, a negotiator (Mintzberg, 1980). Other researchers of team management proposed other divisions of roles, such as a leader, a peer, a conflict solver, an information sender, a decision maker, a resources allocator, an entrepreneur, a technician or an explorer, an organizer, a controller, an adviser (McCan & Margerison, 1989).

Managerial skills and managerial roles have influenced scientists and practitioners so much, that most of research on managerial work was designed as a research either on managerial skills or managerial roles. In the recent years, when intelligent systems are increasingly entering the workplace, gradually moving away from technologies supporting work processes to artificially intelligent (AI) agents becoming team members, there is a need of deep understanding of managerial work (Ulfert, 2021).

These traditional terms still do not recognize what really a team manager makes (Sinar & Paese, 2016) so that it is not possible to recognize team managerial action patterns in (1) a time domain, and (2) a content domain. The answer to this question seems to be hidden in the relation between managerial roles and managerial skills, because it is said, in order for a manager to play managerial roles, they should have some managerial skills (Flak, 2023). It results in understanding playing managerial roles within their managerial skills by day-today activities of managers effects in the managerial actions, which these managers make. Therefore, recording managerial actions on the foundation of the system of organizational terms and the online management tools is so important.

A potential of this research methodology were checked and proved in many previous observations conducted by the author of this project in the last few years, shown in Table 3.

Table 1. Potential of online management tools as research tools verified in research projects

Aim of the research	Main conclusions
Linguistic analysis of team management processes	Managers did not follow the instructions of the project and they planned different actions than they were assumed to accomplish (Alnajjar, Flak, 2016).
Using pattern recognition in team management processes	It is possible to assess similarities of managers actions by pattern recognition methods (Yang, Flak, Grzegorzec, 2018).
Teamwork research based on using online management tools.	Online management tools can be used as research tools and record managerial actions. Then it is possible to draw a trajectory of managerial actions (Flak, 2018).
Teamwork research based on using online management tools.	Online management tools can be used as research tools and record managerial actions. Then it is possible to draw a trajectory of managerial actions (Flak, 2018).
Assessment of using the system of organizational terms in team effectiveness	It is possible to estimate efficiency of team management using TransistorsHead.com as research tools (Flak, 2020).

Recording managerial actions in order to imitate a human manager by an artificial manager.	Literature review and own empirical research show the new organizational reality with hybrid virtual teams, consisting of humans as well as artificial agents. In this organizational reality management tasks, or even a leader's role, would be taken over by artificial intelligence (Flak & Pyszka, 2022).
--	--

Source: own elaboration

Firstly, it is possible to record managerial actions by online management tools (Flak, 2018b; Yang, Flak & Grzegorzec, 2018; Flak, 2018). Secondly, gathered data enables concluding trajectories of managerial actions and repeat them by algorithms (Flak & Pyszka, 2022). Therefore this is a first step implement real artificial management in organizations.

Conclusion

The purpose of this paper was to present the use of online management tools as research tools to implement artificial managers in place of human managers. The construction of managerial tools in the system of organizational terms is also based on the assumption that there is a close relationship between the concept attributed to a given phenomenon in organizational reality and the magnitude that the measuring tool (which is also a managerial tool) measures. The managerial tool collects information about the actions taken by the manager or other participants in the organization with the *ceteris paribus* principle (Flak, 2018).

As it was presented in Section 3, the managerial tool measures about where and when the tool was used, who used it and what resources were produced in the subsequent steps of using the tool and how the process for which the tool was used was carried out. These parameters are necessary to distinguish patterns of behaviour which could be used to implement an artificial manager (Cao, et al, 2021).

The current technological revolution is demanding a rapid pace of change to companies and has increased the attention to the role of teams in fostering innovation adoption. It is supposed that there could be two directions of an evolution from human virtual teams to artificial virtual teams supported by artificial intelligence. The first, vertical direction of evolution is a change from virtual teams with a manager to self-managed virtual teams. The second, horizontal direction of evolution could be a change from totally human virtual teams to totally artificial virtual teams (Flak & Pyszka, 2022). Both directions are the fields of the future research.

Abstract

Research background: The problem of assertiveness in managers' communication is the foundation of the theoretical framework we have addressed. The tactic of assertiveness involves practicing clear, calm, unaffected, and decisive responses to unwarranted or unacceptable requests, without feeling guilty. Assertiveness facilitates interpersonal communication and reduces manipulation.

Purpose of the article: The aim of article was to enhance understanding of assertiveness issues within various communication techniques used by managers. We specified the mutual differences and connections of the examined problems through selected questionnaires. When examining issue, we took into account the respondents' age, years of work experience, type of organization they belong to, type of research and suggested methods of assertive behavior that the respondents should implement.

Methods: A questionnaire was used to collect data, which examined assertive behavior, emotions, manipulation and aggression in managers. We used descriptive statistics to describe the studied set and mathematical statistics, where we analyzed the obtained data more deeply, looking for mutual differences and connections between selected properties of the statistical set, based on which we drew conclusions. Three hypotheses were formulated based on data from the questionnaire survey and statistically tested.

Findings & Value added: The results showed that respondents from the public sector have better skills in asserting their own rights and higher levels of assertiveness compared to respondents from the private sector. At the same time, correlations between the age of respondents and selected assertiveness factors in communication were demonstrated, specifically in the factors of defending one's own rights, skill in asserting one's rights, and violating the rights of others. Similarly, correlations between the number of years of work experience and selected assertiveness factors in utilizing communication techniques were confirmed, particularly in the factors of assertiveness, emotions, manipulation, and aggression.

Keywords: assertiveness, communication, aggression, emotions, manipulation

JEL classification: D12, E71

1. Introduction

The term assertiveness refers to a communication style that encompasses both communication skills and personal stability. Assertiveness is the art of standing up for oneself without suppressing or limiting the rights and needs of others. An assertive person must make decisions for themselves and be able to take responsibility for their choices. According to Praško (2012), assertiveness aids in collaboration with others. Being assertive means asserting one's rights without demeaning others.

People often avoid personal contact because in modern society, it is faster and, in most cases, easier to deal with everything using technology. They often hide their true intentions behind false pretenses, resorting to various intrigues to manipulate the other party and ultimately leading to nothing but disputes. Assertive techniques are increasingly being used for more effective conflict resolution, primarily focused on finding compromises that satisfy all parties involved.

* Corresponding author: jaroslav.gonos@unipo.sk

Bishop (2000) states that assertiveness is the ability to express oneself without manipulating others or resorting to passive or aggressive behavior. It emphasizes listening and responding to the partner's needs without neglecting one's own interests or compromising one's principles. Consideration is given to the ability to express one's needs, opinions, or feelings with the assurance of not being controlled, exploited, or coerced into denying one's intentions.

1.1 Theoretical background to neuromarketing

Assertiveness skills and techniques that can be learned and applied in various communication situations are categorized in various professional literature. Before we delve into the literature overview of assertiveness skills, it is important to emphasize the concept of assertive persistence. It forms the basis of all skills and denotes resilience, steadfastness, resistance to pressure, and standing firm (Sutton, 2021).

Assertiveness is an important communication tool that helps eliminate conflicts, build trust, and improve relationships and effectiveness in the workplace. Numerous studies on assertiveness show that there are many ways to learn to be more assertive.

Chakraborty (2009) discusses in a case study that organizations worldwide struggle to maintain their competitive advantages due to intense competition, global economic uncertainties, and other related issues. Therefore, it is essential for decision-making employees to ensure that stakeholders are reassured about the sustainability despite all obstacles, requiring an assertive approach in life rather than aggressiveness. There are instances where individuals tend to interchangeably use assertive and aggressive behavior without realizing the gap between them. Assertive behavior within and outside an organization not only helps employee growth but also provides a plan for advancing in the ranks. The study highlights the importance of assertiveness at both the individual and organizational levels and underscores the significance of assertive behavior across different levels of the organization.

This is supported by the study of Elang and Srinivas (2022), which states that elements of organizational climate need to be incorporated into human resource policies for success and alignment with the professionalism ethics of the organization. Seyyed et al. (2020) emphasized that a thorough and comprehensive communication process, both top-down and bottom-up, with a systematic plan for implementing the flow of information, would help align the information parallel to the needs of each department in the organization.

Tripathy (2018) states that assertive communication is the ability to speak and communicate in a manner that considers and respects the rights and opinions of others while also standing up for one's own rights, needs, and personal boundaries. Assertive communication skills create opportunities for open discussions with diverse views, needs, and possibilities within an organization, which need to be respectfully listened to and considered to achieve mutually beneficial problem-solving. It can strengthen relationships, reduce stress from conflicts, and provide social support in challenging times.

Sriyanto et al. (2022) also explored assertiveness in their study, focusing on the state in which an individual is assertive. It requires individuals to be honest with themselves when expressing their feelings and work with arguments that should be proportionate and non-manipulative, avoiding favoring or harming others. Assertiveness is beneficial for bridging an individual and their environment to facilitate effective interaction. Through assertiveness, individuals can respect themselves and others, be self-confident, and develop self-control. In the case of managers being assertive, they can share what they want and think with others while still preserving and respecting others. The findings of this study differ from several previous studies claiming that assertive behavior does not influence an individual's communication skills. The study argues that communication skills, particularly in business, are influenced not only by aspects of social skills. Young individuals who are still in their developmental stage are still in the process of achieving assertiveness. It is important for them to understand the significant impact of assertive knowledge on communication skills. Assertiveness is influenced by several factors, including gender, age, and education. Communication in business is a crucial factor for business success. Through effective communication, traders can better sell their products and avoid any misunderstandings between two parties. In this state, communication is inseparable from negotiation. Effective and assertive communication is the result of good negotiation.

Syla (2022) believes that effective communication is vital in business, whether you are an employer or an employee. It helps establish connections with colleagues, effectively convey information, and promote a positive culture and innovation. Communication style refers to how we interact with others, including our words, actions, or reactions towards others. And assertive communication is the most effective style as it allows expressing one's needs while considering the needs of the other person.

2. Methods

The main goal of the research was to enrich the understanding of assertiveness issues within the communication techniques of managers. We specified the mutual differences and correlations of the researched topic. The results of the respondents' answers were processed using IBM SPSS Statistics 21 software, and these results were presented in the form of tables. The research was conducted through questionnaires, with the aim of verifying the established hypotheses.

Hypothesis 1: We assume the existence of statistically significant differences in assertiveness in the communication of traders according to the type of organization.

Hypothesis 2: We assume the existence of statistically significant correlations between assertiveness in the communication of traders and their age.

Hypothesis 3: We assume the existence of statistically significant correlations between assertiveness in the communication of traders and the number of years worked.

Out of a total of 101 respondents who participated in the research, 63 were women (62.4%) and 38 were men (37.6%). Regarding the demographic question about the type of organization, 71 (70%) respondents were from the private sector, and 30 (30%) respondents were from the public sector. In terms of respondents' age, the majority were in the age range of 18 years - 16 respondents (15.8%), 20 and 21 years - 14 respondents each (13.9%), and 19 years - 11 respondents (10.9%). The purpose of the last demographic question was to determine the number of years worked in the organization by individual respondents. The highest number of respondents had worked in the organization for one year, specifically 30 respondents, which is 29.7% of the total number of respondents. Another 25 respondents (24.8%) had worked in the organization for two years, and 12 respondents (11.9%) for three years.

The first questionnaire we used for the research was the Assertiveness Map questionnaire. It is a questionnaire aimed at measuring the level of assertiveness of the respondents, which we adopted from Medzihorský's book (1991). The questionnaire consists of a total of 32 questions and assesses respondents' attitudes towards certain life situations. Each respondent assigns a level of agreement on a scale from 0 to 4 to each item. The questions are generally divided into three areas:

Area (questions 1-11) - situations related to defending one's own rights.

Area (questions 12-27) - situations related to the skill of asserting one's rights.

Area (questions 28-32) - situations related to violating the rights of others.

The questionnaire expresses the overall perception of the respondent's own level of assertive skills. Evaluation: 0 = never, 1 = rarely, 2 = occasionally, 3 = usually, 4 = almost always, always. The resulting degree of assertiveness problems is assessed - low, moderate, and significant. Each answer indicates a problem with asserting one's own opinion in that particular area.

Another tool used was the A-E-M-A questionnaire. In the paper, we address the issue of assertive behavior in business among managers. For data collection, we used a questionnaire based on the knowledge from Lahner's book (2009). This questionnaire contains items that focus on the assertive behavior of managers, as well as their expression of emotions, and whether managers use manipulation or aggression in their assertive behavior. The questionnaire items were divided to cover each area under investigation, with each area containing 10 items. For each item in each area, respondents selected their level of agreement on a scale of 1 = never, almost never, 2 = sometimes, 3 = often, 4 = almost always, always. We will briefly describe the individual dimensions of the questionnaire based on the information contained in the questionnaire manual. The areas of the questionnaire are:

Assertiveness - The essence of assertive behavior is gaining and maintaining healthy self-confidence. Such behavior is characterized by respecting the rights of each individual as well as the rights of others. An assertive person demonstrates self-assured body language and clear expression of their needs, provided they also recognize the needs of others. When we possess assertive behavior, we have the ability to control our own behavior and maintain self-esteem even in situations where we feel anxious or when we perceive that we are losing control of the situation.

Emotions - The prerequisite for assertive behavior is that individuals can acquire abilities and techniques that allow them to overcome the influence of emotions. This enables them to effectively express their interests, feelings, and needs. Assertive behavior allows us to control our own behavior and maintain self-esteem even in situations where we feel anxious or when we perceive that we are losing control of the situation.

Manipulative behavior - This is the opposite of assertive behavior and is related to personality type. We can encounter individuals who use manipulation based on feigned helplessness, while others choose manipulation based on aggression. It is important to recognize manipulative behavior and stop it when identified. This is not a simple process, as manipulation disrupts the symmetry of relationships, limiting

the possibilities for agreement and creative cooperation. When this form of behavior becomes common in workplace communication, it blocks the space for the development of teamwork, interpersonal relationships, and overall corporate strategy. Manipulation can occur in verbal and nonverbal forms, using conscious and unconscious practices.

Aggression - Aggressive behavior, the ability to act aggressively, is often found in individuals who exhibit a high level of aggression. It is a behavior by which individuals often mask their insecurity in a given situation or fear of the outcome or fear of an unfamiliar environment. Aggression is most commonly accompanied by expressions of anger and hostility, but it does not necessarily have to be so.

3. Results

In this section, we present the results based on which we analyzed the hypotheses we formulated, which interpret assertiveness in the communication of managers.

H1: We assume that there are statistically significant differences in selected factors of assertiveness in the communication of respondents according to the type of organization.

The differences we found relate to the type of organization in which the respondents work, specifically the sector in which the organization operates. Using t-tests, we examined the statistical significance among respondents who work as employees in either the private or public sector in terms of assertiveness in communication. Our findings are presented in the following Table 1.

Table 1. Differences in selected factors of assertiveness in respondents' communication within the type of organization

	Organization	Mean Difference	Standard deviation	Test criterion	Sig.
Defending one's own rights	Private	1,8412	,63147	- 1,126	,263
	Public	1,9970	,64481		
Skill of asserting one's rights	Private	1,9859	,68402	- 1,930	,058
	Public	2,2604	,63950		
Violating the rights of others	Private	1,8028	,75175	-,508	,613
	Public	1,8933	,95950		
Assertiveness	Private	2,3127	,50396	- 2,346	,021
	Public	2,5733	,52518		
Emotions	Private	2,5000	,59976	- 1,294	,201
	Public	2,6533	,51911		
Manipulative behavior	Private	2,3310	,55847	- 1,104	,272
	Public	2,4667	,57795		
Aggression	Private	2,3634	,56169	- 1,147	,254
	Public	2,5133	,68518		

Source: own processing

Through the table, we can see that statistical significance is evident within the public sector, specifically within two factors - the skill of asserting one's rights and the assertiveness factor. Employees in the public sector exhibit a more pronounced skill in asserting their rights compared to employees in the private sector, and their level of assertiveness is also higher than that of employees in the private sector.

The skill of asserting one's rights factor suggests that employees in the public sector are usually more capable of initiating a conversation with anyone compared to employees in the private sector. Employees in the public sector are typically better at pointing out someone who has treated them unfairly or wronged them compared to employees in the private sector. Respondents working in the public sector are generally more open in expressing their feelings compared to respondents working in the private sector.

Within the assertiveness factor, employees working in the public sector are usually more able to genuinely praise their colleagues, acquaintances, and friends, unlike respondents working in the private sector. Respondents from the public sector typically prefer emotions not to be part of the discussion, unlike respondents from the private sector. Employees employed in the public sector are usually more capable of communicating in a more cautious and controlled manner than employees employed in the private sector.

Hypothesis 1 was confirmed as we found statistically significant differences in assertiveness in the communication of managers according to the type of organization.

H2: We assume that there are mutual statistically significant correlations with age within selected factors of assertiveness in the communication of respondents.

In our research, we analyzed the mutual correlations between selected factors of assertiveness in the communication of respondents and their age using the Pearson correlation coefficient. In the following Table 2, we can observe statistically significant correlations between selected factors of assertiveness in communication and the age of respondents.

Table 2. Correlations with respondents' age and selected factors of assertiveness in respondents' communication

		Defending one's own rights	Skill of asserting one's rights	Violating the rights of others
Age	Correlation Coefficient	,252*	,306**	,200*
	Sig. (2-Tailed)	,011	,002	,045
	N	101	101	101

** p<0,01 * p <0,05

Source: own processing

We observed statistically significant correlations in the factors of defending one's rights, skill in asserting one's rights, and infringing on the rights of others. The higher the age of the respondents, the higher the statistical significance in these aforementioned factors.

As respondents' age increases, their defense of their own rights becomes stronger. Respondents with higher age usually hesitate more when returning faulty or unsatisfactory goods to the store. They tend to make purchases they originally did not want simply because it is difficult for them to reject the salesperson's offer. With higher age, respondents are more likely to alert someone who cuts in line.

With higher age comes greater skill in asserting one's rights. Respondents with higher age typically have difficulties criticizing their colleagues, acquaintances, and friends. They often try to avoid certain people or situations out of fear of potential difficulties. Respondents with higher age are more prone to using uncontrolled or inappropriate expressions in moments of anger. They also tend to be more critical of others' opinions and ideas and tend to raise their voices to coerce others into doing what they want.

Hypothesis 2 was confirmed as we assumed statistically significant correlations in selected factors of assertiveness in the communication of respondents with their age.

H3: We assume that there are statistically significant correlations in the number of years worked by respondents within selected factors of assertiveness in communication.

In the following Table 3, we examined the correlations between selected factors and the number of years worked by respondents.

Table 3. Correlations with the number of years of work and selected factors of assertiveness in respondents' communication

		Assertiveness	Emotions	Manipulative behavior	Aggression
Number of years of service	Correlation Coefficient	-,230*	-,351**	-,289*	-,254
	Sig. (2-Tailed)	,020	,000	,003	,010
	N	101	101	101	101

** p<0,01 * p <0,05

Source: own processing

In the hypothesis, we assumed statistically significant correlations in selected factors of assertiveness in communication among respondents based on the number of years worked. According to Table 3, we can see that we observed statistical significance only within the A-E-M-A questionnaire. In terms of the assertiveness factor, we found that respondents with more years of work experience less frequently refuse requests for help or services that are problematic or disadvantageous to them. The more years they have worked, the less they mind being observed by someone while working.

The more years of work experience respondents have, the less they try to create an impression and influence others. Respondents with more years of work experience initiate contact with other people less frequently.

Regarding manipulation, respondents with more years of work experience less frequently question the good qualities, abilities, and personalities of others. They criticize and judge them and speak about them with disdain. The more years of work experience they have, the less frequently they express demands, give instructions, and coerce others to act, often leaving it until the last moment.

In terms of aggressiveness, respondents with more years of work experience have fewer tendencies towards explosiveness. These respondents less frequently get angry when they don't receive recognition for their good work.

Hypothesis 3 was confirmed as we found statistically significant correlations in selected factors of assertiveness in the communication of respondents based on the number of years worked.

4. Discussion

To date, a number of studies have been conducted on the topic of communication. These studies have predominantly focused on managerial skills within marketing communication in companies.

Luzio-Lockett (1995) stated that assertiveness is behavior that involves two-way communication and clear expression of one's desires, while interacting with others without denying their rights. Stubbs (1985) explained that assertiveness is behavior that expresses an individual's rights while respecting the feelings and rights of others. Rathus and Nevid (1986), on the other hand, stated that assertive behavior is behavior that expresses genuine feelings, balances rights, and demonstrates social skills. Caputo (1984) argued that assertiveness encompasses five fundamental individual rights: the right to be respected, the right to feel and express emotions, the right to make mistakes, the right to say no, and the right to ask questions. Phau and Sari (2004) explained that assertive behavior does not involve violent acts in defense of rights. Interesting findings were presented in a study by Thangala and Shama (2023), which empirically analyzed the relationship between dimensions of assertive behavior and organizational climate among employees in a multinational company. The study aimed to determine the potential effects of assertive behavior on organizational climate. This study found that members of the organization were still hesitant to express their desires. The results of the study revealed that respondents in the company were still reserved and reluctant to speak the truth or express themselves to others. It was found that employee well-being was not taken seriously, and communication problems and unbalanced flow of information to other departments occurred. However, this study found that despite a high level of organizational climate, assertive behavior,

through dimensions such as the right to be respected, the right to feel and express emotions, the right to make mistakes, the right to say no, and ultimately the right to ask questions, was at a moderate level.

Assertiveness is beneficial for individuals and society as a whole. Its implementation is recommended in many areas. Applying assertiveness in one's behavior allows for much better results in work tasks. The application of assertiveness is possible in various fields. Utilizing assertiveness can be advantageous in fulfilling work obligations within a company. Assertive behavior would greatly facilitate the work of employees in unpleasant situations and lead to achieving the desired outcome that would satisfy both parties.

Due to the increasingly competitive environment, it is essential for a company to establish itself in the market. The most crucial aspect is to orient the entire company's activities towards customers since they are the ones who determine the success of the business. Assertive behavior towards customers can result in better relationships, leading to customer loyalty and loyalty to the company. Nowadays, customers attach increasing importance to the quality of services provided. They demand greater attention, appropriate and suitable approaches in dealing and communication, whether it is services provided by travel agencies, retail stores, or insurance agencies, among others. It is important for representatives of different workplaces to possess the ability to communicate effectively with the other party and thus achieve the desired goals.

When considering the course of our research, it is necessary to mention that the research proceeded without complications. When contemplating further research on assertiveness that could take place in the future, it would be beneficial to create video recordings that would allow for a more detailed analysis of how respondents communicate in the work environment. It should be noted that it is highly probable that we would encounter nervousness and the fact that respondents may not feel comfortable participating in such research. However, we believe that conducting such research, for example, during an assertiveness training course, where video recordings serve as feedback for the respondents or course participants, would be highly beneficial and useful. Respondents would witness firsthand how they communicate and to what extent they acquire assertive behavior.

It is crucial to focus not only on assertiveness but also on general communication among respondents. Based on our experience, we have determined that work activities in various fields, whether it is business or management, are highly demanding and often underestimated by some individuals. From the perspective of respondents' answers, it would be appropriate to introduce more assertiveness courses within training programs. This would enable individuals to effectively interact with any type of client, even with uncooperative ones, which presents a challenging situation for most individuals.

Being assertive means having the ability to convey one's message confidently and self-assuredly without being aggressive. For a business owner, it is important to be assertive in order to effectively express their thoughts, feelings, and direction. Increasing their assertiveness will undoubtedly help both the business owner and their company on the path to success.

Conclusion

Communicating and acting assertively is an interpersonal skill that helps people maintain healthy relationships, resolve interpersonal conflicts, and prevent the suppression of their own needs. Assertiveness can be understood as a relational style that walks the middle path between passive and aggressive behavior. The result of acquiring this ability is a communication style that individuals use to confidently, openly, and positively express their needs.

The main objective of this contribution was to focus on the issue of assertiveness in the communication techniques of respondents based on theoretical foundations from domestic and foreign literature. The research aimed to investigate the level of assertiveness among respondents through the analysis and interpretation of a questionnaire survey. The collected data were processed using IBM SPSS Statistics 21 and presented in the form of tables.

Through the questionnaire, which provided statistically significant data on assertiveness in the communication of respondents, we examined mutual differences within the sector where the respondent works. Furthermore, we explored the mutual relationships based on the respondent's age and years of experience. We brought new enriching information and data to the field of studying assertiveness in communication techniques of respondents.

The limits of our research were mainly the smaller sample size and occasional sampling method. This study may serve as a prerequisite for further investigation of the relationships between socio-demographic characteristics and factors of assertive behavior in communication techniques.

Innovation in Leadership: Towards CSR and the Creation of Shared Value in a Humanistic Management Perspective

*Tonino Pencarelli*¹, *Veronika Škerháková*^{2,*}, *Viktória Ali Taha*²

¹ University of Urbino Carlo Bo, Department of Economics, Social and Political Studies, via Saffi 42, 61029 Urbino, Italy

Abstract

Research background: Based on the continuous environmental changes that companies must face and the crisis of the shareholder capitalism, the framework of our research concerns the need to innovate the traditional approach to leadership, inspired by the scientific management paradigm, to move towards a humanistic management approach.

Purpose of the article: The paper aims to propose a reflection on the need for a paradigm shift in corporate leadership, starting from the need to integrate the perspective of CSR with that of shared value. Pursuing the goal of shared value goes beyond the traditional corporate purpose oriented towards maximizing shareholder value and reflects the humanistic management approach, centered on an anthropocentric vision of leadership.

Methods: Starting from the observation of the significant changes in the environmental and competitive contexts of recent years and the emerging affirmation of the stakeholder capitalism paradigm, the study analyses, through a conceptual approach, the evolutionary path of the leadership approach necessary to face the challenges of change.

Findings & Value added: The study highlights how the shared value perspective can represent an objective capable of inspiring the behavior of leaders in pursuing CSR from a humanistic management perspective. The practical implications are multiple and of enormous impact on the economy and society. In fact, if companies convincingly adopted the humanistic management perspective in leadership activity and pursued CSR strategies to create shared value, the crisis of the current model of capitalism could be neutralized and the well-being of society and the environment would increase. The originality and added value of the contribution lies in proposing the necessary connection between CSR, the leaders as strategic actors of change and the shared value, as a goal to be pursued in the perspective of a humanistic management.

Keywords: humanistic management, CSR, shared value, leadership

1. Introduction

Market globalization, the advent of the digital revolution, and the increasingly frequent and surprising changes in the environment are all contributing to making competitive scenarios very complex, particularly for businesses, accentuating their intensity and augmenting the risks. For years now, the only real certainty that entrepreneurs and managers can count on in the process of governing enterprises and organizations is that change is a constant. Changes have affected consumer needs, market actors, institutional rules, and the macroenvironmental conditions on all levels political, economic, social, technological, environmental, and legal. To deal with these continual and not always foreseeable changes, organizations must turn to new resources and dynamic competences if they are to adapt and pivot by adjusting their set of strategic capabilities necessary for combining and exploiting their internal and external resources to their best advantage. One competence that has taken on paramount importance is the leadership capability of key enterprise actors, i.e., proprietors, managers, entrepreneurs (Hamel, 2008). Leadership is manifested in a series of activities geared toward governance of all types of organizations, both large and medium-small size,

* Corresponding author: veronika.skerhakova@unipo.sk

whether for-profit or not. In the context of modern businesses, corporate leadership represents a strategic function which, more than any other, is repeatedly put to the test by the incessant changes to external contexts and to organizational dynamics; thus, it requires regular updating and adjustment. The profound changes of recent years have fueled an important debate that has compared two models of capitalism: a) the shareholder-oriented model of capitalism, which assumes that the purpose of companies is primarily that of maximizing profits and market value of companies (Friedman's (1971) traditional view) and b) the model of stakeholder capitalism, according to which the purpose of companies must take into account not only the economic and financial aspects, but also the social and environmental ones useful for satisfying the expectations of stakeholders, according to the view of Freeman's (1984). The debate on the company's goals has highlighted how the vision of the company as a subject oriented towards maximizing profit or market value is inadequate to deal with the current needs of people and consumers, forcing a rethinking of the mission and purpose of the firm recognizing its social nature (Jordi, 2010). As highlighted by Brosh (2023), the debate on the purpose of the company, in addition to indicating the purpose as "the reason for being", focuses on the identification of the purpose as an objective beyond maximization, up to the concept of pro-social contribution, in which the corporate purpose is defined as "a statement of a company's moral response to its broadly responsibilities, not an amoral plan for exploiting commercial opportunity" (Bartlett and Ghoshal (1994, p. 88). To govern the company according to the new paradigms oriented to the common good (Hollensbe et al. 2014), the traditional approach to management and leadership needs to be innovated, overcoming the classic instrumentation of scientific management, which is not always attentive to the needs and well-being of stakeholders conceived primarily as people. This signifies that the diverse competences, approaches, and values of the organizational actors in leadership roles must be updated. It follows, then, that the questions to be raised and addressed are: RQ1 *To what managerial paradigms should today's and tomorrow's leaders look for inspiration?* RQ2 *Which aspects of leadership must be innovated?* In the paper, some preliminary conceptual considerations are proposed to try to answer these important and broad research questions.

2. Methodology

Starting from the observation of the significant changes in the environmental and competitive contexts of recent years and the emerging affirmation of the stakeholder capitalism paradigm, the study analyses, through a conceptual approach, the evolutionary path of the leadership styles necessary to face the challenges of change. Path that takes place in parallel with the need to review the company's strategic goals, which must go beyond the classic paradigm of maximizing shareholder value and arrive at a company oriented towards creating value for and with all stakeholders, from a shared value perspective. (see the conceptual scheme below, in Fig. 1)

The conceptual path uses the main bibliographic sources representative of the various theoretical constructs proposes a logical path of holistic analysis useful for connecting concepts often treated separately. It starts from the synthetic analysis of the academic debate concerning the evolution of the capitalism model and the goals of the enterprise and consequently regarding the transition from the paradigm of scientific management to that of humanistic management. The leadership activity is crucial to make this paradigmatic evolution concrete and effective in the life of companies and therefore we will try to shed light on what changes need to be made to leadership styles, going beyond the classic dichotomy between transactional and transnational leadership, to research of a humanistic leadership or a leadership for the new purposes of the companies.

Figure 1. An illustrative concept scheme of the logical path followed in the study

Source: our elaboration

The conceptual approach adopted is inspired by the discussion within the progressive transition from shareholder capitalism to stakeholder capitalism, by the emergent paradigm of *humanistic management* (Melè, 2003; Spitzsch, 2011; Pirson, 2017; Laszlo, 2019; Anadol & Behery, 2020; Koon, 2021), by the

wise company model (Nonaka & Takeuchi, 2021), and by the concept of *shared value* (Porter & Kramer, 2006; 2011). Although these scholars start from different viewpoints, their stances converge on the importance of facing the new challenges arising from changes in capitalism by modifying the underlying principles and methodologies of managerial leadership and work. The starting point is acknowledging that enterprises are following a new objective, one that is no longer limited to the pursuit of maximizing profit for the owners but is focused on creating and co-creating sustainable value for and with all the stakeholders (Sulkowski et al., 2018); such an organization is attentive to social issues, acting from a community-focused enterprise perspective. This approach is not new; in the Fifties it was enacted in Italy by the exemplary industrial experience of the Olivetti company. By its modernity, we can consider it the standard-bearer for the concrete application of a humanistic vision of organizational management. Today we find the humanistic approach to socially responsible business in Brunello Cucinelli, an enlightened entrepreneur capable of exercising humanistic entrepreneurial leadership in the luxury clothing business (La Rocca, 2014).

3. Towards new corporate purpose to create shared value in the perspective of Company Stakeholder Responsibility (CSR)

In reference to the leader of a modern organization a preliminary question to be raised is: “*to what end should a manager or an entrepreneur undertake guidance and governance activities?*”. The setting of strategic goals is, indeed, crucial for every leader of any organization, distribution company, or enterprise that must assess the end goals of his/her behavior and management activities. In fact, the ultimate objectives represent the criteria that guide the choices and actions of strategic and operational governance; they are a crucial aspect of organizational life, especially when the organization aims to carry out actions inspired by the principles of economic rationality. When speaking of the purpose of the company, it must be kept in mind that it can imply an objective perspective, in the sense that it refers to the purposes of the company considered as a system and as a result of the choices of the governing body, or a subjective perspective, in which it would be preferable to speak of the ends of the subjects, of the stakeholders, rather than corporate ends. In the first case, the primary purpose of the enterprise-system is the survival of the system itself, which is achieved thanks to the company's ability to know how to continuously adapt to changing environmental needs and which translates into the pursuit of a minimum profit level that allows achievement of long-term economic equilibrium. If we assume a subjective perspective, however, the aims are those expressed by the relevant stakeholders, who can be majority and minority owners, managers, or other subjects with the power to influence corporate strategies, such as banks, workers, suppliers, etc. In small businesses, the role of small entrepreneurs is relevant, as they play the dual role of owners and subjects of the strategic and operational governance of businesses. Based on the subjective perspective, therefore, the purposes may vary according to the dominant subjects in corporate governance. The goals of maximizing profits, maximizing shareholder value, and controlling are the preferred goals of majority shareholders; maximizing dividends and shareholder value are the preferred goals of minority shareholders; dimensional development is a privileged objective of the managers of companies where there is a strong separation between ownership and government and where dimensional development also implies greater power and prestige for managers; social success and self-realization represent the aims of many small entrepreneurs, in search of a psychological income, prestige and esteem from the local community of reference; the stability of the employment relationship, adequate pay, working hours, safety, career and welfare conditions may represent the expectations of the workers; environmental protection and the creation of social value can be objectives of the communities where the company is located.

In the more recent debate, the discussion of the goals of the firm has polarized, linking itself to two different views of capitalism: Friedman's (1971) traditional view of shareholder capitalism and Freeman's (1984) more modern view of stakeholder capitalism. The two models underlie two different approaches to management and leadership. We therefore wonder “Do the organizational goals to be pursued by contemporary management leadership stem from the traditional vision of capitalism, i.e., maximizing profits and value for shareholders, or should the needs of all stakeholders be considered, and should those goals include socially responsible behavior (CSR) aimed at creating shared value? The concept of corporate social responsibility must be considered as a responsibility of the company towards the stakeholders (Company Stakeholder Responsibility), a concept that goes beyond the traditional idea of Corporate Social Responsibility, which legitimizes the idea of considering business a fact separate from ethics, while in reality in the stakeholders' vision of capitalism it must be incorporated. (Freeman and

Velamuri, 2021). After all, in the context of stakeholder capitalism, the firm aims to create value for and with the stakeholders by adopting a responsible approach, in which business is not separated from ethics. A serious CSR cannot ignore the ethical perspective of corporate strategies, referring to business ethics. A perspective that recognizes how the standards of ethical behavior in business are not very different from the ethical standards and norms of the larger society and culture in which a company operates. Thompson et al. (2016). CSR strategies must be inspired by the principles of business ethics not only to respect ethical standards, but also to avoid incurring the visible costs, internal administrative costs and other intangible and less visible costs generated by the lack of ethics in corporate behavior. The management objective becomes the maximization of the well-being of the stakeholders in the long term (Rusconi, 2007), a condition which should allow to satisfy both the strictly economic expectations and those of a better quality of life of all the stakeholders, including the shareholders and the owners majority shareholder, whose economic return on capital is closely correlated to the company's positive social performance. Empirical research has supported the positive outlook of CSR, highlighting that on financial markets, socially responsible actions increase a firm's reputation and builds trust, strengthening its organizational capital and its competitive capabilities. The underpinning of a balanced response to the interests of the various social entities, which have a relationship with the company influence it to a certain degree, is the stakeholder theory. (Freeman, 1984) According to this theory, the social actors who contribute to varying degrees to the creation of wealth – such as, employees, suppliers, clients, institutions, and the community – must be listened to and kept in consideration in the sharing of value. The concept has evolved from the traditional vision of *shareholder value* to the modern concept of *shared value* and, in this process the confines of the organization have been redrawn, no longer circumscribed to the ownership of capital alone, but expanded to include stakeholders involved in relationships that influence the firm in various ways. From this new perspective, the organizational goal is amplified, and it incorporates not only the needs of the owner(s) but also the expectations of the other stakeholders. Thus, this approach is tied to an innovative, *multistakeholder governance* model with a broader scope. In it, the social actors can participate in the decision-making process, thanks to the redefinition of the firm's social contract with the various stakeholders; it is assumed that benefits will be generated for and with all the stakeholders that invest specifically in the organization. In the past, incentivizing mechanisms utilized by managers have frequently failed, as they were based primarily on the principal-agent model that had originally been designed to maximize shareholder value. Similarly to stock options, these mechanisms often fell short; not only did they fail to maximize value for stockholders, but they often enabled managers to engage in opportunistic and manipulative behaviors that were detrimental to the firm itself and its shareholders.

4. CSR for creating shared value

In the present paper, CSR is considered the standard-bearer of a new way of doing business and of operating in market economy contexts to neutralize any negative effects, integrating business and ethics.

While the economic importance of corporate action is found in the ability to create value, the social relevance is linked to the repercussions (impact) that the company has exercises in the social context in terms of employment and corporate welfare, investments, value proposals capable of generating differential benefits to the market, of participation in life of the community, also through social marketing initiatives, of polluting effects on the environment and distribution of value among the various stakeholders. Various factors are increasing the interest and attention to CSR. First, media and public opinion show increasing disapproval and impatience with the emergence of socially deplorable conduct and at least questionable by many organizations, qualified for this by Gallino (2005) as "enterprises irresponsible", subjects who, beyond the elementary legal obligations, believe they "should not respond to any public and private authority, nor to public opinion regarding the consequences in the economic, social and environmental fields of its activities". The scholar points out how business who act irresponsibly generate high social costs, such as those involved in corporate scandals, in large escapes, in the dismissal of hundreds of workers via text messages, in the practice of salary levels and working conditions often at the limit of decency, increasing their insecurity and in some cases informality, associated with the lack of legal guarantees, in building and relocating chemical plants unsafe in developing countries, in making highly polluting productions without any environmental remediation action, in making products (for example motor vehicles) incorporating defects projects known to the manufacturer that are dangerous for users, or in carrying out relocations sudden production abroad (favored by the liberalization of the circulation of capital and foreign direct investments (FDI) with mass layoffs, without any scruple towards the communities originally hosting the production sites. (Pencarelli, 2020) Attention to responsible

companies towards their stakeholders and the need of correctness and transparency regarding the activities carried out by companies therefore grows in parallel with the occurrence of irresponsibility phenomena, but is also linked to other important factors of changes in the environmental context that are soliciting new positions from the side of public opinion, of governmental and supranational institutions and that push companies to do so fraught with problems previously considered to be the exclusive competence of the state and civil society. (Collis et al., 2012)

On the side of the demand for goods and services, the phenomenon of critical, or responsible, consumption, in which consumer buyers guide the choices of purchase and consumption based on criteria that consider the socio-environmental commitment of companies, favoring goods and services deemed consistent with environmentally conscious consumer behavior and human rights, or boycotting brands deemed guilty of inattentive behavior to socio-environmental issues. In essence, attitudes towards the demand for "other consumption" are affirming or "anti-consumption", both declinable from a domestic perspective or international. On the consumption front, the growing willingness of consumers to pay should also be noted a premium price for the purchase of products made by companies that declare themselves oriented towards the CSR, certifying their conduct through various forms of certification and socio-environmental communication. Civil society and communities are increasingly attentive to respect for human and workers' rights, as well as ecological and environmental issues. In Western countries we are also witnessing the progressive dismantling of the welfare state induced by the public finance crisis, so that the expectations of corporate welfare initiatives, through which companies make available to employees and collaborators, resources and services aimed at improving their well-being. The main forms in which corporate welfare is expressed concern the provision of benefits (supplementary mutuels, cars company, health insurance, etc.), the activation of measures aimed at reconciling work and family (horizontal and vertical part time, nursery schools and company canteens,), the stipulation of agreements with suppliers to ensure more advantageous prices for employees, the implementation of initiatives aimed to protect and enhance diversity in the company, referring to gender, ethnicity and the presence of people disabled. A further driving force behind the attention to responsible conduct from part of the companies must then be identified in the affirmation of the phenomenon of so-called ethical finance, however which in the financial markets are spreading operators (funds) who invest financial resources in companies which are characterized by their social and environmental commitment, excluding them from allocation projects of savings companies not in line with behaviors judged socially and environmentally acceptable.

Also for these reasons, the CSR approach is one which should guide future-oriented wise leaders in their strategic actions, inspiring them to incorporate economic, social, and environmental aspects while embracing profound innovations in managerial culture and in their vision of the firm's goals. Their objectives cannot be limited to maximizing profits or stock value that would only benefit the majority shareholders in the short term, but leadership must look towards creating shared value among all the different stakeholders who contribute to generating wealth in both the present and the future. Sharing value with stakeholders implies that wealth generated by the firm will be divided among workers and managers (in the form of monetary and non-monetary remuneration, quality of work, and organizational welfare), clients (generating customer satisfaction by improving the benefits-to-sacrifices ratio of the socio-environmental value proposition), suppliers (guaranteeing sure and fair compensation for what is supplied), the collective community (increasing well-being and quality of life), the State (ensuring payment of taxes), and owners (guaranteeing adequate remuneration for risk capital invested, either through capital gains or through dividends. All actions must be conducted without harming the environment and in line with the tenets of sustainability; to do otherwise not only can organizations bring about negative consequences for the ecosystem, but they also risk compromising their own competitive and financial performance. (Perrini, 2018; Pencarelli, 2020)

Hence, it becomes paramount to adopt a long-term view that will allow the organization to incorporate an environmental dimension in its resources and competences and to act fairly and inclusively towards the various components of society, including future generations. This evolutionary path will be more rapid and effective if aware leadership plays a crucial role in defining socially responsible and sustainable strategies. Such leaders must learn to recruit, train, guide, and motivate the organization's human resources by innovating the management systems and nudging company action and behaviors towards the new paradigms of creation and dissemination of value. It will require courageous leaders who can propose new visions and new cultural models and who are able to navigate change by finding appropriate resources and allies through effective policies, communication tools, and

engagement. Leaders who pivot towards sustainability and CSR must necessarily be aware that (their) organizations, which pursue strategies aimed at creating shared value, can improve long-term performance and, at the same time, to rescue an ailing, crisis-riddled capitalism by transforming it into an economic system that is sustainable environmentally, socially, and financially. The study of Bosh and Badia (2013) state that according the literature on the empirical evidence on the effects of CSR on corporate financial performance (CFP), three conclusions arise: 1) the relationship between CSR and CFP has evolved from a nil or low correlation to a positive correlation; 2) CSR positively impacts on CFP in the long run; 3) CSR creates value mainly when it is focused on primary stakeholders, but it has an insurance effect when it has a wider orientation. There will be a trade-off between the long- and the short-term views. The former aims to generate lasting competitive advantage and strengthen the social legitimation of the firm while safeguarding natural capital and the need for lasting returns. According to this perspective, CSR represents an investment for the generation of lasting value shared between the various stakeholders of the company, also contributing to the value for shareholders by reducing the political and social risk of corporate strategies. The short-term view, especially in organizations governed by institutional investors that typify the new financial capitalism, is commonly adopted when market and capital pressures push managers to opt for a short-term solution that will yield immediate profitability. Ultimately, innovative leaders who take the long view in responding to current changes must be capable of embracing a new organizational purpose in the “creation of shared value” as so effectively coined by Porter and Kramer (2006, 2011). The two scholars argue that shared value goes beyond social responsibility, philanthropy, or even, sustainability; it represents a new way for businesses to achieve profits and good competitive and social performance, on the assumption that *what’s good for society is good for business*. Bosh Badia et al. (2013) highlights that according the two Authors, CSR “becomes a source of opportunity, innovation, and competitive advantage. The basis of this statement is the distinction between *responsive CSR* and *strategic CSR*. The former is addressed to returning profits to society. The latter is addressed to identifying societal problems that the corporation can contribute to solve, and, as a consequence, create value simultaneously for society and shareholders”. Porter and Kramer hold that such a perspective can significantly contribute to the transformation of the managerial mindset. The vision of this approach is to recognize that *societal needs, not just conventional economic needs, define markets*. (Bosh and Badia, 2013)

In fact, when creating shared value is a core element of an organization’s strategic goals then it is possible to also incorporate financial and competitive objectives to be pursued through the resources and competences unique to the organization, while keeping in mind the need to create social value and safeguard the environment. In sum, the idea put forth by Porter and Kramer (2011) is a far-reaching and revolutionary vision that calls for a radical rethinking of business and the economy as a whole; it offers a multi-value perspective to leaders present and future that can legitimate and reinforce the role of organizations in society, without diminishing the conventional goals of survival and self-generation of the organization as an autonomous system distinct from its subjects. §§§§§§§§§§

More importantly, we must recognize that the conventional concept of the organization or firm as an institution guided by solely by economic principles, which assume that people behave according to egoistic maximizing logics and are capable of rational choices from a series of alternatives, can gradually be overcome. Moreover, corporate governance can no longer follow the principles of *scientific management*, born out of a traditional economic vision, especially given the numerous cases where organizations have failed on multiple levels to create wellbeing for people, organizations, and society. New outlooks are needed, such as those of *humanistic management* (Pirson, 2017 ff.9), of emotional organizations (Pilotti, 2019), and of wise companies (Nonaka and Takeuchi, 2021).

In sum, there is a need to engage in a new narrative for people, organizations, and markets that can move beyond the mechanistic idea of enterprise and beyond the taylorist-fordist principles of scientific management where managers seek to maximize efficiency by planning the work assigned to workers who are expected to obey and perform, machine-like, for monetary compensation. In an era of recurring changes and crises, we must move decisively towards a humanistic leadership approach that prioritizes the dignity and wellbeing of individuals and society (the common good), fosters cooperation among workers and the development of human virtues, spirit of initiative, and learning processes of people inside the organizations. Such an approach sees the organization as a community, rather than simply a set of contracts and just a profit-making mechanism. (Melè, 2003)

5. Leadership in the new context: from *Scientific Management* to *Humanistic Management*

If we agree that the first step to be taken in innovating leadership consists in establishing new strategic orientations for organizations, ones that consider stakeholders' expectations and assign to company leaders the task of aiming to create shared value and common good – based on the principles of humanistic management – then it becomes apparent that the primary strategic goal of organizations must include the principles of CSR and sustainability in the company vision, mission, and culture; ultimately, this should be the guiding force underlying all managerial processes, starting from leadership itself. The generally accepted definition of leadership refers to the guidance carried out by one or more individuals vis-à-vis other individuals or groups of persons and co-workers for the purpose of achieving the company's goals. Therefore, this leadership role must, first, be carried out by the primary stakeholders, i.e., the majority shareholders or principals. (Clarkson, 1996) They, along with the other stakeholders, must define and formulate the foundational goals of organization that have at the core of the organizational strategies and processes, the creation of shared value. Thus, the role of leadership can be actively fulfilled within an organization by those who have the power to do so, by virtue of their role (formal leadership), but also by those who have the opportunity and the ability to guide a group of people towards the achievement of a goal, by virtue of their recognized authority (informal leadership). (Johnson et al. 2017)

As Mintzberg (2017, pp. 15-16) observes, rather than following the tendency of distinguishing leaders from managers by seeing the former as those who do the right things and face change and seeing the latter as those who fix things and face complexities, it is important to see managers of all levels as potential leaders and to consider leadership “a particularly efficacious form of managerial governance”. This is why leadership should be considered widespread throughout an organization, found in every decision-making context where people are working towards achieving company goals, and succinctly expressed, in the words of Bill Gore, founder of W.L. Gore & Associates, as “no bosses, but many leaders”. Cardona et al (2019) refer to the concept of shared leadership, because in this new and ever-changing world, companies need not only heads, but hearts, not only leaders surrounded by followers, but leaders surrounded by leaders, capable of exercising a Purpose-driven leadership, living examples, building trust around shared goals, and overcoming power-based hierarchical approaches. The purpose-driven leadership focuses not so much on what or how to act in organizations, but on why to do it, relying on each leader's ability to discover personal purposes, help others find their personal purpose and connect people to organizational goals stimulating a sense of common purpose, like in top performing sport teams. Therefore, innovation in leadership must be seen as closely tied to innovation in management, suggesting a substantial change and departure from the traditional way of working (as conceived by Taylor and Weber) and of envisioning organizational approaches to achieving company goals (Hamel, 2008). In the humanistic management view, persons who care about their own and others' wellbeing, and who subscribe to the logic of generating shared value, would not hesitate to take on the challenges of the huge global crises that humanity is facing, such as climate change, social inequity, and poverty. (Pirson, 2017, p. 76) Leadership is one of the main activities that can result from a different vision of human nature. Humanistic leadership becomes responsible for guaranteeing the basic tenets of human dignity to workers and for enhancing organizations' capacity to allow their various stakeholders to thrive and reach the highest levels of wellbeing. According to Pirson (2017), the foundational pillars of human dignity consist of the pursuit to acquire the necessary resources for survival and procreation and the desire to defend oneself, which explain human nature from an economic standpoint. To these, one must add – in the humanistic logic – the pursuit of long-lasting and mutually helpful relationships with others and the desire to understand, seek, and share a sense of the world that surrounds us. All these components must be balanced for people to lead a life of dignity and freedom, which represents the primary objective towards which humanistic leadership, based on practical wisdom, must orient its behavior if it is to create wellbeing for people, organizations, and society.

In sum, the humanistic approach, in line with Freeman (1984), pushes leaders towards multiple objectives and a plurality of stakeholders, instead of limiting themselves to the single objective of maximizing value for stockholders. In essence, as Peter Drucker would say, it is human beings who can imagine and “make” the future; this is made possible by their ability to go beyond the narrow interests of firms by putting into practice a practical wisdom based on the tacit knowledge that “puts people in a position to express prudent judgement and carry out actions based on the current situation and guided by values and morals” (Nonaka, Takeuchi, 2021, p. 58) and continually innovating. In light of all these considerations, it is evident that there is a convergence of views presented by the new approaches to the

study of organizational management to leave behind the rigid and partly obsolete paradigms of scientific management and move towards a humanistic approach to management and leadership, as outlined in Pirson's *Humanistic Management* and espoused by his followers and echoed in the recent contributions of other scholars, e.g. on the wise company, which will be discussed in the next section.

6. Beyond the dichotomy between transactional and transformational leadership

According to Pirson (2017, p. 90), in the economic view in which the firm is seen as a bundle of interconnected contracts, leadership activity is manifested in a continual process of negotiation(s) that typifies the so-called transactional type of leadership activities conducted by a leader who can negotiate and maximize organizational efficiency in the context of a hierarchical line of command. This form of leadership is based on the classic carrot and stick approach; it is predominantly focused on the efficient achievement of goals while paying very little attention to people and ethical or moral conduct. On the contrary, in the humanistic view, leadership finds greater resonance in what Bass and Avolio (1993) identify as transformational leadership. Leaders of this type are anchored to solid moral values and are an inspiration for their followers and colleagues; they are intellectually stimulating and can help people to become emotionally engaged in the achievement of organizational goals. This form of leadership is charismatic and is typical of entrepreneurs who are the founders and managers of small- and medium-sized enterprises, particularly if they follow the principles of *Humanae Entrepreneurship*. (Botti, Parente, and Vesce, 2020) In this case, leadership is manifested in responsible activities, and a good leader stands out because his/her actions are oriented towards human wellbeing; their goal is to seek a balance by striving for, defending, relating to, and looking for the meaning that can guarantee human dignity. In real-life organizational and environmental contexts, leadership activities fall somewhere between the two poles of these perspectives. Leadership involved in the day-to-day management of a firm adopts contingent and flexible situational approaches that depend on the leader's own personality, on the characteristics of his/her followers, on the tasks required, and/or on the governance issues to be addressed. A model that can be qualified as contingent and which, in our opinion, fully reflects the requirements of humanistic management, is Daniel Goleman's 'emotional' style of leadership, which systematizes and expands on the seminal work by Salovey and Mayer (1990). He holds that, for effective leadership to take place, managers must listen to and understand the emotions of their co-workers to generate empathy and harmony within the organization. Leaders must have emotional intelligence, possess an awareness of self and others, and be capable of managing themselves and others by adopting different styles of leadership depending on the various contingencies present (1) Visionary; 2) Coaching; 3) Affiliative; 4) Democratic; 5) Pacesetter; 6. Coercive). Goleman identifies anthropocentric leadership models suitable for governing emotional organizations; in such scenarios *Emotional Management* (Pilotti, 2019) represents a daily challenge for managers who embrace participatory and collaborative (Angelini et. al, 2020) leadership styles. Anthropocentric approaches to leadership are pursued by managers who keep in mind that, aside from their position of authority, they are first and foremost, human beings; they avoid excessively assertive behaviors of the executive chain of command, and they prefer management styles that are more horizontally oriented, more focused on the whole project rather than on the individual task. Such leaders' approaches are akin to a cultural revolution deriving from innovation in leadership, at both top and middle management levels; it is characterized by the ability to listen to and interact with people which, in turn, facilitates the emergence of new ideas, critical thinking, inclusion, common goals, team spirit, and equal opportunity. In sum, this type of organizational leadership can put people first, in their entirety and in all their relational, communicative, personal, and interpersonal complexity (Pilotti, 2019, p. 175). This type of people-centered leadership should not be mythicized because, in real life, there is no such thing as the "perfect" company leader, one who can perfectly utilize and balance emotional intelligence *and* rational thinking in decision-making processes. Furthermore, according to Angelini et al. (2019, p. 31), effective leadership cannot stand alone, without the whole set of collaborators' competences and their willingness to collaborate. In these scholars' view, good leadership is a *servant leadership* (Eva et al. 2019), in which the competences required of the manager are the ability to listen, to empathize, to create a climate of trust, to persuade, to engage in forward-looking and systemic thinking; good leaders must promote people's wellbeing and foster an awareness of their strengths and weaknesses, and they must also have an aptitude for stewardship, putting themselves *at the service* of the organization in order to strive for a greater objective where the organization becomes a vehicle for introducing learning and change into society (Senge, 1992, p. 399). Humanistic leadership is not only open to collaboration within the organization, but also to inter-organizational cooperation; its members are activators and facilitators of collaborative

entrepreneurship building and acting within networks that are based on mutual trust and long-term commitment. (Rocha, Miles, 2009) This perspective can be found in the study of Sulkowski et al. (2018) when they underline that “businesses play a fundamental role in "shaking up" stakeholders. Shaking up stakeholders means acting proactively initiate cooperation with the people affected by a company to alter awareness, behavior and networks in order to catalyze change in society and in the market to reward co-created innovations in key company operations that improve social and environmental impacts”. The challenge for humanistic leadership is to address the corporate strategies as the empowering agents to interact with stakeholders for the co-creation of sustainable shared value.

7. The need for new performance assessment tools in leadership innovation

Ultimately, innovative leadership cannot eschew adopting new tools that go beyond the mere control of collaborators and subordinates; these tools involve coaching practices that act on people’s competences as well as on their long-term commitment/engagement, thus creating a culture and value system based on dialogue, collaboration, and innovation. Equally necessary are new methods for assessing companies’ and people’s performance; such tools must be in line with the objectives of creating shared value according to the stakeholder theory of humanistic management and must necessarily balance short term and long term needs in an ambidextrous strategic and organizational perspective.

As concerns performance assessment of firms, multidimensional mapping can track the traditional conventional goals such as competitiveness and balance sheet bottom line figures but can (and should) also include environmental considerations and stakeholder needs, as well as aspects like learning and innovation. This type of map would provide a systemic view of the firm, in both short-term and long-term outlooks. Every organization, whose leaders intend to pursue strategies capable of creating lasting value for their clients, for the majority shareholders, and for the other stakeholders in an environmentally sustainable way, must also avail itself of a balanced and holistic assessment tool that can describe and measure critical success factors, both concomitant with and subsequent to managerial actions, and that can also be used for forecasting. For leaders who are inspired by people-centered visions, such a map should also be able to provide information that is compatible with their need for flexibility and creativity in decision-making processes in organizational contexts affected by instability, uncertainty, and complexity such as we are currently experiencing. Another concern and functional requirement for these maps is that they keep management highly motivated to continue to work for the wellbeing of principals, clients, employees, suppliers, local communities and institutions, by generating and distributing shared value for all stakeholders through socially responsible and eco-sustainable behaviors. In short, profitability must dovetail with a humanistic vision of the firm. (Spitzech, 2011)

Similarly, and in line with the objectives of organizations attuned to the new paradigms of value creation so, too, must the assessment of managers undergo innovation. Management performance assessment processes and tools must be more able to consider people’s needs and stakeholders’ new expectations. While the Taylorist practices of scientific management had evaluated employees and provided incentives based on their level of productivity (of which *Management by Objectives* (MBO) became the icon), the Nineties ushered in the first changes to assessment processes; self-evaluation was introduced for employees, and especially, for high level managers. This practice increased the motivation and engagement of people whose importance for the success of firms was gradually given greater weight and recognition, e.g. by acknowledging personnel as “human capital”. (Angelini et al., 2019, p. 104) According to these scholars, the current evaluation and skills assessment process must be speeded up and should be based on continual and mutual feedback between leaders and followers, thus promoting a more rapid and effective alignment of strategic objectives and organizational behaviors. The setting of goals and objectives no longer follows the traditional top down method but is shared, through proposed goals set by (non-management level) employees, following a bottom up approach, in a climate of high engagement and widespread trust. However, in contemporary capitalism, not only does the *how* change, but the object of the assessment – the *what* – also changes. According to the 2020 *Osservatorio Ambrosetti* report on governance in Italian firms, high and middle level managers in listed companies are more and more frequently evaluated according to increasingly important criteria such as sustainability; new evaluation metrics are being adopted to reflect how well the firm performs in terms of environmental issues, workplace safety, equal opportunity, customer satisfaction, the *Down Jones Sustainability Index*, and training of human resources. Moreover, evaluation parameters are differentiated according to the timeline of reference, balancing short- and long-term criteria. In our view, this is a good sign that Italian leadership has been inspired by the principles of humanistic management and of wise companies; it sends a signal of

hope for the future of Italian companies and, indeed, society. Nevertheless, in the era of globalization one cannot overlook the fact that for there to be widespread acceptance and adoption of the vision by organizations and managers, new rules and regulations need to be issued by international institutions, and future managers and stakeholders must also cultivate a new culture. As suggested by De Los Reyes and Scholz (2019), to make the vision of creating shared value more effective, it must be integrated with a broader model for management and employees to take on responsibility not only for the legal norms but also for the social norms emerging within communities, provided they are also in line with the higher norms concerning human dignity and human rights, for example. This approach was recently adopted (August 2019) by 181 American CEOs at the Business Roundtable on CSR; on that occasion they issued a joint declaration on organization goals that was inspired by the idea of sharing value with all stakeholders. We are aware that the concept of "shared value" presents areas of uncertainty and vagueness and presents important discrepancies in the way it is defined and operationalized. (Dembek, et al., 2016) In fact, there can be numerous and different metrics to measure the ability of a company to obtain shared value, paying attention simultaneously and in a balanced way to the threefold economic, social and environmental dimensions. There are also aspects of conceptual overlap with the themes of CSR and sustainability, although Porter and Kramer (2011) have clarified that taking the perspective of shared value means placing the ability to generate profits and create value for society and the planet. They argue that "Shared value is neither CSR nor sustainability because in contrast to these concepts it creates social benefits through business model (not through additional non-core business activities)". Despite the conceptual uncertainties, we are convinced that shared value should be considered as the goal of the action of modern leaders and the landing of corporate social responsibility strategies.

According to this perspective, an organization must be capable of rediscovering a sense of community, under a type of leadership that Mintzberg (2009) coined "Community-ship". Such a leadership recognizes the importance of involving all components of the organization in the process of governance and finds its inspiration in a strong and motivated culture based on respect. The community-centered firm knows how to adopt a form of governance in which the decision-makers are agents of change who recognize that most of that change will be carried out by others. (Ferri and Esposito, 2020) In the aim of fostering the necessary cultural innovation, a crucial role must also be played by the community of scholars and management docents who will be educating our leaders and citizens of the future. (Giudici et al. 2020).

8. Some inconclusive notes

To answer the research questions of this study, we have developed a conceptual path which, starting from the observation of the crisis of the shareholder capitalism model and from the need to orient the production system towards stakeholder capitalism, we have highlighted the need to review the purpose of companies and the traditional managerial principles inspired by scientific management. Based on these evolutionary tendencies, the affirmation of the principles of a new approach to management was highlighted. The new managerial approach should be less anchored to the principles of Tayloristic efficiency and more attentive to the needs of people, to the human dignity of all internal and external stakeholders to the enterprise. The principles of humanistic management represent the guidelines from which to start for the exercise of new forms of leadership today and in the future (RQ1). This means abandoning the idea of considering people as resources to maximize profits or the shareholder value of companies, instead embracing the idea that people are at the heart of any business project, to be treated with respect for their human dignity and to be considered as actors essentials with which leaders can create shared value.

The application of the principles of humanistic management requires a significant change in the traditional ways of conceiving leadership. We need to overcome the classic dichotomy between transactional and transformational leadership, both models inspired by the hierarchical principles of solitary leaders. Therefore, to the RQ2 "which aspects of leadership need to be innovated?" one can answer that a shared humanistic, situational leadership is needed, capable of involving the other people of the company in the pursuit of a common purpose, a broad purpose where business principles are merged with ethical ones to govern companies responsible towards the stakeholders for which and with which companies want to co-create shared value.

This urges scholars and managers to reflect more on the new ways of measuring manager performance, modifying the metrics to be adopted which inevitably can no longer be limited to reporting only economic and financial results, but must also evaluate the impact on social value and environmental

aspects of the company's actions for the generation of well-being for the stakeholders, according to the paradigm of Corporate Social Responsibility, better conceived as Corporate Stakeholder Responsibility. The authors are aware that the subject matter is and will be the subject of further debates, due to the completion of the transition from shareholder capitalism to stakeholder capitalism and the affirmation of a new managerial culture and new approaches to leadership, necessary to guarantee that businesses become active agents in building a better world.

Factors of Success in Managerial Work: Current View of Slovak Managers

Dávid Miško^{1,*}

¹ University of Presov, Department of Managerial Psychology, Faculty of Management and Business,
Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: In the current competitive business environment, quality leadership is a key factor for the success of an organization. Managers are responsible for resource management, strategy formulation, and goal achievement. Their ability to effectively lead teams and make decisions is critical for the survival and growth of the organization in the face of competition. Additionally, a severe shortage of talented workforce and sustainability poses another challenge for a good manager.

Purpose of the article: This article aims to analyze the current opinions of Slovak managers regarding selected success factors in managerial work. Theoretical foundations provide various perspectives and processing of success factors.

Methods: The article emphasizes the current opinions of 156 Slovak managers. The results show that managers know the importance of personality in managerial work. However, the conclusion highlights extensive questions for further research, including the assessment of managers' soft skills, discrimination against young or older managers and employees, as well as other differences that may not reflect the current state and needs of companies, managers, employees, and society despite being sufficiently processed at a theoretical level.

Findings & Value added: Regardless of the quantitative research results, effectively leading, adapting to changes, and managing resources is critical for achieving organizational goals and maintaining a competitive advantage. Moreover, it is a complex area of research that creates a crossroads between fast and slow gain and short-term or long-term sustainability through talented employees, managers, and their willingness to contribute to the positive development of the organization.

Keywords: management, leadership, success of managers

JEL classification: M00, M5

1. Introduction

The task of managers is primarily to organize groups of people to collaborate productively on known and clear goals (Gilmour, Dixon 2007). According to the Cambridge Business English Dictionary (2011), a factor is one of the many things that affect or influence a situation. Factors are influences, circumstances, or realities that contribute to the outcome. Ianucci et al. (2009) addressed the topic of success among facility managers and property administrators. When asked what they considered a success, their answers varied. Some managers mentioned achieving client satisfaction as success, while others considered maintaining low costs or securing financial resources for investors as success. Two categories of theories are relevant in choosing a managerial career:

- Biological theories that consider these differences as innate,
- Social theories consider them socially determined and variable (Malach-Pines, Kaspi-Baruch 2008).
The contribution highlights the most discussed managerial success factors, which do not encompass all.

1.1 Literature review

The paper focuses on these success factors, and some of them are applied in the results section.

* Corresponding author: david.misko@unipo.sk

The factor of managerial success: Gender

Certain factors differentiate women and men in the workplace. Gender-cultural differences in work are often unnoticed, despite being an everyday part of it. Men and women approach practically every aspect of business differently.

Melero (2004) stated that women managers tend to be more participative and democratic in their approach, while male managers are more directive and autocratic. Female managers are more successful in "transformational" styles that require interpersonal interactions and mentoring. For this reason, they become a managerial or role model for lower-level employees. Males were more successful in the "default management" category and the "carefree negligence" style, which men characterize as managers having a greater tendency to delegate and being less active in supervising employees.

Shambaugh (2012) clarified the differences between women and men in business leadership positions today. She claims that both women and men in managerial positions are at the same level regarding strategic thinking in business. Managers focus on one task in the business and postpone other tasks until the prioritized one is perfectly mastered. In contrast to male managers, female managers can focus on fulfilling multiple tasks in the organization simultaneously. Men are more task-oriented, while women focus on affiliation and inclusion in the workplace. Experienced managers, whether male or female, show no differences in leading employees.

However, specific differences have been found in decision-making styles between men and women in business leadership positions (Aboyasin, Alnsor 2012). An interesting perspective is presented by Luis (2023), who states that it is essential to distinguish between female leadership and female ownership. He found that when women manage companies with no female owners, they exhibit higher average labor productivity. However, if women are among the owners and a woman is a top manager, their productivity is lower than in other companies. He argues that men-owned companies belong to a corporate culture dominated by men and would only choose a female manager if she is more competent than potential male candidates (Tremmel, Wahl 2023).

The factor of managerial success: Age

Karsh and Templin (2013) explain the influence of age or the generation individuals were born into as a factor influencing managerial work. It primarily involves different management styles that are conditioned by life in four distinct generations:

- Veteran/Traditionalist Generation (born between 1928 and 1945) - Traditionalists, as managers, are very disciplined and expect discipline from employees in lower positions. Managers of this generation are loyal to the company, conservative, and prioritize company rules over their own. If they treat employees respectfully, they expect respect and esteem in return.
- Baby Boomer Generation (born between 1946 and 1964) - Managers of this generation are characterized by their knowledge and experience, which they are willing to share with employees. They demand high effort from subordinates in task completion. They have no problem collaborating or competing depending on the company's situation and surroundings.
- Generation X (born between 1965 and 1980) - Managers of this generation primarily make decisions based on their judgment regarding how to proceed and what to do for the company's benefit. They do not require assistance from others and are self-reliant. They prefer practical thinking and decision-making over theoretical approaches but utilize their creativity in their work.
- Generation Y/Millennials (born between 1981 and 2000) - Millennial managers associate work with fun, are optimistic, and aspire to change management within the company and the world. They are energetic and revolutionary, prefer a fast pace, and promote collaboration in the workplace. They follow their dreams and allow more room for their own creativity and innovative thinking (Roestenburg, 2021).

Bae and Choi (2022) highlight the issue of age discrimination among employees and find that younger workers tend to discriminate more against older colleagues. The age of managers may be related to their experiences, which can influence their success. In practice, it is important to ensure that age considerations for managers are made for proper placement and determining the required courses. Efforts should be made to reduce age discrimination tendencies in the workplace (Becker, 2022).

The factor of managerial success: Culture and Nationality

Cultural factors that influence the behavior and management of managers at work. Culture can be defined as a social phenomenon because we share it with people who live or have lived in the same social environment. It represents specific unwritten rules that we should adhere to. We must adopt culture; we are not born with it (Hofstede et al., 2010).

Cultural factors that influence managers can be summarized into five fundamental cultural dimensions derived from the integration of existing models:

- Power distribution - hierarchical or egalitarian.
- Social relationships - individualistic or collectivistic.
- Environmental relationships - oriented towards control or harmony.
- Time and space orientation - monochronic or polychronic.
- Uncertainty and social control - based on rules or relationships (Steers et al., 2016).

From a national and cultural perspective, we can distinguish Asian, European, and American management. Asian management is called Eastern management, while American and European management is called Western management.

Differences in organizational culture tend to be more disruptive than differences in national and professional cultures, which are most relevant for creating alliance values (Sirmon, Lane 2004). Shane et al. (1995) point out that the more uncertainty a society avoids, the more people prefer working according to norms, rules, and procedures. The further a society is from power; the more people prefer to focus on gaining support from those in authority rather than taking alternative steps for innovation, rather than building broad-based support among organization members for new ideas. The more collectivist a society is, the more people prefer champions to seek cross-functional support for innovative efforts.

The factor of managerial success: Personality

A manager's success in a business is influenced not only by demographic factors, which we discussed in the previous chapter, but primarily by psychological factors, such as the manager's personality, traits, and other associated characteristics (Frankovsky et al., 2009). Personality is how a person forms and adapts to the constantly changing internal and external environment. The main functions of personality include feeling, thinking, perception, and their integration into specific behaviors (Fountoulakis, 2014). Mastering demanding and diverse tasks in the work environment places great demands on the personality of coaches and managers. Personality is an essential determinant of the entire organization as it influences individuals' behavior and work commitment.

According to Caruso and Salovey (2019), an emotionally intelligent manager can read the emotions and feelings of their subordinates, sense their moods, and use them as motivation for the team. The primary emotional skills of an ideal and successful manager are:

Predicting future emotions: The manager can anticipate their own emotions and the emotions of others in the group, even when they are not stable, and adjust them to planning and analysis.

Managing emotions: The manager can convert emotions into practical action and behavior, balancing the heart (emotions) and the mind (thoughts).

Managing anger at work: The manager can separate the emotion from the reaction without ignoring it, ensuring that anger does not affect their or others' behavior.

Managing groups: Managers understand that emotions are data, so they do not avoid feelings and integrate them into their thoughts, using them as inspiration.

A manager's success can be achieved through their personality and ability to motivate their employees. According to Singh (2018), the main tools used by managers to motivate their teams are ranked from the most essential elements for employees to the least important:

- Approval, praise, and recognition.
- Trust, respect, and high expectations.
- Expressing and receiving loyalty.
- Removing organizational obstacles that hinder the performance of the group and individuals.
- Enriching work, good communication, financial incentives, and rewards.

Hiriyappa (2011) defines job rewards as tangible outcomes of positive value provided by an organization to individuals or groups.

Organizations realize that to compete in a demanding and rapidly changing global environment, they increasingly need to rely on the ability and engagement of their human resources in terms of operational efficiency, product innovation, service quality, and, ultimately, strategic success. The results indicate that employees who are satisfied with the personality of their managers show positive reactions to the company they work for and higher job satisfaction (Abedi et al., 2016; Boswell et al., 2006).

Employees are also confronted with many job opportunities and promotions, leading many organizations to engage in a talent war. In today's world, a manager can be successful even if they possess different skills and qualities than their successful colleagues. We recommend literature on the personality, temperament, and character of managers such as Zhou et al. (2023), Borgholthaus et al. (2023), Lacam, Salvevat (2023), Štefko, Birknerová, Zbihlejšová (2023).

2. Methods

For statistical analysis, data were collected using a questionnaire inspired by Mahlamäki, Rintamäki, and Rajah (2018). Slovak managers were asked 51 questions grouped into eight sections. After providing information on gender, age, and managerial experience, managers answered questions regarding the influence of 5 factors (personality, emotional intelligence, social intelligence, education, and experience) on their performance. Managers also had the opportunity to write their factors of success. Subsequently, they responded to statements related to self-assessment of success and leadership. The last 30 statements assessed the role of personality and motivation in work performance. The questionnaire items were rated on a scale with the following responses: 1 - completely disagree, 2 - rather disagree, 3 - neither agree nor disagree, 4 - rather agree, 5 - completely agree.

The sample selection was conducted through purposive sampling, where the questionnaires were distributed to Slovak managers in various positions. The research sample consisted of 156 managers, of which 81 (51.92%) were women, and 75 (48.08%) were men. The age of respondents ranges from 24 to 51 years, with an average age of 33.46 years in the research sample. The minimum managerial experience is one year, while the maximum is 21 years. The average length of experience is 9.12 years.

The study aims to verify the significance of individual success factors for managers and the relationships between selected variables at the descriptive and inductive statistical levels (correlations). Two research problems are formulated as questions:

Q1: Is there a statistically significant relationship between the age of managers and the assessment of the importance of individual success factors?

Q2: Is there a statistically significant relationship between the use of a democratic management style by managers and self-assessment of success for the company?

3. Results

The post presents five main factors of success. Descriptive statistics of the observed factors are displayed in Table 1.

Table 1. Descriptive statistics

	Min	Max	Mean	SD.
Personality	1	5	4,34	,652
Emotional intelligence	1	5	4,06	,814
Social intelligence	1	5	4,01	1,297
Education	1	5	3,77	,788
Experience	1	5	3,67	1,021

Source: own processing

Based on the average value, managers consider Personality as the key factor, followed by Emotional and Social Intelligence. They give less importance to Education and Experience. Managers' Personality is considered the dominant factor of success, as it influences behavior, decision-making, delegation, and all activities directly related to the success of the manager and the organization. Some research studies explore the personality traits of managers along with emotional and social intelligence, which, in our case, confirms that these three factors received the highest average scores as assessed by the managers. However, we must consider the country's economic status, cultural conditions, requirements, and goals of the organization, which

may lead managers to have a different perspective on key factors in their specific context. This viewpoint is supported by Alan (2021), who presents several studies emphasizing the importance of personality characteristics. The experience of managers is also mentioned, as interpersonal skills through Personality are among the most desirable skills for success in organizations and for managerial efficiency (Rios et al., 2020; Beenen et al., 2018). Google recently concluded that skills such as coaching others and effective communication are more important than scientific, technological, engineering, and mathematical skills.

Subsequently, the managers responded to an open-ended question about additional factors that impact their success. Out of 156 managers, as many as 58 respondents did not mention any other factors. Among the remaining 57 respondents, the following factors were mentioned: Fifty-nine respondents identified communication skills and proper employee communication as success factor. Thirty-eight respondents mentioned teamwork or collaboration. Only one respondent mentioned creativity as a success factor.

However, the results are influenced by the employment situation in the country, income levels, economic status, goals, and other factors that may influence managers' views on critical success factors. Currently, we observe a trend of a workforce shortage of the necessary qualities and knowledge for performing their professions, which significantly affects the perception of critical managerial traits from both organizational and managerial perspectives. It also highlights the need for practical education of students to prepare them for their managerial roles.

The following Table 2 describes statistically significant correlations between age and managers' assessment of the importance of selected success factors.

Table 2. The relationship between managers' age and selected factors is as follows

		Personality	Emotional intelligence	Social intelligence	Education	Experience
Age	Spearman Corr.	-,270**	-,023	-,003	-,056	,358**
	Sig.	,005	,814	,976	,571	,000

Source: own processing

The results indicate statistically significant correlations between personality and managerial experience. As managers grow older, they consider personality and individuality less influential, and they increasingly lean towards experience as a more influential factor for success. This result may be because older managers, with more experience and a longer tenure in managerial positions, have observed in their younger colleagues that their personality traits are insufficient and cannot replace experience in their work.

The attitude of managers towards the retirement age of their older employees is related to their retirement planning. Managers who intended to work beyond 66 considered it more important to retain older workers after this age than managers who planned to retire at 66. Managers stated that older individuals were more cautious, had valuable experience, skills, and life knowledge in the workplace, and helped guide new and younger employees. On the other hand, most managers agreed with the stereotypical belief that older people are slower, resistant to change, less educated, and hostile towards technology (Nilsson, 2022). In some cases, these age-related differences (whether normative or pathological) can disadvantage older workers as their job performance may be lower than younger workers. However, in other cases, the crystallized knowledge and experience of older managers and their positive outlook on work are likely to be greater at the age of 50 than at the age of 20 (Wegman, McGee, 2004).

Table 3. Descriptive statistics

	Min	Max	Mean	SD.
1. Career growth	1	5	3,42	1,129
2. Contribution to the company	1	5	4,25	,829
3. Company's success	1	5	4,27	,846
4. Respect from colleagues	1	5	3,42	1,094
5. Recognition and praise	1	5	3,14	0,699
6. Employee satisfaction	1	5	3,62	0,901

Source: own processing

From Table 3, we can observe the ratings of the statements: "3) I believe that I contribute to the success of our company," obtained the highest average score of 4.27. The statement "5) I often receive praise and recognition for my work" received the lowest average score of 3.14 among the respondents. Based on the table, the respondents largely agree with statements about their contribution and success in the company. However, they must agree more with statements about employee satisfaction, career growth, colleague respect, and receiving praise. The results indicate that in terms of self-assessment by managers and their contribution to the organization, the average scores are higher than the assessment of the organization itself, specifically in terms of support, respect, and praise received within the organization. It is necessary to discuss whether this result is due to a bias in self-assessment and organizational assessment or if it genuinely reflects employee dissatisfaction regarding their contribution to the organization.

Many organizations recognize the need for effective leadership and management. However, they are still unsure about the good management practices, leadership styles, and behaviors that are most effective for the growth and development of the business sector, multinational companies, and small and medium-sized enterprises, along with the development of their human resources (Kelly, Hearld, 2020). Leadership and management in organizations are crucial in ensuring the success of both multinational and small and medium-sized enterprises. While multinational companies may have more resources and a more formal structure, smaller businesses often have a more flexible and agile approach to leadership and management. Ultimately, the key to success in both types of organizations is to have leaders and managers who can inspire and motivate their teams to achieve their goals (Siyal, 2023).

From this perspective, it is necessary to focus on employee and manager satisfaction, emphasizing the differences in their self-assessment and organizational assessment, which may indicate possible issues.

Table 4. The relationship between a manager's success and the utilization of democratic leadership style

Leadership - democratic		
Success	Spearman Corr.	,477**
	Sig.	,000

Source: own processing

In the case of self-assessment in utilizing a democratic leadership style and performance evaluation within the company, Spearman's correlation coefficient displayed in the table indicates a statistically positive relationship. This means that as managers rated themselves higher in utilizing the democratic leadership style, they also considered themselves more successful and valuable to the company. Rosing et al. (2022) argue that democratic leadership, rather than autocratic leadership, increases trust in the leader. The findings highlight the importance of leader characteristics in emergencies and demonstrate the value of blending autocratic and democratic leadership behaviors in different stages of team performance to build trust in the leader.

However, there is still ample room for theoretical research on participatory leadership and organizational practice, and the current challenge of "employee participation in decision-making" needs to be optimized and improved. It is urgently necessary to balance organizational practice and theoretical research on "employee participation" and "scientific decision-making" at the leadership level (Wang et al., 2022).

4. Discussion and Conclusion

We interpreted the following findings from our research and posed the question: How to monitor, evaluate, and improve these factors in managers? It is complex to monitor and evaluate the psychological aspects of a manager, such as personality and intelligence. To ascertain this, we recommend exposing the manager to challenging and complex situations or using simulation methods that put the manager under pressure, allowing their strong personality traits to emerge. Subsequently, it is essential to observe how the manager behaves when tasked with leading a group of employees who are unwilling to cooperate and reject their commands and advice. Alternatively, observing the manager in simulations where they face tasks with impossible time constraints can also provide insights. This is where the manager's effectiveness in working with their personality and managing their emotions in social situations becomes evident.

Sometimes, it may be simpler for the manager to rely on common sense to solve problems or conflicts rather than employing complex methods they may not even master. The same applies to experience. Years of practice do not necessarily guarantee the most efficient completion of work or success, although this factor can significantly facilitate working with people and tasks.

When evaluating, it is crucial to consider the type of manager and leader the individual is and the specific focus of their work. We must assess personality and personal characteristics differently for a human resources manager who leads a group of people compared to a project manager responsible for all aspects of a project. This topic and objective require in-depth analysis and extensive research conducted on managers and employees under their leadership. By gathering such results from managers and subordinate employees, we could develop a model of critical success factors for managers that could be applied in managerial practice.

Nevertheless, our findings indicate that managers in Slovakia know the importance of personality and other characteristics for their success in managerial roles. Older managers are more aware of the need for experience, whereas younger ones place more emphasis on personality. Differences are also observed in the self-assessment of managers and the assessment of the organization they work for. Managers who believe they apply a more democratic leadership style also consider themselves more successful for the organization.

The limitations of the research lie in the restricted sample size and the drawing of certain conclusions based on average values. This contribution provides a foundation and questions for further research.

Abstract

Research background: COVID-19 pandemic caused a rapid shift to full-time remote work environment. Workforce productivity, engagement, and success are affected by how the company interacts with its workforce. Human-to-human connection without clear communication is impossible. Communication is essential for a stable, engaged company. In e-work environment even more.

Purpose of the article: the purpose of this study is to investigate real e-employees' perceptions of the flow of information in a remote work environment, their communication preferences, and their sense of community.

Methods: a quantitative study (web-based survey) in a Greek multicultural company has been used. Authors tried to find answers to following research questions: How do e-employees perceive internal communication methods in their organization? Which of the internal communication channels were used most effectively?

Findings & Value added: Based on the created questionnaire, a total of 7 hypotheses were determined, all of which were statistically confirmed. Obtained data confirms the raising importance of internal communication, especially in times of crisis as employees considered as a homogenous. We can underline the sample based in Greece but located various European countries and in a context of unprecedented crisis. English as predominant spoken language. Finally, this research only explores the role of internal communication in an organizational context (formal, casual, organized, or unplanned). The survey was conducted during pandemics and has some interesting implications for communication professionals and researchers in the field of internal communication. The present study examines internal communication in e-working settings. Previous studies have excluded the situation for e-employees. The results provide new insights into internal communication behaviour in e-work.

Keywords: internal communication, e-work, methods, channels, multiculturality

JEL classification: D83, M12, M21, M54, J21

1. Introduction

According to EU statistics, in 2019, 5.5 % employees worked from home, in 2020, due to the pandemic, this share increased to 12.3 %; and in 2021, to 13.5 % (Eurostat, 2022). Work from home (WFH) or e-commuting (Beno & Caganova, 2023) allows flexibility for individuals with personal and professional goals. However, it also comes with challenges (Ambikapathy & Ali, 2020; Kurkland & Bailey, 1999; Beňo, 2021). Especially in relation to workplace engagement, including communication (Cagaňová et al., 2019). Erum et al. (2020, p. 16) stated that "when employees have a calling to their work they find themselves more adjusted for their job and are more likely to feel passion towards it, they are intrinsically motivated to perform it thus deriving happiness in their workplace". This disengagement causes various problems due to lowered productivity and decreased satisfaction. Lal et al. (2021) highlighted that social interactions (in the on-site workplace) are an essential feature of social life and shape the workforce's experience of work. However, organizations are able to work to intentionally address these issues. The potential tool may be internal communication (IC) (Cagaňová et al., 2015). It may help e-workers feel more socially connected.

* Corresponding author: michal.b@praguecityuniversity.cz

IC is often interlinked with an organization's reputation and brand. But one of the most crucial links in the organization, which is easily overlooked, is the internal one, namely the workforce. They are the ones who create the brand. Organizations are able to convey the ambitions and values of the brands, but very often sufficient information flow is missing. IC increases trust in organizations, which is often associated with business success. (Cagaňová et al., 2010).

IC should be a deliberate, well-planned, and well-articulated element of a company's communication strategy. Many organizations are still operating remotely with employees scattered across the nation and around the world, like the authors' sample. Thus, it can be difficult to communicate in a way that keeps everyone engaged. Numerous studies have examined the main issues of IC (Flynn & Mazor, 2017; Oak, 2022, RobertHalf, 2013; QueensUniversity, 2023) and have linked IC and the degree to which employees are informed to job satisfaction and performance. The competitive benefits of IC come not only from satisfaction, productivity and sense of community but also from the positivity of external public relations.

The purpose of this study was to investigate real e-employees' perceptions of the flow of information in a remote work environment, their communication preferences, and their sense of community. Simply identify and describe IC according to e-employees. A quantitative IC study has been chosen to identify the issues faced by e-employees in order to answer these questions. The following research questions were outlined:

- How do e-employees perceive IC methods in their organization?
- Which of the internal communication channels were used most effectively?

The company under investigation required anonymity. Its internal communication system was launched several years ago. In the questionnaire survey, employees and basic managers made up the largest sample, but middle and top managers also participated. The survey was conducted in a Greek multicultural company, with employees from Poland, Germany, the Czech Republic, Greece, Portugal, and Romania. All interviewees (total 182) met the condition of remote working mode.

2. Methods

According to McDonough & McDonough (1997), the authors of this study implemented both interpretive and evaluative case study with the aim to interpret the data by developing conceptual categories and add judgement to the phenomena in the data. It allows a deeper understanding of the specifics of IC, providing a close understanding of the e-employees on IC and its meaning.

Because of the nature of a case-study, purposeful sampling was conducted with the emphasis on selecting an information rich group of respondents. The study is conducted on the entire target population which consists of 182 e-employees (57.7 % of females, 40.7 % of males and 1.6 % diverse) with an average age 32, median 30 of a global Greece organization in operating in sector service. This confirms that service sector is the area with the highest female labour rate (Worldbank, 2021). Effective IC can be expected to be an important variable among surveyed e-workforce. All respondents worked for an Greek company, but they work in a remote working mode, i.e. they meet the conditions for the research of this work. At the same time, these are respondents from European countries, mainly from Poland, the Czech Republic, Greece, Germany, Portugal, and Romania.

The data from this research was collected using an online Google survey that was distributed through email accompanied by a brief explanation (with a link that directed to the compilation of a Google form approved by the head of surveyed company) from the 18th May till 9th June 2022. An online survey was chosen (on a voluntary base) as a means for collecting the data due to the company remote work environment and various locations internationally. As Evans & Mathur (2005) stated the suitable reason to utilize an online survey is when a large sample size is desired over a wide geographical area. It included 46 questions (7 open ended and 39 closed questions) asking IC constructs and remote work experience. Questions were modeled specifically on the areas highlighted in this study that may either mitigate or compound the effects of IC in remote work environment. The compilation time was estimated in approximately 15 minutes. Questionnaire was pre-tested with 3 respondents and redesigned in accordance with it. 5 point-Likert scale to measure satisfaction, positivity or negativity and 3 point-Likert and 5 point-Likert scale to measure agreement has been used.

In order to test seven hypotheses, the authors' set seven dimensions central to IC based on Ruck and Welch (2012) six dimensions. In this study, Pearson's chi-squared test has been used to analyse whether the characteristic values of the first variable are influenced by the characteristic values of the second variable and vice versa. The observed and expected frequency of 0.05 has been given. Statistical analyses were performed using Excel and SPSS.

3. Results

As stated previously, this study will focus on the results of those surveyed who expressed some increase or decrease in their levels of internal communication, with discussion of neutral responses where necessary or of relevance to the study. These questions appeared at Questions 15 and 19 (identification), 33 and 35, (workplace relationships), 37 (channel) 42 and 46 (role), 41 and 46 (voice), 10 and 16 (performance), 28 and 37 (support).

IC is receiving focus and organizations are investing in the function (Chalmers, 2008; Helsby, 2009). The main role of IC is to improve corporate values by communicating effectively with the workforce, an important asset, and a sense of belonging.

3.1 Identification

- **H1: Relationships with colleagues related to feeling of connectedness with my employer / team members.**

In the question "How is your relationship with your colleagues?" we can only compare the values "Average" and "Extremely satisfied", since the value "dissatisfied" did not reach a sufficient frequency to participate in the test. Only 1.1 % of employees were dissatisfied with their colleagues. Similarly, the choice "Negative" in the question "My sense of connection with the employer/colleagues" did not reach sufficient representation (0.6 %), therefore this option cannot be tested.

It is also possible to read from Table No. 1 that we obtained a total of 177 answers to the question, although 182 respondents participated in the questionnaire, and 5 employees refused to answer the question. The test criterion value is 104.043, and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, so the dependence between relationships with colleagues and the feeling of connection with employees or team members has been confirmed. According to the table, those who are extremely satisfied with their relationships with colleagues have a statistically significantly higher likelihood of having a positive or rather positive relationship with their colleagues. From this, we can say that when employees feel connected to the company, either because they share the same vision as the company's leaders or because they feel that their co-workers have become like family, they are much less likely to want to look for employment elsewhere and thus are more productive.

Table 1. A sense of connection between employees and colleagues.

19) How is your relationship with your colleagues?	15) My feeling of connectedness with my employer / team members				Total
	Neutral	Positive	Rather negative	Rather positive	
Average	42	24	0	0	66
%	63.64	36.36	0.00	0.00	
Extremely satisfied	0	59	7	45	111
%	0.00	53.15	6.31	40.54	
Total	42	83	7	45	177

Source: Authors' work

Based on this data, fulfilling relationships within the work environment are interlinked with meaningful connections with co-workers. When employees feel connected to one another, they feel better. Connection seems to be the most crucial component because connected teams drive collaboration.

3.2 Workplace relationships

- **H2: Daily contact with your team leaders is related to being satisfied with the frequency of communication from leadership.**

More than 4/5 employees confirmed that they communicate with the team leader at least once a day. This majority is also satisfied with the frequency of communication they receive from management. The test criterion value is 156.865 and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, so the dependence between daily contact with team

leaders and satisfaction with the frequency of communication with management was confirmed. Those who do not have daily contact with team leaders are also less satisfied with the frequency of communication with management. This means that employees would like to be in contact with management more often (see the Table 2).

Table 2. Frequency of H2

33) Do you have daily contact with your team leaders?	35) How satisfied are you with the frequency of communication of leadership?			
	Extremely satisfied	Neutral	Slightly / very satisfied	Total
Mostly disagree	0	0	14	14
%	0.00	0.00	100.00	
Slightly agree	0	0	17	17
%	0.00	0.00	100.00	
Mostly agree	0	25	52	77
%	0.00	32.47	67.53	
Completely agree	56	13	0	69
%	81.16	18.84	0.00	
Total	56	38	83	177

Source: Authors' work

Corporate communication is vital element. Generally, communication with team leaders is a big challenge. Leaders typically hold the key to advancement within the organization. The highest managerial goal is to create a pleasant working atmosphere and find the most successful technique of motivating each employee, which is very difficult due to the diversity of employees and different personalities, but in this company this goal would be met.

3.3 Channel

➤ **H3: More than 40 % of employees prefer to use Zoom as communication tool.**

Employees' channel preferences vary based on the activity and who they are interacting with. As audio and video communications have become more common in daily lives, people often start collaborations with the question: which video communications platform do you know and like to use? We will test this single hypothesis using the proportion test. The software provides only the p-value in the output. It is equal to 0.0379. It is therefore again smaller than the chosen level of significance, and we have thus managed to confirm that Zoom is the most popular communication channel for more than 40 % of employees. In second place, e-mail is preferred by 30.77 % of respondents, and the last chat is preferred by 5.49 % of employees.

3.4 Role

➤ **H4: Chitchatting related to clarity of objectives.**

More than half (61.7 %) of the research participants perceive Zoom as the majority source of information, another 21.7 % slightly disagree. The remaining 16.6 % of respondents reject this, thus they receive information in another way. A more important finding is that 89 % of employees are clear about their assigned daily/weekly tasks. The test criterion value is 108.854 and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, so the dependence between communication using chitchatting and understanding the goals every day / week was confirmed. Those who are not satisfied with the course of communication using normal calls are significantly more often not completely clear about the assignment of the task (clarity of goals). On the contrary, those who are very satisfied with informal conversations are clear about their daily goals. The table of observed frequencies are shown in Table 3.

Table 3. Frequency of H4

42) Most of the information is through chitchatting.	46) Are your work objectives clear each day? Each week?			
	Completely / mostly agree	Slightly / mostly agree	Completely agree	Total
Completely/mostly agree	0	21	5	26
%	0.00	80.77	19.23	
Slightly agree	5	34	0	39
%	12.82	87.18	0.00	
Mostly agree	3	18	51	72
%	4.17	25.00	70.83	
Completely agree	0	0	43	43
%	0.00	0.00	100.00	
Total	8	73	99	180

Source: Authors' work

3.5 Voice

- **H5: Communication using informal written channels is related to understanding daily/weekly goals.**

More than half (54.5 %) of the participants confirmed that they receive work messages through informal written channels. 22.5 % of respondents reject this statement only slightly. 23 % mostly and completely disagree. This means that informal communication is accepted as casual communication between co-workers in the workplace. It is unofficial in nature and is based on informal social relationships that are formed in the workplace outside the normal hierarchy of the business structure. The test criterion value is 38.986 and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, so the dependence between communication using informal written channels (messages, chats) and the understanding of goals every day/week was confirmed. This type of communication is important in the workplace because it can help with employee morale and encourage a sense of belonging for both employees and clients or customers. Those who are not satisfied with the course of communication using informal written channels are significantly more often not completely clear about the assignment of the task (clarity of goals). On the contrary, those who are very satisfied with informal written communication are clear about their daily goals (see Table 4).

Table 4. Frequency of H5

41) Most work-related information from teammates and team leaders to me is transmitted through informal written channels (i.e., instant messages, chat).	46) Are your work objectives clear each day? Each week?			
	Completely / mostly agree	Slightly / mostly agree	Completely agree	Total
Completely/mostly disagree	0	27	15	42
%	0.00	64.29	35.71	
Slightly/mostly agree	8	48	53	109
7.34	44.04	48.62		
Completely agree	0	0	31	31
%	0.00	0.00	100	
Total	8	75	99	182

Source: Authors' work

3.6 Performance

With all the modern comforts of home vying for our attention, it would be understandable if employers saw a drop in productivity with remote workers. However, the opposite is true. In fact, 88 % of employees seem to enjoy working remotely, with another 6.6 % slightly disagreeing with this statement and 5.4 % rejecting it. Almost half (49.5 %) of respondents say their productivity has increased as a result of working from home. Only 7.1 % of employees feel a decrease in work performance. The test criterion value is 137.556 and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, so the dependence between productivity and whether employees enjoy remote work has been confirmed. From Table 5, it can be said that those who enjoy working remotely increased their productivity significantly more often than those who did not enjoy working remotely.

Table 5. Frequency of H6

10) I enjoy working remotely.	16) Has your work productivity changed when you have started work remotely?			
	Decreased	Increased	Same	Total
Completely / mostly disagree	0	5	5	10
%	0.00	0.00	50.00	
Slightly / mostly agree	0	10	74	84
7.34	0.00	11.90	88.10	
Completely agree	13	75	0	88
%	14.77	85.23	0.00	
Total	13	90	79	182

Source: Authors' work

3.7 Support

- **H7: The choice of the preferred communication channel is related to the number of requests for help.**

A somewhat disturbing finding emerged for the last hypothesis, where 27.1 % of employees have difficulty asking for help. So, it seems that the open-door policy is only partially working. Workplaces reflect norms and standards set by management, which are then accepted (or not). Much of this depends on how these norms are enforced and demonstrated. Building a culture of helping is about the art of practicing what you preach. In this hypothesis, we tested whether these concerns are related to the communication channel. The test criterion value is 64.086 and the p-value of the test is 0.000. The p-value is lower than the chosen significance level of 0.05, thus the dependence between communication channel and concern about asking for help is confirmed. From Table 6, it can be seen that those who prefer chat as their communication channel are significantly more often not afraid to ask for help than those who use Zoom or e-mail.

Table 6. Frequency of H7

37) What communication channels work best for you.	28) I feel uncomfortable asking other for help?					Total
	Completely disagree	Mostly disagree	Slightly agree	Mostly agree	Completely agree

4. Discussion

The authors' survey results confirm that it is increasingly important for IC professionals to consider the diversity of the internal team in the organization, as highlighted in previous research (Suh & Lee, 2016; Yeomans & FitzPatrick, 2017). Additionally, as highlighted by McQuail (2010) effective communication requires delivering the right channel, the right message, to the right audience, through the right channel at the right time.

The received data from the first hypothesis is in the vein of past studies that highlight that overall organizational efficacy and efficiency depend on its IC (Grimshaw & Mike, 2008, Hayase, 2009). Communication plays an essential role (Levinson, 1980) as further demonstrated. Interestingly, those who do not have daily contact with team leaders are also less satisfied with the frequency of communication with management. This means that employees would like to be in contact with management more often as confirmed by H2. Because as Men & Yue (2019) explained communication increases stakeholder awareness and satisfaction with what leaders are making and whether their decisions will mitigate tension and improve interpersonal relationships. Almost identical to Stauss & Hoffmann (2000) who stated that IC is practiced through top-down, bottom-up or horizontal communication. IC without internal communication digital channels does not work (Smith et al., 2015). Zoom is the most popular communication channel for more than 40 % of employees. In second place, e-mail is preferred by 30.77 % of respondents, and the last chat is preferred by 5.49 % of employees. Almost similar to Friedl & Verčič (2011) who noted that millennial workforce prefer traditional media. This means that without these channels, it is impossible to match employees to the company priorities, goals and promote creativity. The difference between formal and informal communication lies in the material, not the instrument (Rodrigues et al., 2016; Welch & Jackson 2007). But, based on H4 and H5 data, those who are very satisfied with informal conversations and informal written communications are clear about their daily goals. Identical to Men (2014) who highlighted that the choice of medium for communication is important. According to Bočková & Lajčín (2021) job satisfaction, productivity, engagement and, with mandatory remote working during this pandemic, is more of a challenge for employers than ever before. Thus, H6 confirmed that those who enjoy working remotely increased their productivity significantly more often than those who did not enjoy working remotely. Similar to Dhanesh & Picherit-Duthler (2021) who highlight that social connection mediated the relationship between new ways of working and employee engagement. A somewhat disturbing finding emerged for the last hypothesis, where 27.1 % of employees have difficulty asking for help. Probably, because as Zhao & Epley (2022) indicated those needing help consistently underestimated others' willingness to help, underestimated how positively helpers would feel, and overestimated how inconvenienced helpers would feel. Possible tool seems to be the modern technology because those who prefer chat as their communication channel are significantly more often not afraid to ask for help than those who use Zoom or e-mail. This result is in the vein of Jämsen et al. (2022) statement that communication technology played a crucial role in experiences. Obtained results confirm that "the most important driving force behind the modern economy today is creative, innovative and motivated employees" (Pilukienė, 2017, p. 223).

Conclusion

IC in the surveyed organization is viewed as important and as a specific segment within each element or task. This research has some interesting implications for communication professionals as well as researchers. Obtained data confirms the raising importance of IC, especially in times of crisis as employees considered as a homogenous.

The following research questions were outlined:

- How e-employees perceive IC methods in their organization?

They perceived IC as being tailored to their specific needs. But based on the data, it still invites us to re-consider the specific needs to adapt the content of the messages, their formats, and the best communication channels to these needs. E-employees who perceive communication as transparent are satisfied by the communication in their organization. It means that organization partly created an

effective IC strategy. It has to be prepared and ready to react to sudden changes and circumstances. Creating an effective IC strategy involves evaluating and reviewing the current strategy and identifying the strengths and weaknesses as demonstrated in the research data. Especially when employees are reluctant to ask for assistance.

➤ Which of the internal communication channels were used most effectively?

Technology tools affect how e-workers feel about their organization and work. Communication is the most important predictor of feelings of value and engagement. Both formal and informal IC channels are the way by which e-employees communicate and connect. Zoom is the most popular communication channel for more than 40 % of employees. In second place, e-mail is preferred by 30.77 % of respondents, and the last chat is preferred by 5.49 % of employees. E-mail seems not to be the most common way of connecting in the office anymore.

The study has found that the largest proportion of staff was positively affected in the areas of IC.

Regarding the limitations of this research, we can underline that the sample of our survey only concerned employees from organization based in Greece but located various European countries and in a context of unprecedented crisis. Authors were limited in studying certain fields on more detail. Additionally, the spoken predominant language in organization was English and it may cause problems of understanding and interpretation of sets of questions. This research only explores the role of IC in an organizational context (formal, casual, organized, or unplanned).

For future research, it would be interesting to extend this research by conducting a qualitative study. Other studies could aim to add more companies in different sectors. Future research may focus on the implications of feedback in IC.

Intervening Variable in Business: Burnout in Sales Representatives

Vladimír Čema^{1,*}, and Barbara Nicole Čigarská¹

¹ University of Presov, Department of Managerial Psychology, Faculty of Management and Business, Konštantínova 16, 080 01 Presov, Slovakia

Abstract

Research background: The usual cause of burnout in entrepreneurs includes lack of support, unrealistic expectations, constant need to adapt and evolve in business sphere, unsatisfactory work-life balance, high levels of stress and psychological pressure. Therefore, the goal of the study was to determine the extent to which burnout affects individuals outside the helping professions and whether there exist a relationship between the age, length of practice and burnout.

Purpose of the article: The ambition of the context of the article is for individuals to realize that burnout affect workers outside the helping professions that having a manageable workload and being able to talk about it is the key to healthy mental flexibility.

Methods: The Maslach Burnout Inventory (MBI) was used in the study. It is a questionnaire developed by two American psychologists Maslach and S. Jackson (1986). The questionnaire contains 22 items as statements, feelings, and attitudes. Of these, 9 items focus on Emotion Exhaustion (EE), 5 items focus on Depersonalization (DP), 8 items focus on Personal Accomplishment (PA). Two subscales (emotional burnout and depersonalization) are tuned negative, and only one is tuned positive (personal success).

Findings & Value added: An important finding is that the rate of burnout is not related to age or length of practice. Solving the problem of burnout in sales representatives by reducing or increasing the average age of employees will not bring the desired effect. Burnout affects workers in helping professions, as well as business representatives. The added value of the article lies in the awareness that burnout may arise from a long-lasting mismatch between working individuals and work settings in terms of fairness, values, workload, reward or control and community. Based on that, the article aimed to emphasize the importance of perceiving of sales representatives in context, rather than individually.

Keywords: intervening variable, burnout, mental exhaustion, sales representatives, entrepreneurs

JEL classification: M2, M5, M12

1. Introduction

The study of burnout syndrome within the sales context has found the interest. It includes not only focusing on emotional exhaustion but also examining the other two dimensions (depersonalization and personal accomplishment) of burnout (Ambrose et al., 2021).

Currently, there are several studies and tutorials on how to be successful in business. New sales trends, more efficient communication techniques, and special training of employees are implemented for sale to increase efficiency in offering and selling goods, services, or products. This study aims to point out one of the variables that can negatively affect efforts by traders. The variable is burnout. Customarily used term that appears in the professional literature in the Slovak equivalent, as a burnout syndrome. Because of the simple Anglophone form, the English form burnout will be used instead of the Slovak term burnout syndrome in this study. As it was already mentioned, the burnout of salespersons and sales representatives can simply and unobtrusively sabotage companies' efforts for significant revenue, more clients, and subsequent market expansion. One such company represents a joint-stock company operating in Slovakia and the Czech Republic. Because of its anonymity, it will be undescribed in more detail in this study. Despite its stable market position, digital innovation, expansion of services, portfolio of services and products, and regular and meaningful staff training, it has not made significant progress. Where did the

* Corresponding author: vladimir.cema@unipo.sk

mistake in the improvement happen? Who from sales efficiency specialists made a mistake? It is possible that no one.

Assuming that the company's settings were proper, it is necessary to look for intervening variables, the impact of which was unconsidered in the first plan. One of them, which is the subject of the analysis of the study, is burnout.

1.1 Burnout and its characteristics

This construct was first named and identified by Freudenberger (1975) in the social support professions. Under certain conditions, burnout can express an extraordinary burden for the individual. Burnout syndrome is included in the 11th Revision of the International Classification of Diseases as a syndrome resulting from unsuccessfully managed, chronic stress that activates emotional exhaustion, feelings of unproductivity, cynicism, withdrawal, unsuccessfulness, loss of idealism, and ineffectiveness (WHO, 2019). Burnout syndrome represents one of the most studied work-related syndromes in recent years, especially within the healthcare and services sector (Heinemann, 2017). Individuals who are burned-out distance themselves cognitively and emotionally from work activities, experience high levels of chronic fatigue (Bakker & Costa, 2014). Burnout is a reaction to persistent work stress and so-called work-related burnout is conceptualized as a three-dimensional construct, examined by the Maslach Burnout Inventory (MBI) via determinants of Emotional Exhaustion: described as the feeling of being emotionally drained, depleted, includes symptoms of fatigue, increased sensibility to stressors from the external surrounding or feeling of having very low energy; Personal Accomplishment: a negative self-evaluation, loss of satisfaction and motivation, by a low efficiency on work-related actions (Fontana et al., 2020); Depersonalization or Cynicism: negative feelings, having a lower empathy towards people, bad perceptions about the clients, patients, colleagues with the attempt to be distanced from them. This perception of others, who are considered callous or dehumanized, may lead members of staff to see the clients, colleagues, patients, etc., as somehow deserving of their troubles.

There exist also three different types of this syndrome, overload syndrome – frenetic, which occurs due to continuous demands and responsibilities, under-challenged syndrome – demotivating, produces feelings that everything is developing in a bad direction, then comes total apathy, and the last one is a worn-out syndrome – wear out, brings chronic or repeated need to avoid or ignore all duties (Gold, 1984).

Burnout is considered the result of not having a good support structure and being very stressed. Beneficial or healthy relationships with an appropriate environment, with a good work organization, and the ability to use free time properly, and learn to be assertive means a perfect help from the perspective of prevention (Kohoutek, 2018). This state affects dissimilar professions but mostly nurses, athletes, artists, medical or doctoral students, lawyers, teachers, managers, people in leading positions, early-career people, businessmen, and individuals who put the greatest effort into passion or work – known as perfectionists (Brubaker & Beverly, 2020). Burnout has become a serious problem and we can see that not only businessmen suffer from feelings of being alienated and angry. Work burnout is a type of oversteering that results from prolonged job-related and chronic stressors. The best way how to perceive burnout syndrome is to understand it as a mental state of exhaustion and as a result, starting to appear, e.g., low work efficiency, cynicism, loss of motivation, depersonalization, etc. (Smith, 2020). It is a feeling when an individual is very intensely preoccupied with tasks (ideas), concludes that he can no longer exist in this way, and loses his enthusiasm. It causes nervousness, irritability, and fatigue (Křivohlavý, 2001). The completion of burnout syndrome results in psychological detachment from work, decreased engagement, cynicism, apathy, and rigidity.

Burnout causes physical, emotional, and mental exhaustion. Emotional exhaustion is accompanied by feelings of hopelessness, helplessness, and the feeling of being trapped. Mental exhaustion is characterized by a negative attitude towards oneself, work, and the world (life) in general. The accompanying effects can significantly reduce the work efficiency of the company's salesperson or sales representative. Can this happen despite an experienced employee who is responsible and has a successful work history in the company? Can burnout affect a young and less experienced seller as well? Křivohlavý (2001) states that the most endangered group of employees are those who work above the level of their capacity, consider work as a mission, they are the most efficient, responsible, and consistent. Under normal circumstances, these people are considered workaholics who cannot adequately rest and relax (Křivohlavý, 2001).

1.2 Mental exhaustion among sales representatives and entrepreneurs

Related but different and unfavorable stress outcomes indicate burnout and manifestations of depression (Hammen, 2005). There is an overlap between burnout syndrome and depression, considering some societal etiological factors and symptoms (Bianchi et al., 2017). Symptoms of depression, depressed moods, and anhedonia (inability to experience joy, the first symptom of depression) are outlined in the Diagnostic and Statistical Manual of Mental Disorders (American Psychiatric Association, 2013). The spectrum of depressive symptoms does not exceed the symptoms of burnout. Although the constructs are related, they are different. Burnout includes responses to chronic stress, such as occupational inefficiency, emotional exhaustion, depersonalization.

There exist reasons why sales representatives face stress and why stress is known as an imbalance between environmental requirements and an individual's ability to react. While many sales representatives can successfully reduce the stress of doing business, it is practical to realize that demanding stress processes are necessary for traders to some extent because they cannot be circumvented. Thus, they sporadically invest their energy into the activities that involve a great uncertainty, time pressure, conflict, extended working hours, and ambiguity, thus showing high-stress responses (Baron, Franklin & Hmieleski, 2016). Theories emphasizing the negative effects of stress often point to high demands and perceptions of external stimuli or events, while other theories emphasize the positive effects of control and adaptive replies to stress perception. The conceptual unification of sales representatives' stress construct is ambiguous, contains conflicting results, and almost non-existent theoretical framework of metastudies. Because of it, the conceptual unification of trade stress is a challenge for researchers (Harkness, 2020).

The theory of stress assessment and resulting burnout syndrome remains criticized for its subjectivity – individuals take responsibility for assessment and business stress research is not properly separated from employee stress literature – identified stressors among paid employees are of minimal importance in the business environment (Eager, Grant & Maritz, 2015). However, stress is a complex phenomenon composed of stressors, perceived stress, and tension (Bliese, Edwards & Sonnentag, 2017). Business researchers argue that stressful problems at the individual and organizational levels create perceived stress (PS) (Rauch, Fink & Hatak, 2018). Obstacle stressors are characterized by basic limitations of resources and abilities valuable for the welfare of sales representatives. Cognitively driven stressors are characterized by the formation of a gap between an individual's perception and real outcomes (Monroe & Slavich, 2019). Perceived entrepreneurial stress (PES) interferes with critical competencies related to innovation and decision-making (Su et al., 2020).

Ghanimeh (2019) distinguishes between existential and circumstantial categories of burnout. The first is based on a loss of meaning in professional life, a reduced level of communication with the environment, a very weak professional identity, and a lack of self-acceptance. The second is based on inadequate work requirements, disrespect for personal life - no free time to regenerate physical and mental strength.

The report on professional identity, burnout, and managerial work states that low identification with the job description – weak professional identity – carries a higher risk of early burnout. In conclusion, a critical link between burnout and inadequate approval of specific standards of professional identity was confirmed, often in terms of gratitude and work requirements (Hamouche & Marchand, 2021). Not only these findings underscore the importance of examining the associations between work intensity and the stress-causing mental exhaustion.

1.3 Problem, goals and hypothesis

Can burnout act as an intervening variable in business? Can this syndrome also affect workers outside the helping professions? Is there a significant relationship between the age, the length of the practice, and burnout? This study aims to find out to what extent burnout affects individuals outside of the helping professions, particularly sales representatives. Another aim is to find out whether there is a statistically significant relationship between the age of employees, the length of their experience, and burnout. It can be assumed that burnout will not significantly affect the organization's employees. At the same time, it can be assumed that there is no statistically significant relationship between the age of employees, the length of their practice, and the extent of the burnout syndrome.

2. Methods

The Maslach Burnout Inventory (MBI) is a questionnaire developed by American psychologists Maslach and S. Jackson (1986). It is one of the most widespread tools in the detection context of burnout syndrome. The questionnaire contains 22 items as statements, feelings, and attitudes. Of these, 9 items focus on Emotion Exhaustion (EE), 5 items focus on Depersonalization (DP), 8 items focus on Personal Accomplishment (PA). Two subscales (emotional burnout and depersonalization) are tuned negative, and only one positive (personal success). The response framework is an interval from 0 to 6 (0 - never, 1 - several times a year, 2 - monthly, 3 - several times a month, 4 - weekly, 5 - several times a week, 6 - daily). The Emotional Burnout subscale represents professional exhaustion and is usually associated with work perceived as serious, tiring, stressful, and so on. Unlike depression, which has similar symptoms, the symptoms of emotional exhaustion may likely be alleviated during vacation/recreation. Within the measured levels, the most emotionally depleted are people with a high degree, and the least exhausted are with a low degree. Low level of emotional burnout: up to 16 points (inclusive). Medium level of emotional burnout: 17 – 26 points (inclusive). High level of emotional burnout: over 27 points (inclusive). Items for emotional burnout: 1, 2, 6, 8, 13, 14, 16, 20.

The second subscale of inventory, depersonalization, or loss of empathy is typical for a loss of respect for others (clients, colleagues) and the maintenance of a greater emotional distance. It can be manifested by cynicism and derogatory remarks, or callousness. Within the measured levels, the most depersonalized are individuals with a high degree and vice versa. Low level of depersonalization: up to 6 points (inclusive). Medium level of depersonalization: 7 – 12 points (inclusive). High level of depersonalization: over 13 points (inclusive). Items for depersonalization: 5, 10, 11, 15, 22.

The third subscale is personal success and expresses job fulfillment. It is a feeling that acts as a safety valve and helps to achieve balance if the employee is emotionally exhausted and depersonalized. It ensures the fulfillment of work duties and a positive view of professional success. People with a high degree have the highest satisfaction, and people with a low degree have the lowest satisfaction within the measured levels. Low level of personal success: over 39 points (inclusive). Medium level of personal success: 32 – 38 points (inclusive). High level of personal success: up to 31 points (inclusive). Items for personal success: 4, 7, 9, 12, 17, 18, 19, 21.

2.1 Research sample

The research sample of 56 companies was selected by a simple random sampling from 234 trading companies in eastern Slovakia. Subsequently, sales representatives of these companies (N=56) were addressed to participate in the research. The research sample (N=56) presents approximately ¼ of the population (N=234) and it is considered large enough. The representativeness guarantees the way it is chosen – not its size. The population is not based on one enterprise. Given the homogeneity of the population and the type of sample, it is possible to assume that the sample is representative.

Table 1. Descriptive analysis of the research group in terms of age

	M	σ	Min	Max	N	Mis
age	54.11	6.987	30	64	55	1

Source: authors (2023)

Note: M – Average Value, σ – Standard deviation, Min – minimum score, Max – maximum score, N – population size, Mis – missing values

Results of descriptive analysis showed that the age within the whole research sample (N=55) reached the average value of M=54.11, with a standard deviation of $\sigma=6.987$. The minimum score that represents the lowest age has reached 30 years. The maximum score representing the highest age in the sample is 64 years. Missing age data were in one subject (Mis=1).

Table 2. Descriptive analysis of the research group in terms of gender

	n	%
women	2	3.6
men	54	96.4

Source: authors (2023)

Note: n – sample size, % – percentage

The results of the descriptive gender analysis showed that the research group included 54 men and 2 women, representing 96.4% of men and 3.6% of women.

Table 3. Descriptive analysis of the research group in terms of years of practice

	M	σ	Min	Max	N	Mis
years of practice	10.00	6.912	1	26	54	2

Source: authors (2023)

Note: M – Average Value, σ – Standard deviation, Min – minimum score, Max – maximum score, N – population size, Mis – missing values

Descriptive analysis results of the years of practice showed that years of practice within the whole research sample (N=54) reached the average value of M=10.00, with a standard deviation of $\sigma=6.912$. The minimum score that represents the lowest year of practice has reached 1 year. The maximum score representing the highest year of practice in the sample is 26 years. Missing data from years of practice were in two subjects (Mis=2).

3. Results

Sales representatives may transfer positive emotions through the tone of positivity in the workplace that improves cooperation and decreases conflicts. Their followers in the positive leadership condition generate more original and valuable problem solutions (Morganson et al., 2014). It should be used in applicable way to encourage work-family balance and well-being not only among employees since entrepreneurs are perceived as a significant source of work-life balance support (Todd & Binns, 2013). The following tables clearly summarize the research results.

Table 4. Results of descriptive analysis of the rate of Emotional Burnout

	M	σ	Min	Max	N
Emotional Burnout	20.95	7.275	6	42	56

Source: authors (2023)

Note: M – Average Value, σ – Standard deviation, Min – minimum score, Max – maximum score, N – population size, Mis – missing values

Descriptive analysis results of the rate of Emotional Burnout showed that the average score of Emotional Burnout within the whole research sample (N=56) reached the value of M=20.95, with a standard deviation of $\sigma=7.275$. The minimum score representing the lowest rate of Emotional Burnout achieved the value of 6. The maximum score representing the highest rate of Emotional Burnout in the sample stands for the value of 42.

Table 5. Results of descriptive analysis in terms of degree of Emotional Burnout

	n	%
low degree	20	35.7
moderate degree	29	51.8
high degree	7	12.5

Source: authors (2023)

Note: n – sample size, % – percentage

The results of a descriptive analysis of the degree of Emotional Burnout showed that a low degree of Emotional Burnout was recorded in twenty subjects (n=20), representing 35.7% of subjects from the whole group. A medium degree of Emotional Burnout was recorded in the 29 subjects (n=29), representing 51.8% of the subjects from the whole group. The highest degree of Emotional Burnout was recorded in seven subjects (n=7), representing 12.5% of subjects from the whole group.

Table 6. Results of descriptive analysis of the rate of Depersonalization

	M	σ	Min	Max	N
Depersonalization	12.30	4.686	4	23	56

Source: authors (2023)

Note: M – Average Value, σ – Standard deviation, Min – minimum score, Max – maximum score, N – population size, Mis – missing values

Descriptive analysis results of the rate of Depersonalization showed that the average score of Depersonalization within the whole research sample (N=56) reached the value of M=12.30, with a standard deviation of $\sigma=4.686$. The minimum score representing the lowest rate of Depersonalization achieved the value of 4. The maximum score representing the highest rate of Depersonalization in the sample stands for the value of 23.

Table 7. Results of descriptive analysis in terms of degree of Depersonalization

	n	%
low degree	2	3.6
moderate degree	26	46.6
high degree	28	50.0

Source: authors (2023)

Note: n – sample size, % – percentage

The results of a descriptive analysis of the degree of Depersonalization showed that a low degree of Depersonalization was recorded in two subjects (n=2), representing 3.6% of subjects from the whole group. A moderate degree of depersonalization was noted in twenty-six subjects (n=26), representing 46.4% of the subjects from the whole group. The highest degree of Depersonalization was recorded in twenty-eight subjects (n=28), representing 50.0 % of subjects from the whole group.

Table 8. Results of descriptive analysis of the rate of Personal Accomplishment

	M	σ	Min	Max	N
Personal Accomplishment	20.20	8.269	6	46	56

Source: authors (2023)

Note: M – Average Value, σ – Standard deviation, Min – minimum score, Max – maximum score, N – population size, Mis – missing values

Descriptive analysis results of the rate of Personal Accomplishment showed that the average score of Personal Accomplishment within the whole research sample (N=56) reached the value of M=20.20, with a standard deviation of σ =8.269. The minimum score representing the lowest rate of Personal Accomplishment achieved the value of 6. The maximum score representing the highest rate of Personal Accomplishment in the sample stands for the value of 46.

Table 9. Results of descriptive analysis in terms of degree of Personal Accomplishment

	n	%
low degree	51	91.1
moderate degree	4	7.1
high degree	1	1.8

Source: authors (2023)

Note: n – sample size, % – percentage

The results of a descriptive analysis of the degree of Personal Accomplishment showed that a low degree of Personal Accomplishment was recorded in fifty-one subjects (n=51), representing 91.1% of subjects from the whole group. A moderate degree of Personal Accomplishment was noted in four subjects (n=4), representing 7.1% of the subjects from the whole group. The highest degree of Personal Accomplishment was recorded in one subject (n=1), representing 1.8% of subjects from the whole group.

Table 10. Results of correlation analysis between the age and the rate of Emotional Burnout

	r	p	N
age – the rate of Emotional Burnout	.032	.814	55

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

Correlation analysis results between the age and the rate of Emotional Burnout did not show a significant relation between variables (p=0.814). Pearson correlation coefficient value in the sample N=55 reached only r=0.032 in this relation.

Table 11. Results of correlation analysis between the age and the rate of Depersonalization

	r	p	N
age – the rate of Depersonalization	-.046	.739	55

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

Correlation analysis results between the age and the rate of Depersonalization did not show a significant relationship between variables (p=0.739). Pearson correlation coefficient value in the sample N=55 reached only r=-0,046 in this relation.

Table 12. Results of correlation analysis between the age and the rate of Personal Accomplishment

	r	p	N
age – Personal Accomplishment	-.178	.194	55

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

Correlation analysis results between the age and the rate of Personal Accomplishment did not show a significant relationship between variables ($p=0.194$). Pearson correlation coefficient value in the sample $N=55$ reached only $r=-0,178$ in this relation.

Table 13. Results of correlation analysis between the length of practice and the rate of Emotional Burnout

	r	p	N
practice length – Emotional Burnout rate	.089	.521	54

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

Correlation analysis results between the length of practice and the rate of Emotional Burnout did not show a significant relationship between variables ($p=0.521$). Pearson correlation coefficient value in the sample $N=54$ reached only $r=0,089$ in this relation.

Table 14. Results of correlation analysis between the length of practice and the rate of Depersonalization

	r	p	N
practice length – Depersonalization	.010	.944	54

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

Correlation analysis results between the length of practice and the rate of Depersonalization did not show a significant relationship between variables ($p=0.944$). Pearson correlation coefficient value in the sample $N=54$ reached only $r=0.010$ in this relation.

Table 15. Results of correlation analysis between the length of practice and the rate of Personal Accomplishment

	r	p	N
practice length – Personal Accomplishment	-.036	.794	54

Source: authors (2023)

Note: r – Pearson correlation coefficient, p – significance, N – population size

The results of the correlation analysis between the length of practice and the rate of Personal Accomplishment did not show a significant relationship between variables ($p=0.794$). The value of the Pearson correlation coefficient in the sample $N=54$ reached only $r=-0.036$ in this relation.

To summarize it up. Descriptive analysis of the Emotional burnout rate showed that the average score of Emotional Burnout within the whole research sample ($N=56$) reached the value of $M=20.95$, with a standard deviation of $\sigma=7.275$. The minimum score, which represents the lowest rate of Emotional Burnout, reached 6 points. The maximum score representing the highest rate of Emotional Burnout in the sample reached 42 points. Analysis of the degree of Emotional Burnout noted in twenty subjects ($n=20$), a low degree of Emotional Burnout that is 35.7% of the whole group. A medium degree of Emotional Burnout was noted in the twenty-nine subjects ($n=29$), representing 51.8% of the subjects in the group. The highest degree of Emotional Burnout was identified in seven subjects ($n=7$), representing 12.5% of subjects in the whole group.

Descriptive analysis of the rate of Depersonalization displayed that the average score of Depersonalization within the whole research sample ($N=56$) reached the value of $M=12.30$, with a standard deviation of $\sigma=4.686$. The minimum score, which represents the lowest rate of Depersonalization, reached 4 points. The maximum score representing the highest rate of Depersonalization in the sample achieved 23 points. Analysis of Depersonalization showed in two subjects ($n=2$) a low degree of Depersonalization that is 3.6% of the whole group. Moderate Depersonalization was noted in the twenty-six subjects ($n=26$), representing 46.4% of subjects in the whole group. The highest Depersonalization was identified in twenty-eight subjects ($n=28$), representing 50.0% of subjects in the entire group.

Descriptive analysis of the rate of Personal Accomplishment showed that the average Personal Accomplishment score within the whole research sample ($N=56$) reached the value of $M=20.20$, with a standard deviation of $\sigma=8.269$. The minimum score that represents the lowest rate of Personal Accomplishment, reached 6 points. The maximum score representing the highest rate of Personal

Accomplishment achieved 46 points in the sample. Analysis of personal accomplishment showed in fifty-one subjects (n=51) low Personal Accomplishment that is 91.1% of the entire group. The average Personal Accomplishment was noted in four subjects (n=4), representing 7.1% of subjects in the whole group. The highest Personal Accomplishment was noted in one subject (n=1), representing 1.8% of subjects in the whole group.

Correlation analysis results between the age and Emotional Burnout rate did not show a significant relationship between variables ($p=0.814$). Pearson correlation coefficient value reached only $r=0.032$ in the sample (N=55) in this relationship. The analysis between the age and Depersonalization rate did not show a significant relationship between variables ($p=0.739$). Pearson correlation coefficient value reached only $r=-0.046$ in the sample N=55 in this relationship. Similarly, the results of the correlation analysis between the age and Personal Success rates did not show a significant relation between variables ($p=0.194$). Pearson correlation coefficient value reached only $r=-0.178$ in the sample of N=55.

The correlation analysis between the length of practice and Emotional Burnout rate did not show a significant relationship between variables ($p=0.521$). The Pearson correlation coefficient reached a value of only $r=0.089$ on sample N=54 for this relationship. The analysis between the length of practice and Depersonalization rate did not show a significant relationship between variables ($p=0.944$). The Pearson correlation coefficient reached only $r=0.010$ value on sample N=54 for this relationship. Similarly, the results of the correlation analysis between the length of practice and the rate of Personal success did not show a significant relationship between variables ($p=0.794$). The Pearson correlation coefficient reached only $r=-0.036$ on sample N=54 for this relationship.

4. Discussion

Based on the results, it could be stated that burnout affects not only workers in the helping professions but also workers in the field of trade and business. The highest degree of Emotional Burnout representing professional exhaustion was diagnosed in 12.5% of subjects, and a moderate degree reported up to 51.8% of subjects. The lowest degree reported 35.7% of subjects. With the highest and medium degree of Emotional Burnout together, up to 64.3% of sales representatives perceived their work as difficult, tiring, and stressful. Depression-like symptoms may occur with a high degree of Emotional Burnout (12.5% of subjects). Based on the correlation analysis there was no relationship neither in the length of practice nor in the age. It can be mentioned that other intervening variables caused a higher rate of emotional exhaustion. However, certainly not the age and length of the practice. According to Moss (2019) prevention strategies may reverse formation of burnout or its symptoms because roots of it do not relate only with the individual but with the society around him, e.g., his colleagues, style of leadership, work atmosphere, social support etc. Also, the most common causes of burnout are lack of the role clarity – ambiguity, unreasonable time pressure, lack of communication and work support, unmanageable workload, unfair work treatment. Beck et al. (2011) adds that individuals who suffer from stress, depression or emotional burnout tend to focus on negative experiences while failing to recognize the positive ones; any new activities seem hopeless and pointless. This goes with thoughts like *I am not going to text my friends because they will not want to meet up with me*, or *I am not going to apply for this job because perhaps I will not get an interview*. We may say that the stress resulting from views like this threatens careers because individuals avoid talks, they are hardly smiling, have poor dress code (it makes them less visible) or do not realize positive qualities.

Another of the measured variables was a degree of Depersonalization representing a loss of empathy, characterized by a loss of respect for clients and the maintenance of a greater emotional distance, manifested by cynical and derogatory statements or callousness. Even at this subscale, a high rate was recorded among trade workers. Demonstrated the highest Depersonalization was in up to 50.0% of employees and the average degree in 46.4% of employees. Only 3.6% of employees reported a low depersonalization rate. Based on the correlation analysis, there was no relation with the length of practice or the age. It could be stated that a higher degree of Depersonalization causes other intervening variables. However, certainly not the age and the length of the practice. For example, the research of Čigarská and Birknerová (2021) reported a higher tendency of female entrepreneurs and sales representatives to be more often emotionally exhausted than males. But Personal Accomplishment and Depersonalization did not report any statistically significant differences in terms of gender. The research assumed the existence of positive differences between the assessment of determinants of burnout syndrome in terms of gender.

Negative attitude or depersonalization toward customers, colleagues, clients, patients etc. can be major problem for individuals who hold sales and service work that requires kindness or sensitivity

in interactions with others. Based on this, sales representatives show depersonalization as an uncaring response or cold-hearted attitude towards other individuals.

The third construct saturating burnout was Personal Success that expresses work satisfaction also. It was recorded high accomplishment in only 1.8% of employees and the average one in 8.1% of employees. For these employees, this feeling acts as a safety valve and contributes to achieving balance if the employee experiences emotional exhaustion and depersonalization. It ensures the fulfillment of work duties and a positive view of professional success. A low feeling of personal success that also represents a very low level of job satisfaction, was recorded in up to 91.1% of employees. We dare to say that personal success characterizes the self-confidence of individuals in the ability to accomplish a job and meet goals since it is considered one of the key factors for effective performance. Civelek and Pehlivanoğlu (2019) add that their study about personal accomplishment contributes to the existing literature by explaining statistically significant links between emotional fatigue, depersonalization, and personal accomplishment.

The question was whether personal the success of the sales department employees from the pharmaceutical industry is affected by emotional exhaustion and depersonalization or not. The result was a negative statistically significant relationship between emotional exhaustion and personal success, and negative statistically significant relationship between personal success and depersonalization. Therefore, the achievement of balance is low for most employees, and consequently, it is also a low tendency to perform work duties without a positive perception of work results. In this factor neither the relationship with the age of employees nor with the length of experience was confirmed. Other intervening variables affect the low rate of personal accomplishment. It is possible to assume that the elimination of problems in the performance of their profession could increase it.

According to Shapiro (2020), individuals confronted by challenging situations tend to respond by either increasing their self-esteem or deepening their shame, but it does not work at all. Instead, it creates the reverse biological response of releasing stress hormones (norepinephrine or cortisol) that distract cognitive flexibility and eliminate the capacity to learn. Based on this, we suggest to sales representatives not repeat the same mistakes but start to learn from them - use it as an original coping strategy even if it is not easy. We suggest applying self-care habits, practice saying no and setting boundaries, scheduling regular breaks throughout the day, separating personal life from work (not checking e-mails after work hours), avoiding multitasking whenever feeling exhausted and worn-out, practice favorite sports, devoting time to a favorite hobby, taking a walk-in nature, do different kind of art, etc.

One of the methods to raise the satisfaction or success is regular socio-psychological training of employees focused on the positive attributes in the performance of their profession, and the subsequent acquisition of skills to perceive more positive aspects. When a challenging situation occurs, entrepreneurs can distract themselves from negativity through meditation, favorite music, talking to relatives, writing down thoughts, breathing techniques, etc., because it is believed that the effective could be literally breaking the cycle of negative thoughts as they arise – *the domino effect of negative thoughts will not follow* (Čigarská & Birknerová, 2021).

Conclusion

We conclude that sales representatives should support the necessity of prevention and make time for relaxation, sports, activities that help to feel happy, not frustrated. While the issue of burnout considers primarily medical workers, we tried to point out *another field of occupation that brings a burden on its workers* – entrepreneurs and sales representatives.

Burnout affects workers in helping professions, as well as business representatives. It can be assumed that it also *contributes significantly to the success of companies. An important finding is that the burnout rate is not related to the age or length of the practice.* Solving the problem of burnout syndrome in sales representatives in a company by reducing or increasing the average age of employees will not bring the desired effect. Symptoms of emotional exhaustion can be temporarily alleviated during recreation or even if stressful situations are permanently eliminated. Regular socio-psychological group training is one of the enduring ways to relieve Emotional Burnout, where employees would learn and train skills to cope with stressful situations. Due to the massive occurrence of high and average depersonalization, it is appropriate to include employees in regular socio-psychological training focused on interpersonal skills. Otherwise, it is possible to expect a decrease in turnover and loss of clients, to a significant extent. Other intervening variables affect the low rate of Personal Accomplishment. It is promising to assume that the elimination of problems in the performance of their profession could increase it. One of the methods to increase the satisfaction or success is regular socio-psychological training of employees focused on positive attributes

in the performance of their profession and following acquisition of skills to perceive more positive aspects than negative in their professional performance.

The study *has its limitations*, resulting from self-expression and self-selection. The findings that point to burnout, do not give the impression that the answers of respondents were overstated or otherwise adapted. According to the current overview of the issue, we can say that an important role can be played not only by the characteristics and the resulting differences at the level of individuals but also due to cultural and national differences, original family habits while upbringing. For instance, the specificity of women positions in society, different working conditions, the legal background for the performance of the managerial profession, etc. These could explain inconsistent findings of the role of gender, length, age in the incidence or intensity of burnout in sales representatives. Our plan is to compare burnout in terms of demographic perspectives and we intend to implement meta-analyzes to require more applicable results.

Abstract

Research background: The migration of physicians has become a global problem with far-reaching consequences for health care systems in countries of origin. Medical students represent a source of potential labour, but their attitude towards migration is equally positive.

Purpose of the article: The aim of the study is to examine the migration intentions of physicians and medical students and the factors that influence their decision-making.

Methods: A questionnaire survey of physicians and medical students is being conducted. The questionnaire is administered as part of the APVV and VEGA project. The study analyses the impact of basic characteristics of respondents and personnel practices of hospitals on migration intentions. Correspondence and factor analysis will be used for statistical analysis.

Findings & Value added: The study will point out the specificity of weighing pull and push factors. It identifies and evaluates groups of pull and push factors for intentions to migrate. Medical graduates are a potential source of labour, how can their migration intentions or possible return migration be influenced? The findings will provide important information for workforce planning in the healthcare system in Slovakia.

Keywords: migration intentions, physicians, medical student

JEL classification: F22, J28

1. Introduction

Recently, migration flows have been changing dramatically due to economic, social, health and cultural factors. Globally, health worker migration has become a critical issue with massive consequences for the functioning of health systems around the world (Dohlman et al., 2020). In general, health systems focus on three main goals: ensuring good health for population, responding to population's expectations, and financial equity of reimbursement. To achieve these goals, health systems need a well-trained and motivated workforce, properly maintained infrastructure, and reliable supply of medicines and technologies, supported by adequate financing, robust health plans, and evidence-based policies (World Health Organization, 2021). It is the human resources that are the primary and essential input of the health care industry, which plays a crucial role initiating and using all other resources (Buchelt, 2020; Li, Sun, 2019). Health care systems worldwide are placing more emphasis on effective personnel management. Personnel management activities have been observed to have direct impact on patient outcomes. Staff numbers and skill sets have a correlation to clinical outcomes such as lower mortality rates, healthy life years, and reduced number of years lost etc. (Fanelli et al., 2020; Cugin et al., 2017; Wysocka, 2017). Hospitals will increasingly prioritize productivity, flexibility and sustainability as important indicators of success while maintaining high standards of quality and safety (Kenderessy, 2020). This shift from quantity to quality is a reflection of current developments in the healthcare industry.

* Corresponding author: magdalena.tupa@tnuni.sk

This reinforces the importance of the need for hospitals to have effective human resource management processes in place. High-performing hospitals in the future will rely on committed, competent and contributing human resources. Therefore, there is a need to emphasize employee retention and meeting the needs of competent and knowledgeable employees (Ulrich, Dulebohn, 2017; Jankelová, 2021).

The healthcare sector faces a significant shortage of both quantity and quality of human resources, with global trends indicating a growing challenge (Jankelová, 2021). The increasing demand for health services due to ageing population and the need for preventive healthcare, is a source of exponential demand for labour in the health professions.

Personnel management plays a crucial role in ensuring adequate numbers and appropriate skill sets of physicians are available when needed (Shipton et al, 2016). However, the current negative trend in the number of health workers and the capacity crisis in healthcare facilities makes this task challenging. This has resulted in the inability of health institutions to function effectively, so it is necessary to focus on the sources of recruitment of physicians and stabilisation of the health workers.

Research on health worker migration focuses on individual behaviour and factors such as remuneration, career development, skill training, motivation, working relationships, and working conditions. Becker, (2022); Castro-Palaganas et al (2017); Ndikumana (2018) highlights the importance of these factors in determining health worker migration patterns. For healthcare facilities to thrive, HR managers must focus not only on attracting and retaining quality staff (Becker, 2022; Castro-Palaganas et al, 2017), but also on their continuous improvement, training, and development because even the best technical equipment is no substitute for skilled physicians, nurses, or other medical staff (Dimitropoulos, 2017). It is obvious that it is the personnel activities that can regulate the labour migration of health workers abroad.

2. Methods

The aim of the study is to examine the migration intentions of physicians and medical students and the factors that influence their decision-making process.

Data for this study were collected through a questionnaire survey with physicians and medical students between April 2022 and November 2023. The questionnaire designed under the framework of the APVV project No. 19-0579 Setting up personnel management processes in hospitals and its impact on the migration of physicians and nurses for employment purposes abroad and VEGA No. 1/0691/22 Economic aspects of emigration of medical graduates in the context of the sustainability of staffing of health care institutions in the Slovak Republic. The first part of the questionnaire gathered information regarding the basic characteristics of the respondents and the health facilities they worked. In the second part, respondents were asked to assess their satisfaction with the setup of HR processes in the hospitals (measured factors: Organization of work, Remuneration, Employee benefits, Office appearance/furniture, Shortage of physicians - the work load, Bureaucracy, Communication and relations with colleagues, Communication and relations with superiors, Communication and relations with patients, Training and career development, Physical and spatial conditions, Instrumentation, Digitalization of work, Prestige of medical profession, Current political, economic and social situation in Slovakia). A total of 338 respondents participated in the study, including 212 physicians and 126 medical students. The questionnaire was distributed online through Google Forms by directly approaching the management of the hospitals and universities.

The data obtained was subjected to normality of distribution testing through histogram, with the Gaussian curve showing that the data did not have a normal distribution in either set of respondents. We then verified the results by Kolmogorov-Smirnov test ($n > 50$) and Shapiro-Wilk test ($n < 50$).

The analysis of the obtained data and the evaluation of the empirical survey were carried out through mathematical and statistical methods: descriptive statistics, correspondence analysis, Kaiser-Meyer-Olkin test (KMO), Bartlett's test of sphericity and factor analysis.

3. Results

The study addresses the intentions to migrate of physicians and students of general medicine as the factors that influence their decision-making process. Correspondence analysis was used to examine the impact of specific background characteristics of the respondents on their intentions to

seek work abroad. The specific background characteristics of the physicians were (Table 1): gender, age, completed attestation training. The medical students included in the study were identified based on their gender, year of study and their level of satisfaction with the study of general medicine (Table 1). This qualitative variable was included to provide insight into how the students feel about their educational experience in this field.

Table 1. Relative frequencies of physicians' responses to the analysis of migration considerations and age of respondents

Physicians		
Average age	43,22 rokov	
	N	% of Total
Gender	168	100%
Female	103	61,3%
Male	65	38,7%
Competed attestation	168	100%
Without attestation	32	19,0%
With attestation	136	81,0%
Medical students		
Gender	125	100%
Female	81	64,80%
Male	44	35,20%
Ročník	125	100%
1 - 2 year of study	8	6,40%
3 - 4 year of study	21	16,80%
5 - 6 year of study	96	76,80%

Source: authors' elaboration, STATISTICA output

There is no significant difference between the factors of physicians' considerations about working abroad and gender. Calculated value of χ^2 test is 4.28237 at $df=4$ ($p=0.3692$), thus we can conclude that at the significance level $\alpha = 5\%$ there is no significant relationship between the gender of physicians and their propensity to look for a job outside the Slovak Republic.

Table 2 shows differences in physicians' migration considerations with respect to age category.

Table 2. Relative frequencies of physicians' responses to the analysis of migration considerations and age of respondents

Percentage of total (Table 1)						
Row variable: migration considerations (5)						
Column variable: age (5)						
	to 30 years of age	31-40	41-50	51-60	above 61	Total
No	2.844	6.161	11.374	8.531	6.635	35.545
Rather no	2.370	7.583	4.739	6.161	0.948	21.801
Neither yes nor no	1.422	2.844	3.318	1.896	0.474	9.953
Rather yes	4.265	10.427	7.583	0.948	0.000	23.223
Yes	2.370	2.844	3.791	0.474	0.000	9.479
Total	13.270	29.858	30.806	18.010	8.057	100.000

Source: authors' elaboration, STATISTICA output

χ^2 value is je 43.2208 at $df=16$ ($p=0.0003$), thus age is significantly associated with the migration intentions of the physicians at the selected significance level. Figure 14, a correspondence map, reveals that physicians in the under 30 and 41-50 age categories are more likely to consider looking for work abroad than other age categories.

The correspondence map in Figure 1 depicts the relationship between age and considerations to migrate.

Figure 1. Correspondence map to analyse age and migration – physicians
 (Source: authors' elaboration, STATISTICA output)

Statistically significant differences were found in migration considerations based on attestation (Table 3). χ^2 value in nurses is 11,6528 at degree of freedom $df=4$ reach the significance level of 0.0201 at $\alpha = 5\%$. The study found statistically significant differences in migration considerations among attested physicians. This suggest that attestation plays a role in the decision-making process of whether to migrate or not.

Table 3. Relative frequencies of physicians' responses to the analysis of migration considerations and competed attestation

Percentage of total (Table 1)			
Row variable: migration considerations (5)			
Column variable: competed attestation (2)			
	Without attestation	With attestation	Total
No	4.265	31.280	35.545
Rather no	4.265	17.536	21.801
Neither yes nor no	1.896	8.057	9.953
Rather yes	8.531	14.692	23.223
Yes	2.844	6.635	9.479
Total	21.801	78.199	100.000

Source: authors' elaboration, STATISTICA output

Gender does not have a significant impact on the migration intentions of medical students after they complete their education. The calculated value of χ^2 test is 2.26558 with two degrees of freedom and a p-value of 0.3221 at the significance level of 5%.

The statistical analysis shows that there is a significant relationship between the year of study and the likelihood of students considering leaving the country. The chi-square value of 23.6895 with four degrees of freedom and p-value of 0.0001 suggest that the higher the year of study, the more likely the students are to consider leaving the country (Table 4).

Table 4. Relative frequencies of medical students' responses to the analysis of migration considerations and the year of study

Percentage of total (Table 1)				
Row variable: migration considerations (5)				
Column variable: year of study (3)				
	1-2 year of study (YoS)	3-4 YoS	5-6 YoS	Total
No	0.000	1.600	25.600	27.200
Not thinking about it	3.200	5.600	4.800	13.600
Yes	3.200	9.600	46.400	59.200
Total	6.400	16.800	76.800	100.000

Source: authors' elaboration, STATISTICA output

The correspondence map in Figure 2 depicts the relationship between the year of study and considerations to migrate.

Figure 2. Correspondence map to analyse the year of study and migration – medical students
(Source: authors' elaboration, STATISTICA output)

The result of the χ^2 test indicated non-significant impact of satisfaction with medical studies on migration. With a χ^2 value of 2.77949 and four degrees of freedom, the p value was 0.5954, indicating that the result was not statistically significant at $\alpha = 5\%$ level of significance. This suggests that the students are satisfied with their studies.

3.1 Factor analysis of physicians' satisfaction with working conditions – results

The Kaiser-Mayer-Olkin test (KMO) and Bartlett's test of sphericity were used to assess the appropriateness of using factor analysis to assess physicians' satisfaction with working conditions in hospitals. The KMO test value is 0.812, which represents a highly appropriate and justified use of factor analysis for processing research data. In addition, Bartlett's test of sphericity, which is a statistical test of correlations between the original attributes, was performed. The result of Bartlett's test of sphericity is 1031.99 with 105 degrees of freedom. The significance level of the test was set at $\alpha=5\%$, but the corresponding significance value is much smaller, less than 0.0001. Based on the results of KMO and Bartlett's test, it can be concluded that the realization of the sample correlation matrix with 15 satisfaction factors is not unitary, so the factor analysis method is suitable for processing these data.

The factor model's quality was evaluated using the estimated and residual correlation matrices. The correlation results are consistent with the model used.

The eigenvalue matrix was used to determine the number of common explanatory factors underlying the model. Using the Kaiser criterion (R), an eigenvalue greater than one is required. Table 5 shows that there are 4 common factors standing behind the correlation matrix of data with 15 variables through principal components factor extraction method, which cumulatively explain 60.76% of the total variance.

The use of other methods of principal factor analysis through communality explains only 33.14%, iterated communality (MINRES) 32.72%, maximum likelihood factors 32.56%, centroid method 33.79% and principal axis method 32.69% of the total variance.

Table 5. Eigenvalues of the sample correlation matrix (R) – physicians

Eigenvalues (Table 1)				
Extraction: Principal component				
	Eigenvalue	% total variance	Cum.eigenvalue	Cum. %
1	4.632	30.881	4.632	30.881
2	1.943	12.956	6.576	43.837
3	1.329	8.863	7.905	52.700
4	1.209	8.063	9.114	60.762

Source: authors' elaboration, STATISTICA output

Factor analysis is a method that examines factor loadings of extracted factors. In the study, varimax factor rotation was used to produce Table 6, which displays the sum of variances for individual items in each row.

The first factor has the highest correlation with training and career development (0.760255), communication and relations with superiors (0.749659), work organization (0.680765), employee remuneration (0.642252) and employee benefits (0.570087). It is about satisfaction with the hospitals' internal setup of HR processes and management. The quality of communication and relations with superiors have a significant impact on the creation of conditions for physicians' training or career development. Supervisors play a crucial role in organizing work and managing people. Remuneration and employee benefits are part of the personnel activities that fall under the internal personnel management system. The results of factor rotation show that the first factor accounts for 2.773767 of the total variance, explaining 18.49% with 15 variables.

The second factor has the highest correlation with the variables of communication and relationships with colleagues (0.837921), communication and relationships with patients (0.618086), and prestige of the medical profession (0.553248). Effective communication and building strong relationships are crucial components of a physician's daily tasks, both within the medical team and with patients as clients. The importance of this aspect needs to be seen in terms of creating the culture and values of the hospital. Good relationships and clear communication among medical professionals are crucial for maintaining the reputation of the medical field. It is important to work in an environment where these factors are prioritized. The factor rotation method shows the strength of the second factor at 1.734912 total variance, which is 11.57% with 15 variables.

The third factor has the highest correlation with the variables of material equipment and space (0.833118), instrumentation (0.767590), office equipment (0.720858) and digitalization of doctors' work (0.575695). This is the factor grouping the tangible conditions of physicians' work. Hospital facilities and material equipment impact both physicians' satisfaction and the quality of care provided to patients. The appearance of the office can affect greatly the way patients perceive the physician's practice environment. The advancement of technology has enabled physicians to streamline their work processes and allocate more time to their patients and practice. Based on factor rotation, the third factor accounts for 1.317812 of the total variance, or 19.24% for the 15 variables examined.

The fourth factor has the highest correlation with the current political, economic, and social situation in Slovakia (0.740961), bureaucracy (0.626973) and shortage of physicians (0.568779). Physicians are highly sensitive to the contextual factors influencing their work, including policy decisions, administrative processes, and the broader socioeconomic landscape. All these factors have implications for the quantity and quality of the health workers. The factor rotation method shows the strength of the fourth factor at total variance of 1.734912, which is 11.47% with 15 variables.

Table 6. Factor loadings for a factor model of physicians' satisfaction with working conditions

Factor loading (Varimax normaliz.) (Table 1)				
Extraction: Principal component (marked loads >,700000)				
	Factor	Factor	Factor	Factor
Organization of work	0.680765	0.013589	0.127685	0.182618

% total variance	0.184918	0.115661	0.192366	0,114680

Source: authors' elaboration, STATISTICA output

In addition to the parameters of the factor model, factor analysis offers estimates of common factors, which are also referred to as factor scores. The values taken by the common factors for the observed n -observations are a useful tool for data diagnostics.

3.2 Factor analysis of medical students' perceptions of working conditions in hospitals - results

The Kaiser-Mayer Olkin test (KMO) verified the appropriateness of using factor analysis for students which took the value of 0.791. The KMO test result indicates that it is appropriate and valid to use factor analysis for processing data on the factors of students' satisfaction with working conditions in hospitals. In addition, Bartlett's test of sphericity was used, which yielded a result of 128.31 with 36 degrees of freedom. The significance value is less than 0.0001, which is less than the chosen significance level of $\alpha = 5\%$. The results of KMO and Bartlett's test show that the realization of the sample correlation matrix at 15 factors is not unitary, thus it is appropriate to use the factor analysis method to process the data.

The quality of the factor model obtained was evaluated with estimated correlation matrix and residual correlation matrix. The correlation results align with the model utilized.

As with physicians, the goal is to identify a number of common explanatory factors underlying the model and an eigenvalue matrix was implemented. Based on the Kaiser criterion (R), the eigenvalue must be greater than one. In the background of the correlation matrix of data with 9 variables through the principal component method of factor extraction, there are 3 common factors standing behind the correlation matrix, which cumulatively explain 55.87% of the total variance (Table 7).

The use of other methods of principal factor analysis through communality explains only 31,28%, iterated communality (MINRES) 32,02%, maximum likelihood factors 32,22%, centroid method 31,87% and principal axis method 32,40% of the total variance.

Table 7. Eigenvalues of the sample correlation matrix (R) – students of general medicine

Eigenvalues (Table 1)				
Extraction: Principal component				
	Eigenvalue	% total variance	Cum.eigenvalue	Cum. %
1	2.445	27.163	2.445	27.163
2	1.319	14.658	3.764	41.821
3	1.265	14.057	5.029	55.878

Source: authors' elaboration, STATISTICA output

Table 8 lists the results of using the varimax factor rotation method, through which 3 factors combining 9 variables were extracted.

The first factor includes the following variables: setting the professional and career development processes of physicians in hospitals (0.747697), organization of work (0.625429), relations between colleagues (0.626381), actions and behaviour of supervisors (0.587391). The results of factor rotation show that the first factor accounts for 1.846549 of the total variance, explaining 20.51% with 15 variables. Medical students acknowledge the significance of management and organizational culture in determining physician satisfaction. The immediate supervisor's personality and competence affect and workplace atmosphere, as well as relationships with colleagues. A systematic approach to the organization of work paves the way to attestation training. The second factor has the highest correlation with the following variables: instrumentation and material equipment (0.530413), legal norms, regulations and job requirements, i.e. bureaucracy (0.623067) and good social climate (0.815014) impacting the perception of the prestige of the medical profession as well as the current situation in the country. The results of factor rotation show that the first factor accounts for 1.914182 of the total variance, which explains 21.27% with 15 variables. The third factor has the highest correlation with performance evaluation and remuneration (0.836048) and standard of living (0.625428). Even though the medical field is considered a helping profession, the salary of physicians remains an important consideration for students. The setting of wage levels for physicians plays a crucial role in determining their standard of living and public perception. Based on the factor rotation carried out, the fourth factor accounts for 1.268296 of the total variance, which is 14.09% with 15 variables.

4. Discussion

Having investigated the given basic characteristics, it was found that the migration of Slovak physicians to work abroad is influenced by age. The study found that physicians under the age of 30 are more likely to migrate than their older counterparts. An interesting piece of research finding is that physicians aged 41 to 50 are more likely to explore employment opportunities outside their home country than their younger counterparts aged between 31 and 40. This can be due to the attestation training that physicians undergo in this age range. This is also confirmed by the results of the impact of completed attestation training with respect to migration considerations. It was found that gender and number of dependent children are statistically insignificant variables for physicians and gender for medical students in relation to the research topic. However, for medical students, the year of study at the time of the research was significant at the selected level of significance.

In the next step, through factor analysis, we investigated the impact of the setting of staffing activities on the satisfaction of physicians and general medical students with the conditions of work in health care facilities in the country's health care system. Next, factor analysis was conducted to determine the influence of personnel activities on the satisfaction of physicians and students of general medicine regarding their working conditions in health care facilities. Several scholarly studies suggest that push factors hold more significance than pull factors when it comes to migration decisions. Satisfaction with working conditions is a trigger - a push factor - in a physician's migration decision-making process. In physicians, four factors were extracted from the 15 variables examined. The study found that the physical conditions of work have the most significant influence on employees, followed by the internal setting of personnel processes, organizational culture, and external setting of working conditions.

In students of general medicine, the factor model consisted of 3 extracted factors. Factor 2 external setting of working conditions resulting from government policy had the most significant impact, followed by factor 1-management and organisation of internal processes, and factor 3 performance evaluation, remuneration and standard of living was least significant for students.

Based on the results, it can be concluded that the physical conditions, which can be divided into the work environment and the instrumental or material conditions of physicians' work are the key factor of satisfaction. The factor closely relates to health financing and efficient allocation of resources which can be achieved at national, local and top management levels. Consequently, we can talk about the strength of the internal setting of personnel processes in the hospitals themselves, which falls within the authority of direct supervisors and their managerial competence.

Conclusion

The migration of physicians has become a global problem with far-reaching consequences for health care systems in countries of origin such as Slovakia (more than 5,200 doctors from Slovakia migrated abroad for work). Medical students represent a source of potential labor, but their attitude towards migration is even more positive (8 out of 10 medical students want to migrate after completing their medical studies).

Research on health worker migration focuses on individual behaviour and factors such remuneration, career development, skill training, motivation, working relationships, and working conditions. In Slovakia, similar research is missing.

The aim of the study is to examine the migration intentions of physicians and medical students and the factors that influence their decision-making process in Slovakia.

The study found that physicians under that the migration of Slovak physicians to work abroad is influenced by age (under 30 years, 41 to 50), of completed attestation training and for medical students the year of study at the time of the research. In the parts of the research, through factor analysis, we investigated the impact of the setting of staffing activities on the satisfaction of physicians and general medical students with the conditions of work in health care facilities in the country's health care system. Several scholarly studies suggest Satisfaction with working conditions is a trigger - a push factor - in a physician's migration decision-making process, while they indicate wages as the most important. The study found that the physical conditions of work have the most significant influence on employees only then followed by the internal setting of personnel processes (with wages). In students among students, this factor was placed at the end of the reasons for migration. Based on the results, it can be concluded that the physical conditions are the most significant. The factor closely relates to health financing and efficient allocation of resources, therefore, a systematic approach to the management and financing of healthcare by the state is important.

Managed Family: Application of Management Principles on Family Dynamics

Nurit Calfon^{1,*}

¹ University of The South-West "Neofit Rilski" Faculty of Social, Economic and Law Sciences,
Blagoevgrad, Bulgaria

Abstract

Research background: This article aims to highlight the similarities between managerial abilities in the workplace and their relevance to parenting. By examining the interconnectedness of personal experiences within families and professional experiences in the organizational context, a circular learning process can be established.

Various managerial skills parallel parenting attributes. Proficient managers adopt pragmatism, directness, active listening, and methodical workflows. These align with parenting's empathy, sharing, and fostering of belonging. Effective management involves staying updated, offering support, and setting boundaries—akin to parenting's rules and encouragement. Just as parents draw from managerial skills for family dynamics, familial experiences inform organizational contexts.

Purpose of the article: Illustrate how the connection between the worlds of parenting and management is parallel and how to use skills and insights from the management field in the family field and vice versa.

Methods: My approach is theoretical, and includes data analysis from empirical studies, bibliographic analysis, and process monitoring in the research field. Although I am not collecting empirical data, the goal is to provide a foundation for future research and practical applications in the fields covered in the review.

Findings & Value added: The results reveal four distinct similarities between concepts in the realms of work and family: socialization and social structures, skills and social relations, leadership in both family and organizational contexts, parental and business visions.

This perspective offers a fresh and distinct understanding of how individuals in the workplace and family members influence and are impacted by processes of change within their respective institutions, as well as the interconnected processes between them.

Keywords: managers, management skills, family, parental authority, modern family

JEL classification: A14

1. Introduction

Although everyone has an understanding of what management is, it is not easy to define it formally. The fundamental assumptions and perspectives regarding management derive from various theories that have developed over the years (whether the organization is a machine, a living organism, a social network, etc.). "Management is the attainment of goals through others. To fulfill this definition of management, you must understand your objectives and the others through whom you will achieve these goals" (Shaked, 2022).

This article comes to illustrate how the relationship between the worlds of management and parenting is parallel and even circular. Thus, claims the concept of "the managed family". Here I will propose to call the connection between the worlds of management and parental conduct and the use of skills and insights from the field of management in the family field "the managed family". I assume that when you bring skills from the management field to the family and from the family to the organization, you create a more positive environment that promotes growth and development.

There are similarities between a family and an organization. An organization is defined as a purposeful social system that produces products or services through coordinated and controlled activity

* Corresponding author: nuritcalfon@gmail.com

cycles. This system is intentionally established by a group of individuals who cannot achieve their objectives through other means. Similarly, the origin of a family lies in the connection of two individuals (usually) to fulfill a goal - romantic relationship, procreation, etc. - that neither of them can accomplish alone. Couples form partnerships, divide roles between them, and consciously or unconsciously work towards achieving the goals that brought them together. With the birth of children, the "organization" grows, power dynamics and hierarchy change, and the pattern of communication becomes more complex and enriched.

This is a relevant connection since, from an individual's perspective, the family creates the strongest social experience. The family is the primary and most influential social group. The individual brings their early family experiences with them to new groups or organizations, and these experiences influence their functioning within them. Therefore, the metaphor of the family is relevant in understanding an individual's membership in an organization.

"Parents are the managers of the most important and complicated organization - the family" (Amit, 2006, p. 109). I assume that the family organization management tool can be used for better management skills and vice versa.

1.1 Socialization and Social structures

The family is a boundary concept, that is, a concept that challenges a series of accepted distinctions and the establishment of conceptual boundaries. For example, it is not clear where the family is placed given the distinction between private and public. Is it more correct to understand the family through categories of ownership, rights, and obligations or in psychological terms (David, 2012).

The philosophy of "managed family" encompasses the principles and strategies required for efficient management and maintenance of a family unit. It recognizes the family as a complementary institution to broader social structures such as education, religion, and governance. Just as these institutions contribute to the socialization of individuals, the family plays a critical role in shaping the values, beliefs, and behaviors of its members.

The primary goal of socialization is to enable the continuity of social order by imparting social values, norms, and customs to children. The process of socialization can occur throughout a person's life, but it is most intensive during childhood and adolescence when individuals learn about their roles and how to interact with others.

Parents and other family members are the primary agents of socialization, providing guidance and support and promoting the development of social, emotional, and cognitive skills in children. Parents benefit from a systemic presence in which they experience themselves and are supported by others. However, parents do not operate in an empty space but are constantly influenced by one another, by people, culture, and institutions in which they live (Omer, 2000).

Parenting is not simply about having or not having certain styles, but rather it is a complex social practice that is constantly influenced by spatial, temporal, and socio-cultural factors. Above all, parenting is about dynamic, emotional relationships between parents and children that are subject to change (Allgurin and Enell, 2022, p. 109).

People's meaning-making is shaped by their interaction with social, cultural, historical, and material contexts. The meaning of being a father, mother, husband, wife, partner, son, or daughter is likely to be changing, and how individuals embody these roles may change as a result of these shifting meanings (Eikrem and Sjøhelle Jevne, 2022).

The basic unit of human organization has always been the family, although the meaning and composition of "family" have changed throughout thousands of years of human existence. The current perspective in Western thought is that there is a distinct dichotomy between the family and other social organizations, particularly those related to work. Broadly speaking, the family is considered in the realm of private human interaction, while work organizations are in the realm of public interaction (David, 2012). The family is seen as a prototype on which relationships in other social spaces are based. The natural evolution of cities and civil life is a product of the expansion of kinship relationships within family units to larger circles, concepts from family life such as authority, submission, obedience, sovereignty, and governance are derived into the political and social spheres (David, 2012).

According to Bandura's social learning theory, managers are an essential and significant source for shaping the behavior of employees, learning new abilities, acquiring optimal behavior, and adopting expected norms. The reason for this lies in the high status that managers have in the organization, their great power in the organizational hierarchy, and the degree of influence they have in the decision-making

process. According to the social learning theory, this design process takes place through four psychological and social learning mechanisms: learning through imitation, social learning, setting a personal example, and contagion. Through these mechanisms, managers "imprint" desired patterns in employees on how their role should be performed, how quality service should be provided, and how they are expected to conduct their daily work tasks (Eldor, 2023).

Every organization strives to gain a competitive advantage in the business game. In order to achieve this, organizations adopt strategies aimed at motivating employees to be more committed to organizational goals and objectives. One such strategy is to make employees perceive and relate to their organization as a family. The decrease in the significance of traditional family enhances the number of people who do not see themselves fulfilled in starting a family and raising children. However, more unmarried people are feeling a huge dissatisfaction with life, though they often try to conceal it. Some of them find an alternative to overworking and burn themselves out. (pachkova, 2018). The justifications for encouraging family life by the state are based on two sets of arguments. The first indicates the vitality of family life for the individual, the emotional security that family life gives to the individual and their being decisive for the development of his identity, character traits, and personality. The second group emphasizes the national social benefit of the existence of a family - the family contributes to the strength of society and to the creation of a tradition of passing on values and rituals (David, 2012).

So how can we view these two systems as transferring values and messages between each other? How can parents draw upon their knowledge as managers and employees and vice versa, considering that these are two very different frameworks in nature? On one hand, there is a large, goal-oriented, non-emotional, and profit-driven organizational framework, which is tested for survival in a highly competitive economic world. On the other hand, there is a small, intimate, emotionally committed, non-profit-driven family framework, which is tested for creating a nurturing environment for its members' development.

I would argue that there are also similar characteristics between family and organization. These characteristics allow for significant transfer processes from one framework to another.

According to Bronfenbrenner's socioecological theory of human behaviors, which offers a framework for integrating various factors associated with parenting, parenting skills depend on an interplay of several ecological subsystems, including the individual parent, child, family, and the broader social context in which the parent-child interaction is embedded (Massarwi, Cluver, Meinck, Doubt, & Green, 2022). The individual in the family grows within the complete ecosystem. This system consists of social subsystems that help support and guide human growth. These systems are spread out starting with the micro-system that refers to the relationships between a developing person and his immediate environment (such as school and family) and ending with the macro-system that refers to institutional patterns of the culture such as economy, customs, and bodies of knowledge. Therefore, to understand human development, we must take into account the complete ecosystem within which growth occurs (Omer, 2000).

1.2 Social Skills and Relations

An organization is defined as a purposeful social system that produces products or services through coordinated and controlled activity cycles. An organization is not formed as a result of a natural evolutionary process. It is an artificial system, intentionally created and conceived initially by a group of individuals who could not or should not achieve their goals through other means (Amit, 2012). The organizational field is defined as "a community in which the participants share a common system of meanings, and in which they engage in frequent and fateful interactions with one another and with players outside the field" (Nicklich, Endo, & Sydow, 2022).

In this sense, a family is also rooted in the connection of two individuals (generally) to fulfill a specific purpose romantic relationships, procreation, etc. that cannot be accomplished by each individual alone. With the birth of children, the organization grows, power relations and hierarchies become more diverse, the system of relationships becomes more complex, and communication patterns enrich.

Spouses form a partnership at their wedding or by choosing to live together. They share roles and work—consciously or unconsciously—to achieve the goals for which they established their partnership. Parenthood is the most common occupation in the world (Rosenbaum, 2017).

Virginia Satir, one of the great figures in family therapy, referred to the family as a business, concerning family management, Satir asserts that the management of a family is not vastly different from any other form of management, as families, like any organization, require individuals, time, space, and resources to carry out their assigned tasks (Amit 2012).

The concept of family encompasses various aspects in contemporary times: expression of blood ties and genetic relationships, the fabric of social life and personal identity, the nurturing of individual emotional and personality development, a framework of communication patterns, legal rights and obligations, and the manifestation of love, responsibility, and care (David, 2012).

"Family taught us several management concepts and organizational philosophies; the corporate mindset has prevented us from applying that wisdom or even grasping it! We have engrossed our minds to be fast-tracked in everything. Hence it seems too trivial to notice that we have, in fact, learned the management skills and organizational values in childhood or adulthood itself...our management style reflects what we've inherited from our upbringing in families" (Ogiral, 2018).

Piaget stated that a schema is a cognitive structure that contains a collection of actions, and ideas through which we act and adapt to the environment. And through assimilation and accommodation, we work to create change. and adapt existing schemes to new information we receive from the environment (David, 2012).

Human beings exist within a larger whole - the social field: the family, the kindergarten, the school, work, the neighborhood, the city, the country, the world, the universe. The family is the primary social field that a child encounters. "The family is the field in which a person grows, and their personality is shaped" (Rosenblum, 2017). As they subsequently encounter additional social fields, they will examine and relate to them according to the values they have developed within the family regarding the nature of a social field and how it operates. Therefore, the family plays a central and unique role for the child in preparing them for the expected social interactions in the future (Rosenbaum, 2017). Children live their daily lives within a social discourse about childhood (Michelson, 2022). This means that every child is surrounded by ideas shaped in the context of what it means to be a child and what children can do, that is, ideas about the identity and agency of children. These ideas exist at every level of children's lives: in their family context, in the local community, and society as a whole (Michelson, 2022).

A well-structured society is based on individuals capable of integrating into society normatively. This requires individuals to possess the social skills, values, and behaviors necessary to function efficiently within the broader social fabric. A family that embraces the philosophy of family management contributes to the development of individuals with the required characteristics for successful social integration. These individuals can then make a positive contribution to society and work towards its improvement.

When managers allow themselves to connect their work with their experiences in their own families, both in their current family and in their family of origin, their managerial abilities are enriched, both in cognitive understanding and emotional engagement.

the first to coin the concept of employee engagement (Engagement Employee) is Kahn. According to Kahn (Eldor, 2023), employee connectedness is the bond that engages oneself in work behaviorally (a high sense of vigor), emotionally (a sense of pride and dedication to work), and cognitively (deepening the job tasks). The organization emotionally and are cognitively focused on their work. If so Connected employees are currently considered in the literature of employee motivation as a relationship pattern between an employee and the organization because of the multidimensional-behavioral, emotional, and cognitive investment of the employee at work. In other words, Matan. The hands, heart, and feet of the employee to achieve the goals of the organization and its success (Eldor, 2023). Akio Morita, one of the founders of Sony and former chairman and CEO of the company, writes, "The most important task facing a Japanese manager is to develop a healthy relationship system with employees and create a sense of family within the organization - a sense that managers and employees share a common destiny" refers to the significance of family in terms of its meaning and importance. He emphasizes the level of emotional commitment. Other managers emphasize the sense of equality within the family and the organization (Amit 2012).

When matters flow smoothly in the family, the ideal family dream also flows peacefully along a hidden path. However, when problems arise in the family (and when does that not happen?), when we fail to exert a comfortable influence and family relationships deteriorate, when it seems that we are losing our way, it is important to stop, examine ourselves, and reassess our parenting goals and the way we pursue them (Amit, 2006, p. 124).

According to Shaked, the goals set by a manager in an organization are the manager's own., not of others, not of his boss, and not of the organization. Others are the ones with whom the manager interacts to achieve his goals. A manager manages 360 degrees around him. He manages his employees, but also his colleagues and those above him in the hierarchy. Since he needs resources to achieve his goals, he

must ensure that his manager provides them, so some of the others he interacts with to succeed are also his managers (Shaked, 2022).

1.3 Leadership in the family and Organization

In order to lead, sources of power and inspiration are required, and the vitality of clear internal sources alone is not sufficient. There are also external sources of power, such as role models, leaders, family members, processes, and shaping events (Hirsh, 2019). Henry Kissinger said "The task of a leader is to bring his people from where they are to where they have never been" (Amit, 2006, p. 72).

A parent is not a friend of their children - they are their parent. A manager is not a peer of their employees - they are their manager (Hirsh, 2019). The parent, as an individual, brings to the family also their parts as a worker or as a manager from the professional sphere. The parent has a role not only in their professional sphere but is also a parent and a family member from the personal sphere (Omer, 2000, p. 40). Parents have needs and desires beyond their parental role.

A leader must have a goal, and their life journey will be meaningful (Hirsh, 2019). Parental leadership is the ability of parents to guide their children towards a worthy goal and motivate them to perform tasks and missions that they may not always want to do, all without coercion or minimal use of it. Parental leaders shape the desired family reality in various ways. They create their family through shared goals, rules, and customs. They intelligently imply their children and set reasonable boundaries for their aggressive behavior. They listen to their children and try to help them according to the guiding values. They strengthen and support their children's personal development and more (Amit, 2006).

The ability of leadership within the family is associated with the delegation of authority both within and outside of it. "We cannot demand collaboration; we must be entitled to it," wrote Dreikurs and Soltz. "The best way to earn collaboration is to freely discuss what each individual thinks and feels and together seek ways to improve mutual relationships" (Rosenbaum, 2017). These ideas find expression in the professional field as social skills, which enable the flexible adaptation of different interests and social competencies aimed at either change or maintenance. Social skills are precisely defined as "the ability of actors to induce cooperation in other actors to produce, contest, or reproduce a given set of rules" (Nicklich, Endo, & Sydow, 2022, p. 6).

There are two main aspects of parental leadership: setting family goals and making decisions to guide the family toward achieving those goals (Amit, 2006, p. 78). A family leader should strive to create an environment that fosters the mental, emotional, and physical well-being of all family members. The path to the right way, as mentioned earlier, refers to the principles and values that guide a family to ensure the overall well-being of its members. This approach includes prioritizing the mental, emotional, and physical health of individual family members. It involves nurturing positive relationships, supporting personal development, and providing a sense of belonging and security within the family.

Numerous studies in the literature suggest that cultural values and beliefs shape how individuals and families respond to life adversities. For Example, In Chinese culture, positive family relationships and interpersonal harmony are considered essential for a happy family (Fu Keung Wong, La Yim Lau, Sze Chan, Zhuang, 2022).

Parents should strive to achieve presence and not impose conditions on their children. Parental presence is a principle that aims for dialogue. A parent seeks to be present in a relationship of mutuality, where parental presence assumes a dialogue-based relationship. Parents aspire to be present for and with their children (Omer, 2000). According to this parenting model, children raised in such families are likely to grow up to be successful in the business field. This is supported by Stoyanov and Stoyanova's article, which explores how collaborations contribute to the success of complex projects. Successes in this context are characterized by the synergistic integration of diverse expertise and interests, even among individuals separated by cultural and institutional boundaries (Stoyanov & Stoyanova, 2022).

In the professional field, when the principle of dialogue is not realized, for example, when an employee chooses such behavior because that's how things are done, it is not individually learned. It is not related to risk and self-defense specifically in the context of speaking to authorities. Silence is not something you learn; it is someone you are (Mygind du Plessis, 2022). The data demonstrates how sensemaking and self-reflectiveness (as part of inward identity work) and the relational process of identity negotiation (as part of outward identity work) enable individuals to span knowledge boundaries. (Stoyanov & Stoyanov, 2022).

Leading by Doing is a practical involvement of managers in working in the field together with the employees (giving a personal example and showing the employees how tasks should be carried out).

Unlike other leadership approaches prevalent today among managers, which emphasize the verbal channel as a tool to motivate employees and raising business performance, the emphasis in Leading by Doing is on the behavioral channel, giving a practical example in the field as a tool to increase employee engagement, productivity, and service quality (Eldor, 2023). True leadership is leadership from within, closely connected to people, to the extent of leading from within them. The leader is the first to take on any duty and the last to claim any right. First in task, first in responsibility, and first in leadership. People observe the leader, their behavior, actions, way of life, and speech. They understand what is right and appropriate through the leader's deeds and actions, not through explanations of the correct way to behave. The leader is first among equals (*Primus inter pares*) (Hirsh, 2019). Leading society means being a "builder of watches, not a teller of time". Building society is the important thing, not the leader and their personality (Collins & Porras, 1995).

Through personal example (Modeling), we help our children establish their attitude toward other people, animals, plants, and natural treasures. We serve as a meaningful reference model for our children. A child who knows they have someone to rely on can develop a healthier personality (Rosenbaum, 2017).

To fulfill all the characteristics and values befitting a leader, an organization needs to cultivate an environment conducive to leadership. This includes creating an organizational climate, culture, and leadership approach that encourage and facilitate the growth of new leaders. A worthy leader is constantly engaged in the development and preservation of a leadership-fostering environment, driven by a sense of responsibility for the growth of the next generation of leaders (Hirsch, 2019). Parental leadership within the family facilitates a socialization process that promotes the desire and ability of children to later integrate into the workforce as adults (Pachkova, 2018). This process occurs both during vocational training and the onboarding process at a specific workplace (every workplace has its own dress code, behavior expectations, norms, etc., which the new employee must be aware of). A child who grows up in a family that respects laws and boundaries will be able to integrate into any other system, from kindergarten to school and youth movements, university, and the world of work (Rosenbaum, 2017).

Flexibility, adaptability, and the ability to cultivate one's network are central characteristics of successful individuals, preferred by those capable of navigating, establishing connections, and realizing their potential in dynamic organizations, at the expense of individuals who are not the individual requires assistance, and with answers on how to acquire security, achieve well-being, and succeed within new structural conditions (Mygind du Plessis, 2022, p. 87). However, relations among actors and changes regarding these relations are central to the governance of those fields and influence the actors' status and possibilities (Nicklich, Endo and Sydow, 2022).

Currently, the theoretical approach that views organizations as open social systems is widely accepted. An organization as an open system maintains ongoing interrelationships with its environment. At its core are reciprocal relationships: the acquisition of resources necessary for survival and functioning, and in return, the provision of products or services that the environment requires. This can be described as the conversion of inputs into outputs (Amit, 2012). Similarly, a family can be described as a system that converts inputs into outputs through conversion processes. Among the family inputs, one can include knowledge of household management and child-rearing, time, willingness, support factors (such as grandparents), and more. Among the conversion processes, one can mention parenting style, family structure, communication patterns, and so on. Family outputs can include, for example, a healthy child, an independent child, a happy child, and so forth.

In families where interactions occur in open and non-territorial spaces, parental roles are filled by the parent who is available at the time. This allows children to develop a richer personality (Rosenbaum, 2017), with self-confidence, self-belief, and emotional resilience.

Resilience is defined in developmental psychology literature as demonstrating competence in functioning (Owens, Stokes & Haskett, 2022).

1.4 Parental and Business Vision

Israeli companies are perceived as a "fun" place to work, and charismatic leadership is crucial to their success. These companies are visionary, achieving exceptional performance beyond the norm, in the long run (Collins & Porras, 1995).

Family functioning is considered an important indicator of family well-being and quality of life. It refers to how families meet their physical and psychological needs to maintain the family unit and thrive as a group (Fu Keung Wong, La Yim Lau, Sze Chan, Zhuang, 2022).

We live and function within a human community. We are social beings in need of a sense of belonging. We shape the image of society, and it is through society that we can feel a sense of belonging. Parents who establish a parental vision envision how their children will be in their adulthood and how they will perform various life tasks that each faces. They establish their parental vision by incorporating the most meaningful values for them to develop the desired future image. Values serve as benchmarks, criteria that determine what is right and wrong, what is correct and incorrect, and what is good and bad (Rosenbaum, 2017). Family Vision and parental leadership aim not to control children but to motivate each child toward the goal they define for themselves, taking responsibility for it willingly. In such a parenting style, goals and vision convey the message: "Here at home, we fulfill goals. Here, we initiate rather than react. A meaningful vision promotes significant success" (Duvdevani, 2023).

A parent who establishes a vision takes the initiative to promote it. The recommended educational methods to promote our parental vision encourage and promote the child's independence, responsibility, and a positive sense of self-worth. A child who can maintain positive and reciprocal relationships with the environment. Through interpersonal relationships, collaboration and significant achievements can be reached in the business field (Stoyanov & Stoyanova, 2022).

relations among actors and changes regarding these relations are central to the governance of those fields and influence the actors' status and possibilities (Nicklich, Endo, & Sydow, 2022).

Just as in organizations, rules and boundaries are essential for the proper development of children in a family. The family serves as an agency of connection, with its crucial role as the most significant educator of children, teaching them to function according to social codes and legal systems. In the family, the law is an obligatory expectation derived from the system, while boundaries represent the personal logic of an individual and define one's personal space. Family leaders are the parents, with their expertise and responsibility. Therefore, parents choose the rules by which the household operates (Rosenbaum, 2017).

According to Emery and Dillon, boundaries are explicit or implicit rules that define the structure of family relationships and the psychological space of an individual or a relationship. They safeguard the family's autonomy and subsystems by managing closeness and hierarchy (Eikrem and Sjøhelle Jevne, 2022).

Despite the differences between a family and a business organization, it has been observed that managers often strive to establish connections between them. Many managers aspire to develop a familial atmosphere and a family culture within the workplace, even though not everyone openly agrees with this notion. Each manager understands to some extent what a family culture entails in the context of the organization.

A harmonious and cohesive parental stance, rooted in understanding the needs of the child, serves as a compass for proper and respectful conduct by the parent, enabling the child to develop in appropriate conditions.

Parenting reflects the needs, emotions, and values of the parents. Values and personal style are not made of one mold (Omer, 2000, p. 103). In family management, it is the responsibility of parents to create and maintain a positive family atmosphere. This includes fostering open communication, promoting trust and respect, setting clear boundaries and expectations, and resolving conflicts constructively. Similar to parenting, leadership does not necessarily require choosing between option A or option B; one should not submit to "authoritarianism" when both option A and option B are available. The term "both" here replaces the "or," and successfully, one can choose both to achieve profit and gain, preserve the core ideology of the society, and implement significant changes (Collins & Porras, 1995).

Every individual desires to feel that they have an impact on their lives. The role of a parent is to mediate the demands of reality and enable the child to choose between options through reasonable flexibility. Instead of prohibiting and resorting to power struggles, our role as parents is to enable our children to feel empowered through contribution, usefulness, and cooperation (Rosenbaum, 2017). Sometimes, despite the desire to create stability, parents revolve around what they cannot control and help children cope with uncertainty by focusing on what they can provide, such as letting the child know they are loved (Rose & Co., 2022). Love is essential in leadership (Hirsch, 2019).

Managers in many organizations employ family and cultural models to create a sense of belonging and camaraderie among employees. They understand the importance of establishing a positive family culture within the organization to encourage trust, collaboration, and a stable working environment. A

positive family culture can foster an atmosphere of openness and support, which contributes to employee satisfaction, productivity, and overall organizational success.

2. Methods

My article focuses on theoretical analysis and does not include data collection but aims to develop a concept with potential implications for future research and behavioral change, my methodological approach is anchored in theoretical analysis. I aim to provide a strong theoretical basis for understanding the "managed family" while highlighting its potential for practical applications and future empirical research. This approach paves the way for a comprehensive investigation of the concept's impact on the field of organizational and family counseling and its potential to drive positive behavioral changes in the field of parenting and management.

2.1. Methodological approach: My approach is mainly theoretical and conceptually oriented, with the aim of laying the foundation for future empirical research and practical applications related to a positive and optimal environment for families and organizations.

2.2. Development of a conceptual framework - Literature review: My methodological approach begins with a comprehensive review of the existing literature in the fields of parental authority, psychology, sociology and theories in the field of management and human resources in the organization. I analyze relevant theories and concepts, such as socialization and social structures, social skills and relationships, leadership in family and organizational contexts and parental and business vision in order to identify gaps and potential connections that can explain the connection between the worlds of parenting and management.

2.3. Theoretical fusion: This review deals with theoretical fusion, blending concepts from diverse fields, such as psychology, sociology, and management theory. By combining these concepts, he provides a comprehensive framework for understanding the connections between family and organizational dynamics.

2.4. Implications and future research: While the primary focus of this review is theoretical, it offers practical implications. Organizations that aim to foster a sense of commitment and belonging among employees may benefit from adopting family structures or principles. Recognizing the emotional aspects of work relationships can lead to improved workplace dynamics and employee well-being. and how parents can apply their parental leadership in the workplace. As parents draw on managerial skills for family dynamics, family experiences lead to organizational contexts.

Future Research: The theoretical analysis presented here opens avenues for future research. Future studies can explore how management principles and leadership styles in organizations can be adapted from parenting models and vice versa. This indicates a potential for a two-way flow of knowledge and practices between the family and organizational domains.

In addition, future research could delve into the specific mechanisms through which family dynamics influence organizational behavior and vice versa. Understanding these mechanisms can lead to more effective organizational strategies and family support programs.

3. Results

The concept of "the managed family" serves as a theoretical framework for applying management principles to family dynamics. The research findings yield a comprehensive review, emphasizing several key issues. First, they emphasize the complex interrelationships between family and organizational structures in a managerial context. Second, they emphasize the significant role of managers in the workplace as well as of parents in the family in shaping employee behavior and values, which are aided by various psychological and social learning mechanisms, and ultimately influence the organizational culture and employee conduct. In addition, the study emphasizes the importance of recognizing common characteristics between family and organizational systems, emphasizing the influence of family experiences on management styles. Finally, the findings highlight the critical importance of fostering employee engagement and maintaining positive relationships in the workplace as in families.

Furthermore, the study highlights basic concepts and results. First, it delves into the complexity inherent in leadership, and includes various internal and external factors. Second, it emphasizes the central

role of parental leadership in families, which extends beyond care and includes establishing shared family values and guiding children towards meaningful goals. Finally, it addresses the universal principles governing the influence of leadership and adaptability in diverse contexts, emphasizing the relationship between parenting and leadership.

This comprehensive review provides a concise summary of the main contributions and insights derived from the theoretical review. Such an understanding has the potential to guide future research and practical applications in the fields of parenting and management.

family and organizational structures, even though they are different, show remarkable similarities, which enable the transmission of values and messages between them.

Summary of findings: Family and organizational, if we refer each of them as a social structure then they develop separately, simultaneously, and together.

In each of them, the leader plays a central role, both in family and organizational contexts. Effective leadership qualities and positive guidance in shaping behavior and values, driven by psychological and social learning mechanisms, ultimately influence organizational culture, employee behavior, as well as family atmosphere and family members. Achieving a balance between autonomy and setting boundaries is vital for the healthy development of individuals in both structures.

Both families and organizations. Influenced by communication patterns, power dynamics and relationships. Parental leadership is not only taking care of the family members, but it includes establishing common family values and guiding the children towards meaningful goals. As a good manager is not only a leader of the organization but also takes care of the vision and advancement of the employees and the system in which he works for significant achievements. In order to maximize the organization's potential and foster a functioning family, it is essential for leaders in both contexts to encourage involvement and maintain positive relationships, both in the workplace and within families.

4. Discussion

The strength of the family lies in meaningful emotional relationships among its members. However, at times, family members may struggle to deal with conflicts in an objective manner due to an excess of emotional involvement. Emotional dependence among family members and the intensity of their relationships can turn everyday conflicts into major and unproductive disputes. Discussions around decision-making topics may deteriorate into mutual blame due to personal sensitivities within the family.

Therefore, an approach that focuses on relevant content within the family and enables decision-making on practical matters is necessary. Modern management is characterized by an objective, task-oriented approach rather than emotional relationships. Organizational management emphasizes objective goals external to the organization's members, such as product production, development, and marketing. It is understood that emotional conflicts are prevalent in organizations. Competition, power struggles, jealousy, fear of failure, fear of layoffs, aspiration for power, and more, are potential motives for conflicts. In such situations, employees are called upon to focus on achieving the common objective and adopt an objective-oriented approach. The fear of losing one's job security, personal boundaries, incentives provided to employees, enjoyment of work, shared sense of success, and more, all enable employees to focus on shared work content and coexist reasonably despite tensions and conflicts. Practical issues can be resolved even amidst interpersonal tensions.

In the modern family, parents often struggle with their ability to guide the way due to the ambiguity of societal expectations for a democratic approach within the family, the proliferation of educational-psychological messages, and the decreasing dependence of children on their parents in a society characterized by open mass communication. In such circumstances, concerns about family dispersion and disintegration have grown.

Therefore, it is necessary to adopt an approach that teaches parents to utilize more effective tools for democratic and inclusive family management.

In contrast to traditional management, which was authoritative, hierarchical, and rigid, modern management is significantly more democratic, participatory, and flexible. The reasons for this shift are intriguing but beyond the scope of this discussion. Nevertheless, the image of the manager as a police officer, inspector, and organizer has now significantly transformed into that of a coach, educator, and facilitator. The contemporary workplace is characterized by a new language of collaboration, empowerment, employee involvement, shared leadership, and quality teams. Organizations encourage

employees to increase their skills while adopting growth interventions and policies to foster employee development (Rogers, Siegel Christian, Jennings, and Lanaj, 2023).

Conclusion

The social and economic changes that have occurred in recent decades have made the management of work and family life closely linked, which has led researchers to pay more attention to the different forms of integration between work and family.

One of the aspects of this integration concerns the work-family interface. That is, the connections between the activities, attitudes and interpersonal relationships defined for the field of work and characteristics in the family.

Initially, the studies in this area focused mainly on work-family conflict, according to which participation in the work context made it difficult to participate in the family, but recently, researchers also discovered the positive effects of combining work and family functions.

Following this development, the structure of work-family enrichment emerges, emphasizing the fact that resources accumulated at work promote better family performance, and therefore, personal quality of life (Gabardo-Martins, Ferreira & Valentini, 2023).

The relationship between the family and the organization offers important insights into management and leadership practices. By recognizing the parallels between these two systems, people can leverage their knowledge and experience in one area to enrich their abilities in the other. Understanding the role of the family in socialization and the principles of managing the family unit can provide effective leadership strategies within organizations. Moreover, adopting the values of presence, dialogue and mutual support found in families can contribute to a positive organizational culture and employee satisfaction. By combining the wisdom gained from the family context, employees, managers and leaders can create cohesive and thriving organizations.

An intense family life engulfs the parents, with ongoing, routine, and overwhelming management. The ability to adapt, renew and change is essential in family management, just as it is essential in advanced organizational management. Innovation and creativity can help the process of renewal and change. A parent who can perceive parenting and his family from a fresh perspective, making connections between their family experiences and professional encounters, is about to embark on a creative and enriching journey. By tapping into a wellspring of personal perceptions, experiences, skills, and ideas, they can integrate and augment aspects of their personal and professional narratives. Throughout this transformative process, both personal growth and personal development occur within the family unit.

This study contributed to my understanding of how parents can help and use family dynamics by learning from their experience and knowledge from the professional field and their role as employees or managers and vice versa.

3. Business and Marketing

The Companies' Attitude towards the Fairtrade Social System

Jan Šalamoun^{1,*}, and Ladislav Rolínek²

¹ University of South Bohemia in České Budějovice, Department of Trade and Tourism,
Faculty of Economics, Studentská 13, 370 05 České Budějovice, Czech

Faculty of Economics, Studentská 13, 370 05 České Budějovice, Czech

Abstract

Research background: The article focuses on the social concept of Fairtrade for micro, small, medium and large enterprises in selected EU countries with a focus on the Czech Republic. 14 out of 37 companies were included in the sample. The research was conducted in the form of CAWI in the autumn of 2021.

Purpose of the article: The main objective of the article is to analyse the benefits and limitations of the involvement of companies in the Fairtrade system and to determine the attitudes of the companies involved in this system.

Methods: To meet the sub-objectives, an analysis of platforms of European countries that are part of similar Fairtrade platforms and represent their business or licensing partners was compiled. To uncover the benefits and attitudes of the companies themselves, a marketing questionnaire survey was conducted. The chosen quantitative research method was CAWI, which is a method of data collection through online surveys.

Findings & Value added: Most European companies categorise their business partners into commodity areas (coffee, cocoa) or into their field of activity (manufacturer, wholesale, retail, etc.). Despite the different structure of the European platforms compared to the Czech platform, this does not change the fact that companies' approaches to fairtrade issues are not based directly on increasing competitiveness, but on helping disadvantaged producers in developing countries. In this case, the results of the questionnaire survey suggest a greater involvement of smaller companies, which, beyond helping disadvantaged producers, are also interested in gaining new customers.

Keywords: fairtrade, analysis, survey, certification, companies

JEL classification: F18, L20, L21, Q01

1. Introduction

Fairtrade is one of the trading systems that have emerged in the last few decades to promote sustainable agriculture in developing countries. (Petersen, Snapp, 2015) According to De Pelsmacker and Janssen (2007), Fairtrade is an alternative trading approach that aims to offer better trading conditions to discriminated producers and workers in developing countries. Fairtrade has a positive social impact on farmers and workers in developing countries by supporting improvements in their living and working conditions (Becchetti & Costantino, 2008; Valkila, Haaparanta & Niemi, 2010). Fairtrade ensures a minimum income that covers the cost of sustainable production while providing a premium for investment in community development (Nicholls & Opal, 2005). Specifically, Fairtrade certification provides smallholder farmers with higher prices, access to pre-financing, protection against price volatility, and price premiums that enable them to adopt sustainable agricultural production techniques. (Borsky and Spata, 2016) To access these benefits, farmers must comply with certain requisites of environmental and socioeconomic measures and regulations for "sustainability". (Makita, Tsuruta, 2017) Socioeconomic measures aim to increase smallholder income stability, strengthen farmer organizations, and improve farmers' access to markets on more equitable terms. The means by which Fairtrade attempts to achieve more equitable conditions includes paying higher and therefore 'fair' prices to producers in developing countries, enabling these

* Corresponding authors: salamj00@ef.jcu.cz

producers not only to increase their income but also to develop their skills and knowledge and to benefit their communities and to improve the environment. (Rosen, Kishawy, 2012)

Fairtrade is understood according to DeCarlo (2011:2), as a trade partnership based on a two-way dialogue between producers from so-called developing countries and their partners from developed countries. Long-term collaborations are a prerequisite to ensure the transparency of the whole relationship. According to Hunt (2012), the main essence of this system is the grouping of individual farmers from developing countries under single producer organisations, which significantly strengthens the bargaining position vis-à-vis large traders whose demand is usually to buy large quantities of production. Chambolle and Poret (2013) explain the fairtrade system as a vertical communication between producers (farmers) and spot market distributors who sell finished products. Fairtrade, according to Manning et al. (2012), is an innovative value chain that aims to provide higher economic value and social benefits to primary producers in less developed countries through international trade in food, beverages and domestic products. According to Renard (2005), sales of Fairtrade certified products, which were previously limited to specialised markets, are growing rapidly and are now sold through mainstream channels. According to Andorfer and Liebe (2012), research on Fairtrade products has so far mainly focused on consumer attitudes following a theoretical approach based on social psychology and sociology. (Chatzidakis et al., 2007; Doran, 2010; Hwang and Kim 2018)

However, the issue of business involvement in the Fairtrade system, which is the focus of the paper, is not well addressed in the literature. The aim of the paper is to understand and map the views, attitudes of companies involved in the Fairtrade system on its benefits and limitations.

2. Methods

The main objective of the article is to analyse the benefits and limitations of the involvement of companies in the Fairtrade system and to determine the attitudes of companies involved in this system, with a focus on the Czech Republic. A sub-objective is to compile an analysis of platforms of European countries that are part of similar Fairtrade platforms and represent their business or licensing partners and to conduct quantitative marketing research in the form of questionnaires aimed at mapping their opinions, attitudes and real benefits of selected companies involved in the Fairtrade system and to create profiles of major companies involved in the Fairtrade system.

The authors based the following research assumptions in pursuit of the paper's objective:

- In the Czech Republic, the representation and structure of companies is different than in other selected European countries.
- The main reason for small companies to join the certification is to increase their production.
- The benefits of Fairtrade certification for companies are based on the possibility of gaining new business partners.
- Higher representation is given to firms that trade mainly in finished products in the Czech Republic.

The following methodological approach was chosen to meet the objective of the paper:

1. Definition of basic approaches to the problem of the article, based on the current state of knowledge of the problem at the theoretical level.
2. Specifying the aim of the article and the corresponding research method.
3. Compiling an analysis of platforms of European countries and conducting marketing research based on questionnaires.
4. Data analysis and evaluation.
5. Discussion
6. Conclusion

In line with the methodological approach, an analysis of the structure of the platforms of European countries was carried out in 2020, based on available resources. These platforms communicate Fairtrade issues and also provide information on a database of companies that have been certified and offer or broker Fairtrade products. The list of countries was taken from the Fairtrade International website (fairtrade.net). The greatest benefit of the analysis is its applicability to different types of textual data, but also its adaptation to the research design. (Hendl, 2009)

In addition to the above analysis, quantitative marketing research was carried out. The marketing research was conducted in accordance with the procedure according to Preston (2009). The main characteristics of marketing research may include its uniqueness, high telling power and timeliness of the information obtained.

(Gaál et al, 2021) According to Affek et al (2019), the main focus is on objectivity and systematicity in the design of the plan and the actual implementation of marketing research, which does not use a single method but is a combination of methods and information obtained from multiple sources independent of each other. The marketing research instrument was a questionnaire containing a total of 12 questions. It was a combination of open, semi-open and closed questions. Data was collected online through a request sent to a specific company. The questionnaire was focused on the database of Fairtrade Czech Republic and Slovakia platform companies, which at the time of data collection contained 37 companies. Of the 37 companies, 14 companies completed the questionnaire. The resulting sample is relatively small in terms of the number of respondents, which is due, among other things, to the small size of the population. It represents 37 % of the companies contacted. These are small, medium and large companies operating on both the domestic and international markets for a long time.

3. Results

3.1 Analysis of European country platforms

In order to evaluate the research assumption whether the representation and structure of firms in the Czech Republic is different than in other selected European countries, it was necessary to analyse the platforms of European countries. From the available Fairtrade International resources, European countries that have established a Fairtrade platform were analysed. From the websites of these platforms, the number of trading companies per platform and the breakdown by product offering were identified for some countries. This method varied with some platforms only listing their partner companies, while others classified these companies into different forms according to the commodities traded (coffee, cocoa, tea, sugar, bananas, etc.) or according to the service provider in the form of wholesalers, retailers, online shops. The structure and number of firms participating in the Fairtrade platform is shown in Table 1.

Table 1. Structure and number of companies in platforms in selected European countries

country	number of companies	division by form	
		product categories	service providers
Belgium	105	yes	none
Denmark	26	yes	none
Finland incl. Baltic States	59	yes	none
France	340	yes	yes
Germany	127	yes	yes
Ireland	58	none	
Italy	27	yes	yes
Luxembourg	30	yes	yes
Netherlands	249	yes	none
Norway	146	yes	none
Spain and Portugal	73	yes	none
Sweden	35	yes	
Switzerland	324	yes	yes
United Kingdom	155	yes	yes
Czech Republic and Slovakia	37	none	
Poland	56	yes	yes
Austria	118	none	

Source: Šalamoun (2020)

Table 1 shows that the structure of firms in other countries differs compared to the structure of firms in the Czech Republic. This may be due to historical aspects, in other words, a deeper perception of fair trade issues. Under the label Division by form, there is a categorization of products such as coffee, cocoa, tea, sugar, dry fruits, cosmetics, cotton, alcohol and service providers, which include retailers,

wholesalers, shops providing online services, etc. Of the 17 country groups, it was found that 9 of them have a form within their platform, either based on product categorization or service provider. Another difference in the comparative structure of companies in our country and abroad may be the fact that many companies are perceived locally abroad (such as Lidl in Germany) compared to our international perception.

Table 2. Number of Fairtrade companies per 1 million inhabitants

country	number of inhabitants (in millions)	number of companies	number of companies/one million inhabitants
Belgium	11,46	105	9,162303665
France	66,99	340	5,075384386
Germany	83,02	127	1,529751867
Ireland	4,904	58	11,82707993
Netherlands	17,28	249	14,40972222
Norway	5,433	146	26,87281428
Switzerland	8,57	324	37,80630105
United Kingdom	66,65	155	2,325581395
Czech Republic	10,69	36	3,367633302
Poland	37,97	56	1,474848565
Austria	8,859	118	13,31978779

Source: Šalamoun (2020)

Table 2 shows the differences in the number of Fairtrade firms per million population. Switzerland has the largest representation, followed by Norway, the Netherlands, Ireland and Austria. Further, the differences are not very large for foreign firms and this may stem from various reasons. For example, the smallest differences are for Germany, France and the UK. Although there is relatively high purchasing power, similar to Switzerland, Norway, the per million population ratio is still quite low. For this trio of countries, we believe that there will probably be other similar platforms.

3.2 Evaluation of quantitative marketing research

This research was carried out online by contacting Fairtrade partner companies of the Fairtrade Platform Czech Republic and Slovakia focused on their fairtrade operations. A total of 14 completed questionnaires were received. The completed questionnaires include not only micro and small enterprises, but also medium and large international companies with operations in the Czech Republic. The research sample will be presented first - it was an exhaustive survey as representatives of all Fairtrade Czech Republic and Slovakia platform partner companies were contacted.

Composition of the sample of respondents by company size

The size of enterprises was monitored according to the number of employees, in accordance with the criteria for the classification of a specific enterprise set out in Annex I to Commission Regulation (EC) No 800/2008.

For the sake of clarity in the following text, companies have been classified into different categories, precisely on the basis of size. Henceforth, only these categories will be used:

Table 3. Companies size categories

micro	1-9 employees
small	10-49 employees
medium	50-250 employees
large	over 250 employees

Source: own processing (2022)

Figure 1. Structure of the research sample by size of companies
Source: own processing (2022)

Figure 1 shows that the research portfolio consisted of micro enterprises - 36% of the total 14 respondents and small enterprises - 29%, medium enterprises accounted for about 14% of the respondents and 21% of the respondents belonged to the large enterprise category.

Reasons for and expectations of Fairtrade certification

In order to fulfil the aim of the article, it was also necessary to find out what the reasons and expectations of Fairtrade certification are for individual companies. Some partial conclusions can be drawn from the results, which reflect the implications of certification for new entrants to the market.

Figure 2. Fairtrade certification, reasons and company expectations
Source: own processing (2022)

In order to analyse the individual reasons or expectations of Fairtrade certification for respondents in more detail, it was necessary to identify the reasons and expectations of certification for firms according to their size based on pairwise analysis.

Figure 2.1 Comparison of reasons for and expectations of Fairtrade certification by company size
Source: own processing (2022)

The reasons and expectations for Fairtrade certification tend to be more on the side of micro and small businesses. However, a significant expectation of most businesses is to help disadvantaged producers in developing countries. This reason is further reinforced by the coronavirus pandemic, resulting in the reality of weakening business relationships between Fairtrade commodity producers and intermediaries to customers and final consumers.

It can also be noted in the graph that the reason for certification is also to attract new customers. This was most pronounced for small enterprises and for large enterprises. It can be seen that even large enterprises are concerned about gaining new customers, if only because they are constantly strengthening their range of fairtrade products.

Such a balanced reason or expectation from Fairtrade certification is to gain awareness of Fairtrade. Of course, businesses offering Fairtrade products, have at least a basic awareness of Fairtrade, but have responded in terms of increased interest in regular or more detailed information about this social certification.

Benefits of Fairtrade certification from a business perspective

In this part of the thesis I come to the main issue, on the basis of which the aim of the thesis is also defined, which should reveal, on the basis of the analysis, the possible steps for entering companies into the certification process itself, or checking the possibilities whether the certification system can be recommended for new companies entering the Fairtrade concept.

Figure 3. Benefits of Fairtrade certification for compenies
Source: own processing (2022)

Since the benefits differ across categories of firms, it is necessary to use pairwise analyses to evaluate the benefits for different sizes of firms.

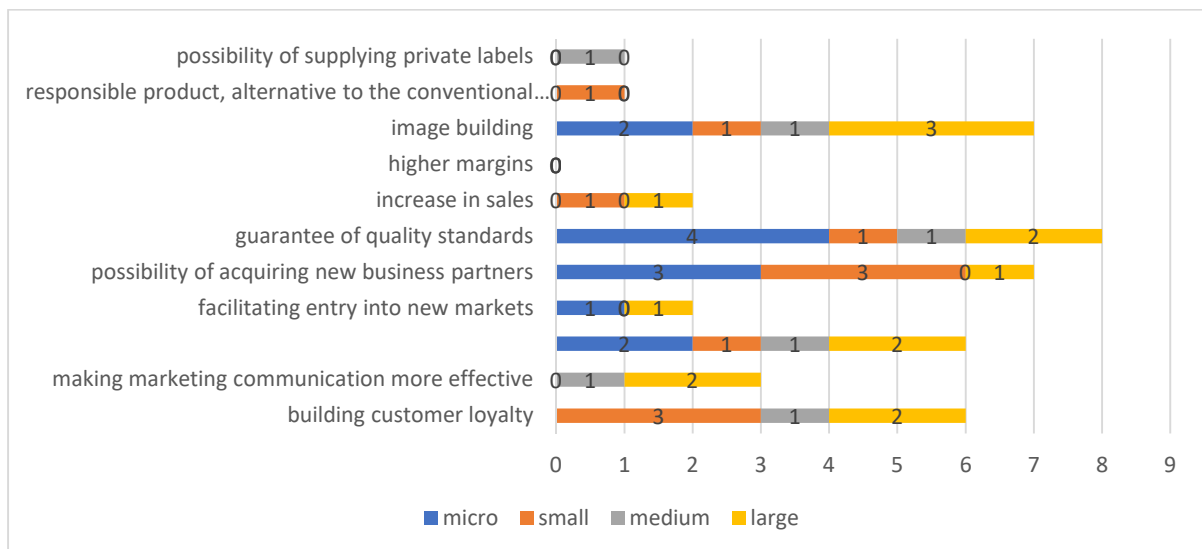

Figure 3.1 Comparison of the benefits of certification by companies size
Source: own processing (2022)

The benefits of Fairtrade certification for businesses are perceived more significantly by micro-businesses. From the number of different answers in the questionnaires, the majority of respondents belong to micro companies. From this it can be concluded that the entry into the certification process is likely to be significant for micro companies. On the other hand, even large companies perceive this possibility as a certain advantage or help for the visibility of a product category. In addition to micro companies, small companies are also standing out in this matter, so it could perhaps already be partially concluded that the certification system can be recommended for smaller companies entering the Fairtrade concept. On the other hand, medium-sized enterprises do not find much advantage in certification for their inclusion among licensing partners.

In general, it can be seen from the graph that the areas of building customer loyalty, guaranteeing quality standards and image building are of the greatest importance for businesses to Fairtrade certification.

Image building or corporate image enhancement is of course a goal of most organisations, whether profit or non-profit. However, within the general concept of corporate social responsibility, this should not be the most important issue, but it should not be neglected either.

The answer offered by the "higher margin" option was not selected by any respondent. The question therefore remains whether this option is not subject to certification or whether it is just perceived as such.

Only for a small percentage of responses can we notice the impact of certification on 'increased sales'. This response was noted for small and large companies.

Business activities of the sample companies

This result uncovered established relationships between what firms produce, use, import, trade and what does not concern them.

Figure 4. Business focus of the companies in the research sample
Source: own processing (2022)

At first glance, it is clear that the firms in the sample are on the one hand the most active in final products and on the other hand the least active in services. This finding may suggest that there is little awareness of fairtrade production on the part of firms.

4. Discussion

Two applied methods were used in this paper: platform analysis of European countries and marketing research. The applied methods were carried out with local and temporal differences and their focus also differed. The applied methods aimed not only to gain important insights into attitudes towards the Fairtrade system, but also to fulfil, among other things, the objectives of this paper, to confirm or refute the research assumptions.

In the Czech Republic, the representation and structure of companies is different than in other selected European countries.

On the basis of the analysis of firms from European countries, it can be confirmed that the structure of firms in the Czech Republic is different compared to firms from abroad. The structure differs both in the number of firms in individual countries, where the number itself is exceeded by up to three or four times, as is the case, for example, in Great Britain, Switzerland, Austria, Germany, the structure differs in comparison with individual products and there are also differences in the number of Fairtrade firms per one million inhabitants. The difference can also be seen, according to Csikszentmihalyi (2000), in ethical consumption as a way for European consumers to take responsibility and become more involved in sustainability, which nowadays allows them to address the contradictory idea of an ever growing market and the limited resources of the planet. This may also be the reason for the different structure

of companies in the Czech Republic compared to other companies in European countries. The fact that firms in the Czech Republic are different in terms of representation and structure than in other selected European countries may also be based on the historically long-lasting operation of the planned economy in the socialist establishment between 1948 and 1989. These more than forty years may still have an impact on the current behaviour of firms and consumers.

The main reason for small companies to enter certification is to increase their production.

In the case of this assumption, we conclude that the main reason for small firms to enter certification is not to increase their production. This reason does not emerge from the other firms (micro, medium and large) either. Therefore, this assumption can be refuted because the main reason is to gain new customers and help disadvantaged producers.

The benefits of Fairtrade certification for companies are based on the possibility of gaining new business partners

In the case of this assumption, the research did not lead to a clear confirmation or refutation, because the results of the individual categories often showed very similar values, such as: building customer loyalty and image, guaranteeing quality standards and also the possibility of acquiring new business partners. Fairtrade certification often helps farmers in training, apprenticeship and input supply. (Sellare et al., 2020a) One study has shown that Fairtrade certification is associated with higher production prices and higher incomes for smallholder farmers in many situations. (Dragusanu et al., 2014) Several other studies have also shown positive effects of certification on overall household living standards. (Becchetti et al., 2012) However, higher prices of certified Fairtrade products in markets are not always sufficient to increase household incomes and living standards. (Beuchelt and Zeller, 2011)

Higher representation has companies that trade mainly with final products in the Czech Republic.

In order to evaluate this assumption, relationships were established between what firms produce, use, import, trade and what they do not.

Since firms mainly trade in final products, this assumption can be confirmed. The general trend in some European countries is to produce or process final fairtrade products alongside trade in them. In the Czech Republic, we are more likely to encounter trade in final products themselves.

The overall limit of the paper can be considered to be the sample used for the purpose of evaluating the questionnaire survey, which is relatively small. Of the 37 companies contacted, only 14, or 38%, were able to obtain data. In this case, we focused on specific companies operating in the fairtrade sector. For the selection, we relied on the available sources reported by the Fairtrade Czech Republic and Slovakia platform, which lists these entities as business partners in the Czech Republic. Also because they are business and licensing partners of the platform, we also thought that the return would be slightly higher. Nevertheless, the companies in the research sample include very important companies with an annual turnover of tens of billions of crowns, especially in the area of consumer goods.

A recommendation for companies could be to participate jointly in the ESG methodology, or Environment, Social and Corporate Governance. This is a relatively young discipline that seeks to invest in companies that are socially responsible to their environment, their employees, their shareholders, and overall to all stakeholders that shape the operation of the company (Jamali et al, 2017).

Conclusion

The article focused on mapping the attitudes, opinions and benefits of the Fairtrade concept by manufacturing or trading companies on the Czech and international market. The idea is based on the mission of the concept itself, i.e. the need for an ever-increasing level of sustainability and mediated fair trade. The Fairtrade concept brings many benefits throughout the supply chain. However, it supports the most vulnerable links, i.e. the growers and producers of Fairtrade products. They are entitled not only to a fair price for their work, but also to other social benefits such as educational support. It is the complexity of the whole Fairtrade concept that makes it stand out, but this complexity also brings with it the obstacle of the difficulty of entering the system.

The aim of the article was to analyse the benefits and limitations of the involvement of companies in the Fairtrade system and to determine the attitudes of companies involved in this system. In order to fulfil

the aim of the article, it was necessary to create an analysis of the platforms of European countries and to carry out a questionnaire survey.

The analysis of platforms in European countries has clearly demonstrated the relationships and attitudes of European platforms towards companies in comparison with the platform in the Czech Republic. Based on the analysis of firms from European countries, it was possible to confirm the assumption that the structure of firms in the Czech Republic is different compared to firms from abroad. The structure differs both in the number of firms in individual countries, where the number itself is exceeded by up to three or four times, as is the case in the UK, Switzerland or Austria.

The scope of the research carried out by questionnaire survey was to address all partner companies of the Fairtrade Czech Republic and Slovakia platform, focused on the operation in the field of fairtrade. Thus, the entire core group was contacted, which, however, only includes 37 companies. A total of 14 completed questionnaires were received, which gives a return rate of almost 40%. With a small base set, it goes without saying that the total number of respondents included will not be very high. However, it is important to have a sufficiently diverse composition of the research sample, as the respondents include not only micro and small enterprises, but also medium and large international companies with operations in the Czech Republic.

The marketing research shows that the main reason for companies to enter certification is not only to increase their production, to increase their own image, but mainly to support disadvantaged producers, which was especially evident in small companies. It was also found that the benefits of Fairtrade certification for firms are based, among other things, on attracting new business partners, both from the Global South and the Global North. The paper examined the differences between the Czech Republic and other countries in the European Union. The results show that the difference is not only in the structure of firms according to the Fairtrade Czech Republic and Slovakia platform, nor per million inhabitants, but also in the representation of the firms themselves, which in the Czech Republic trade mainly in final products.

Abstract

Research background: The gradual introduction and use of medical devices in marketing research has led to the emergence of a separate discipline called neuromarketing. The willingness of consumers to become respondents to neuromarketing research is often paralyzed by ignorance and fear of the unknown.

Purpose of the article: The objective of this paper was to investigate in which cases the respondents would be willing to participate in neuromarketing measurements. When examining this willingness, the age of the respondent, the type of research (in terms of the purpose of using the obtained data), and the proposed neuromarketing methods that the respondent should undergo were taken into account.

Methods: Two hypotheses were established and statistically verified using the data from a questionnaire survey. According to the first hypothesis, the respondents' willingness to participate in neuromarketing research relates to their age. The premise of the second hypothesis was that there are statistically significant differences between generations in the willingness to participate in the neuromarketing research.

Findings & Value added: The results showed that younger respondents are more willing to participate in the neuromarketing research than the older ones. At the same time, differences between the generations in the willingness to participate in such research studies were demonstrated. Generational differences in terms of willingness to participate in the research were not demonstrated when taking the defined neuromarketing methods into account.

Keywords: age differences, consumer generations, neuromarketing, willingness, innovative methods

JEL classification: D12, E71

1. Introduction

As Lee, Butler and Senior (2010) accentuate, application of neuroscientific tools and a neuroscientific way of thinking to business problems will, undoubtedly, have a major impact on the way we understand marketing and business in the near future. Gonchigjav (2016) adds that „business companies' leadership have become aware of the importance of this science and see marketing as business philosophy and understand that analyzing the market, business environment and conditions by consumers is the key to success“.

A number of scientists (e.g., Schafer, 2005; Walton, 2004; Petty & Cacioppo, 1983) agree that the traditional method of obtaining data through a questionnaire survey does not provide accurate and truthful information. Morin (2011) also points to the lack of traditional research, which depends primarily on the will and abilities of the subjects, and then a description of how they feel when they are exposed to advertising, when they decide to buy goods or services or when they consume this product. The research participants have to verbalize their answers, which leads to some distorted data within their expressive abilities. Aydınođlu and Sayın (2016) state that concerns about the inaccuracies of traditional surveys have led to the use of different techniques aimed at measuring the physiological responses that accompany the affective, conative, and cognitive processes that consumers undergo.

Concerning these issues, the paper describes a non-traditional, or innovative perspective of conducting a survey, particularly in the context of neuromarketing, which is defined in the following section.

* Corresponding author: anna.tomkova@unipo.sk

1.1 Theoretical background to neuromarketing

The gradual introduction and use of medical devices in marketing research has led to the emergence of a separate discipline called neuromarketing. Neuromarketing is defined as a field of study that uses the application of neuroscientific methods to analyze and understand human behavior in relation to markets and market changes (Lee et al., 2007; Ariely & Berns, 2010; Morin 2011; Babiloni, 2012). Neuroeconomics as well as neuromarketing use clinical information about brain functions and mechanisms to help explain what is happening inside the black box, leading to an explanation of consumer behavior (Fugate, 2007; Eser et al., 2011). According to Khushaba et al. (2013), consumer neuroscience combines neuroscience, psychology, and economics to study how marketing and advertising strategies physiologically influence the brain. It is an interdisciplinary field that acts as a tool for obtaining data about the customer, how, where, and in what environment they prefer to shop, and where they spend the most money and time shopping (Dooley, 2012).

Examining a number of different definitions of neuromarketing, de Oliveira and Giraldo (2017) compiled a merging definition: "Neuromarketing is an interdisciplinary field of science that uses various tools traditionally used in medicine, psychiatry and psychology on neurofeedback, biofeedback and metabolic processes measures, in conjunction with traditional marketing tools in the search to better understand the most diverse types of emotions, cognitions, physiological reactions, behaviors and thoughts of economic agents, both conscious and unconscious related to typical issues of Marketing and its various sub-areas".

Lim (2018) mentions five key aspects in defining neuromarketing: 1. interdisciplinarity – the nature of the knowledge on which neuromarketing is based and which develops in it; 2. neuroscientific methods – types of methods used in neuromarketing; 3. studies on the brain and nervous system – results from the use of neuromarketing methods; 4. understanding instinctive human behavior in applied marketing environments; 5. conceptual and managerial implications for marketing theory and for planning and implementation of marketing strategies – impacts of the results of neuromarketing studies.

Lindström (2009) argues that neuromarketing is a tool for finding out what a customer thinks about products or specific brands. Through neuromarketing, we can also detect unfair business practices of traders. Neuromarketing tries to explain why and how what consumers tell us in research differs from what they actually do. The implicit approach also shows advantages over the explicit in the form of not obtaining information through the "question and answer" system and thus minimizes possible mutual misunderstanding between the researcher and the respondent.

Neuromarketing is thus characterized by the use of special tools to examine human behavior, which are currently as follows:

- Positron emission tomography – PET (Hsu, 2017);
- Functional Magnetic Resonance Imaging – fMRI (Harrell, 2019);
- Electroencephalography – EEG (Sebastian, 2014);
- Eye tracking (Krafka et al., 2016);
- Heart rate and respiration (Gorgiev & Dimitriadis, 2015);
- Galvanic skin response – GSR (Orzan et al., 2012).

The willingness of consumers to become respondents to neuromarketing research is often paralyzed by ignorance and fear of the unknown. As the most common reason for potential respondents not to participate in the research, several authors state that their free will would be jeopardized, thereby violating their personal privacy to a completely unacceptable extent (Wilson et al., 2008; Stanton et al., 2017). Non-invasive techniques, such as brain scan research, have also a slightly negative reputation. Moore (2005) claims this may be one of the reasons of possible unwillingness of respondents to participate in market research studies.

2. Methods

The aim of the paper is to examine the willingness of consumers to undergo neuromarketing research in terms of age and in terms of type of research (purpose of data use and type of measurement method).

Based on the aim, two hypotheses were formulated:

- H1: The willingness to participate in neuromarketing research is statistically significantly related to the age of the consumer.
- H2: There are statistically significant differences between generations of consumers in their willingness to participate in neuromarketing research.

The data for verifying the hypotheses were obtained through an online questionnaire survey, which took place in March 2022 among Slovak consumers.

The research sample was selected by non-probability (occasional) selection. The sample consisted of 192 respondents, of whom 86 (44.8%) were men and 106 (55.2%) women. The average age of the respondents was 34.47 years (min. = 19, max. = 81, SD = 11.983). In terms of education, 108 (56.3%) respondents completed secondary and 84 (43.8%) higher/university education. To find out how the age groups differ in terms of the researched issue, we created age categories based on the marketing division of generations, as reported by Shams et al. (2020):

- Baby Boomers – year of birth before 1965 (in 2022: people aged 58 and over);
- Generation X – year of birth 1965-1979 (in 2022: people aged 43-57);
- Generation Y – year of birth 1980-1994 (in 2022: people aged 28-42);
- Generation Z – year of birth after 1994 (in 2022: people under the age of 27).

An own questionnaire was used to collect data which examined the degree of willingness to participate in neuromarketing research from two perspectives:

- neuromarketing methods used: brain scanning, biometrics, eye tracking,
- purpose of using the obtained data: medicine, science, military forces, marketing.

These investigated variables were selected based on the results of our previous research (Birknerova et al., 2022), where they proved to be significant parameters in the evaluation of respondents' willingness to participate in neuromarketing research. The questionnaire consisted of 3 demographic items (gender, age, education) and 12 survey items.

Respondents had the opportunity to respond to the questionnaire items in terms of the following Likert scale: 1 – strongly disagree, 2 – partially disagree, 3 – neutral, 4 – partially agree, 5 – strongly agree. The analysis was performed using the IBM SPSS statistical program.

Examples of survey items:

- Would you be willing to participate in a brain scan for medical purposes?
- Would you be willing to participate in biometric measurements for scientific purposes?
- Would you be willing to participate in eye tracking for military purposes?

Table 1. Descriptive statistics of survey results

Neuromarketing method	Purpose of using the obtained data	N	Min	Max	Mean	SD
Brain scanning	Medicine	192	1	5	3.34	1.564
	Science	192	1	5	3.29	1.461
	Military forces	192	1	5	2.66	1.578
	Marketing	192	1	5	3.09	1.511
Biometrics	Medicine	192	1	5	3.17	1.596
	Science	192	1	5	3.21	1.558
	Military forces	192	1	5	2.53	1.531
	Marketing	192	1	5	2.93	1.526
Eye tracking	Medicine	192	1	5	3.23	1.602
	Science	192	1	5	3.38	1.485
	Military forces	192	1	5	2.70	1.599
	Marketing	192	1	5	3.14	1.609

Source: own processing

Table 1 shows the results of the research items of the questionnaire survey. The answers show that respondents were more willing to participate in neuromarketing research for medical and scientific purposes and less for military purposes.

3. Results

The presumed relationship between the willingness to participate in neuromarketing research and the age of the respondent was confirmed by the Pearson's correlation coefficient (Table 2).

Table 2. Correlation of the degree of willingness to participate in neuromarketing research with the age of the respondents

Variable	Correlation Coefficient	Sig. (2-Tailed)	N
Age	-.210**	.004	192

** Correlation is significant at the 0.01 level (2-tailed).

Source: own processing

Hypothesis 1 was thus supported and based on the results of the analysis it can be stated that the researched willingness of respondents decreases with increasing age.

To verify the second hypothesis, the respondents were categorized into groups according to generations: 6 Baby Boomers (3.1%), 48 Generation X (25.0%), 68 Generation Y (35.4%), 70 Generation Z (36.5%) (Table 3).

Table 3. Descriptives of generations

Generation	N	Mean	SD	Std. Error
Baby Boomers	6	2.00	1.000	.577
Generation X	48	2.71	1.654	.338
Generation Y	68	3.59	1.328	.228
Generation Z	70	3.80	1.052	.178
Total	192	3.40	1.395	.142

Source: own processing

Due to the small group of respondents in the Baby Boomers generation, this generation was not included in further analyses.

One-way ANOVA demonstrated the existence of intergenerational differences in the willingness to participate in neuromarketing research (Table 4), and the similarity of generational variance was confirmed by Levene's test.

Table 4. Generational differences in willingness to participate in neuromarketing research

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	48.329	3	16.110	9.418	.000
Within Groups	321.587	188	1.711		
Total	369.917	191			

Source: own processing

Mutual differences between the generations were subsequently confirmed by the Bonferroni test (Table 5).

Table 5. Multiple comparisons – willingness to participate in neuromarketing surveys among generations of respondents

		Mean Difference	Std. Error	Sig.	Lower Bound	Upper Bound
Generation X	Generation Y	-.880*	.247	.003	-1.52	-.24
	Generation Z	-1.092*	.245	.000	-1.73	-.46
Generation Y	Generation X	.880*	.247	.003	.24	1.52
	Generation Z	-.212	.223	.777	-.79	.37
Generation Z	Generation X	1.092*	.245	.000	.46	1.73
	Generation Y	.212	.223	.777	-.37	.79

* The mean difference is significant at the 0.05 level

Source: own processing

Based on the results of the analysis it can be concluded that there are statistically significant differences between Generation X and Generation Z, as well as between Generation X and Generation Y in the degree of willingness to participate in neuromarketing research, so Hypothesis 2 was supported. With increasing age, this willingness decreases, so Generation Z has a higher degree of willingness than Generation Y.

Furthermore, the intergenerational differences in the use of data obtained by neuromarketing research were investigated, while the examined areas of data use were: medicine, science, military forces and marketing.

As illustrated in Table 6, One-way ANOVA showed differences between the generations in the willingness to participate in neuromarketing research in terms of the use of data obtained from such research.

Table 6. Generational differences in willingness to participate in neuromarketing research in terms of the purpose for which the data were used

		Sum of Squares	df	Mean Square	F	Sig.
Willingness – medicine	Between Groups	28.408	3	9.469	6.148	.001
	Within Groups	289.571	188	1.540		
	Total	317.979	191			
Willingness – science	Between Groups	16.965	3	5.655	3.653	.014
	Within Groups	291.035	188	1.548		
	Total	308.000	191			
Willingness – military forces	Between Groups	16.155	3	5.385	3.775	.012
	Within Groups	268.158	188	1.426		
	Total	284.313	191			
Willingness – marketing	Between Groups	14.251	3	4.750	2.960	.034
	Within Groups	301.728	188	1.605		
	Total	315.979	191

In terms of marketing tools used, intergenerational differences were examined, and the research methods were: brain scanning, biometrics and eye tracking (Table 7).

Table 7. Multiple Comparisons – Generational differences in willingness to participate in neuromarketing research in terms of neuromarketing methods used

			Mean Difference	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
Willingness – brain scanning	Generation X	Generation Y	-.58333	.39626	.866	-1.6519	.4852
		Generation Z	-1.06905*	.39391	.048	-2.1312	-.0069
	Generation Y	Generation X	.58333	.39626	.866	-.4852	1.6519
		Generation Z	-.48571	.35790	1.000	-1.4508	.4794
	Generation Z	Generation X	1.06905*	.39391	.048	.0069	2.1312
		Generation Y	.48571	.35790	1.000	-.4794	1.4508

		Generation Y	.16471	.36997	1.000	-.8329	1.1623

* The mean difference is significant at the 0.05 level.

Source: own processing

The Bonferroni test demonstrated intergenerational differences in willingness to participate in neuromarketing research in terms of the neuromarketing methods used between Generation X and Generation Z in willingness to undergo brain scans (Table 7). The rate of this willingness is higher for Generation Z.

4. Discussion

The representativeness of the research sample in the case of neuromarketing research is much more dependent on the willingness of consumers to participate than in the case of traditional research methods. One of the basic socio-demographic characteristics is the age of the respondent, so in our research we focused on the relationship between age and willingness to participate in such research. The sample consisted of 192 respondents, but after dividing them into defined generations, we performed analyses with 186 respondents. Through a questionnaire survey, the degree of willingness to participate in neuromarketing research in terms of neuromarketing methods used (brain scanning, biometrics, eye tracking) and the purpose of using the obtained data (medicine, science, military forces, marketing) was determined.

From a general point of view, the survey showed that the respondents are more willing to undergo neuromarketing measurements if the data is used for medical and scientific purposes. A lower willingness was shown in the case of military purposes. These results can be explained by the fact that the mentioned neuromarketing methods are generally associated with the medical and scientific environment. Our previous research (Birknerova et al., 2022) shows that the less information people have, the more they fear the unknown. This may be the case when the respondents did not sufficiently understand the reasons for using neuromarketing for military purposes.

The relationship between the age of the respondent and the willingness to participate was confirmed, and the differences between Generation X and Generation Z, as well as between Generation X and Generation Y in the willingness to participate in neuromarketing research were also confirmed. Subsequent examination of generational differences in the willingness to participate in research in terms of neuromarketing methods used and in terms of the use of data obtained in this way were confirmed in all research areas – medicine, science, military forces and marketing.

The reason for the proven differences may also be the fact that the younger generation is more informed about the news, while neuromarketing can still be considered a new trend in marketing research. Ignorance or insufficient information often raise concerns and fears of the unknown, which may be the cause of the reluctance of the older generation to take part in new research. Nádanyiová (2015) conducted research on the perception of neuromarketing by Slovak consumers. In her study she recorded a great deal of ignorance of neuromarketing among the respondents as well as distrust of this method as they generally perceive neuromarketing as dangerous and unethical.

Pescatore (2021) studied the connection between the age of the respondents and their willingness to undergo neuromarketing research and found out that the respondents over 40 distrust neuromarketing more than the younger ones. Uydaci and Karabiyik (2015) examined the relationship between the perception of the fMRI method as dangerous to health and demographic characteristics and then between willingness to engage in fMRI research and demographic characteristics, confirming the existence of correlations with the age, education, social status and income of the respondents.

The media's approach to neuromarketing has only strengthened people's distrust of the new technology (Lindstrom, 2009) as they feel manipulated to make purchasing decisions in favor of a particular company, product, or service. The abuse of more vulnerable segments of the population is one of the ethical problems of neuromarketing. We state this fact because it is the older generations that belong to vulnerable groups. As reported by Murphy et al. (2008) and Acuff (2005), older people, children and people with mental disorders are considered more vulnerable audiences in this case. Neuroscientists can provide their findings about these vulnerable groups to marketers who may misuse such information to manipulate these consumer groups, as they are easier to handle.

Conclusion

It can be concluded that the results of our research confirm the findings of previous studies, accentuating the fact that younger consumers are more willing to participate in neuromarketing research than older ones.

Effective and modern leadership incorporating insights from neuroscience should be, according to Waldman et al. (2011), guided by the fact that a practical solution is to create research or application teams with relevant expertise in neuroscience, leadership, software applications and so on.

By adopting a neuroscientific approach, it is possible to design specific remuneration that is designed for the individual worker, which should maximize productivity as well as job satisfaction. From a consumer behavior perspective, this feeds through to knowledge regarding the most effective design of marketing communications, including social marketing, which aims to prevent undesirable behavior (Lee et al., 2010).

The limits of our research were mainly the smaller sample size and the occasional sampling method. This study may serve as a prerequisite for further investigation of the relationships between socio-demographic characteristics and factors of neuromarketing research.

Consumer Perceptions of Neuromarketing Research in the Context of Socio-demographic Characteristics

Ivana Ondrijev^{1,*}

¹ University of Presov, Department of Managerial psychology, Faculty of Management and Business, Konstantnova 16, 080 01 Prešov, Slovakia

Abstract

Research background: The topic of neuromarketing sparks discussions on ethics due to concerns that it may not just remain at reading consumers' thoughts but also has the potential to influence them through neuromarketing research. In certain cases, neuromarketing can create a negative attitude towards companies employing such practices if consumers perceive them as unethical (Fořtov, 2015).

Purpose of the article: The aim of this study is to examine consumers' opinions on the issue of neuromarketing in the context of their socio-demographic characteristics. The hypotheses set forth predicted differences in the perception of neuromarketing based on the gender and education of the respondents.

Methods: The research methodology used was based on Flores et al.'s (2014) approach, which examines respondents' opinions regarding their endorsement of neuromarketing by companies and perceived threats to consumers. The questionnaire consisted of 13 survey items, divided into four sections based on defined factors: Attitudes Towards Neuromarketing, Word of Mouth, Privacy Invasion, and Behavior Manipulation. The study was conducted on a sample of 183 respondents, consisting of 111 females (61%) and 72 males (39%), with an average age of 39.26 years. In terms of education, the respondents were divided into two groups: 91 respondents (49.7%) had secondary education, and 92 respondents (50.3%) had higher education.

Findings & Value added: The analysis did not confirm any significant statistical differences in the examined socio-demographic characteristics. The survey confirmed the results of previous studies, indicating that respondents still have concerns about their privacy and unwanted manipulation when it comes to the use of neuromarketing by companies.

Keywords: neuromarketing, gender, education, consumer behavior, consumer perceptions

JEL classification: M31

1. Introduction

This article seeks to bridge the gap in existing research by examining the relationships between socio-demographic characteristics and consumer perceptions of neuromarketing. Understanding how different groups of consumers perceive this novel marketing approach can provide valuable guidance for companies seeking to employ neuromarketing strategies responsibly and ethically.

"Neuromarketing," also known as "consumer neuroscience," is a neuroeconomic subfield that investigates marketing-relevant issues (Hubert, 2010). It is an interdisciplinary area that combines psychology, neuroscience, and economics to study how advertising and marketing strategies physiologically influence the brain (Khushaba et al., 2013). Currently, consumer market research focuses on utilizing diagnostic techniques from neuroscience, thereby advancing neuromarketing as a modern form of marketing research (Nemorin & Gandy, 2017; Plassmann et al., 2012). Neuromarketing examines consumer responses to marketing stimuli using medical technologies to measure activity in specific brain regions. Its fundamental goal is to understand why and how consumers make decisions, which brain regions are activated during the process, and what influences their behavior (Eser, Isin, & Tolon, 2011; Fugate, 2007; Morin, 2011).

* Corresponding author: ivana.ondrijova@unipo.sk

Based on the examination of multiple definitions of neuromarketing, de Oliveira and Giraldo (2017) have compiled a comprehensive definition: "Neuromarketing is an interdisciplinary field of science that combines various tools traditionally utilized in medicine, psychiatry, and psychology, such as neurofeedback, biofeedback, and measures of metabolic processes, together with conventional marketing tools. Its aim is to gain a better understanding of a wide range of emotions, cognitions, physiological reactions, behaviors, and thoughts exhibited by economic agents, both consciously and unconsciously, in relation to typical issues in marketing and its various sub-areas."

For studying the brain's response to environmental stimuli, scientists employ various measurements, which can be categorized into neurological and physiological methods. Physiological research includes facial expressions, eye tracking, electrodermal activity, respiration, heart rate, and response time (Genco, Pohlmann, & Steidl, 2013). Neurological methods encompass techniques such as electroencephalography (EEG), magnetoencephalography (MEG), positron emission tomography (PET), Doppler sonography (fTCD), and functional magnetic resonance imaging (fMRI) (Hsu, 2017; Sebastian, 2014).

One advantage of neuromarketing as a measurement technique is that the obtained results are not influenced by consumers' opinions or their unwillingness to reveal the truth. There is nothing inherently wrong with using this technology, but a potential issue is that researchers may gain insights beyond the boundaries set by consumers for such testing. The use of neuromarketing thus raises ethical concerns, which can be divided into two categories: protection of consumer autonomy and safeguarding the interests of various groups that could be harmed or exploited by such research. The privacy of individuals involved in neuroscientific studies conducted in medical institutions is typically protected by law. However, in the case of neuroresearch for commercial purposes, outside of medical institutions, legal protection does not apply, and the preservation of respondent autonomy is left to the moral values of researchers (Murphy et al., 2008). Exploitation of vulnerable population groups represents another ethical issue in neuromarketing. Older adults, children, and individuals with mental disorders are considered more vulnerable in this context. The results of neuroscientific research on these groups could be provided to marketers who might misuse this information for manipulation, as these groups are more easily influenced. For instance, video game manufacturers employ children for this type of research to create new games based on the findings (Murphy et al., 2008; Acuff, 2005).

Some critics of neuromarketing research argue that methods investigating the human brain should only be used for the purpose they were primarily designed for: socially beneficial research in the field of human health. There should not be the possibility to utilize them for completely different commercial purposes of companies. The argument is strengthened by the claim that these companies did not contribute to the development and rigorous testing of these methods. According to opponents, these companies are merely parasitic on the results that were originally intended for use in a completely different field (Koukolík, 2012).

The topic of neuromarketing sparks discussions on ethics due to concerns that it may not just remain at reading consumers' thoughts but also has the potential to influence them through neuromarketing research. In certain cases, neuromarketing can create a negative attitude towards companies employing such practices if consumers perceive them as unethical (Fořtová, 2015). This attitude is also linked to the fear that advertising and marketing campaigns utilizing neuromarketing research could become so effective that consumers would lose their ability to resist. This could jeopardize consumers' free will and invade their privacy (Stanton, Sinnott-Armstrong, & Huettel, 2017).

Ulman, Cakar, and Yildiz (2015) emphasize that the concept of human dignity should serve as the foundation for ethical principles such as autonomy, self-determination, privacy, confidentiality, protection of vulnerable groups, reliability, and honest interpretation of research results in line with the risk of manipulation by commercial entities. Studies by AlSayegh et al. (2020), Gorgiev (2020), or Berlińska and Kaszycka (2016) highlight variables such as social status, respondents' education, social environment, and cultural stereotypes, which play an important role in their willingness to participate in research involving physiological observations. The two main ethical concerns when using neuroscientific methods in marketing are the protection of test subjects and the scientific reliability, validity, and transparency of neuroscientific findings (Lim, 2018). Neuromarketing is a discipline that should complement marketing research and, as such, should provide the most realistic results possible without violating ethical rules, as the analysis results would be used to produce and sell products based on consumer preferences (Šola, 2013).

2. Methods

The aim of the study is to examine consumers' opinions on neuromarketing in the context of their socio-demographic characteristics. The research was based on two hypotheses:

- H₁: We assume that there are statistically significant differences in opinions on neuromarketing based on gender.
H₂: We assume that there are statistically significant differences in opinions on neuromarketing based on education.

Data collection was conducted through a questionnaire, the methodology of which was based on a study by Flores et al. (2014). The questionnaire consisted of 13 items, which were divided into four parts based on defined factors:

- Attitudes Towards Neuromarketing - items 1-4.
- Word of Mouth - items 5-7.
- Privacy Invasion - items 8-10.
- Behavior Manipulation - items 11-13.

The first two factors (Attitudes Towards Neuromarketing, Word of Mouth) are composed of items with positive statements about neuromarketing. The next two factors (Privacy Invasion, Behavior Manipulation) consist of items expressing potential threats of neuromarketing. Respondents had the opportunity to answer on a Likert scale from 1 to 7 (1 - strongly disagree to 7 - strongly agree).

The hypotheses were tested on all four factors of the utilized methodology using t-tests.

The study was conducted on a sample of 183 respondents, including 111 women (61%) and 72 men (39%), with an average age of 39.26 years (min. = 18, max. = 80). In terms of education, the respondents were divided into two groups: 91 respondents (49.7%) had secondary education, and 92 respondents (50.3%) had higher education. The sample was selected using convenience sampling from the population of Slovak consumers.

3. Results

The questionnaire survey revealed different results in responses according to individual factors. The values were calculated from the response scale of 1 to 7, with the score for each factor expressed as the sum of responses corresponding to the items. The higher the average score, the more respondents leaned towards agreeable answers.

In the case of the factors Attitudes Towards Neuromarketing (mean = 19.11) and Word of Mouth (mean = 12.99), respondents showed more agreement with positive statements about neuromarketing. For the factors Privacy Invasion (mean = 12.33) and Behavior Manipulation (mean = 12.14), agreement was expressed towards statements about the threats of neuromarketing, with respondents showing slight agreement. Table 1 displays the results of the questionnaire survey.

Table 1. Descriptive statistics of questionnaire survey

	Attitudes Towards Neuromarketing	Word of Mouth	Privacy Invasion	Behavior Manipulation
Mean	19,11	12,99	12,33	12,14
Median	20,00	13,00	12,00	12,00
Std. Deviation	5,678	4,806	4,402	4,755
Minimum	4	3	3	3
Maximum	28	21	21	21

From Table 2, it can be observed that a statistically significant gender difference at a significance level of $p \leq 0.05$ was confirmed only in one case, specifically for item 13 (I believe that neuromarketing can influence my behavior) in the factor Behavior Manipulation. According to Table 3, on average, men had a more positive opinion (mean = 4.46).

Table 3. Descriptive statistics of item 13. of questionnaire survey

Item	Gender	N	Mean	Std. Deviation	Std. Error Mean
13. I believe that neuromarketing can influence my behavior	women	111	3,86	1,778	0,169
	men	72	4,46	1,964	0,231

Source: own processing

The second hypothesis assumed that there are statistically significant differences in opinions on neuromarketing based on education. The results of testing hypothesis H2 are shown in Table 4.

Table 4. Differences in opinions on neuromarketing based on education.

Source: own processing

From Table 4, it can be concluded that statistically significant differences based on the education of respondents at a significance level of $p \leq 0.05$ were confirmed in two items: item 4 (Neuromarketing should be used if an organization can afford to pay for its use) in the factor Attitudes Towards Neuromarketing, and item 8 (I believe that neuromarketing invades my privacy) in the factor Privacy Invasion. Table 5 indicates a higher level of agreement for item 4 among respondents with secondary education (mean = 5.22) and for item 8 among respondents with higher education (mean = 4.25).

Table 5. Descriptive statistics of item 4. and 8. of questionnaire survey

Item	Education	N	Mean	Std. Deviation	Std. Error Mean
4. Neuromarketing should be used if an organization can afford to pay for its use	secondary school	91	5,22	1,711	0,179
	high school	92	4,70	1,689	0,176
8. I believe that neuromarketing invades my privacy	secondary school	91	3,67	2,022	0,212
	high school	92	4,25	1,855	0,193

Source: own processing

Differences in the perception of neuromarketing based on the gender and education of respondents were confirmed in only three cases, therefore, based on our sample, it is not possible to conclude significant differences.

4. Discussion

The results of our study did not reveal significant differences in the perception of neuromarketing based on the gender and education of respondents. However, we found that respondents expressed positive views about neuromarketing and considered it a useful technique for businesses and marketing firms. On the other hand, respondents agreed with statements regarding the threats of neuromarketing, such as privacy invasion and manipulation of consumer behavior.

In comparison to the results of the study by Flores et al. (2014), which served as the basis for our methodology, their respondents achieved an average value of 14.56 in the Privacy Invasion factor, while our respondents had an average value of 12.33. Similarly, in the Behavior Manipulation factor, their respondents had an average value of 13.74, while our respondents had an average value of 12.14. In both cases, our respondents expressed less concern about these threats of neuromarketing.

Luna-Nevarez (2021), in their study on social media, states that two topics that interest consumers regarding neuromarketing are the lack of regulation and standards, leading to unethical practices by companies, and the tendency of companies to use their experiments and findings to manipulate consumers through subliminal advertising.

According to Hensel et al. (2017), any existing or future ethical code of neuromarketing should include five critical components: protection of research subjects, protection of vulnerable population groups from marketing exploitation, full disclosure of objectives, risks, and benefits, accurate media and marketing representation, and internal and external scientific validity.

Conclusion

Our research, similar to previous studies, suggests that respondents still have concerns about new techniques used in modern marketing. These concerns revolve around potential privacy invasion and undesirable influence on purchasing behavior. Nevertheless, they generally view neuromarketing positively when considering the perspective of businesses and marketing firms. Addressing the issue of negative consumer perception of neuromarketing can involve several measures and approaches.

Consumer awareness of what neuromarketing is and how it works can help alleviate their concerns and mistrust. Companies should provide clear and understandable information about the data they collect and how they use it, enabling consumers to feel more informed and in control of the situation. Firms should adhere to ethical standards and principles when utilizing neuromarketing techniques. Respecting consumer privacy and protecting their data should be a priority. Transparency towards consumers and safeguarding their rights can help rebuild trust. Companies should provide transparent information about how consumer data is collected, stored, and used. Accountability for the proper and ethical use of neuromarketing should be clearly defined and demonstrated.

A limitation of our research is the convenience sampling and the level of understanding and awareness among respondents regarding neuromarketing. Further research can be focused on neuromarketing research in terms of other socio-demographic variables such as social status or age, as well as differences in willingness to undergo the same type of research for medical purposes. This opens up opportunities for further exploration of this issue, considering other factors as well.

In conclusion, exploring consumer perceptions of neuromarketing research in the context of socio-demographic characteristics is crucial to navigate the ethical and practical implications of this cutting-edge marketing technique. By gaining insights into how different consumer groups respond to neuromarketing, we can foster a more informed and transparent relationship between businesses and their target audiences. Ultimately, this research can contribute to the development of ethical marketing practices that enhance consumer satisfaction while respecting individual rights and values.

Abstract

Research background: Neuromarketing uses concepts and techniques of cognitive neuroscience and examines the basic brain mechanisms involved in consumer decision-making. Neuromarketing influences the subconscious, which can reevaluate purchasing decisions.

Purpose of the article: The paper presents the results of the research that focuses on the neuromarketing attributes of Willingness, Attitude, and Awareness. It also approaches the determinants of business behaviour from the consumer's perspective, such as Engagement, Assertiveness, Manipulation, and Empathy for stress. The aim of the research is to determine the existence of statistically significant connections between the attributes of neuromarketing and the determinants of business behaviour.

Methods: 232 respondents aged between 18 and 60 took part in the research (average age was 25.65 years, standard deviation 7.864 years), of which 114 (49.1%) were women and 118 (50.9%) were men. The research was based on the correlation analysis using the Pearson correlation coefficient.

Findings & Value added: The research results show that there are statistically significant connections between the attributes of neuromarketing and the determinants of business behaviour. There are many other attributes of neuromarketing that can be investigated, but the research examined specific attributes such as Willingness, Attitude, and Awareness in the context of business behaviour determinants from the consumer's perspective, particularly Engagement, Assertiveness, Manipulation, and Empathy for stress. The results can contribute to creating better relationships with customers and retaining their trust.

Keywords: neuromarketing, attributes, business behaviour, determinants

JEL classification: M3, M31

1. Introduction

Neuromarketing represents the union of two scientific disciplines of neurology and marketing. The main reason for this connection was the creation of an effort to gain insight into the human brain, in the context of understanding the behaviour of consumers in their purchasing behaviour and decision-making. This insight brought the possibility of influencing their behaviour through the subconscious in the form of subliminal advertising, marketing based on smell, emotions, and the like. In today's society, it is very difficult to satisfy the constantly changing and growing preferences of consumers, so companies focus on the subconscious, which the consumers cannot influence despite their high preferences. The aim of the paper is to focus attention on neuromarketing as an independent scientific discipline and to examine specific attributes, namely Willingness, Attitude, and Awareness in the context of business behaviour determinants from the consumer's perspective, particularly Engagement, Assertiveness, Manipulation, and Empathy for stress.

1.1 Neuromarketing and attributes of neuromarketing

Neuromarketing uses concepts and techniques of cognitive neuroscience and examines the basic brain mechanisms involved in consumer decision-making. It has significantly advanced conventional marketing, which clarifies how unconsciously our reactions and emotions influence decision-making processes in consumer behaviour (Mileti et al., 2016). Neuromarketing is based on the condition that represents the

* Corresponding author: eva.benkova@unipo.sk

identification of sensory and motor systems in specific networks of brain cells, as well as on the condition that represents the fact that the observation of neural networks can reveal the very unconscious and rational characteristics of consumer decision-making that conventional quantitative and qualitative research cannot reveal (Achrol & Kotler, 2012). Dragolea & Cotirlea (2011) understand neuromarketing as a new field of marketing that uses medical technologies such as nuclear magnetic resonance (NMR) to study the brain's response to marketing stimuli.

According to Hubert & Kenning (2008), neuromarketing is the application of knowledge from neuroscientific consumer research within managerial practice. Kotler & Keller (2009) define neuromarketing as a means of describing the activities of the brain under the influence of marketing stimuli, which, using specific tools, cooperates with the psychological reaction to the stimuli exposed to it - advertisements.

The basic attribute of neuromarketing is the application of neuropsychology as a scientific field to marketing research. It deals with the study of human behaviour in consumer decision-making through research, its cognitive, affective, and sensorimotor reactions (Birknerová et al., 2021). The authors describe the following areas of research and use of neuromarketing: Subconscious research; Emotion research; Multisensory processes in the brain; Emotional-cognitive processing; Neurolinguistics; Neuromarketing personality research; Neuroscientific research on gender differences; Neuromarketing research of age (Birknerová et al., 2021).

1.2 Determinants of business and consumer behaviour

According to Kotler et al. (2007), a businessman performs various professional activities that include finding new customers, taking care of the customer, and activities leading to the success of the business through customer satisfaction. A businessman is a person who sells their products for resale, with or without further processing. The task of the businessman is to obtain all the necessary information and provide it to the customer. Determinants of business behaviour play a key role in business relations. Birknerová & Koval'ová (2018) describe the determinants - the engagement of businessmen, their assertive behaviour, handling of manipulative expressions, and empathy for stress. Frankovský, Štefko & Baumgartner (2006) use a situational approach to assessing the behavior.

The term 'engage' or 'engagement' is associated with co-creation, feedback, and interaction (Honora, Chih & Ortiz, 2023). Macey et al. (2009) define engagement as purposefulness and focused energy that others perceive as personal initiative, adaptability, effort, and persistence of an individual leading toward the achievement of the organization's goals. Alfes et al. (2010) define engagement as a means for achieving better results. Engaged salespeople are more innovative, interested in staying in the current organization, achieve better personal well-being, and perceive their workload as sustainable.

Assertiveness is defined by Ward & Holland (2018) as the ability to express one's thoughts and feelings, both positive and negative, in an open, direct, and honest way. Hamraoui et. al. (2023) add that assertiveness as the ability to express one's opinions, is closely related to self-esteem, and it is a skill that can be learned. Assertiveness is based on the assumption that it is possible for an individual to acquire skills, knowledge, and specific techniques that allow a person to overcome emotions in the communication sphere and, thanks to this, be able to effectively express their feelings and opinions (Lahnerová, 2012). The goal of assertiveness is to teach a person to adequately express their emotions, opinions, and attitudes (Lelková, 2014).

Manipulation is defined by Sinha (2022) as the action of handling and managing a situation skillfully to serve one's goals. It can have negative connotations, too, such as carrying out cunning behaviours to abuse and control others using emotional and psychological tactics to change or alter someone's perception or behaviour. Kubík (2023) defines manipulation as a behaviour where we force people to do things in a dishonest way that these people would never freely decide to do.

Empathy can be understood as the ability to empathize with the psychological state of another individual, to see through the eyes of another person, to listen with that person's ears, and to be able to feel with their heart. Bitektine & Song (2022) emphasize that empathy is associated with cooperation, the common good, and concern for others. According to Černohorský (2020), thanks to empathy, a person can estimate human behaviour, understand the consequences of a person's behaviour towards another person, be able to understand the wishes of others, their concerns, and fears, motivate people around them and be sensitive to their own stress, as well as the stress of other individuals.

The paper's research seeks the existence of connections between the mentioned attributes of neuromarketing and the determinants of business behaviour.

2. Methods

The goal of the research project is to find out the existence of statistically significant relationships between selected neuromarketing attributes using the neuromarketing attribute methodology (AN) and business behaviour determinants using the business behaviour determinants methodology (DOS).

The AN methodology (Birknerová et al., 2023) is aimed at capturing the respondents' attitudes toward selected attributes of neuromarketing. Its subject focuses attention on the respondents' potential willingness to undergo neuromarketing research, their opinions on neuromarketing as a scientific discipline, and their views on the application of various sales techniques in order to shape and subsequently indicate the direction of consumer decision-making.

The DOS methodology (Birknerová & Kovařová, 2018) is focused on the engagement of sellers, their contribution to the business, and positive relations with customers. The subject of the DOS methodology emphasizes the assertiveness of sellers and the benefit of assertive behaviour toward customers. Part of the DOS methodology is also the manipulation determinant, as well as empathy towards stress, which represents the consumer when showing empathy and consideration towards stressed-out sellers.

Attributes for neuromarketing and determinants for business behaviour are assessed on a Likert scale from 1 to 6, where 1 = definitely no and 6 = definitely yes, and evaluated by Pearson's correlation coefficient in the statistical program SPSS 26.

The research group consisted of 232 respondents aged between 18 and 60 (average age 25.65 years, standard deviation 7.864 years), of which 114 (49.1%) were women and 118 (50.9%) were men. Consumers indicated their status as senior managers 24 (10.3%), middle managers 14 (6.0%), junior managers 26 (11.2%), executives 38 (16.4%), part-time workers 53 (22.8 %), and students 77 (33.2%).

Based on the research objective, we established the hypothesis: "We assume that there are statistically significant correlations between neuromarketing attributes and determinants of business behaviour" which was verified by using Pearson's correlation coefficient (r).

3. Results

To evaluate the correlations between attributes and determinants, Pearson's correlation coefficient (r) was used. We recorded the results of the correlation analysis in Table 1.

Table 1. Relationships between neuromarketing attributes (AN) and determinants of business behaviour (DOS)

		Attributes of neuromarketing – AN methodology			
			Attitude	Willingness	Awareness
Determinants of the DOS methodology	Engagement	r	0.548**	0.097	0.340**
		p - value	0.000	0.139	0.000
	Assertiveness	r	0.597**	0.138*	0.418**
		p - value	0.000	0.036	0.000
	Manipulation	r	0.367**	0.103	0.448**
		p – value	0.000	0.088	0.000
	Empathy for stress	r	0.115	0.089	0.306**
		p - value	0.081	0.179	0.000

Source: own processing (2023)

By means of correlation analysis, the presence of several significant correlations between the factors of the DOS and AN methodology was found. The AN methodology factor of Attitude achieves a positive correlation score in connection with the DOS methodology factors of Engagement, Assertiveness, and Manipulation. AN methodology factor Willingness achieves a positive correlation score in only one correlation with the Assertiveness factor. The AN methodology factor Awareness achieves the highest correlation score, it is the factor's ability to correlate with all the DOS methodology factors. Overall, a sufficient correlation score was manifested between all selected factors of the DOS and AN methodology at least once.

The neuromarketing attribute of Attitude focuses on the Attitude of a person, as an individual, toward neuromarketing as a tool for creating advertising campaigns and as a tool that uses specific technologies for human brain research. This attribute is positively correlated with the business behaviour

determinants of Engagement, Assertiveness, and Manipulation. The Attitude attribute is positively correlated with the Engagement determinant because a positive opinion can positively influence a person's engagement and vice versa. The Attitude attribute is also positively correlated with the Assertiveness determinant, which means that an individual's assertiveness depends on the individual's opinion on neuromarketing as a scientific discipline, i.e. the more knowledge we have about neuromarketing, the more positive our opinion is, which we can interpret more clearly through assertive behaviour. Manipulation is another determinant that is positively correlated with the Attitude attribute. The reason for the positive correlation is the fact that individuals who hold a positive opinion on neuromarketing are not the target of marketers' manipulations because their perspective does not perceive neuromarketing sales techniques as manipulative. The attribute Attitude is not statistically significantly related to the determinant Empathy for stress because an individual with a positive opinion of neuromarketing does not show stress if exposed to neuromarketing techniques or methods.

Neuromarketing Willingness attribute focuses on the individual and their willingness to undergo neuromarketing research, the course of which consists in completing various types of research based on testing through various technologies used in neuromarketing research. The attribute of Willingness is positively correlated with the determinant of Assertiveness, which means that respondents with assertive behaviour who participate in neuromarketing research are not worried about the impact of research on their subconscious because they are capable communicators and can clearly interpret their feelings and opinions. A person with assertive behaviour represents the best candidate for participation in neuromarketing research.

The attribute of Willingness is not statistically significantly related to three determinants of the DOS methodology – Engagement, Manipulation, and Empathy for stress. The attribute of Willingness is not significantly related to Engagement, which means that despite the individual's willingness to undergo neuromarketing research, their future engagement in this field does not develop in any way, and often some motivation plays a significant role in participation in neuromarketing research, in most cases it is only a financial motivation. Another statistically insignificant correlation appears to be the attribute of Willingness with the determinant Manipulation, which simply means that the willingness to undergo neuromarketing research is in no way related to manipulation in consumer decision-making. We interpret the last correlation of the attribute Willingness with the determinant Empathy for stress as statistically insignificant, which represents a similar situation to the correlation with the determinant Manipulation. The individual's willingness to undergo neuromarketing research is not affected in any way by the expression of empathy towards stress during consumer decision-making between a customer and a merchant.

The neuromarketing attribute of Awareness is focused on the consumer's awareness and attitude when making a purchase decision. It presents the ways in which the consumer can be influenced and different types of tricks that influence the respondent during the purchase decision, whether it is the packaging, the price, or the quality of the product. The Awareness attribute is positively correlated with all business behaviour determinants used in the research. The correlation of the Awareness attribute with the Engagement determinant is statistically significant, which represents a situation where the consumer's behaviour is externally influenced, and the sellers' engagement during sales increases because they try to turn that influence into action and trigger a purchase decision in favor of the merchant. The Willingness attribute is also significantly correlated with the Assertiveness determinant, which means that the more it is outwardly known that the consumer's awareness is affected, the more beneficial the seller's assertive behaviour is. The Awareness attribute is positively correlated with the Manipulation determinant, which means that the more the consumer's awareness is influenced by the type and kind of product, the lower the effectiveness of the manipulation by the merchant will be. The Willingness attribute is also significantly correlated with the last determinant, Empathy for stress, which means that the more the consumer's awareness is affected, the more important the display of empathy and consideration from both sides.

Based on the correlation analysis using the Pearson correlation coefficient, it is possible to accept the hypothesis: *"We assume that there are statistically significant connections between the attributes of neuromarketing and the determinants of business behaviour."*

4. Discussion

Consumer and marketing researchers have been interested in understanding the potential influence of situations, circumstances, or contexts on consumer behaviour (Junghyun, Minki & Pradeep, 2022). MacInnis et al. (2020) state that marketing-relevant consumer research can affect significant stakeholders,

including marketing academics and as well as a broad range of market players (e.g., business practitioners, policymakers, the media, and society). Consumer and business behaviour is discussed from various perspectives and contexts. De La Rosa & Tully (2022) analyze the spending decisions of consumers. Frankovský, Ištvaníková & Štefko (2009) focused their research on the selection of behavior strategies based on the situation. Yin & Huang (2022) show that social jetlag decreases conspicuous consumption. Lawrence, Scheer, Crecelius & Lam (2021) find that the customer and seller experience the most desirable outcomes when the salesperson advocates strongly for both parties. Anderson, Chintagunta, Germann & Vilcassim (2021) examine the effects of a business support intervention of international professionals to improve consumption and business growth. This research project was based on the analysis of connections between neuromarketing attributes and the business behaviour determinants methodologies. Through correlation analysis, it was found that the attributes of the Neuromarketing attributes methodology are closely related to the determinants of the Business behaviour determinants methodology.

A possible move forward is to ensure awareness in the form of promotion. Along with the promotion of opportunities to participate in neuromarketing research, it is important to provide information about neuromarketing and, in this way, prepare the consumer for neuromarketing research and ensure the supply of information that will create a sense of security. Neuromarketing influences consumers' subconscious, which can reevaluate purchasing decisions. Engaged salespeople are, therefore, an important part of the business. When choosing them, attention should be paid to their empathic side, desire to work, and communication skills.

Conclusion

Awareness and knowledge of neuromarketing are key factors. The first way is information through the media, as well as social networks, where the customer spends more free time. This creates favorable conditions for the promotion of projects focused on collective knowledge. The second way is teaching neuromarketing in schools. Most marketing schools do not pay enough attention to neuromarketing despite its influence on consumers every time they visit a shopping center to make a purchase.

If a store has assertive employees, it can be seen as prosperous, as customers can turn to them at any time if needed. Nowadays, consumers are more often exposed to manipulative behaviour, which makes them able to detect it in time and avoid it. Disclosure of manipulation by consumers can damage the reputation of the business. In order to build trust with the customer, it is important to avoid undesirable forms of behaviour as well as stress. It is advisable to show empathy towards customers, as it leads to openness and friendliness and relieves the stress of purchasing decisions. A negative atmosphere caused by inappropriate forms of behaviour leads to the creation of stress and pressure on the customer. A friendly atmosphere will ensure that they do not buy under pressure and return as loyal consumers.

There are many other attributes of neuromarketing that can be investigated in the same way, which in other cases could probably achieve higher correlation scores, which could mean elucidating new connections connected to purchasing decisions and the subconscious of human thinking. This is a possible direction for further research.

Engaging with Brands Online: A Study of Consumer Online Brand Related Activities on Tik Tok as a Part of Brand E-commerce

Ludovít Nastišin^{1,*}, *Róbert Štefko*¹, and *Richard Fedorko*¹

¹ University of Presov, Department of Marketing and International trade, Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: This research primarily delves into the domain of social media engagement, focusing on the consumer's Online Brand-Related Activities (COBRAs) as a part of e-commerce ecosystem on platforms like TikTok. It aims to comprehend the key motivators for consumers' escalating levels of engagement, such as the need for information, desire for entertainment, social interaction, and remuneration, while examining how these activities influence brand awareness, referrals, purchase intent, and customer loyalty in the form of Word of mouth. TikTok, with its unique short video content format, high user engagement, and potential for content virality, provides a suitable landscape for studying these engagement behaviors.

Purpose of the article: The study evaluates the interplay between specific motivations, COBRAs, and their influence on e-commerce branding, particularly word of mouth, using TikTok within the Slovak market as a model.

Methods: Our approach combined Confirmatory Factor Analysis (CFA) and Maximum Likelihood Estimation (MLE) to study attitudes related to e-commerce brand activities on TikTok. Metrics such as Average Variance Extracted (AVE), Composite Reliability (CR), and Root Mean Square Error of Approximation (RMSEA) were crucial for latent variable analysis. The Partial Least Square - Path Modeling (PLS PM) method further delineated relationships.

Findings & Value added: Our results affirm five hypotheses, particularly noting the impact of information and entertainment motives on e-commerce COBRA content consumption on TikTok. The remuneration motive consistently influenced all COBRA and e-commerce relationships. A significant connection was identified between content consumption and word of mouth for online shopping brands. Differences from earlier studies possibly arise from TikTok's distinct nature, expanding our insights into e-commerce user behavior on the platform.

Keywords: consumer, activity, motive, TikTok, e-commerce

JEL classification: M31

1. Introduction

Social media has radically changed the way customers communicate and interact with everyone and with brands. The growing number of customers on these platforms has created new opportunities and challenges for brands. Active customer engagement on these platforms has become fundamental to value creation and brand strategies. Promoting customer interaction with content on social media is often a key element of brands' online strategies. A framework for online customer engagement, referred to as COBRA (Consumers' Online Brand-Related Activities), defines three levels of customer engagement. The first tier, content consumption, is a fundamental step to increasing brand awareness and acquiring new fans. More active engagement, such as contributing to a brand's content through comments or even creating their own content, represent higher levels of engagement that are more challenging for brands to achieve.

This study focuses on understanding what motivates consumers to higher levels of engagement. As part of the analysis, it assesses how these activities influence brands and, based on these findings, seeks to identify which activities are most relevant to brands.

* Corresponding author: ludovit.nastisin@unipo.sk

In addition, research is also being conducted to assess the brand implications of COBRA activities to better understand how these activities affect brand awareness, referrals, purchase intent, and customer loyalty. As an example, the social network TikTok is used to analyze the different trajectories of motivations and their impact on COBRA activities and consequently on "Word of Mouth" about the brand. This approach allows to generate a detailed view of customer engagement on social media and its impacts on brands.

1.1 Consumers' online brand related activities

The research of consumers' engagement with brands, known as Consumers' Brand-Related Activities (COBRAs), has been significantly informed by the U&G Uses and gratification theory. According to this theory, individuals selectively use different forms of media based on their personal needs and expectations, with the goal of satisfying those needs. Social media represents an intriguing dimension of this landscape, given that it requires active user participation. In their work, Muntinga et al. (2011) segmented this participation into three distinct tiers of involvement: low-level engagement, which consists of content consumption (such as watching videos or reading posts); mid-level engagement, characterized by content contribution (including rating products and commenting on posts); and high-level engagement, represented by content creation (like producing user-generated videos, images, or blog posts).

Four primary motivations have been identified as driving these engagement levels: the need for information, the desire for entertainment, social interaction, and remuneration (as proposed by Dolan et al., 2017; Schivinski, 2021; Azar et al., 2016). The information motivation is central to the function of virtual communities, directing consumers in their search for product or brand-related information, such as reviews (as discussed by Foster et al. 2010; Lin & Lu 2011; Zaglia 2013). Entertainment motivation is understood as the pursuit of relaxation, escape, and pleasure, which has been observed to increase community participation and encourage content sharing (referenced by Cheung et al., 2011; Lin & Lu, 2011). Social interaction serves as a means of strengthening social identity and sharing experiences with a brand, and has been predicted to boost levels of content consumption, contribution, and creation (as mentioned by Kang et al., 2014; Luarn et al., 2015). Lastly, remuneration motivation is driven by economic incentives and has been least studied, but is believed to encourage involvement in brand-related activities (as posited by Azar et al., 2016; Davis et al., 2014).

COBRAs, fueled by these motivations, can have a broad impact on brands. They may stimulate brand awareness and generate Word of mouth, further enhancing consumer engagement (as highlighted by Pöyry et al., 2013; De Vries & Carlson, 2014; Jahn & Kunz 2012).

1.2 Social media engagement on TikTok

TikTok has rapidly become a platform of paramount importance for social media engagement. According to Datareportal's "Digital 2021 Global Overview Report", TikTok was the seventh most used social network in the world in 2021, boasting over 689 million monthly active users worldwide. Its unique format, focused on short, user-generated video content, often set to popular music, has resulted in high user engagement. This has opened new avenues for personal expression, creative content production, and marketing opportunities. A report by Influencer Marketing Hub (2021) highlighted that TikTok users spent an average of 52 minutes per day on the platform, indicating high levels of user interaction and content consumption.

Research from the Pew Research Center (2020) demonstrated that the platform's user base skews young, with nearly half of all U.S. adults between the ages of 18 and 29 reported using the app. This demographic concentration presents specific opportunities and challenges for brands seeking to engage audiences on TikTok. It's worth noting that while TikTok started as a platform mostly for dance and lip-syncing videos, it's since expanded to include a wide range of content, from educational to comedic skits, which diversifies the potential for user engagement. Brands interested in leveraging TikTok for business can take advantage of the platform's unique algorithm, which tailors content distribution based on user behavior, making it possible for content to go viral even without a large following (Hootsuite, 2021).

2. Methods

This study aims to contribute significantly to the existing body of knowledge on the topic. The primary goal can be stated as: to evaluate the importance of the effects resulting from selected motivations and consumers' brand-related activities' trajectories, and subsequently, to assess the significance of the effects of these activities' trajectories on the brand in terms of Word of mouth. The investigation is tailored

towards the Tik Tok social network platform within the scope of the Slovak market. In relation to the goal mentioned above, the research query has been developed: does a meaningful trajectory exist between the examined motivations, activities, and the impact on the brand in the context of the Tik Tok social network? This question forms the foundation for the following hypotheses to be proposed:

- H1:** Consumer information motivation has a significant relationship with selected COBRA activities associated with the brand on the social network TikTok.
- H2:** Consumer entertainment motivation has a significant relationship with selected COBRA activities associated with the brand on the social network TikTok.
- H3:** Consumer social interaction motivation has a significant relationship with selected COBRA activities associated with the brand on the social network TikTok.
- H4:** Consumer remuneration motivation has a significant relationship with selected COBRA activities associated with the brand on the social network TikTok.
- H5:** Selected consumer COBRA activities associated with the brand on the social network TikTok have a significant relationship with Word of mouth about the brand.

All the data that constitute the subject of this analysis are of a primary character. Data were collected over two months, from February 2023 to March 2023. The research was conducted via Google Forms in the form of an anonymous questionnaire. The questionnaire was distributed through social networks and email communication. Through this, 314 respondents' responses were collected, however, 27 (8.6%) of them were disqualified due to incorrect completion or some other criterion. There were several reasons for disqualification, such as not completing all mandatory questions in the questionnaire or respondents' age, which was outside the age interval of the target sample. Based on the gathering of available resources, data collection, and our own materials obtained from February 2023, we can state that the Slovak market is most represented by 2 age groups of reachable audiences: 18-24 years and 25-34 years. This criterion was also applied in our research file, and the results of the analysis can be generalized precisely for a specific age category. Another criterion was that respondents have an active account on the social network TikTok.

The questionnaire contained a total of 35 questions, of which 6 pertained to the respondents' demographics and behavior in the realm of social networks, and 29 questions were dedicated to the explored COBRA (Consumer Online Brand-Related Activities) concept on the social media platform TikTok. These questions were identified by an exploratory factor analysis (EFA) in the study by Piehler et al (2019) under the conditions of social networks. In our analysis, manifest variables were presented, the reduction of which yielded the latent variables of the COBRA concept under the conditions of the TikTok social network. A 5-point Likert scale of agreement was used to detect these constructs. Factors related to the measurement of consumption, contribution, and creation of content from the COBRA concept were published in studies by Muntinga et al. (2011), Men and Tsai (2013), and Azar et al. (2016). Factors describing the motive of social interaction and rewards were formulated in the study by Hennig-Thurau et al. (2004), for the information motive in the study by Ko et al. (2005), and for the motivation of entertainment by Taylor et al. (2011).

Table 1. Research sample - basic demographic structure and social media use

CHARACTERISTICS	PERCENTAGE (%)
Characteristics of the gender of respondents	
Male	85 (29,62%)
Women	202(70,38%)
Age characteristics of respondents	
18 - 24 years old	201 (70,03%)
25 - 34 years old	86 (29,97%)
Characteristics of the respondents' region of residence	
Banská Bystrica Region	6 (2,09%)
Bratislava Region	22 (7,67%)
Košice Region	60 (20,91%)
Nitra Region	6 (2,09%)
Prešov Region	168 (58,54%)
Trenčín Region	6 (2,09%)
Trnava Region	8 (2,78%)
Žilina Region	11 (3,83%)

Characteristics of the social status of respondents	
Student	175 (60,98%)
Employed	86 (29,97%)
Self-employed	11 (3,83%)
Unemployed	6 (2,09%)
Other	9 (3,13%)
Number of active social media accounts	
2 active accounts	61 (21,25%)
3 active accounts	89 (31,01%)
4 active accounts	78 (27,18%)
5 or more active accounts	59 (20,56%)
Number of brands actively followed on social networks	
1 - 2 brands	33 (11,50%)
3 - 5 brands	56 (19,51%)
5 - 10 brands	49 (17,07%)
10 - 15 brands	52 (18,12%)
15 - 20 brands	31 (10,80%)
20 - 30 brands	13 (4,53%)
30 or more brands	53 (18,47%)

Source: own processing (2023)

The implementation of the main goal mainly relies on the application of Confirmatory Factor Analysis (CFA) using Maximum Likelihood Estimation (MLE). With the help of this procedure, it was possible to exclude individual items that did not disrupt, or did disrupt, the internal structure of the tool's factors. Subsequently, this captured selected areas of attitudes and perception of the issues of activities associated with the brand under the conditions of the TikTok social network. The Average Variance Extracted (AVE) and Composite Reliability (CR) metrics were implemented according to Fornell et al. (1981) and Hair et al. (2014). The mentioned AVE and CR metrics were applied to describe and assess the suitability of the construction of the analyzed latent variables. When assessing the manifest latent ones for CFA, we used the Factor Loadings (FL) metric. We further applied the Comparative Fit Index (CFI), Root Mean Square Error of Approximation (RMSEA), and also the Standardized Root Mean Square Residual (SRMR). The mentioned metrics are considered common procedures for the application of this type of analysis. After the Confirmatory Factor Analysis (CFA), we conducted the analysis using the Partial Least Square - Path Modeling (PLS PM) method, which describes the relationships under investigation.

3. Results

In the first stage, confirmatory factor analysis (CFA) was used for the purpose of subsequent application of the PLS PM equations. Confirmatory factor analysis was performed on a sample of 287 observations, and at 351 degrees of freedom, the result of a given confirmatory analysis is significant (p value $\chi^2 < 0.001$).

Table 2. Confirmatory analysis of the COBRA model on TikTok

Manifest Variables	Latent Variables	LF	CR	AVE
Info_1 Info_2 Info_3	Information (motive)	0.912 0.882 0.939	0.936	0.830
Entertain_1 Entertain_2 Entertain_3 Entertain_4	Entertainment (motive)	0.942 0.922 0.945 0.922	0.964	0.870
SocInter_1 SocInter_2 SocInter_3	Social Interaction (motive)	0.881 0.911 0.877	0.919	0.792
Remu_1 Remu_2 Remu_3	Remuneration (motive)	0.919 0.949 0.912	0.048	0.959

Cons_1 Cons_2	Content consumption (activity)	0.964 0.964	0.963	0.929
Contr_3 Contr_4 Contr_5 Contr_6	Content contribution (activity)	0.874 0.905 0.887 0.903	0.940	0.796
Crea_1 Crea_2	Content Creation (activity)	0.977 0.977	0.977	0.955
WOM_1 WOM_2 WOM_3 WOM_4 WOM_5 WOM_6	Word of mouth (brand impact)	0.805 0.916 0.911 0.902 0.899 0.836	0.953	0.773

Source: own processing (2023)

The PLS PM analysis was performed using the bootstrap method at 500 iterations (bootstrap resamples) by applying a centroid weighting scheme, and 27 manifest and 8 latent variables were entered into the calculation.

Table 3. Test selected effects for content consumption on TikTok (PLS PM model)

Content Consumption				
DV	Estimate	Std. Error	T value	Pr(> t)
Intercept	0.000	0.040	0.000	1.000
Information	0.174	0.059	2.946	0.003
Entertainment	0.440	0.062	7.061	0.000
Social interaction	0.132	0.063	2.104	0.036
Remuneration	0.128	0.048	2.690	0.008

Source: own processing (2023)

The first dependent variable we tested is content consumption. In the case of brand-related content consumption, significant effects were observed at the $\alpha < 0.05$ level in all the motives analyzed, i.e., the information motive, the entertainment motive, the social interaction motive, and the reward motive. In all the mentioned domains, it was a positive effect, as a higher value of the mentioned motives can be expected in the domain of consumption of brand-related content in the conditions of TikTok social network.

Table 4. Test selected effects for content contribution on TikTok (PLS PM model)

Content Contribution				
DV	Estimate	Std. Error	T value	Pr(> t)
Intercept	0.000	0.048	0.000	1.000
Information	0.136	0.070	1.924	0.055
Entertainment	0.093	0.075	1.249	0.213
Social interaction	0.196	0.075	2.619	0.009
Remuneration	0.299	0.057	5.244	0.000

Source: own processing (2023)

The second dependent variable we tested is represented by the activity of contributing to brand-related content. Significance at the $\alpha < 0.05$ level was confirmed in this case only in two motifs. These were the motives of social interaction and reward. In both cases, a positive effect was reported and thus we can expect that if the value of the social interaction motive or the reward motive is higher, the contribution rate of brand-related content on the social network TikTok may also increase.

Table 5. Test selected effects for content creation on TikTok (PLS PM model)

Content Contribution				
DV	Estimate	Std. Error	T value	Pr(> t)
Intercept	0.000	0.055	0.000	1.000
Information	0.115	0.079	1.454	0.147
Entertainment	-0.018	0.084	-0.218	0.828
Social interaction	0.151	0.084	1.789	0.075
Remuneration	0.234	0.064	3.648	0.000

Source: own processing (2023)

The creation of brand-related content was the last of the theme-level effects examined. In this case, significance at the $\alpha < 0.05$ level was observed for only one motive, and that was reward. We can conclude that this is a positive effect. As with the previous effects, we can expect that if the value of the reward motive is higher, so will be the rate of brand-related content creation in TikTok social network terms.

Table 6. Test selected effects for Word of mouth on TikTok (PLS PM model)

Word of mouth				
DV	Estimate	Std. Error	T value	Pr(> t)
Intercept	0.000	0.043	0.000	1.000
Consumption	0.506	0.052	9.675	0.000
Contribution	0.233	0.064	3.669	0.000
Creation	0.040	0.057	0.711	0.478

Source: own processing (2023)

The last effect we analyzed was the effect of word of mouth activities about the brand in terms of the TikTok social network. A significant effect at the $\alpha < 0.05$ level was confirmed in two cases, namely content consumption and brand-related content customization. In both cases, this was a positive effect. Based on the above findings, we can expect higher levels of word of mouth at higher levels of consumption.

4. Discussion

Based on the above results, we can accept all 5 stated hypotheses. We observed only one significant effect of information motive with COBRA content consumption activities in the TikTok social network condition by confirmatory analysis. Since the given effect is even weaker, more detailed research would be appropriate. To some extent, we can see the similarity with the scientific studies of Piehler, et al. (2019) and the study of de Vries (2012), where information motive was also not observed as significant. However, the results of non-significance of the information motive on two of the three activities examined by us do not go in line with the findings of Jahn and Kunz (2012) and Pöyry, et.al (2013). The reason for this inconsistency may be due to the different conceptualization of all four motivations in the selected studies and also due to the specificity of the social network in question. The significance of this single but not strong enough effect towards content consumption can also be explained by the fact that TikTok has a myriad of varied and extensive content in the form of videos and is also one of the most used apps ever. In addition to entertaining videos, users on this social network can often find various tips and techniques to help them solve a problem. Information as such is not enough to motivate people to contribute or create some content. Regarding the entertainment motive in the TikTok social network setting, like Piehler, et al. (2019), we observed only one significant trajectory of the relationship of the entertainment motive to the activity of consuming brand-associated content. The examined findings related to the significance of that relationship have support in many scholarly studies such as De Vries and Carlson 2014; Jahn and Kunz 2012; Pöyry, Parvinen, and Malmivaara 2013. In the case of non-significance of the fun motive in relation to contribution activities, this is supported by the study of de Vries et al. (2012). The definition of the fun motive plays an important role here. The latter does not require particularly interactive behaviour to fulfil the needs related to the fun motive. To a large extent, behaviour associated with consuming brand-related content is sufficient for this. In a study by Pletikosa Cvijikj and Michahelles (2013), some contradictory results were observed. However, that study discussed a different definition of the entertainment motive

and also exhibited several elements of the social interaction motive. Therefore, it is particularly important to be able to distinguish between these two motives, which may have many similarities in their definitions, but the effect on COBRA activities may be quite different. In the case of social interaction on the social network TikTok, we identified the significance of two trajectories to the activities of consuming content and contributing to content. No significant relationship was identified to the content creation activity. This may be due to the nature of the social network in question, as it is much easier to share something than to create the content in question. For this finding, we identified a similarity in the study by Buzet et al. (2020). We can also support the signaling of the motive for social interaction as a whole with findings in selected scholarly studies (Piehler et al. 2019; Davis, Piven, and Breazeale 2014; De Vries and Carlson 2014; Dolan 2015; Jahn and Kunz 2012; Kang, Tang, and Fiore 2014; Luarn, Lin, and Chiu 2015). On the TikTok social network, the remuneration motive emerged as significant for all three relationships to COBRA activities. In the case of the remuneration, the brand requires a higher level of interaction or engagement. A consumption metric such as the number of video views is social network specific and is a particularly important variable in the TikTok social network algorithm. It can also help other content perform better. Our results support the findings of Pletikos Cvijikj and Michahelles (2013) who identified an effect on comments, Luarn et al. (2015) who identified an effect on likes, and Piehler et al. (2019) who identified effects on contributing and creating. Our findings thus broaden the perspective of the specifics of the network in question and thus enrich the knowledge base related to the remuneration motive and its effect on COBRA activities. The effects of COBRA activities on word of mouth as offline brand waste were the next set analyzed. In the case of the social network TikTok, we identified two trajectories as significant. These were content consumption and content contribution activities and their impact on the brand. The result of our investigation is supported by the study of Piehler et al. (2019) who also identified the same significance and equally in relation to Word of Mouth. In studies by Jahn and Kunz (2012) and de Vries and Carlson (2014), we found partial support for this pathway in the context of brand loyalty. In the present study, significance was also confirmed in the case of content contribution, but as this was a broader concept related to brand loyalty, which Word of Mouth only partially constitutes. Therefore, omitted aspects of loyalty that were not included in our investigation may play a significant role here. We can also see a partial correspondence in the study by Pöyry, Parvinen, and Malmivaara (2013), in which content consumption activities were significant in the same way in our study, but not anymore in the case of participation in content contribution and creation activities.

Conclusion

Our analysis focused on the social network TikTok, through which we determined and appealed to the call of authors Piehler et al. (2019). In this study, the given contexts were analyzed exclusively on the social network Facebook and in the conditions of the German market. They assumed that the individual results would be different based on different social networks and our investigation confirmed this assumption. The reason for this variability is the uniqueness of social networks and as there are still enough platforms that have not yet been explored. Therefore, it would be a good idea to replicate this research to other social networks. It is also essential to explore the contexts in question in other cultures or countries, as according to the authors Tsai and Men (2017) this can be a very important factor. Another limitation is related to the potential impacts of COBRA activities. Because this analytic investigation focuses exclusively on the word-of-mouth aspect, future studies should examine the visible effects of COBRA on other brand-related outcomes. In addition, potential variables such as the social status of consumers, the market category in which the brand might operate, the size of the brand site community, or engagement in different product categories were not included in the present analysis. All of these variables may be important factors in future research. The present study is one of the first to use confirmatory analysis to confirm the exploratory model of motives and consequences of COBRA activities put forward by Piehler et al. (2019). They were the first to use four categories of motives and a spectrum of activities in three stages in relation to the offline consequence of word of mouth towards a brand. We also drew attention to a number of differences in the outcomes of the selected motives and activities, based on which we later postulated potential reasons from our perspective. We then formulated implications based on these results that flowed from them. The results of our analytical investigation are significant in answering questions such as why consumers engage in brand-related activities on social media, what types of brands are most likely to be able to get consumers to engage with social media, or what types of marketing activities influence consumer interaction with brand-related content in a social media environment. From a global perspective, it is clear that individual COBRA activities could be applied by social media

administrators to individual consumer motives and thus increase the chances of achieving the desired outcome for the brand. Thus, we consider the aim of the study to be fulfilled and conclude that we have contributed to the state of theoretical knowledge through our observed significance of the trajectories of the relationships between motives, COBRA-related activities and offline impacts for the brand in the form of word of mouth.

Socio-Demographic Differences in Consumer Behavior and Purchase Intentions: The Role of Sustainability in Online Shopping

Lenka Štofejová^{1,*}, Štefan Král¹, Richard Fedorko¹, and Mária Tomášová¹

¹ University of Presov, Department of Marketing and International Trade,
Faculty of Management and Business, Konštantínova 16, 080 01 Prešov, Slovakia

Abstract

Research background: With consumers becoming more environmentally conscious, sustainability has emerged as a crucial element in the online shopping landscape. The demand for eco-friendly products and brands is steadily increasing. Various socio-demographic factors also influence the online purchasing decisions and behavior of consumers, based on which it is also possible to divide consumers into different market segments.

Purpose of the article: The research aimed to explore disparities in consumer behavior and purchase intentions related to sustainability in the context of online shopping, considering specific socio-demographic factors. The focus was on specific socio-demographic characteristics, particularly education and net monthly income.

Methods: Sources of secondary data were international scientific and statistical databases. The research employed a questionnaire survey as the primary data collection method, targeting 506 Slovak consumers as the sample. Socio-demographic differences among the respondents were examined using the Kruskal-Wallis H test, utilizing the IBM SPSS Statistics 26 program.

Findings & Value added: The findings from the study revealed noteworthy variations in environmentally sustainable consumer behavior and purchase intentions when shopping online, which were found to be influenced by their educational background and net monthly income. Significant differences in future purchase intention were found, with consumers holding the 1st degree university education scoring the highest. The results indicate that by supporting the increase of consumers' environmental awareness, it is possible to achieve their pro-environmental online shopping behavior. These results provide valuable insights for online sellers to develop targeted marketing strategies that take into account the socio-demographic differences among consumers.

Keywords: online shopping, e-commerce, sustainability, online consumer, purchasing behaviour

JEL classification: M14, M30, M31

1. Introduction

E-commerce has had a profound influence on the market dynamics, reshaping it and opening up a myriad of possibilities for businesses and consumers alike. The convenience, speed, and ease of online shopping have greatly enhanced the consumer experience. Businesses make use of e-commerce as a means to sell their products or services and optimize profitability by streamlining costs. The setup and maintenance of an online store entail lower expenses compared to a brick-and-mortar store. Furthermore, e-commerce businesses operate 24/7, providing uninterrupted service and relying solely on internet connection. The flexibility of e-commerce allows businesses to operate without fixed opening hours or the requirement for staff availability during specific times. Furthermore, the extended accessibility provided by online platforms grants e-commerce businesses the opportunity to reach a wider pool of customers. A vital aspect of their operations involves customer targeting and segmentation, which is simplified by collecting relevant consumer information. In the context of e-commerce, the process of data collection is notably more efficient (Nolan 2022).

In today's consumer landscape, engaging in online shopping has become an immensely popular endeavor. The online market provides individuals with the opportunity to engage in more accessible,

* Corresponding author: lenka.stofejova@unipo.sk

convenient, and efficient shopping experiences. It empowers consumers to explore and purchase a diverse array of products and services at their own convenience, from any location. Moreover, online platforms consolidate all relevant information about the offerings in one place, including customer reviews. It is not uncommon for online stores to offer lower prices compared to their brick-and-mortar counterparts (Pillemer 2020).

When making a purchase, consumers embark on a decision-making journey that significantly shapes their buying behavior and purchase intentions. They carefully evaluate the options available to them, weighing the advantages and disadvantages of each potential purchase. Numerous factors contribute to consumer buying behavior, with social, psychological, and personal elements being recognized as particularly influential (Fontanella, 2022). Personal factors encompass demographic information, such as age, gender, and cultural background, which shape the individual's buying tendencies. Psychological factors, including attitudes, opinions, perceptions, and motivations, greatly impact the consumer's response to marketing campaigns. Additionally, social factors encompass the consumer's affiliations with different social groups throughout their life, as well as their income and level of education, all of which play a pivotal role in their purchasing decisions and intentions (Radu 2023). Extensive research conducted by Nagra and Gopal (2013) has demonstrated that gender, age, and income play a significant role in shaping consumer shopping behavior and purchase intentions. When examining online consumer behavior and purchase intentions, various factors come into play, including seller characteristics and credibility, product or service attributes and quality, and website quality. Additionally, delivery options and time, price, security, customer service, payment methods, and supplementary services can all influence consumer behavior (Wu et al. 2018). Svajčiaková (2023) emphasizes that the clarity and uniqueness of the website, ease of navigation, sufficient product information, price comparisons, delivery time, shipping costs, reviews, and shopping safety are all influential factors in online consumer purchasing behavior.

As the number of Internet users continues to increase annually, there is a parallel rise in the number of online shoppers. In line with this trend, consumers are increasingly considering the environmental impact of their purchases. The aspect of sustainability has gained prominence in consumer behavior and intentions. Caldwell (2021) highlights the growing emphasis on renewable energy sources, sustainable environmental practices, and a long-term sustainable mindset among consumers and governments alike. Consequently, many consumers make brand choices based on the brand's commitment to environmental issues. Embracing sustainability and tailoring products or services accordingly can lead to increased popularity, trustworthiness, and customer loyalty for a seller. Today, consumers place great importance on the materials used in products, the brand's commitment to environmental sustainability, and its endeavors to minimize negative effects associated with its activities. The increasing environmental awareness has long influenced public consciousness, making environmental issues a significant subject that motivates individuals to adopt pro-environmental behavior (Chang et al. 2015). Despite the emphasis on the environmental outcomes of pro-environmental behavior, researchers in this area often overlook behavior with tangible environmental effects. Nevertheless, there is general agreement that e-commerce, in numerous scenarios, offers a more environmentally friendly alternative to conventional commerce (Lange et al. 2018).

Socio-demographic factors, including gender, age, income, occupation, education, and lifestyle, have a substantial influence on both the inclination to purchase eco-friendly products and the environmental purchasing behavior of consumers (Comi, Nuzzolo 2016). Previous studies have revealed varied outcomes and significant distinctions in purchase intentions and pro-environmental purchasing behavior concerning these socio-demographic characteristics. (Nielsen 2018). It can be argued that consumer behavior is a vast and complex topic. Gaining a comprehensive understanding of consumer behavior and having a perfect grasp of their habits and needs is a challenging task. Accurately predicting consumer behavior in specific situations is nearly impossible. Therefore, sellers strive to exert influence on consumer behavior in a desired manner. Given the ever-changing purchasing behavior of customers, it becomes crucial for businesses to adapt their marketing strategies accordingly. Environmental issues have a significant influence on customers' emotions and purchase intentions. To effectively engage with their target audience, green marketers must have a deep understanding of their customers, including their consumer behavior and the underlying factors that guide their decisions. Analyzing and comprehending customers' purchasing intentions becomes paramount as it allows for the prediction of their future purchasing behavior (Fontes et al. 2021).

2. Methods

The objective of the study was to examine variations in consumer behavior and purchase intentions concerning sustainability within the context of e-commerce. The focus was on specific socio-demographic characteristics, particularly education and net monthly income. The research aimed to derive managerial implications from the findings, and the following research questions were formulated:

RQ1: Are there significant differences in consumer behavior with regard to the aspect of sustainability in the context of e-commerce in terms of selected socio-demographic characteristics of consumers?

RQ2: Are there significant differences in the intention to purchase green products online in terms of selected socio-demographic characteristics of consumers?

Based on the formulated research questions, the following research hypotheses were established:

H1: We assume that there are statistically significant differences in consumer behavior with regard to the aspect of sustainability in the context of e-commerce in terms of selected socio-demographic characteristics.

H1a: We assume that there are statistically significant differences in consumer behavior with regard to the aspect of sustainability in the context of e-commerce from the point of view of education.

H1b: We assume that there are statistically significant differences in consumer behavior with regard to the aspect of sustainability in the context of e-commerce in terms of net monthly income.

H2: We assume that there are significant differences in the intention to purchase green products online in terms of selected socio-demographic characteristics of consumers.

H2a: We assume that there are significant differences in the intention to purchase green products online in terms of education.

H2b: We assume that there are significant differences in intention to purchase green products online in terms of net monthly income.

To conduct the literature review, secondary sources from international scientific and statistical databases were utilized. The primary data was obtained through the inquiry method, employing a questionnaire survey created using Google Forms. The data collection period spanned from November 2022 to February 2023. The research sample was selected based on availability and voluntariness, utilizing a nonprobability sampling method known as convenience sampling (Lunsford and Lunsford, 1995). The sample primarily consisted of Generation Y and Generation Z consumers. The research sample was selected based on the rationale that young consumers are frequent users of digital technologies, including online shopping, and show a greater concern for environmental protection. The classification of generations followed the framework proposed by Young et al. (2017). The questionnaire was distributed to respondents using the authors' personal e-mail database and also via the social network Facebook.

At the beginning of the questionnaire, respondents were asked to provide four socio-demographic details, namely gender, year of birth, education attained, and net monthly income. The main body of the questionnaire encompassed 11 items designed to gauge respondents' agreement or disagreement on a 7-point Likert scale, ranging from 1 (completely disagree) to 7 (completely agree). These items focused on consumer behavior in terms of e-commerce and the inclination to purchase environmentally-friendly products online. Specifically, six items explored respondent's environmentally-conscious consumer behavior (Barbarossa and De Pelsmacker 2014; Peterson 2021; Cuc 2022), while five items delved into their intentions to buy green products (Yang et al. 2018; Peterson 2021).

In order to statistically analyze the obtained results, the following techniques were employed. To assess the internal consistency reliability, Cronbach's Alpha (α) coefficient was computed. As per Kline (2011), reliability coefficients are evaluated as follows: $\alpha \geq 0.7$ indicates adequate internal consistency of responses; $\alpha \geq 0.8$ suggests very good internal consistency of responses; $\alpha \geq 0.9$ signifies excellent internal consistency of responses. The normality of the data was examined using the Shapiro-Wilk normality test (or alternatively, the Kolmogorov–Smirnov test). Subsequently, the non-parametric Kruskal-Wallis H test was used to explore differences among respondents. The statistical software IBM SPSS Statistics 26 was employed for data processing.

3. Results and Discussion

The initial research sample comprised 537 participants, and after excluding incomplete or irrelevant responses, the final sample consisted of 506 participants. Table 1 presents the socio-demographic characteristics of the finalized research sample.

Table 1. Frequency table of socio-demographic characteristics of respondents

Item	Value	Frequency	Percentage
Gender	Male	146	28.9
	Female	360	71.1
Generation	Generation Y	313	61.9
	Generation Z	193	38.1
Education	Secondary education	289	57.1
	University education - 1st degree	150	29.7
	University education - 2nd degree	67	13.2
Monthly Income	less than 500 €	326	64.4
	501 - 1000 €	110	21.7
	1001 - 1500 €	46	9.1
	1501 - 2000 €	12	2.4
	2001 - 2500 €	6	1.2
	more than 2500 €	6	1.2

Source: author's own work based on results of the questionnaire survey

Table 2 presents the descriptive statistics (Mean, Median, Standard Deviation, Skewness, and Kurtosis) for each aspect and specific questionnaire items obtained during the evaluation and analysis of the questionnaire responses. It is noteworthy that within the Environmental Purchasing Behavior aspect, the statement "I prefer online shopping to brick and mortar" received the highest level of agreement among respondents. Similarly, in the Future Purchase Intention aspect, the statement "I believe that I will become more interested in shopping for green products online in the future" received the highest level of agreement. Furthermore, Table 2 includes Cronbach's Alpha coefficient values, which indicate the internal consistency of the measuring instrument for the investigated aspects.

Table 2. Descriptive statistics of researched aspects and items

	Mean	Median	SD	Skewness	Kurtosis	Cronbach's α
Environmental Purchasing Behavior	3.52	3.50	1.26	0.24	-0.33	0.81
EB1: When shopping online, I only buy green products.	2.76	2.00	1.638	0.686	-0.381	
EB2: When shopping online, I purchase from retailers who care about the environment.	3.07	3.00	1.729	0.530	-0.632	
EB3: Buying green products online makes me feel like a green consumer.	3.71	4.00	1.777	0.061	-0.942	
EB4: I feel good when shopping for green products online.	3.74	4.00	1.851	0.080	-0.992	
EB5: I prefer online shopping to brick and mortar.	4.45	4.50	1.817	-0.322	-0.793	
EB6: I recommend people I know to shop online because it's more eco-friendly.	3.39	4.00	1.733	0.213	-0.830	
Future Purchase Intention	3.95	4.00	1.43	-0.12	-0.47	0.91
PI1: In the future, when shopping online, I am determined to give up those products that are not green.	3.67	4.00	1.612	0.038	-0.670	
PI2: In the future, I am determined to buy only green products online.	3.37	3.00	1.698	0.210	-0.828	
PI3: In the future, I will recommend online shopping for green products to acquaintances.	3.77	4.00	1.686	0.039	-0.728

To validate the hypotheses, the normal distribution of data was examined using the Shapiro-Wilk test of normality and the Kolmogorov-Smirnov test (Table 3). A significance level of $p < 0.05$ was employed

for all investigated scenarios, and it was determined that the data did not adhere to a normal distribution, rendering the use of parametric tests inappropriate. Consequently, the non-parametric Kruskal-Wallis H test was employed to assess the hypotheses, specifically examining whether statistically significant differences existed in terms of education and net monthly income.

Table 3. Results of Shapiro-Wilk test of normality and Kolmogorov-Smirnov test

	Shapiro-Wilk test		Kolmogorov-Smirnov test	
	<i>W</i>	<i>p-value</i>	<i>K-S</i>	<i>p-value</i>
Environmental Purchasing Behavior	0.988	0.000	0.065	0.000
EB1	0.199	0.000	0.883	0.000
EB2	0.174	0.000	0.907	0.000
EB3	0.122	0.000	0.938	0.000

The first hypothesis sought to establish whether noteworthy variances in consumer behavior concerning sustainability in e-commerce were present across distinct socio-demographic factors, specifically education and net monthly income. Likewise, the second hypothesis aimed to identify potential statistically significant distinctions in the intention to acquire green products online, taking into account the same socio-demographic factors as in the previous hypothesis (education and net monthly income). The Kruskal-Wallis H test results, displaying statistical significance at $p < 0.05$, can be found in Table 4. Regarding education, significant variations in Future Purchase Intention were substantiated, with respondents holding a university education - 1st degree scoring the highest. When examining specific questionnaire items, the statement "I believe that I will become more interested in shopping for green products online in the future" garnered the highest level of consumer agreement among those with a university education - 1st degree. In terms of net monthly income, no statistically significant differences were observed at the $p < 0.05$ level. However, when considering the $p < 0.10$ level, significant differences were found in both investigated variables, with respondents earning between 2,001 – 2,500 € attaining the highest score. The item "I prefer online shopping to brick and mortar" received the highest score for Environmental Purchasing Behavior. Regarding the Future Purchase Intention aspect, the item "I believe that I will become more interested in shopping for green products online in the future" achieved the highest score.

Table 4. Results of Kruskal-Wallis H test - Hypothesis 1 (1a, 1b) and Hypothesis 2 (2a, 2b)

Aspect	Education differences		Monthly income differences	
	<i>Kruskal-Wallis H</i>	<i>p-value</i>	<i>Kruskal-Wallis H</i>	<i>p-value</i>
Environmental Purchasing Behavior	3.670	0.160	9.981	0.076
Future Purchase Intention	8.384	0.015	10.548	0.061

Source: output from IBM SPSS Statistics 26

In their study, Steiner et al. (2017) incorporated socio-demographic factors such as income and education to examine and describe distinct consumer segments based on their motivation for engaging in environmentally friendly behavior when purchasing sustainable products. Nogueira et al. (2023) conducted research that revealed individuals with higher education exhibit greater pro-environmental tendencies when engaging in online shopping, indicating a higher consideration for environmental protection. Furthermore, their findings indicated that consumers with higher incomes showed less

inclination towards the sustainability aspect. These findings align with similar conclusions drawn by Rai et al. (2019).

The research included participants from Generation Y and Generation Z, two consumer groups recognized for their heightened awareness of environmental concerns and their consideration of ecological impacts when making consumer choices. These generations are known for their readiness to embrace green products as a regular part of their lives, acknowledge the intrinsic value of pro-environmental practices, and have the ability to motivate and influence others to prioritize sustainability. They not only recognize the significance of sustainability in the present but also display a growing inclination to make online purchases that align with green principles. Due to these characteristics, they are regarded as influential catalysts for promoting sustainable online shopping behavior and intentions (Nielsen 2018).

Contemporary consumers exhibit a growing inclination to consider sustainability and the environmental consequences when engaging in online shopping. This encompasses evaluating the impact of products and the entire purchase process, ranging from order placement to product utilization and delivery. Online merchants who recognize and proactively address this opportunity have a higher probability of attaining a competitive advantage over their competitors (Rajnoha et al. 2019). Consequently, it is crucial for future research to focus on examining the influence of environmental aspects on online shopping, given its pertinence and potential significance. With the Internet permeating every aspect of consumers' lives, it is widely acknowledged among researchers that online sellers must continually discern distinctive behavioral patterns exhibited by various consumer segments. These patterns encompass gender, education, income, and other socio-demographic characteristics. By uncovering and comprehending the preferences, priorities, and needs of online consumers, retailers can devise pertinent marketing strategies. Moreover, the insights gained can aid in devising information and communication strategies that enhance awareness among online consumers regarding product sustainability and the purchasing process (Rai et al. 2019).

Conclusion

The objective of the study was to discern disparities in consumer behavior and purchase intentions regarding sustainability in terms of e-commerce, focusing on selected socio-demographic characteristics such as education and income. The findings revealed significant variations in environmental online shopping behavior and purchase intentions among consumers, both in terms of educational attainment and net monthly income. Consumers with a 1st degree university education exhibited the highest inclination to purchase green products online, while those with an income ranging from € 2,001 to € 2,500 demonstrated similar tendencies. However, it is important to note that these outcomes might be influenced not only by consumers' perception of sustainability but also by their financial capabilities.

As part of the support for online shopping of green products, it is necessary to implement public policies and marketing activities to increase awareness of the sustainability of green products and their environmental impacts. It could subsequently lead to the support of the circular economy, which should be in the interest of government policies. In the same way, businesses should support increasing the environmental awareness of consumers and the subsequent increase in the sale of green products, which would lead to an increase in their profits and the satisfaction of not only economic but also environmental goals.

The issue of consumer behavior has garnered substantial attention from researchers and marketers alike, and it continues to be a prevalent area of study today. Numerous academics and researchers are dedicated to exploring consumer behavior for various reasons. Understanding consumer behavior is believed to have a direct impact on the overall success and prosperity of businesses. To thrive in a competitive environment, entrepreneurs must consistently offer high-quality products or services, establish attractive pricing structures, and ensure convenient customer access. Furthermore, they must maintain regular communication with existing and potential customers, suppliers, and other relevant parties. As a result, emphasis should be placed on effective marketing strategy, as it is the decisive tool able to sway consumer perceptions when executed appropriately. By carefully planning and delivering targeted communication messages, entrepreneurs can influence customer attitudes towards particular products or services, compelling them to make a purchase (Yeboah, Atakora 2013).

It is important to acknowledge a possible limitation of this study - the geographical scope of the research, which was limited to Slovakia. Since the research was conducted exclusively in Slovakia, caution must be exercised when generalizing the findings to online consumers worldwide. Nevertheless,

the same research could be duplicated in other countries, including those within the V4 region, allowing for comparative analysis and a more comprehensive understanding of consumer behavior.

Abstract

Research background: The timeline of artificial intelligence is relatively brief, spanning no more than half a century when we consider recent times. Artificial intelligence has evolved into a formal scientific and academic field, constituting a distinct area of study. Throughout the history of artificial intelligence, we have witnessed phases characterized by undue optimism, achievements, subsequent downturns in enthusiasm, and a resurgence in the significance of artificial intelligence.

Purpose of the article: This paper's central aim is to investigate whether there is evidence of the positive influence of artificial intelligence within companies. In pursuit of this goal, a research question was framed to assess whether a statistically significant link can be identified between the constructive effects of artificial intelligence on society and the prospects of future opportunities in the field of e-commerce.

Methods: A questionnaire was sat down for the quantitative part of the research. The established research hypothesis was verified using the correlation analysis. Since the variables entering the analysis were measured on an ordinal scale, Spearman's correlation coefficient was used to test the hypothesis.

Findings & Value added: Based on the analyzes carried out, it can be concluded that the respondents register a positive impact of AI in their company. Moreover, the respondents are of the opinion that AI will bring new opportunities to the field of e-commerce. The research carried out also confirmed that there is a statistically significant connection between the positive impact of artificial intelligence in society and the perception of future new opportunities that artificial intelligence would bring to the field of e-commerce.

Keywords: artificial intelligence, consumer behavior, company, digital marketing.

JEL classification: M30, M31, M37

1. Introduction

Artificial intelligence is a ubiquitous discipline in both global and local educational contexts, encompassing nearly every specialization within the computer science domain. The content and expectations associated with an artificial intelligence study program, including its primary areas of focus, derive from the fact that informatics is categorized as a distinct scientific field. It belongs to a cluster of cognate sciences that share content similarities and exhibit a closely related character. Consequently, as an academic discipline, artificial intelligence aligns with other closely affiliated fields of study (Copeland 2000). The unquestionable legitimacy of this classification prompts the consideration of why artificial intelligence holds such a significant standing within the realm of informatics.

Historically, artificial intelligence is a relatively youthful discipline, yet its very name elicits considerable optimism (Europarleuropaeu 2022). In its most extreme forms, there may even arise both theoretical and practical interest in the creation of a phenomenon that could be somewhat inaccurately described as an "artificial being" (Barták 2017). The primary objective of activities within the field of artificial intelligence is to conceive and construct intelligent entities, comprehending their capabilities and modes of operation. It chiefly revolves around the application of computational processes, establishing a fundamental link with computer science while also exhibiting distinctions from other disciplines centered on intelligence.

* Corresponding author: jakub.horvath@unipo.sk

Notably, artificial intelligence does not inherently seek to answer the fundamental question of what constitutes intelligence, although it often contributes to this line of inquiry (Floridi 2018). The definition of artificial intelligence is founded on the notion that it involves the capacity of a device to exhibit abilities that are equivalent to or reminiscent of human capabilities, such as planning, logical reasoning, creativity, and learning. Certain technical systems, enabled by embedded artificial intelligence, have the capacity, for example, to differentiate their environment, identify discernible issues, and pursue specific objectives (Gregor & Gregor 2015). Artificial intelligence systems possess the capability to function independently and, to a certain extent, adapt their capabilities by analyzing past actions. The continuity of artificial intelligence is maintained when computer systems or programs remain unaltered. This adaptability and expansiveness are exemplified by the statement from *Europarlepupaeu* (2022). The pivotal role of artificial intelligence in the digitalization of businesses underscores its status as a top priority in both research and educational institutions, as highlighted by Barták (2017).

Remarkably, artificial intelligence, or its constituent elements, is now pervasive across various levels of social life, often unnoticed. The anticipation of epochal changes arising from its future applications is widespread (Pavliček 2010). It is imperative to sustain current trends, where advancements in computer technology, the abundance of data, information, and novel algorithms have led to numerous groundbreaking discoveries (Sekaj 2021). Artificial intelligence can be categorized into two primary types, as delineated by Joshi (2019; van Esch & Black 2021): software-based and embedded in devices. Software-based artificial intelligence encompasses a diverse range of systems, including those for shape recognition (including faces), speech processing, image analysis, and various search engines. Within this context, we can also mention the presence of virtual assistants, as highlighted by Návrát (2006). On the other hand, embedded artificial intelligence is found within devices such as drones, autonomous vehicles, IoT (Internet of Things) devices, and various types of robots, as described by Sraders (2019). It involves the integration of artificial intelligence components into a wide array of systems, like vacuum cleaners, motion sensors, medical devices, and more, thereby enabling them to perceive and respond to stimuli. The speed of response required for each specific task is also of paramount importance (Vysekalová et al. 2012).

The applications of artificial intelligence span a broad spectrum (Frey 2008): web search, automatic translators, online shopping and advertising, digital personal assistants, cars, smart cities, homes and infrastructure, and cyber security. Search on the web – search engines know how to get the necessary information for the user from an enormous amount of data. In this case, the reaction time is usually enormously short. Search engines are characterized by high reliability (Vincent 2018). Automatic translators – this feature enables instant translation of word meanings, serving as a translingual tool that translates lexicons between languages.

Alternatively, it often provides multiple synonyms for a given word, which is crucial for effective communication (Popenici & Kerr 2017). Online shopping and advertising - Online shopping plays a pivotal role in generating personalized shopping suggestions and proves invaluable in warehouse and logistics management (Wertime & Fenwick 2008; Yang et al. 2021). Digital personal assistants is the terminus technicus for the device's ability to search for and offer certain procedural solutions. They are found in smartphones, e.g. as navigation, which helps to optimize movement along a certain route (Joshi 2019; Lawton 2023). Automobiles – passenger or freight cars – represent a very important civilizational factor of today. In the developed world, they are relatively affordable and represent a necessity rather than a luxury (Kinelski 2022).

The automotive industry has fully embraced the incorporation of artificial intelligence as a strategic move (Canva 2020). In today's vehicles, AI components abound, providing support in tasks like navigation and vehicle operation. While self-driving cars are a reality, their widespread adoption still faces delays due to various factors (Karam 2012). Furthermore, artificial intelligence plays a pivotal role in the development and regulation of smart cities, households, and infrastructure, aiding in tasks such as managing transportation to reduce congestion and improve connectivity (Emeritus 2023). Within households, AI devices like smart thermostats contribute to energy conservation (Vincent 2018; Janouch 2014). At a broader level, connectivity signifies the level of intercommunication among computers, enabling multiple systems to exchange information on various aspects, including traffic conditions and a patient's health status (Koman et al. 2020). Cyber security – when it comes to cybersecurity, artificial intelligence systems prove invaluable by continuously storing data, identifying patterns, and conducting retrospective analyses, including tracking back through various activities such as criminal acts and various

types of attacks. This capability aids in the detection and prevention of cyberattacks (Hedggde & Shainesh 2018).

2. Methods

The main goal of this paper is to find out whether the companies perceive any positive impact of artificial intelligence.

Based on this objective, the following research question has been formulated:

RQ: Is there a statistically significant link between the positive societal effects of artificial intelligence and people's outlook regarding the future potential of artificial intelligence in the e-commerce sector?

Based on the above research question, the following hypothesis has been formulated:

We assume that there is a statistically significant connection between the positive impact of artificial intelligence in society and the people's outlook regarding the future potential of artificial intelligence in the e-commerce sector.

Data for this analysis were collected using a questionnaire approach, which encompassed six demographic inquiries dividing respondents based on gender, age, region, highest education level, current employment status, and their position within their respective companies. The subsequent 15 questions focused on artificial intelligence, offering respondents the choice of responding on a Likert scale or selecting predefined options. The research hypothesis, once established, will undergo validation through correlation analysis. Given that the variables under examination are measured on an ordinal scale, Spearman's correlation coefficient will be employed to assess the hypothesis. This coefficient can yield values within the range of $\langle -1, 1 \rangle$. Statistically significant relationships between variables will be affirmed if the p-value from the test falls below the significance level $\alpha = 0.05$.

The survey sample comprises individuals categorized into four distinct age groups, a methodology inspired by the approach employed by the author Young (2017) at Ogilvy & Mather. Utilizing this method, we conducted an online questionnaire survey facilitated by the Google Workspace suite, specifically Google Forms. Data collection occurred during the period of February through March 2023. This online survey was distributed to specific target groups with professional exposure to artificial intelligence, resulting in a total sample size of 160 respondents.

Figure 1. Age distribution of respondents
Source: Young (2017)

3. Results

Item no. 9 employed a 5-point scale to gauge respondents' perceptions of the positive influence of AI in their organization, with a rating of 5 signifying the most substantial positive impact on society. The majority of respondents selected level 5, constituting 33.80 % of the participant pool. This was followed by the 3rd rating, chosen by 25.60 % of respondents. Level 3 was succeeded by level 4, which represented 20 % of respondents' responses. The 3rd rating was trailed by the 1st rating, accounting for 11.90 % of participant responses. The least frequently chosen option was the 2nd rating, selected by 8.80 % of respondents. Based on these findings, it is evident that respondents perceive a positive impact of AI within their organization.

Item no. 20 aimed to assess the potential impact and growth of AI in the realm of e-commerce. A five-point scale was utilized once again, with level 1 denoting the lowest value, "definitely not," and level 5 signifying the highest value, "definitely yes." A majority of respondents, specifically 58.80 %, selected level 5. This was followed by level 4, chosen by 26.90 % of respondents, and subsequently, level 3, with 11.90 % of responses. The least frequently chosen options were levels 1 and 2, both selected by the same number of respondents, i.e., 1.30 %. Based on the responses received, it can be inferred that AI is expected to bring new opportunities to the field of e-commerce.

Subsequently, the subject hypothesis was verified:

H: We assume that there is a statistically significant connection between the positive impact of artificial intelligence in society and the people's outlook regarding the future potential of artificial intelligence in the e-commerce sector.

H0: No significant relationship was demonstrated between the analyzed variables.

H1: A significant relationship was demonstrated between the analyzed variables.

To assess the hypothesis at hand, an investigation was conducted to determine whether a statistically significant correlation exists between the favorable societal effects of artificial intelligence and the anticipation of future opportunities in the e-commerce sector. The analysis incorporated responses to questionnaire items 9 and 20. The findings, as presented in Table 2, provided support for the established research hypothesis, as indicated by the p-value (0.0000) falling below the predetermined significance level (0.05). Spearman's coefficient, calculated at 0.4470, denotes a positive and monotonic relationship between the variables. This implies that a favorable perception of artificial intelligence's societal impact corresponds to an equally positive perception of future e-commerce opportunities. The hypothesis in question was thus confirmed.

Variables	Spearman's rank correlation coefficient	p value
Impact of AI AI opportunities	0.4470	0.0000

Figure 2. Results of hypothesis verification

4. Discussion

Artificial intelligence has the power to captivate and excite, but it can also evoke unease among individuals. It's evident that AI is poised to play an increasingly prominent role across various industries and in different facets of our social lives. Recent developments hint at an AI revolution that may have already occurred and may now be beyond our complete control. In a way, artificial intelligence is starting to comprehend us, and this fact serves as both an observation and a cautionary note. We've been integrating AI into our lives for several years, but the real excitement began when it started "conversing" with us, making us feel understood. Although programmers have taught machines to grasp human language, they're now pushing further. Some machines can discern emotions and moods, a capability that has advantages in fields like e-commerce. Undoubtedly, artificial intelligence brings numerous benefits, streamlining and expediting various work processes. Yet, there's another side to its application. AI can replace humans in tasks, leading to depersonalization, which can pose challenges under certain circumstances. The rise of artificial intelligence is an irreversible process, with humanity deeply intertwined with it. We encounter AI almost everywhere we go. However, it's crucial to remember that numerous jobs and roles still demand the unique human skills of creativity and professionalism.

Research in this area has already been carried out in Slovakia, specifically by the Go4insight portal (2023). However, this research focused on Slovaks' experiences with artificial intelligence in the online environment. Artificial intelligence was employed, albeit infrequently, by a minority of respondents; nevertheless, both in our study and in their experiences, the prevailing sentiment is one of positivity rather than negativity.

The research conducted has limitations primarily stemming from an inadequately representative sample of respondents. Furthermore, the findings in question should not be extrapolated to the entire population of Slovakia, as over half of the respondents originated from the Košice and Prešov regions (63.8 %).

For future research, it would be intriguing to replicate the current study with a representative sample encompassing the entire country of Slovakia. Additionally, it could be valuable to compare the findings from this research with those obtained in similar studies conducted in the neighboring V4 countries.

Conclusion

Drawing from the conducted research, it was evident that a significant portion of companies does not currently integrate artificial intelligence into their operational workflows. The largest group of respondents, comprising 46 individuals or 28.7 %, reflected this trend. Consequently, a recommendation emerges, suggesting that these companies should consider implementing artificial intelligence to streamline their processes and enhance efficiency. Another noteworthy observation was the anticipation

that artificial intelligence will contribute to simplifying societal and corporate workflows, as indicated by the majority of respondents, totaling 80 individuals or 50 %. The final aspect considered the potential impact of artificial intelligence on specific job sectors, with a substantial 62 respondents or 38.8 % believing that certain professions may face extinction due to AI.

From the analyses conducted earlier, it can be deduced that the respondents acknowledge a favorable influence of UI within their company, and they also hold the view that UI will usher in fresh prospects for the e-commerce sector. Furthermore, our research has validated the existence of a statistically significant correlation between the positive societal impact of artificial intelligence and the perception of forthcoming opportunities in the realm of e-commerce.

The Impact of the Corona Crisis and Support Measures on Micro, Small and Medium-sized Enterprises in Slovakia

Marta Urbaníková^{1,*}, Michal Levický¹, and Daniela Vörösová¹

¹ Constantine the Philosopher University in Nitra, Institute of Economics and Management,
Tr. A. Hlinku 1, 949 01 Nitra, Slovakia

Abstract

Research background: The COVID-19 pandemic has become a global threat with a direct impact on the economy and business environment. In addition to endangering public health, it caused fundamental restrictions on private and working life. It significantly affected all business entities, which had to adapt very quickly to new challenges. The Government of the Slovak Republic has approved several support measures aimed at mitigating the economic impact of the COVID-19 pandemic.

Purpose of the article: The purpose of the article is to find out the effects of the crisis on micro, small and medium enterprises. We find out how entrepreneurs perceive the support measures adopted by the government, whether these measures were sufficient and how they helped entrepreneurs overcome the difficult period of the corona crisis.

Methods: The research is based on a questionnaire survey conducted with the managers or owners of small and medium enterprises in Slovakia. The questionnaire research was subsequently evaluated using the methods of descriptive and inferential statistics.

Findings & Value added: Based on the questionnaire research, we can conclude that the pandemic has largely affected the economic situation of business entities. Employers often had to provide their employees with a temporary change of work activity in order to avoid their dismissal. The COVID-19 pandemic has forced business entities to reassess their business and, if possible, adapt to the new market needs. It can be concluded that employers used state aid to maintain employment, but assessed this aid as insufficient. At present, in times of high uncertainty, business is most affected by expensive energy, inflation, expensive and difficult-to-access loans, and a lack of qualified labor in many business sectors. The presented research provides a new perspective and current responses of the micro, small and medium-sized enterprises (MSME) to the corona crisis.

Keywords: crisis, micro, small and medium-sized enterprises, support measures

JEL classification: D22, E24, J21, L26

1. Introduction

Crises of any type have become an integral part of business activity, and responses to them can mean the difference between survival and failure. This applies especially to small and medium-sized enterprises (SME) (Durst et. Al 2021.). The economic crisis caused by public policy measures caused by the COVID-19 pandemic was truly new compared to any other types of crisis that global and local economies have experienced so far (Landmesser, 2021; Liu et al., 2021). The COVID-19 crisis represents a new type and quality of challenge for companies. (Kraus et. al. 2020) In terms of economic impact, it is compared to the great economic crisis of the 1930s. Almost all countries of the world took measures due to the lack of any successfully proven drug for the spreading epidemic that could prevent a large increase in the number of infections, with a negative impact on national economies and the level of economic activity of their citizens (Kuc-Czarnecka, 2020; Zinecker et al., 2021).

The COVID-19 pandemic crisis was significantly different from previous crises in terms of its onset, development, scope, strong effects on the economy and the proper functioning of countries. It was characterized by its unpredictable duration, as well as its effects on various areas of the economy. It had

* Corresponding author: murbanikova@ukf.sk

no geographical boundaries. As a result of this crisis, millions of people died and many economies of individual countries were shocked. It led to the deepest recession and subsequently to the financial crisis.

Due to the fact that the number of infected people in the individual countries increased sharply and uncontrollably, individual countries of the world approached strict quarantine measures, which were associated with curfews, closing schools, shops, companies, and limiting leisure activities (Leite, Hodgkinson, Gruber, 2020).

The first wave of the pandemic began to fully manifest itself in the spring of 2020, when several countries began to restrict economic and social life, to the so-called lockdown of the economy. All countries tried to deal with the consequences of the crisis and adopted a wide range of measures to prevent the spread of the disease and subsequently measures to jump-start the subdued economy.

In addition to the impact on public health, the disease COVID-19 has caused a major economic shock and the biggest consequences have been felt by small and medium-sized enterprises. As a result of the crisis caused by the COVID-19 pandemic, countries and their companies are facing major problems of sustaining human and business capacities (Gavric et al., 2021).

1.1 Anti-pandemic measures

The first measures that were taken after the outbreak of the COVID-19 pandemic were to protect human health, prevent the spread of the disease by limiting direct contact between customers and service providers. Strict restrictive measures were gradually introduced in Slovakia, which were among the strictest in Europe. Operating companies in sectors with a higher risk of spreading COVID-19 were forced to reduce or to completely close their operations. Borders, international transport, operations, schools, cultural facilities, etc. were closed.

As a result of the massive cancellation of vacations, the suspension of international transportation at the beginning of the pandemic, there was also a change in the tourism industry (Gallego et al., 2020).

In many countries, including the territory of the Slovak Republic, a state of emergency was declared in connection with the constantly worsening situation within the second wave of the pandemic. The state of emergency negatively affected the economic situation of several business and non-business entities (Shen et al., 2020).

The anti-pandemic measures taken during the COVID-19 pandemic managed to lower the epidemiological curve, but contributed to a sudden and sharp economic decline, unemployment and an increase in public spending. The COVID-19 pandemic has significantly affected major economic variables such as economic growth, world trade, public spending, unemployment, foreign direct investment, production and sales, household consumption, business investment etc. (Khan et al. 2021).

1.2 Impact of corona crisis on the economy of Slovakia

All problems were also reflected in macroeconomic indicators. During 2020 and 2021, there was a decline in the gross domestic product, which in the critical second quarter of 2020 reached a year-on-year drop of 8.8%. In the following months, the situation in the economy stabilized and such high year-on-year declines did not occur. The decline also occurred in the industry sector, representing more than 30% year-on-year. This is mainly a consequence of anti-pandemic measures, which also meant the closure of industrial production.

From the point of view of other macroeconomic indicators, the development of inflation is interesting. During the first wave and the second wave of the coronavirus, it dropped to values around zero. From March 2021, there was a reversal of the interannual trend of the Harmonized Index of Consumer Prices. By the end of the year, inflation had already reached more than 5%. Moreover, inflation continued to grow during the following period, with month-on-month inflation reaching 2.8% in January 2022. Year-on-year inflation reached more than 10% in 2022, which represents long-term records. Price growth can be seen across all sectors. The price growth of industrial products in 2022, after the end of the corona crisis and also due to the conflict in Ukraine, reached the limit of 30%, which is the highest in the last several decades.

The development of unemployment appears to be relatively positive during the corona crisis. A significant impact on reducing the effects of the corona crisis, especially with regard to employment, are several measures of the government - aid packages.

The effects of the corona crisis on entrepreneurs are also significant. The negative impact on the microeconomic environment most affected entities that had to completely or at least partially limit their business as a result of anti-pandemic measures. According to e-kasa data, there was a decrease in sales,

most significantly in sectors such as tourism and gastronomy, or in the chemical and automotive industries, which secondarily affected many other companies that, although we do not directly classify them as car manufacturers, but are in the position of their suppliers of components or services.

Although the crisis caused by the COVID-19 pandemic affected all business entities in Slovakia, whether in the form of various restrictions or increased costs, not all industries were affected equally.

The analysis of the management of non-financial enterprises for the year 2020, carried out by FinStat in August 2021 (FinStat, 2021a), showed an average decrease in sales by 6.1% and the result of management by 11.3%. At the same time, the industries that recorded the largest increase in sales in 2020 were determined. Specifically, it concerned gambling operators, retail (excluding pharmacies and fuel), pharmaceuticals (production, wholesale distribution, pharmacies), agricultural sector, manufacturers of boilers and radiators, couriers, healthcare, ICT sector, wagon production.

1.3 Measures taken to mitigate the economic impact of the corona crisis

All countries tried to deal with the consequences of the crisis caused by the COVID-19 pandemic, to adopt a wide range of measures and to restart the suppressed economy.

Most countries introduced measures to support SMEs and self-employed persons, primarily aimed at maintaining short-term liquidity of companies and employment.

The amount of measures adopted by the government of the Slovak Republic since the beginning of the pandemic can be divided into two groups, namely anti-pandemic measures to prevent the spread of the disease and support measures to help entrepreneurs and employees most affected by anti-pandemic measures.

First, the most significant measures were taken, which aimed to reduce mobility and the number of contacts within the population. In practice, retail sales and schools were closed, but also (also due to measures in other states) a large number of industrial enterprises were closed.

As regards support measures aimed at mitigating the economic impact of the COVID-19 pandemic, new types of social benefits in the form of pandemic sick and nursing allowances were first approved. Subsequently, on March 31, 2020, the government of the Slovak Republic also approved a scheme of direct assistance to maintain jobs, the so-called "First aid" package. It was co-financed from the European Social Fund, aimed at compensating for the loss of income and wages of entrepreneurs, self-employed persons (SZČO in Slovak) and employees.

For almost two years, the "First Aid" project was the main tool for protecting jobs and household incomes from the pandemic in Slovakia. It was prepared and implemented by the Ministry of Labour, Social Affairs and Family, taking into account the risk of the dynamic development of the pandemic. The project had a flexibly set framework of rules, thanks to which the state was able to modify it so that it was effective even after unexpected changes in the pandemic rules and could promptly react to instability in the economy and in the labor market. During the project, the Government of the Slovak Republic issued a total of 13 resolutions by which "First Aid" was improved and adapted to the current situation.

In accordance with the development of the epidemic situation, "First Aid" was legislatively amended several times, with the aim of relieving the burden on employers and the SZČO and covering part of their wage costs. The original framework was replaced and direct financial support increased in the period October 2020 - January 2021 in the form of "First aid +". With this adjustment, the compensation was simultaneously expanded from 80% of the gross salary to 80% of the total price of the work. From February 2021, the more attractive "First Aid ++" came into force. The amount of the contribution was capped at 100% of the total price of the work. With the calming of the pandemic situation and the economic recovery, the need to subsidize the maintenance of jobs decreased, which was also reflected in the parameters of "First Aid". In the period July to October 2021, the basic framework "First aid" was applied, while aid was not paid for August. For November 2021, support was paid through the "First Aid +" framework, and in the period December - February 2022, micro and small businesses were allowed to use "First Aid +".

The eligible period of the project, within which employers and self-employed persons could apply for assistance, was from 13 March 2020 to 28 February 2022.

In the Labor Code Act no. 66/2020 Coll., which supplemented the law no. 311/2001 Coll. the Kurzarbeit model was introduced. Used since April 4, 2020, as a support during the reduced work, which appeared to be an effective tool for solving crisis situations on the labor market, when a large number of establishments were closed as a result of the anti-pandemic measures taken.

Employers and compulsorily insured SZČO, in the event of a decrease in sales by more than 40%, could apply for a postponement of the payment of levies, social insurance premiums and health insurance advances, for a postponement of income tax advances.

The government of the Slovak Republic has taken several measures in the area of fulfilling tax, customs and accounting obligations, whether in the area of income tax, VAT, customs, as well as local taxes, excise taxes or tax on motor vehicles, not forgetting also the mitigation of obligations related to the use of eKasa.

Indirect financial aid measures were aimed at deferring repayments of loans, leases, state bank guarantees, as well as providing advantageous financial products and services through state financial institutions such as EXIMBANKA, Slovenská záručná a rozvojová banka or Slovak Investment Holding. The recipients of financial assistance were small and medium-sized enterprises and SZČO.

The result of the corona crisis is also the introduction of the pan-European project Recovery and Resilience Plan. It is a program of incentives for the economies of individual countries, while the condition for its use is mainly the reform program of the given country.

2. Methods

The aim of the article is to characterize the support measures taken by the government of the Slovak Republic aimed at mitigating the economic impacts of the COVID-19 pandemic for companies SZČO and to analyze the perception and impact of these measures on micro, small and medium enterprises/MSMEs/. We focused on this type of business entity because the world economy is dominated by small and medium-sized enterprises (SMEs) in the number of total enterprises (90-99% of all enterprises, depending on the definition used) and in economic contributions (GDP growth, productivity, job creation, innovation, level of competition, etc.) (Lundstrom & Stevenson, 2001). Since small businesses create jobs, tax revenues, functional products, charitable donations, technological development and social contributions to communities, their success and sustainability are important for social and economic development (Gavric, T., et al. 2021).

In the first stage of the solution, it was necessary to carry out a literary search of domestic and foreign authors based on the analysis of secondary sources. In this stage, methods of scientific work such as summarization, synthesis of knowledge and methods of analogy and deduction were used. The second stage was focused on the analysis of primary sources obtained by conducting an empirical survey, using the inquiry method.

We determined the following research questions:

RQ1 How did the pandemic affect the business of individual companies,

RQ2 How do MSMEs perceive support measures from the state,

RQ3 What problems did MSMEs have in relation to using the aid,

RQ4 What were the reasons why entrepreneurs did not apply for assistance,

RQ5 What factors fundamentally affect MSME business nowadays, when the corona crisis has continuously turned into an energy and financial crisis.

Using the Google Form, we created an anonymous questionnaire that was distributed electronically to individual respondents. After selecting suitable questions for our questionnaire, we first determined their comprehensibility using pilot testing. In total, 7 respondents participated in this testing, based on their comments, we subsequently modified the questionnaire into its final form. The content and form of the questionnaire was adapted so that filling out the questionnaire took as little time as possible for the respondents and the questions were unambiguous. Our research sample was constructed by available sampling. For the research, we focused on micro, small and medium-sized enterprises. We approached the respondents via e-mail and social networks.

Research preparation began in October 2022 and data collection began in January 2023. Data acquisition was completed on March 21, 2023.

The questionnaire, through which the data collection was carried out, contained 13 closed questions and 2 questions with a choice of multiple options and one open question.

In the first five questions of the questionnaire, we obtained basic information about the respondents, such as the business sector, the size of the company according to the number of employees, the region in which the company does business, the legal form of the business and the length of the company's existence. We were also interested in how much the pandemic affected the business of individual companies, whether there was a change in the companies as a result of the anti-pandemic measures, or a

drop in sales, and whether state aid compensated them for the drop in sales. In the event that companies applied for support measures, what caused them the biggest problems in obtaining them, or how do they evaluate the support measures received. What were their reasons if they did not apply for support measures.

In the next part of the questionnaire, we were interested in whether they were forced to take measures to temporarily change their work activities, or whether they had to adapt production/service provision to new market needs.

In the end, we asked which factors negatively affect their business at present, in today's energy and financial crisis. We also interested in what positive things the crisis brought to businesses.

We also analyze the relationship between the size of the company and the impact of the COVID-19 pandemic on business in the MSME sample. We verify the assumed relationship by testing the hypothesis **H1: There is no statistical dependence between the size of the business and the impact of the COVID-19 pandemic on business.**

In the next part we test hypothesis:

H2: There is no statistical dependence between the size of the enterprise and the assessment of the possibilities of using support measures.

In addition to descriptive statistics, we also used inferential statistics to process the results obtained from the questionnaire survey. To evaluate the results, we replaced the ordinal answers with numbers.

We test the research hypothesis **H1** and **H2** by using χ^2 the independence test, which tests the independence of two discrete characters acquiring finitely many values. The frequencies of individual combinations of occurrences of the values of these characters are shown in the contingency table.

We test the hypothesis of independence, where, $H_0: p_{ij} = p_i \cdot p_j$, kde $p_{ij} = P(Y = i, Z = j)$, $p_i = \sum_j p_{ij}$, $p_j = \sum_i p_{ij}$, $i = 1, \dots, r$, $j = 1, \dots, c$, YY is a discrete quantity having values $1, \dots, r$, and the quantity Z is a discrete quantity having values $1, \dots, c$. Testing statistics has the following shape:

$$\chi^2 = n \sum_{i=1}^r \sum_{j=1}^c \frac{n_{ij}^2}{n_i \cdot n_j} - n,$$

where n_{ij} are empirical frequencies, $n_i = \sum_j n_{ij}$, $n_j = \sum_i n_{ij}$. We reject the hypothesis of independence H_0 at the significance level α if $\chi^2 \geq \chi_{(r-1)(c-1)}^2(\alpha)$, where $\chi_{(r-1)(c-1)}^2(\alpha)$ is the tabulated critical value (Andel 2019).

We performed the tests at the level of significance $\alpha = 0,05$; Data analysis for statistical processing was created in Excel using the Real Statistics Resource Pack (edition 7.6). Copyright (2013 – 2021).

3. Results

In this section, we present the results of the questionnaire survey. 82 respondents took part in the survey. From the point of view of regional representation, representatives based in all eight regions of Slovakia were approached in the survey. The representation of regions can be seen on the figure 1.

Figure 1. Business seat of the respondents
Source: author (2023)

The survey was attended by 53.7% of respondents belonging to the category of micro enterprises (1 to 9 employees). Small businesses (10 to 49 employees) made up 30% of the total number of respondents, and 16.30% were medium-sized businesses, which belong to the category employing 50 to 249 employees.

Looking at the structure of respondents represented by legal forms of business, the highest representation was limited liability companies (s.r.o.), which made up 45.1% of the total sample. This was followed by self-employed persons with a share of 32.9% and joint-stock companies with 9.8%. The sample was further supplemented by business entities with a different legal form (7.3%).

26.8% of the respondents were entities that carry out their main business activity in the accommodation and catering services sector. Representation of other activities can be seen on figure 2.

Figure2. Respondents by main type of economic activity
Source: author (2023)

50% of survey respondents were entrepreneurs who have been doing business in Slovakia for more than 10 years, 29.2% of respondents have been doing business for 4-9 years, 15.9% of respondents have been doing business for 1-3 years. The least represented category (4.9%) was respondents who have been in business for less than 1 year.

In the next part of the questionnaire, we were interested in how much the COVID-19 pandemic affected the respondents' business (figure 3)

Figure 3. Impact of pandemic on the business

Source: author (2023)

In their answer to the question "How much has the COVID-19 pandemic affected your business?", many business entities stated that due to strict anti-pandemic measures aimed at slowing down, or to limit the spread of COVID-19, they had to close their operations completely or accept certain restrictions. As many as 62.1% of respondents said that they had to accept moderate or extensive changes in the functioning of their business. 23.2% of respondents had to stop their business activities, either because of the order of the Central Crisis Staff of the Slovak Republic or because of a significant drop in demand and sales. 11% of respondents worked in normal mode. 3.7% of respondents even benefited from the given situation, as they produced insufficient goods.

We verify the statistical dependence between the size of the company and the impact of the COVID19 pandemic on the business activities of the company by testing the hypothesis *H1: There is no statistical dependence between the size of the company and the impact of the COVID19 pandemic on the business activity of the company.*

In order to verify the tested hypothesis, the χ^2 independence test is used. Testing statistics is $\chi^2 = 13.24$ and on the importance level $\alpha = 0.05$ the $p - value = 0.1684$. As $p - value > \alpha$, we do not refuse the hypothesis *H1* on the importance level $\alpha = 0.05$. It can be concluded that there is no statistically significant dependence between the size of the company and the impact of the COVID19 pandemic on the business activity of the company.

Of the 82 respondents who answered the seventh question "Has there been a change in sales in your company as a result of the pandemic?", up to 72% confirmed that the pandemic reduced their sales, 17% of respondents did not notice any changes in sales, and 11% even saw sales increase.

In the next question, we investigated whether the aid provided compensated them for the drop in sales. Based on the survey, we can conclude that the drop in sales was significantly higher than the aid provided by the state for 24.4% of respondents. The worst situation was in the sector of accommodation and catering services, where the businessmen approached recorded a significantly higher decrease in sales than the aid received from the state. Support was able to at least partially compensate for the loss of sales caused by the pandemic in 43.9% of respondents. Not one of the 82 respondents answered that the loss of sales was completely compensated by the help from the state. For various reasons, up to 31.7% of the respondents did not use state aid.

In the next question, we found out how entrepreneurs evaluate the possibilities and conditions of using support measures aimed at mitigating the effects of the crisis. According to the results of the questionnaire survey, 55.1% of respondents consider the state's package of economic measures to mitigate the economic impacts of COVID-19 to be insufficient. Arts, entertainment and recreation, accommodation and catering services were among the most critical areas in the perception of the support measures taken. Respondents whose sales decreased during the pandemic rated the measures taken as insufficient more often. 30.2% of respondents could not assess the possibilities and conditions of using support measures, while only 2.5% of respondents rate the conditions as very good and 12.2% as sufficient. Entrepreneurs working in the healthcare sector and companies that achieved positive economic results despite the pandemic were the least critical of the adopted measures.

We were interested in whether the size of the company had an impact on the knowledge of support measures. We tested the hypothesis *H2: There is no statistical dependence between the size of the enterprise and the evaluation of support measures.*

In order to verify the tested hypothesis, the χ^2 independence test is used. Testing statistics is $\chi^2 = 5,63$ and on the importance level $\alpha = 0.05$, the $p - value = 0.0788$. As $p - value > \alpha$ we do not refuse the hypothesis *H2* on the importance level $\alpha = 0.05$. It can be concluded that there is no significant difference in the perception of support measures between micro, small and medium enterprises.

Given that the state created conditions for vulnerable groups of employees, entrepreneurs, and companies since the beginning of the pandemic, we were interested in what caused them the greatest problems when submitting applications (figure 4).

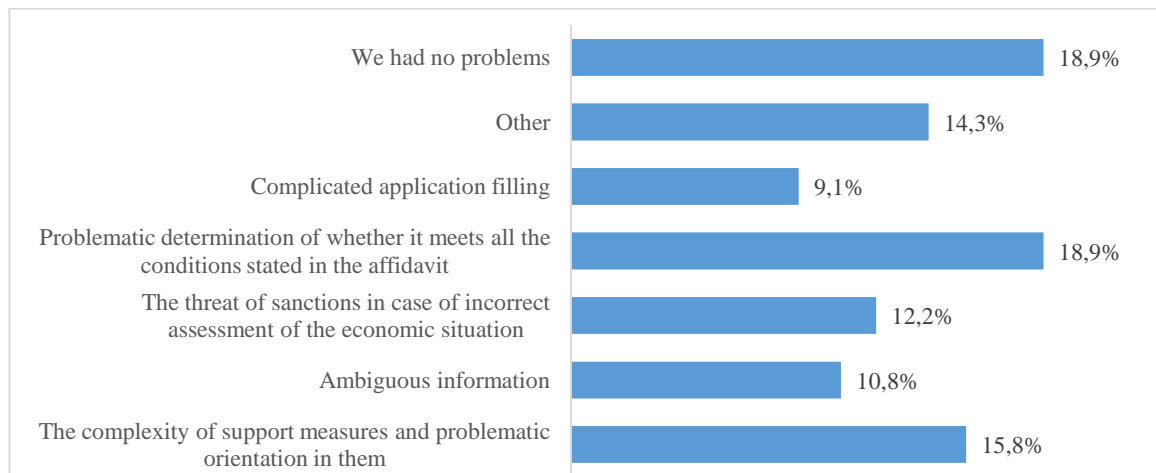

Figure 4. Problems related to the request for support measures

Source: author (2023)

In the event that the company did not apply for support measures, we were interested in the reasons for not applying for support to mitigate the effects of the pandemic. Respondents had the opportunity to mark several answers. The answers are clearly displayed in figure (figure 5).

Figure 5. Reasons for not applying for support to mitigate the effects of the pandemic

Source: author (2023)

The most frequent reasons why the respondents did not apply for support were the complexity of the applications and the lack of transparency and ambiguity in the conditions for approving the aid.

Closing the so-called economy The lockdown also affected employment. As many as 47.6% of employers had to temporarily change the work activities of employees in order to prevent their loss.

The COVID-19 pandemic has brought about a number of measures that have changed most people's daily lives and forced business entities to rethink their field of business. As many as 69.5% of respondents indicated in the survey that they had to partially adapt production or service provision to new market needs. Full market adaptation was reported by 13.4% of respondents. Production, or 17.1% of respondents did not have to change the services provided.

In the last part of the questionnaire, the respondents had the opportunity to state the factors that negatively affect their business the most. Based on the questionnaire survey, we can conclude that currently the most negative influence on the respondents' business is expensive energy 38.3%, inflation 32.2% and lack of qualified labor 27.3%. As a result of the pandemic and the war, many industries face a shortage of materials and components (8.6%). 6.2% of respondents cited expensive and hard-to-get loans as a negative factor. Few companies can operate without credit. They are used either to bridge a difficult period, to acquire competitors, or to buy expensive equipment. The last question was open. We asked the respondents how the crisis helped their business. In up to 90% of companies, the crisis accelerated digitization, in 62% it brought flexibility of work, home office began to be used, 35% of MSMEs said that their portfolio of activities had changed, 21% said that they pay attention to substitutability.

4. Discussion

Based on the analysis of empirical data, we managed to answer all the research questions. The questionnaire survey revealed that the COVID-19 pandemic and the anti-pandemic measures adopted by the government, which led to the closure of operations, significantly affected the economic situation of MSME companies. 23.2% of respondents had to stop their business activities. As many as 62% had to adapt their business to changing conditions. Authors (Durst, S., et al., 2021) and (Gavric, T., et al., 2021) present similar results. Author (Durst, S., et al., 2021) points out the important role of crisis management.

MSMEs perceive support measures as insufficient. We found that the size of the company does not affect the perception of support measures.

There were several forms of aid, they were gradually modified, the conditions of acquisition were supplemented, which, according to the respondents, brought a lot of chaos and bureaucracy to the entire aid process. Many companies were deterred by the incomprehensible and complicated conditions for submitting an application and therefore preferred not to even ask for help. It follows that the system of providing assistance to business entities was complicated and unclear.

That is why we suggest that the government should set the rules for the aid provided in advance and not change them when drawing aid from the Recovery Plan. To offer administratively simple requests, uniform and substantive information that would not be confusing for business entities. It would be appropriate to clearly and comprehensibly explain who is entitled to help and what the help consists of through an information campaign. We also propose to create help centers for business entities that would provide accurate and up-to-date information on the conditions and possibilities of using aid.

Our findings show that expensive energy, inflation and shortage of skilled labor and poor availability of credit are currently the most negative factors affecting MSME business. According to (Soni, G., et al., 2022), for MSMEs, limited capital available for investment is an obstacle to growth.

On the other hand, the COVID-19 pandemic has opened up new challenges but also opportunities for MSMEs. As we found out, in up to 90% of companies, the crisis accelerated digitization and brought greater work flexibility.

Conclusion

The COVID-19 crisis meant one of the biggest tests for Slovakia and its economy since the founding of the republic. A pandemic of such dimensions has not occurred in our territory in the last hundred years.

The government had to proceed with strict quarantine measures, which were connected with a curfew, closing schools, shops, companies, and limiting leisure activities. This had a negative impact on the business environment, many entities closed their business. On the other hand, the COVID-19 pandemic has often changed the business activities of MSMEs, strengthened the ability and flexibility of MSMEs to solve major business problems. The crisis has accelerated the digitization of many areas, which has also caused a faster change in the demands on the workforce. It brought an increase in energy prices and high inflation, expensive and unaffordable loans.

The findings presented in this article may be of interest to the government, managers and executives of MSMEs, but also to universities and other educational institutions, which should adapt the content of education to the new needs of practice, especially digitalization. This survey provides current MSME responses to the pandemic.

Innovative Forms of Marketing and their Impact on Customer Behaviour

Martina Kuperová^{1,*}, and Anton Lisnik¹

¹ Slovak University of Technology in Bratislava, Institute of Management,
Department of Management of Chemical and Food Technologies, Vazovova 5, 812 43 Bratislava, Slovakia

Abstract

Research background: As a consequence of technological advances, we are opening up to online space and environment for purchasing, and the need for innovative forms of marketing (digital, virtual and influencer marketing, social media). Customer preferences are changing with each generation. Today, Generation Z dominates - people born after 2000 who are quite different from their parents.

Purpose of the article: The aim of this paper is to highlight the innovative forms of marketing and their impact on customer behaviour, to describe in a selected segment of the target group the method of using viral marketing in a specific market segment. We obtained primary information using our own research.

Methods: A questionnaire was used for the quantitative part of the research. We focused on the target group Generation Z - young people from 12-20 years old. In the context of post processing were used traditional scientific methods: method of analysis, synthesis, induction, deduction, comparison and observation.

Findings & Value added: The output of the paper will be an evaluation of the impact of the use of social media and innovative forms on the buying behaviour of Generation Z. The aim of the contribution is to point out the usability of innovative forms of marketing and their impact on the purchasing behavior of young customers aged 12-20. Therefore, marketers have to adapt the form of their campaigns and focus on promoting products using innovative and creative marketing strategies to win new customers and also retain loyal ones.

Keywords: digital marketing, virtual marketing, influencer marketing, social media

JEL classification: M30

1. Introduction

With the advent of the Internet in the 1990s, digital marketing is becoming more popular. The first very popular tool for digital marketing was email. With the development of the internet, brands started to focus on communicating with customers through Facebook or Twitter. With the next evolution of the times, smartphones came into the market and with them came various apps such as Instagram and Tik Tok, opening the largest online shopping environment.

Almost all businesses are increasingly using the online space to promote their products or services. According to the report, in 2022, the internet has just over 4.95 billion users and 5.31 billion phone users use this device to access the internet. The most commonly used channels in digital marketing are: search engine optimization (SEO), pay per click (PPC), social media marketing, email marketing, affiliate marketing. (O'Brian, 2022)

Digital marketing has many benefits that can be very beneficial to companies.

Data analysis: nowadays it is very easy for marketers to analyse what is the traffic on their website, what demographic group visits it the most. This information is very valuable and from this, further strategy can be developed to drive customers to purchase.

Content creation: social networks are no longer just for individuals, but also for businesses to add their own content, where they can interact with customers, promote their products, and create an effective interaction with followers and potential customers.

* Corresponding author: martina.kuperova@stuba.sk

Real-time results: digital marketing is a very good tool to effectively evaluate a campaign or a chosen marketing strategy. Marketers can see the results immediately and can react instantly.

Digital marketing has many advantages, one of which is that small companies can compete with large corporate companies. On social media, a company doesn't have to pay for advertising to become popular, sometimes all a company needs are interesting content. It has never been easier to break through with a brand than it is now in the age of social media. (Mankad, 2019)

The presentation of brands using modern social networks has greatly developed during the measures to protect society from the spread of Covid. This helped to develop social media marketing activities and thus changed the behavior of customers.

Mobile applications and social media platforms have been claimed to be drivers of change in consumers' behavior. In this vein, the confinement measures had an enormous impact on the way in which people purchased. The Internet and the online shopping made possible the continued purchase of many products and services, yet it changed substantially the customer journey map, urging companies to understand this new experience and to adapt accordingly. (Vazquez-Martínez et al., 2021)

Monitoring the development of customer behavior on social networks is one of the important sources of information necessary for obtaining knowledge necessary for the development of marketing strategies of brands.

Considering that it was an experimental study that focused on identifying the research areas covered by the different researchers in marketing and social networks, specifically twitter, the study presents important points where its information can contribute to Knowledge. (Alarcón et al., 2018)

Generation Z is known for its special and unique way of looking at values. One of the facts is lifestyle. It is influenced both by social networks, but also by the social environment in which the individual is located. It is very important to examine the relationship of the individual and his lifestyle in relation to values in the decision-making process in purchasing behavior.

Finding quality dimension as an important value for the targeted segment is not enough. It is also critical to understand what the meaning of quality is for a given product or service. (Akkaya, 2021)

How the environment perceives it is very important when presenting a brand. Based on this, innovative brand strategies can be made. Although the impact of environmental reputation on brand performance is intuitively appealing, there is a limited understanding of the mechanism through which environmental reputation could predict brand performance. Our study shows that brand satisfaction is a mediator of the link between environmental reputation and brand performance. (Opoku et al., 2023)

Self-control of spending is very important in generation Z under the influence of changes in society and awareness.

Demonstration of spending self-control can effectively influence consumer purchase intention, as these factors enable consumers to perceive the social and epistemic value. (Yanhong et al., 2023)

Research into brand positioning on the market shows that it is very necessary to focus on the right market segment and to communicate in a targeted manner, e.g. product packaging.

Retailers could also use external cues to enhance the consumers' perception of store brand products' quality, such as the use of attractive labelling and packaging design. (Calvo-Porall et al., 2017)

The external characteristics of product packaging play an important role in the customer's decision-making process. In the battle for the dominant design, wise decisions need to be made on three key aspects: the market, the technology, and complementary assets. (Fernández, 2019)

There are many factors that influence the successful sale of a product. One of the basic factors is the name (name) of the product. This factor is closely related to the study of the customer's purchasing behavior and the digital strategic marketing of the brand in close connection with advertising.

More, behavioral data could be beneficial in order to examine the logistics startups' user engagement in depth. Additionally, social analytics can be extracted and analyzed in correlation to behavioral and technical factors in order to get a holistic approach to the digital entities. (Sakas et al., 2023)

1.1 Viral marketing

Viral marketing is a technique used in digital marketing. It aims to reach the largest possible audience through social sharing. There are different ways of viral sharing, how through emails, videos, mobile apps.

The main goal of viral marketing is to create a campaign or an advertisement that will be shared everywhere. This type of campaign is unique in that it does not use a paid distribution channel but relies on social sharing. If such content is shared by a celebrity or influencer, there is a high likelihood that it

will go viral. The faster and more frequently the content is shared, the faster it can go viral and attract a large following. (Directive, 2023)

In 2014, the Ice Bucket Challenge video for Amyotrophic Lateral Sclerosis (ALS) also went viral. It was a challenge where people poured ice water on themselves in support of the disease, such videos were shared on social media by celebrities, athletes, politicians. The challenge caused a sensation on the internet, millions of people joined in, raising awareness of ALS significantly. (Kagan, 2022)

As the potential of viral marketing began to become more and more apparent to companies, they struggled to understand the factors that influence a successful viral campaign. The STEPPS model describes six factors that are believed to contribute to the spread of content.

Social Currency, if a user believes that sharing a piece of content will make them look favourable to their audience, they are more likely to share it.

Triggers are anything that connects thoughts, ideas or different stimuli. For viral marketing to be effective, people should be able to identify with it, it should match the everyday experiences of consumers.

Emotions, people react most to content that evokes an emotional response in them. People who share such emotional content may feel that they are improving their status by showing interest in emotional, socially important issues.

Public, if it is a message, advertisement or video that is shared by many individuals or various celebrities, the user is more likely to share something like this.

Practical Value, an effective method of making content go viral is to provide some added value to those who share such content. People are happy to engage with something that promotes a good cause and are more likely to share such content.

Stories, people are more likely to understand things better if they are presented to them in the form of a story. The story must be engaging, it must tend to motivate social media users to share it. Sharing an advertisement about a company, a product in a concise, visually appealing format can have a very good effect, which can make the brand more visible. (Directive, 2023)

Viral marketing has its advantages and disadvantages. The advantages include:

- Cost effective – a good campaign will be effective and will not have a large cost as it relies on people sharing without the need to pay. Because of the ease of sharing content, there is no need to do extra work because content is shared naturally,
- Rapid growth – a company's digital presence can grow through viral content. If a company has a larger reach, it gives it a good opportunity to attract new customers and also retain customers,
- Brand awareness – viral content helps a brand to introduce itself to customers and showcase its products. People will first remember a funny video which they will then associate with the brand. This kind of advertising is most beneficial for startups or small businesses.

The disadvantages of viral marketing are:

- Negative advertising – the campaign can have a negative impact with users, which can cause negative advertising to spread, which can have a disastrous impact on the company. It may happen that customers stop buying the products of a given company because of such advertising, influencers stop working with them,
- Implementation and control – viral marketing is unpredictable, so there is a possibility that the ad may not reach the target group of users, making management and control more difficult,
- Wasted time – it may happen that the campaign does not generate interest among consumers. This can lead to financial losses for the company,
- Feedback – gathering feedback can be challenging as it is viral advertising which cannot be measured in any way. (Study Smarter, 2022)

1.2 Influencer marketing

The most charismatic among us have always influenced what we buy. It used to be the Mary Kay Lady, the Avon Lady, today it's the popular people on social media. (McKinsey&Company, 2023)

The word influencer marketing was searched on Google 465% more than ever in 2016. Influencer marketing is a collaboration between an influencer and a brand, whereby it is the promotion of a product or service. The role of an influencer is to promote a product or service on their profile. Many times they have different discount codes or contests in collaboration with the brand. The brand chooses the influencer to collaborate with according to different criteria such as : target audience, life

values, content on the profile, number of followers. Companies can collaborate with influencers not only to promote a product but also become ambassadors for the company. An ambassador gets free products on a regular basis, also promotes them and has different discount codes on a regular basis. (Geysler, 2023)

Brands have also been working with media celebrities for a long time. Compared to influencer marketing, this type of collaboration involves a much larger investment for companies and it is harder to determine an accurate return on investment. Influencer marketing is simpler in that it is easier to monitor the number of likes, shares and clicks on a page. (McKinsey & Company, 2023)

Further, companies can also work with micro influencers who, while they may not have hundreds of thousands of followers, have only a few thousand, but have a closer relationship with followers. Promotion from a micro influencer can be more natural and many times more persuasive than from a large influencer. (Geysler, 2023)

This type of marketing is not without risks. It can be riskier and harder for big brands to appear authentic when working with an influencer, as it is always a monetary transaction between the influencer and the company. On the other hand, when it's a lesser-known brand, the promotion may seem more authentic. It's also important to consider that influencer brand loyalty doesn't always have a positive effect. When a brand collaborates, it cannot influence social media behaviour and when influencers behave unprofessionally, it can jeopardise the brand's reputation. (McKinsey&Company, 2023)

1.3 Social media

In 1997, the first social network was created called SixDegrees.com where users could create their own profile, create a list of friends and chat with them. Later, sites like Friendster or Myspace were created that worked on a similar principle. (Hines, 2022)

In 2006, one of the most popular social networking sites that has over a trillion users, Facebook, came into the world. Later in 2010 came Instagram where users could add photos, the platform came through many upgrades and now users can not only add photos or even chat there, try different filters but also follow their favorite celebrities or influencers. And last but not least, TikTok came to the social networking world in 2018, it is the most used social media of today, which has over three trillion users. Users post short videos of themselves dancing, painting, doing various tricks, etc. (Britannica, 2023)

The Merriam-Webster dictionary defines social media as, "a form of electronic communication through which users create online communities to share information, ideas, personal rights, and content". The same dictionary also defines networking as, "the exchange of information or services between individuals, groups, or institutions, specifically: the cultivation of productive relationships for employment or business". (Dictionary, 2023)

The great advantage of social media is the quick feedback from customers, they share their positive and negative experiences with products or services. To which companies can quickly respond and resolve negative customer reviews. Marketers are also using social media for crowdsourcing. Crowdsourcing is getting information, opinions from a large group of people who share information on social media. (Edosomwan, 2011)

Social media has different forms of platforms, these can be divided into four main categories:

Social networks: users use social networks to communicate, share opinions or ideas. Users create a profile where they can share their age, gender, where they live, or they can choose to use such a platform to create different groups where people share their products, opinions, tips and tricks. Examples of such social networks include Facebook.

Media sharing networks: users create different 'content' which they share. This content can be of different nature, such as: funny, educational, informative. Many companies use such media to share information about their products and their company. Such media include YouTube, Instagram, TikTok.

Community social networks: this type is mainly used for discussions, users hold discussions on various topics. Each user can comment and contribute his/her opinion. An example of such a social network is Reddit.

Review social networks: this type of social network is focused on customer reviews of a product or service. An example of such social network is Yelp, users can write reviews on bars, restaurants and rate their experience. (Lutkevich, 2021)

Individual reaction to the product is an important element in the creation of the social context of the products. Social networks thus create a model of relationship with the evaluator based largely on his feelings, experience, or validity (his social impact in the community).

Individuals can take a series of actions on Facebook when engaging with a brand. They can like or react to a post, comment on another and share the other. Regarding reactions, an extension of the like button, users can express their sentiments (love, haha, wow, sad and angry) toward a publication. Furthermore, commenting provides users the opportunity to express their opinions through debate with others while sharing is considered the most valuable form of user engagement for brands, considering its potential for viral redistribution. Liking a post requires less commitment than commenting or sharing. Clicking is enough to like, while comments and shares demand additional actions and extra commitment. (Romão et al., 2019)

1.4 TikTok

TikTok, was first launched in 2016 in China. The app was very popular, so the parent company, ByteDance, introduced it to the international market. In 2017, with the acquisition of Musical.ly, the company was able to establish itself in the international market as it imported around 80 million users, most of which were from the US, onto the TikTok platform. In 2023, Tik Tok has just over 1.53 trillion active users, with just over 3 trillion people having downloaded the app, of which up to 57% are women. It is the world's sixth most popular medium. (IQBAL, Mansoor, 2023)

Table 1. Comparison of user ages to percentages

Age category	Percentage of users
13-17	28
19-29	35
30-39	18
39+	19

Source: <https://datareportal.com/reports/digital-2023-deep-dive-the-worlds-top-social-media-platforms> (2023)

Every day, a Tik Tok user spends 1.5 hours on the platform, for a yearly total of 547.5 hours. The most popular category is entertainment, followed by dancing, pranks, fitness, beauty, fashion, cooking. The engagement rate on Tik Tok in terms of micro-influencers is 17.96% as opposed to Instagram where it is only 3.86%. Larger influencers have an engagement rate of 4.96% on Tik Tok and 1.21% on Instagram. (Ruby, 2023)

Figure 1. The world's most used social platforms in January 2023

Source: <https://datareportal.com/reports/digital-2023-deep-dive-the-worlds-top-social-media-platforms> (2023)

TikTok's algorithm is tailored to show users content that they have "liked" or watched in its entirety, then automatically show them videos in a similar genre. In Slovakia, not many brands have TikTok, so the

level of competition is low, while abroad companies use TikTok to promote their brand, either through their profile or through paid promotion by influencers.

The most used hashtag for 2021 was *tiktokmademebuyit*, with up to 67% of users confirming that TikTok introduced them to products they hadn't even considered buying before. It's important to remember that with such a huge number of videos, you need to be creative, follow trends and also post videos on a regular basis. A clever way to break through on TikTok, for example, is a 'challenge', where you try to get as many users as possible to take part in the challenge, with users using a hashtag that lets other users know what the challenge is about. This is a very good opportunity for businesses to connect with their customers. Other popular videos are lifehacks, where users present interesting tutorials to followers. (Gašparová, 2022)

2. Methods

The main objective of the present paper is to analyse the current state of the use of modern marketing methods, especially viral marketing in a specifically targeted group of respondents.

The basic scientific methods such as observation, method of analysis, synthesis, induction, deduction, abstraction and comparison have been used in the preparation of the paper.

At the first stage, we set the objectives of the paper, selected the relevant scientific methods to be used in the treatment of the chosen issue, then through the fulfilment of the partial objectives we get to the actual treatment of the issue and the assessment of the current situation. Based on the facts and facts dealing with the issue, we have identified the analysis of the results as an important factor, which we have formulated into conclusions, recommendations and evaluation of the objectives.

The paper presents the results of our own primary research carried out by questionnaire method. The questionnaire was created using the Click4Survey website and was made available from February 25, 2023 to March 25, 2023. Respondents were approached through acquaintances, family friends, students, and lecturers. A total of 335 potential respondents opened the survey, but only 252 responded.

Definition and characteristics of generation Z. According to which we selected the sample of respondents. Generation Z, defined as individuals born between 1995 and 2009, which is the youngest and largest consumer group for the period from 2017 to 2030. Members of this generation are known to be innovative, pragmatic, narcissism-oriented, and averse to negative events; they tend to have a strong focus on praise and a high level of social approval. Most importantly, they are known as technology-savvy digital natives, the first generation to be born into an entirely digital world, and thus they have grown up developing relationships with digital technologies extensively. From a marketing perspective, their great dependence on SNS plays a significant role in generating sales and revenue, especially under the economic disruption of the Covid-19 pandemic. (Wang et al., 2023)

The structure of the paper follows the structure of scientific papers: introduction, aim and methods, results and discussion, conclusion.

3. Results

In cooperation with Herba Drug, s.r.o., we focused on social media and digital marketing research in the field of hair and body cosmetics oriented to Generation Z - using a questionnaire survey, which was oriented to the target group of 12-20 years old. They identified the following three sub-objectives:

1. what social networks are most used by respondents
2. on what basis they choose a product
3. what external influences affect the purchase of products

The questions in the questionnaire were also communicated with Herba Drug, Ltd (a cosmetics company dealing with hair and body cosmetics), these were modified and asked in such a way that the survey would be beneficial for them as well. In the questionnaire we asked what social networks the respondents use (Figure2).

Figure 2. Number of users of social networks
Source: own processing (2023)

A question where respondents could select multiple answers was what social networks they use the most. The most used social network is Instagram, which is used by 199 respondents. The second most used network is Tik Tok, which is visited by 95 respondents. The least used network is BeReal, which is a relatively new social network, so we consider this to be an expected result. Only 8 respondents use this network.

In the next section, we asked what influences their purchase, if there is any viral video or advertisement that influenced them in hair and body cosmetics.

The questionnaire was created using the Click4Survey website and was made available from February 25, 2023 to March 25, 2023. Respondents were approached through acquaintances, family friends, students and teachers. A total of 335 potential respondents opened the survey, but only 252 responded.

In Figures 3 and 4, we can observe the response to the question of influencer's influence when it comes to choosing cosmetics. Up to 66% of respondents answered none or not at all to this question.

Of the Slovak influencers, Moma is the most followed, followed by chemist, mom and cosmetics product development manager b_b_w_k and the same number of respondents answered Jana Hrmová and Radka Žilinčík.

Of the foreign influencers, the most prominent are the Kardashians and Kylie Jenner, also footballers such as Cristiano Ronaldo and Robert Lewandowski.

Figure 4. Number of respondents - Foreign influencers
Source: own processing (2023)

Another question in the survey asked what respondents choose cosmetics based on (Figure 5). Most respondents choose based on scent (65.1%), followed by price (50.8%). For 36.5% of respondents, recommendation from family and friends is important. The least important factor influencing the choice of cosmetics is advertising on TV and in the media, only 4.8% of respondents chose this answer.

Figure 5. Reasons for choosing cosmetics
Source: own processing (2023)

In Figure 6 we can observe the answer to the question if there is any viral video, advertisement, billboard in the field of cosmetics that influenced the respondents. 83.3% of the respondents answered no or did not answer at all. Head & Shoulders brand advertisement influenced 2.8% of the respondents, the reason was footballers who were doing advertisement for the brand. The Old Spice brand was also written by 2.8% of respondents, only one reason was given and that was an animal in the shower. Respondents also wrote other brands such as Adidas, Schauma, Nivea, Florence by Mills, Nature Box.

4. Discussion

TikTok is currently the most used social network, where new users are added every day. Many companies abroad are using this medium to promote their brand. In Slovakia, this market is still new and unexplored. Few cosmetic companies use TikTok in Slovakia, there is a great potential here, because the competition is still very small.

From our market research we found that only 3 brands out of 20 have a Slovak TikTok. All three are Slovak brands. Out of 252 respondents, TikTok is used by 95 respondents, which is 38%. The most used medium is Instagram, which is used by 199 respondents, which is 79%. Videos that are uploaded on TikTok are also very popular on Instagram now. The app introduced Instagram Reels in 2020, as an effort to rival the TikTok platform. The app has also added a separate section where users can watch these short videos. Many users share the same content on both social networks. Instagram Reels is also a very good way for businesses to interact with their audience and promote their brand at the same time. In this way, they can showcase their products, share behind the scenes of production, and create various educational content, whether about their company, products, or ingredients. The length of a video on Instagram can be from 15- 90 seconds, while the length of a video on Tik Tok can be from 15 seconds to 10 minutes.

We found that only three brands have a Slovak Tik Tok, and they are Biofy, Kvítok and Two cosmetics. Biofy currently has 905 followers, Kvítok has 44 followers, and Two cosmetics has 1080 followers. All three are natural brands. Most of the brands have TikTok, but only the foreign one. The fact that not many brands in Slovakia have this social network yet, so the space on Slovak TikTok with hair and body cosmetics remains open. And right now is a good opportunity to take a leading position on this social network.

Conclusion

The paper is focused on identifying the state of use of current viral marketing methods in a specific group of respondents and in a specific market segment. Tik Tok is the most used viral tool for presenting videos especially among the young generation. Its main advantage is the "anatomical" positioning of the mobile device while viewing the video. It also changes the philosophy of artificially placing advertisements in videos which has caused an increase in the interest of respondents. Tik Tok is viewed by respondents on average twice as long as other viral assets. Young people of our respondents' age have abandoned traditional forms such as FB and are moving to viral networks such as Tik Tok and Instagram.

The presentation of the survey results shows that Tik Tok has a high potential to improve the sales leads of a specific product line especially grounded to a specific group of respondents. A big advantage is the expansion of the offer and product innovation. It is also of great importance for collecting data on the basis of which we would be able to specify customer needs to satisfy them by developing and innovating products and product lines.

The contribution of the presented article is the description of the current potential of using viral media and viral marketing for the presentation of specifically targeted products for generation Z. The paper also identifies channels for communicating information shared among a specific group of the population, which is absolutely different from previous generations, but forms a significant part of current and future buyers of products and services. Identifying these channels and needs defines the future framework and means of marketing, especially viral marketing.

Abstract

Research background: Today's highly interconnected and digital world, traditional forms of marketing alone are insufficient for business success. Companies need to engage in digital marketing strategies not only to reach their target audiences more effectively but also to remain competitive in a broader sense. It suggests that digital marketing has become an integral part of how businesses interact with their environments, affecting everything from customer acquisition to the brand's visibility and beyond. Social networking as an integral part of digital marketing has become a frequent topic of academic inquiry, with researchers examining the concept from a variety of perspectives, including participant motivation.

Purpose of the article: The paper deals specifically with the information search motive, that is, consumer search for information about products, brands, events or relevant news. The paper's objective is to highlight disparities in consumers' information requirements based on gender, particularly within the realms of social media platforms such as Facebook, Instagram, and Youtube.

Methods: Initially, it involved illustrating prevailing attitudes towards this issue using descriptive statistics. Additionally, the Mann-Whitney U test was employed to ascertain the significance of variations in perception between male and female users.

Findings & Value added: Interestingly, while Facebook did not exhibit noteworthy gender-based disparities in information search motive, the scenario on Instagram and Youtube was distinctly different. These findings can be instrumental in formulating more effective, targeted, and resource-efficient marketing strategies for businesses operating in the ecosystems of Facebook, Instagram, and YouTube. By understanding the nuanced behavior of different genders across these platforms, businesses can better allocate their resources and refine their approaches to customer engagement.

Keywords: digital marketing, social media, online platforms, information motive

JEL classification: M31, M37

1. Introduction

Technological development significantly affects the marketing and marketing policies of companies. Likewise, changes in the market environment resulting from current situational factors cause changes in marketing communication, and the key to success seems to be innovative technologies. As an integral part of marketing communication, digital marketing has changed the way businesses and other companies communicate with audiences. Frey (2008) understands digital marketing as an overarching term that includes not only online communication on the Internet, but all communication that uses digital technologies. It also includes on-line marketing and mobile marketing.

Consumers have the option of choosing from a wide range of domestic as well as foreign products. (Chaffey, Chadwick, 2019) The Internet has significantly changed marketing. Information about a product or service is easily available on the Internet today. People use the options to compare products, prices, and can express their feelings and satisfaction with purchases using opinions and share them with other customers. Internet is open to everyone, including retailers and local merchants. Compared to traditional marketing, the online interface offers many advantages, such as monitoring and measurement, 24/7 availability, comprehensiveness, individual approach and dynamic content. (Janouch, 2020) Continuous

* Corresponding author: nella.svetozarovova@unipo.sk

development has also taken the form of means of communication such as websites and social media, which have expanded and improved in the online world.

1.1 Digital Marketing and Social Networks

In recent times, there has been a growing integration of unconventional marketing communication tools into the communication mix. Alongside a heightened emphasis on creativity, this transformation is closely tied to the influence of the Internet and its associated applications. Persistent trends and the process of digitization are challenging traditional marketing methods and fostering the emergence of novel forms of marketing communication.

As stated Kessel et al. (2019) digital marketing involves the strategic use of internet-based or electronic technologies to promote products, services, or brands, encompassing a diverse range of activities, including search engine optimization (SEO), social media marketing, email marketing, and pay-per-click (PPC) advertising, among others. This means that digital marketing tools are all Internet services that support marketing activities within the online environment. The significant development of digitalization in the world has opened the door to new technologies, thanks to which various tools have been created to support digital marketing. A specific subcategory of digital marketing is social media marketing, focused on creating and maintaining relationships with a target audience through social media such as Facebook, Instagram, Twitter, and others. Both areas are closely connected. Social media marketing is one of the channels that digital marketing uses to achieve various goals, such as increasing brand awareness, customer engagement or conversions. Social media often serves as a platform for other forms of digital marketing, including content marketing and paid online advertising. This makes social media marketing an integral part of a comprehensive digital marketing strategy.

The popularity of social networks is constantly changing and therefore it is necessary to change the marketing strategy regularly. The marketing strategy should be tailored to satisfy the site's fans and, above all, to be a source of entertainment. It is not appropriate for the text form of communication to prevail on social networks. Visual posts are more memorable and unique. A big advantage is direct communication with potential customers. Nowadays, it is necessary for companies to devote themselves to social networks.

Social networks have become a frequent topic of academic inquiry, with researchers examining the concept from a variety of perspectives, including participant motivation (Raacke and Bonds-Raacke, 2008; Piehler et al., 2019), social interactions, and usage patterns (Azar et al., 2016; Luarn, Lin, and Chiu, 2015) and user characteristics (Schivinski, 2021). Less attention, however, has been paid to the role of social networks from a marketing perspective. Practitioners have largely been at the forefront of efforts to advise businesses on their social media content strategy, with a number of industry blogs, websites and best practice guides for social media marketing emerging in recent years. (Dehouche, 2020) Although the list of advice and strategies for social media marketing efforts seems endless, academic research and empirical evidence in this area remains rather scarce. While millions of brands have adopted sites such as Facebook, theory-based academic research guiding marketing and communication strategies in this regard remains limited.

Social networks are widely regarded as the most frequently visited websites. It's important to recognize that individuals frequent social networks for leisure and relaxation, as well as for the purpose of seeking information. This motive refers to the consumer's search for information about the brand's products, events or relevant news, searching for advice, experiences and opinions of other consumers, or searching for any other information that could be relevant for purchasing or using the brand's product. (Azar et al., 2016) And this need to search for information also drives the use of social networks as social media tools (Lin and Lu, 2011; Raacke and Bonds-Raacke, 2008), participation in virtual communities (Zaglia, 2013) and also contributing to groups on the social network Facebook (Park, Kee, and Valenzuela, 2009). Based on these findings to date, it is reasonable to assume that information available on brands' social media pages can significantly contribute to content consumption, content contribution, and brand content creation itself. The study of Pletikos Cvijikj and Michahelles (2013) found that brands' posts on social media with added informational value increase the rate of liking and commenting on posts, which is in line with content contributing activity. Pöyry et al. (2013) identified a positive relationship of utilitarian motivations to content browsing, i.e. content consumption activities.

Despite the recognition of the importance of information delivery through advertisements in more traditional media, attention is also paid to the role of informational advertising and content in online social media. Searching and retrieving information about a brand is one of the main satisfactions of consumer

participation in online brand communities (Raacke and Bonds-Raacke, 2008). The desire to seek information directly from brands is a motivating factor for consumers to continue using social media sites (Lin and Lu, 2011). Content satisfaction through information seeking, knowledge, and learning predicts consumer usage patterns (Stafford, Royne, and Schkade, 2004), attitudes toward websites and brands, purchase intentions, and interaction behavior (Ko, Cho, and Roberts, 2005).

2. Methods

The aim of the paper is to point out the gender differences in consumers' information needs, specifically in the conditions of social networks Facebook, Instagram and Youtube. The analysis relies on primary data, and in this section, we will detail the methods and techniques employed to acquire this data, along with the criteria used for dataset selection. The data collection spanned six months and was executed through Computer Assisted Web Interviewing (CAWI). Distribution was facilitated via social networking tools, involving platform-based advertisements and targeted email outreach to the selected respondent profile.

The structure of the research sample that entered the analysis fulfills the established criteria of age and activity on social networks, which were identified on the basis of current statistical data of the audience profile and social network preferences on the Slovak market. The sample consisted of 401 respondents, of which 131 (32.7%) were men and 270 (67.3%) were women. In terms of age, there were 247 (61.6%) respondents in the sample between 18 and 24 years of age, and 154 (38.4%) respondents between 25 and 34 years of age.

Drawing upon data extrapolated from research on social media and their advertising tools conducted in January 2021, we find that two specific age groups constitute the predominant target audience segments in the Slovak market. These age groups are individuals aged 18-24 years and 25-34 years. This same criterion was applied to our research dataset, allowing us to generalize the findings for this particular age demographic. The second criterion stipulated that respondents must possess active accounts on the selected social networks under investigation, namely Facebook, Instagram, and YouTube. Statista's 2020 statistics and the web analysis tool Similarweb's 2021 data both affirm that these are the most frequently used social networks in the Slovak market, with all three platforms ranking among the top 10 most visited websites in Slovakia (YouTube at 2nd, Facebook at 3rd, and Instagram at 10th).

Table 1. Gender differences on social networks _ information search motive - the statements

Information motive (latent variable)	
[BRAND]'s Facebook (Instagram /YouTube) page helps me learn about things I don't know yet.	FB/IG/YT _info_1
Facebook (Instagram /YouTube) brand page [BRAND] is a good place to research relevant information.	FB/IG/YT _info_2
[BRAND]'s Facebook (Instagram /YouTube) page helps me learn about things that are useful to me.	FB/IG/YT _info_3

Source: own work (2023)

The aim of the inquiry was to find out attitudes of the respondents to the issue using descriptive statistics, while the Mann-Whitney U test was used to identify the significance of the differences in perception between men and women.

3. Results

The first social network to be analyzed was Facebook. We analyzed the differences of 3 manifest variables and observed their significance. The results are shown in the table below.

Table 2. Gender differences on Facebook

Manifest Variables	Mann-Whitney U	FROM	Asymp. Sig. (2-tailed)
FB_info_1	15808.000	-1.586	0.119
FB_info_2	15858.000	-1.504	0.132
FB_info_3	15351.000	-1.706	0.088

Source: own work (2023)

With regard to Facebook, no significant gender differences were demonstrated in the case of the three manifest variables of the information search motive.

The second analyzed social network was Instagram. Here, too, we analyzed the differences of 25 manifest variables and observed their significance. The results are shown in the table below.

Table 3. Gender differences on Instagram

Manifest Variables	Mann-Whitney U	FROM	Asymp. Sig. (2-tailed)
IG_info_1	13048.000	-3.503	0.000
IG_info_2	13903.000	-2,650	0.008
IG_info_3	12997.500	-3.570	0.000

Source: own work (2023)

Significant gender differences were observed on the Instagram social network. These are all three cases of information search motifs, specifically IG_info_1 the value $\bar{x} = 3.49$ ($\tilde{x} = 4.00$) was observed for men and $\bar{x} = 3.93$ ($\tilde{x} = 4.00$) for women, then IG_info_2 reached $\bar{x} = 3$ for men, $\tilde{x} = 3.00$ and for women $\bar{x} = 3.60$ ($\tilde{x} = 4.00$) and the last information variable IG_info_3 reached for men $\bar{x} = 3.30$ ($\tilde{x} = 3.00$) and for women $\bar{x} = 3.70$ ($\tilde{x} = 4.00$).

With regard to Instagram, women evaluated the studied variables with a greater degree of agreement than men. In no case was this situation reversed. Other differences observed did not show statistical significance.

Table 4. Gender differences on Instagram

Manifest Variables	Mann-Whitney U	FROM	Asymp. Sig. (2-tailed)
YT_info_1	13727.000	-3.189	0.001
YT_info_2	13237.500	-3.554	0.000
YT_info_3	12284.500	-4,550	0.000

Source: own work (2023)
